Rogers, Meacham & Shields is the title of a new firm of Pig Iron merchants just established at St. Louis, Mo., with offices in the Laclede Building, the partners being D. B. Meacham, W. H. Shields, Archer Brown and W. A. Rogers. Rogers, Brown & Co. make the following explanatory statement: "We have pleasure in announcing to the Iron trade a change in our St. Louis business, which is in line with the apparent needs at this point—namely, the formation of a distinctively St. Louis Pig Iron firm. It has lately been the subject of remark that the Pig Iron business here is done by branches of Cincinnati and other houses. In organizing the firm of Rogers, Meacham & Shields, our St. Louis business is placed on an independent basis, the new firm working entirely free from the Cincinnati office. Mr. W. H. Shields, who has been our St. Louis representative, is taken into the partnership, and we have associated with us Mr. D. B. Meacham, who, to join us, resigns the position of vice-president and general manager of the Norton Iron Works, manufacturers of Pig Iron and Nails, where he has earned an enviable reputation for large business capacity, conservative management, energy and integrity."

A new firm has been established in St. Louis under the title of A. P. De Camp & Co., Laclede Building, to handle Southern, Ohio, Missouri and Lake Superior pig iron, old car-wheels, old rails, scrap iron and Connellsville coke. A. P. De Camp, one of the partners, has been connected for 11 years with Matthews, Addy & Co., first in their Cincinnati firm, and for the last seven years at their St. Louis branch. William Yule, the other partner, has been for several years in the employ of the L. M. Rumsey Mfg. Company, St. Louis, as stenographer and accountant.

Cleveland.

CLEVELAND, February 4, 1889.

Iron Ore.—The first sale of new Ore for lower lake delivery comprises a 10,000-ton lot of non-Bessemer Menominee Ore, at \$4.15, f.o.b. cars Cleveland. About 2000 tons of this Ore were brought down last season and are now on dock. This will be delivered to the furnace making the purchase, along with the 8000 tons of new Ore to come down after the opening of navigation. This grade of Ore sold at the beginning of last season at about \$3.85, declined at one time to \$3.50, and closed the season at about \$4 or \$4.10. Several local dealers are interested in the sales of new Ore said to have occurred at Chicago late last week and vigorously denied in some quarters. Cleveland dealers are familiar, however, with sales in that city aggregating, perhaps, 30,000 or 35,000 tons. The price was 40¢ in advance of last season's opening quotations and about at the same figure at which the market closed late in November. One year ago over 600,000 tons of old Ore remained unsold on the docks. To-day, outside of a 36,000-ton lot of Soft Ore, unsold on the dock, not 5000 pounds of any one grade of Ore could be scraped together in any kind of an emergency. The odds and ends remaining unsold comprise remnants varying from 400 to 2000 tons in amount. These will be lumped in with new Ore when the active buying movement begins. The agitation over lake freights continues, with a fair prospect of the schedule being finally fixed on a basis of \$1.15 or \$1.20 from Escanaba. The oremen hope for season charters at \$1.10, and the vesselmen ask \$1.35. The concessions will come principally from the latter.

Pig Iron.—Southern Irons are beginning to make their presence felt in the local market, although there is nothing approaching activity in the situation. Scattering sales of Mill Irons at shaded prices are reported. The market, however, possesses a healthy tone, and any amount of confidence is expressed in the future. The new Pig Iron rate has temporarily demoralized business.

Old Rails.—There is no demand, although the price has suddenly tumbled to \$22.50. Only scattering sales at this figure are reported.

(Later, by Telegraph.)

One of the large mining companies reports having made season charters from Ashland to Cleveland at \$1.25 per ton. This rate is far below the price for which vesselmen have been contending, and seems likely to completely demoralize the pool.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, February 4, 1889.

Pig Iron.—There has been less pressure to sell Pig Iron in the local market during the past week, and to that extent the market has improved in tone. But there has been no marked recovery in prices, although several large furnaces have withdrawn from the market. The volume of business has been fair, but no very large individual sales have been made. The demand for speculative account has continued, and some purchases for this interest have been made, but there is a disposition among some sellers to discountenance such transactions. The buying has been more of Mill than of Foundry grades, but business has not been confined to either. About 5500 tons Gray Forge, Southern and Northern brands, sold at \$12.75, 3000 tons do. on the same basis, and 2000 tons mixed grades Foundry Iron on basis of \$15 for No. 1. The establishment of the storage or warrant system and its operation already in the South is credited with assisting, if not inducing a more confident feeling, giving moral support to furnaces before its more material benefits have been tested. The following are the approximate prices current here at the close for cash, f.o.b.:

Foundry.

Southern Coke, No. 1 (new classification).....	\$14.75 @ \$15.00
Southern Coke, No. 2 (new classification).....	14.25 @ 14.50
Southern Coke, No. 3 (new classification).....	13.50 @ 14.00
Ohio Soft Stone Coal, No. 1.....	15.00 @ 16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.00
Mahoning and Shenango Valley.....	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.00
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

Forge.

Strong Neutral Coke.....	13.00 @ 13.50
Mottled Neutral Coke.....	12.00 @ 12.25
Gray Forge.....	12.50 @ 13.00

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	21.00 @ 22.00

Manufactured Iron.—The demand has been a little improved, and the market has ruled steady.

Nails.—The market has ruled slow and easy in tone, without essential change in prices. 12d. @ 40d. sell at \$1.90 @ \$1.95 per keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$1.95, and Steel Wire Nails at \$2.60 @ \$2.65 per keg.

Old Material.—The market has been without improvement. The demand has been light, but there has been no pressure to sell. Old Rails are quotable at \$21.50 @ \$22, and Old Wheels at \$18 @ \$18.50, spot cash.

Detroit.

WILLIAM F. JARVIS & Co., under date of February 4, 1889, report as follows: There has been very little activity in the market here during the past week. A few sales of round lots have been made for future delivery, mostly for Southern Iron. Very few Ohio furnaces are willing to accept present price for long deliveries. Car Wheel Irons are in fair demand, but no very large orders have been booked. Several buyers have made inquiry for round lots of Lake Superior Charcoal for delivery after the opening of navigation, but manufacturers refuse to shade quotations on this grade. With trade quiet, we quote for the present as follows:

Lake Superior Charcoal, all numbers.....	\$19.50 @ \$20.00
Lake Superior Coke, all ore.....	19.00 @ 19.50
Lake Superior Coke, cinder mixed.....	18.00 @ 18.50
Standard Ohio Black Band.....	19.00 @ 19.50
Southern No. 1.....	17.00 @ 17.50
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	16.50 @ 17.00
Jackson County (Ohio) Silvery.....	18.25 @ 19.75
Old Wheels.....	19.00 @ 20.00

New York.

Office of *The Iron Age*, 66 and 68 Duane street, NEW YORK, February 6, 1889.

American Pig.—The principal event has been the establishment by the Thomas Iron Company of its opening price on Gray Forge, which has been placed at \$15.30, equal to \$15 for Southern ex-ship at tidewater. About 80,000 tons of this grade have been placed by the Thomas Iron Company, nearly all of it with Pipe makers. Additional transactions are pending which are likely to carry the total up to about 50,000 tons. No opening price has been recorded for No. 1 and No. 2 Foundry by the Thomas Iron Company, Mr. B. G. Clarke stating that he has not reached a conclusion, and that there is a possibility that no reduction whatever will be made. It is intimated, however, that low prices are being made in some quarters. Considerable Southern Iron has been placed at private terms, and it is now stated that two of the largest concerns have withdrawn. It is stated by merchants who have close connections with Southern interests that the sharp decline in the West was due to the operations of one large firm there, who succeeded in breaking the market, and purchasing very heavily especially for Pipe makers on the Ohio River. The reports received from the furnaces are not quite complete enough to give the full data. They indicate, however, that as yet there has been no falling off in the make, except on Bessemer Pig. The latter is very weak, both in Pittsburgh and in the East, it having been reported that it has been offered as low as \$15 at the former point, while in the East \$16 is shaded at furnace. Lots are offered for sale by rail mills who had purchased beyond their requirements. We quote No. 1 Standard Foundry Iron, nominally \$17.50 @ \$18; No. 2, \$16.50 @ \$17, and Gray Forge, \$15.30 @ \$15.50, all at tidewater.

Scotch Pig.—We quote: Coltness, \$20.50 @ \$21; Shotts, \$20 @ \$20.50; Langloan, \$20 @ \$20.25; Summerlee, \$20.25 @ \$20.50 and Dalmellington, \$19.25 @ \$19.50.

Plates.—We quote Iron Tank, 2¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.15¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3¼¢ @ 4¢.

Structural Iron.—The market is quiet, weak and dull. We quote Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 2¢ @ 2.10¢; Tees, 2.4¢ @ 2.6¢, and Channels and Beams, 2.8¢ on dock for all sizes. The Columbia Iron and Steel Company, of Uniontown, Pa., has joined the Beam Association.

Bar Iron.—We quote: Carload lots on dock, half extras, Common, 1.65¢ @ 1.75¢; Medium, 1.75¢ @ 1.8¢, and Refined, 1.8¢ @ 2¢.

Steel Rails.—No new transactions of any magnitude are reported in the East or South. Some of the sales lately made by Eastern mills were made at a low figure, close to \$28, but it is explained that they were due to special circumstances, the mill having a large accumulation of raw material which it was deemed best to convert into a saleable product. The market is dull and still unsettled, with \$27 @ \$27.50 the nominal quotation.

Tool Steel.—The Crucible Steel manufacturers have reduced the price 1¢ per pound to meet the competition of makers outside the association.

Old Rails.—The market is dull at \$23 @ \$23.50 for Tees here. A lot of 1000 tons afloat for Baltimore is being offered at \$24. We note a sale of 1000 tons at \$23.50, Jersey City.

Metal Market.

Copper.—Aside from small transactions in Lake Copper, which is sold by the small outside companies in modest quantities at 16¼¢ @ 17¢, and in Casting Copper, which fetches 15¼¢ @ 16¢, nothing is doing. The famous extension of contracts with the American mines, which was semi-officially announced as completed over a month ago, is making favorable progress. Negotiations are going on, and rumor has it that they have progressed far enough to be on the eve of being closed. It seems to be the general impression that the syndicate is in a good position to coerce the mining companies, and that it may at the next pool sale decide to mark prices down, with the object of stimulating consumption. As to the stability of the syndicate there seems to be little question—at least, so far as the immediate future is concerned. Chili Bars are cabled to-day \$77.15/ for spot and \$77 for futures, with Best Selected at \$79.10/. The statistical position abroad was as follows on the 1st inst.:

Stocks in Tons.	Jan. 1, 1889.	Feb. 1, 1889.	Feb. 1, 1888.
Chili Bars, Liverpool & Swansea.....	29,120	31,270	32,316
Fine Copper, Liverpool & Swansea.....	20,430	24,400	795
Foreign Copper at London.....	5,630	6,400	2,081
Chili Bars in France.....	29,015	30,300	700
Other stuff in France.....	10,490	10,500	1,500
Afloat from Chili.....	94,685	102,870	37,302
" " Australia.....	5,000	3,600	6,680
" " England to Continent.....	2,300	2,000	1,000
	104,110	108,470	45,482
Receipts and Deliveries.	Dec. 1888.	Jan. 1889.	Jan. 1888.
Chili charters for month.....	2,900	1,900	2,100
Total supplies, England and France.....	11,400	0,700	9,119
Of which from North America.....	2,600	2,800	3,219
Deliveries, England and France.....	5,200	4,300	5,928

Tin.—The market is quiet, and was irregular in London during the greater part of the week, closing steady there at £97 for spot and £97/15 for three months' futures. Here the last sale to-day was 10 tons of February at 21.75¢. **Tin Plates.**—The market has been quiet, but steady. We quote large lines per box: Siemens-Martin Steel, Charcoal Finish, \$4.75 @ \$5.50; Terns \$4.12½ @ \$4.25; Coke Tins, \$4.22½ @ \$4.30, and Wasters \$4.12½ @ \$4.15.

Lead.—The market has been extremely dull and lifeless, the total transactions for the week, large and small, probably not footing up to more than 300 to 400 tons. One sale of 100 tons was made at 3.75¢,

but holders generally are endeavoring to secure 3.77½¢ @ 3.80¢ in a small way. Buyers are utterly indifferent. They will not pay more than 3.75¢, and probably, even at that price, would take only a small quantity. The stock of about 15,000 tons in New York warehouses, and of 5000 tons in Chicago and St. Louis, is under the control of banks and bankers, who advanced 4¢ on the metal. They are not disposed to part with the stock at present prices, so that it does not cut any figure in the market now. Any approach to 3.90¢ or 3.95¢ would probably bring out considerable of it, however. For the present there seems no chance for an advance. On the contrary, the market is decidedly in buyers' favor. We quote 3.75¢ @ 3.77½¢ for Domestic.

Spelter.—We quote 5¢ for Domestic.

Antimony.—We quote Hallett 11.25¢, and Cookson, 13.25¢.

New York Metal Exchange.

The following sales are reported:

THURSDAY, January 31.	
10 tons Tin, March.....	21.80¢
10 tons Tin, prompt shipment.....	21.80¢
FRIDAY, February 1.	
10 tons Tin, May.....	22.15¢
28,000 lb G. M. B. Copper, March.....	16.00¢
28,000 lb G. M. B. Copper, May.....	15.50¢
48 tons Lead, February.....	3.77½¢
SATURDAY, February 2.	
10 tons Tin, April.....	22.15¢
10 tons Tin, May.....	22.15¢
WEDNESDAY, February 6.	
10 tons Tin, February.....	21.75¢

Coal Market.

The dullness of the Anthracite Coal trade at the present time, popularly called the "depth of winter," is phenomenal. The demand falls so much short of the ordinary rate of consumption that severe restriction must be enforced if operators expect to hold up prices anywhere near the schedule. More accumulation is reported at several points and new orders have gone out to shut down collieries. The Reading Company will operate but 21 of their 48 collieries in the Schuylkill, Mahanoy, Shamokin and Lykens Valley districts, and a temporary suspension was ordered by the Lehigh and Wilkesbarre Coal Company. The companies represent that circular prices are adhered to despite the heavy cuts by individuals, but it is intimated that opportunities to sell are improved to the best advantage possible under the circumstances. The regular prices are as follows: Hard White Ash, Lump, \$4.50; Broken, \$4.15; Egg, \$4.40; Stove, \$4.65; Chestnut, \$4.55; Free-Burning, f.o.b., Broken, \$3.95; Egg, \$4.30; Stove and Chestnut, \$4.65; Pea, \$2.75.

Bituminous Coal is in good supply at easy prices. No agreement has yet been reached between the Seaboard Association respecting either production or prices for the Coal year beginning March 1, and the Beech Creek shippers still stand aloof. Cumberland shipments since January 1 are 223,600 tons, a decrease of 25,000 tons compared with last year. The Buffalo, Rochester and Pittsburgh Railroad Company have purchased four large docks on the ship canal in Buffalo, which gives them one of the most extensive water fronts in that city. An immense coal and freight depot is to be erected on the docks. An Altoona dispatch says a Soft Coal syndicate has been organized by Eastern capitalists to develop the rich Coal lands about the towns of Frugality and Hastings, in Cambria County. The syndicate includes Vice-President-elect Levi P. Morton, Gov. James A. Beaver and First Vice-President Frank C. Thompson, of the Pennsylvania Railroad.

The news comes from Hermosillo, Sonora, that negotiations are pending in New York City for the purchase of the Yaqui coal fields of Sonora by New York men.

Fire destroyed the engine house and breaker of the North Ashland, one of the Reading Company's largest collieries, at Ashland.

Henry G. Davis, president of the West Virginia Central Railway Company, gave an elaborate dinner in Baltimore Monday night to the members of the Seaboard Soft Coal Association. President Mayor, of the Baltimore and Ohio Railroad, supplied a special train, and all the New York companies were represented.

Financial.

The business situation is not in all respects satisfactory, dullness being a common complaint, but it is conceded that those influences which restrict trade are in their nature temporary, due in no small degree to extraordinary weather conditions. Money is in liberal supply. The negotiations of railroad representatives at Chicago have been successfully conducted, American securities are regarded with more confidence in foreign markets, and there is some improvement in the export trade, particularly in the movement of grain from Baltimore. Exports of provisions are large, but prices continue on the downward grade. Over 11,000,000 pounds of lard went out last week and fully 8,500,000 pounds of bacon. The wheat markets are unsettled and again lower, with a light demand either for export or milling. The spring season in dry goods at the hands of jobbers has fairly opened, in response to orders from the South. The well-known dry goods house of J. & C. Johnston, Broadway and Twenty-second street, made an assignment without preference. The liabilities are estimated at \$100,000, and the assets consist of stock, &c., and cannot at present be estimated. Coffee is quiet, sugar about steady and most other staples well sustained.

The Stock Exchange markets during the past week showed more activity, and at times were buoyant under cheerful accounts respecting the Western conference, a reduction in the Bank of England rate favoring larger purchases of American securities on foreign account, and reports to the effect that the South Pennsylvania scheme had ceased to be a disturbing influence. Touching this latter point there was a disposition to await further developments. On Thursday, Friday and Saturday there was a gain of several points in the leading specialties. On Monday there was a selling of the grangers on unfavorable reports from the West respecting a decision by Judge Brewer dissolving the injunction against the Iowa Railroad Commissioners, thus giving the State courts more complete control in the matter of railroad freights. A reduction of freight charges averaging 30 % has already been made on the lines of the Burlington system. The choice of Mr. Walker, of the Interstate Board, as chairman of the Executive Committee of the Interstate Railway Association was favorably construed. On Tuesday the most prominent features were a rise in the Chesapeake and Ohio and a further advance in Cleveland, Columbus, Cincinnati and Indianapolis. The market closed generally firm.

Government bonds were firm at the following quotations:

U. S. 4½, 1891, registered.....	107½
U. S. 4½, 1891, coupon.....	108
U. S. 4, 1897, registered.....	127½
U. S. 4, 1897, coupon.....	127¾
U. S. currency 6s.....	120

The total clearings of 42 cities were not up to the average of several weeks past,

but the increase compared with the same week last year was 5.9 %. Outside of New York the increase was 4.4 %. Unlike the previous week, about one-half of the leading centers showed a decline, in no instance material. New York gained 6.6 %, Boston, 2.1 %; Philadelphia, 16.7 %, and Chicago, 6.4 %. For the month of January New York clearings increased 21.8 %; Boston, 17.9 %; Philadelphia, 15.4 %; Chicago, 14.9 %; St. Louis, 10.4 %; Baltimore, 11.8 %; Kansas City, 25.5 %; Milwaukee, 25.9 %; Detroit, 19.2 %, and Minneapolis, 25.9 %.

The weekly statement of the city banks was something of a surprise, the surplus reserve having decreased \$1,121,000, while the loans showed an expansion of \$7,088,000, supposed to be due to activity in the purchase of securities. The surplus reserve now held is \$18,893,000; specie is increased \$855,400, and the deposits other than United States are increased \$6,817,300. Money is in full supply, much in excess of the demand, and the banks discount more freely. Time loans are 2½ % for 30 to 60 and 3 % for 90 days, 3½ % for four and 4 % for five and six months. Rates for commercial paper are 4 % for 60 to 90 days' indorsed bills, 4½ % and 5 % for four months. The disbursements by corporations in this city, February 1, on account of interest and dividends amounted to \$19,500,000.

The market for sterling was quiet and only fairly steady in tone, partly owing to recent foreign purchases of American securities. Posted rates for sterling closed at \$4.87 @ \$4.89. The Bank of England rate was lowered from 3%. Paris advices announce the dissolution of the old Panama Company on the petition of parties representing M. de Lesseps with a view to re-organization.

The public debt reduction during January amounted to \$12,216,284, and the receipts of the Government during the month were \$82,000,000 in excess compared with \$30,700,000 in January, 1888, \$28,300,000 in 1887, and \$24,700,000 in 1886. A noticeable feature in the financial statement is an increase of silver dollars in the Treasury, January 31, to \$14,440,000, from about \$7,600,000 at the opening of the month.

According to the Custom House report, the exports of opium from this port last week amounted to \$398,000, and the imports \$50,000. Since January 1 the exports are \$3,119,000, against \$2,274,000 for the same time last year.

The imports of merchandise at this port last week were heavy, the transactions being \$12,198,000, of which \$3,836,000 represents dry goods. Since January 1 the total is \$50,056,000, as compared with \$46,280,000 last year. The exports were \$6,458,241.

An agreement among express companies to restore express charges to the figures in vogue prior to May 1, 1888, have taken effect, with an average advance considerably over 25 %.

The new Stuyvesant Bank will be situated on the corner of Fifth avenue and 125th street; capital \$150,000.

The Rhodes Holiday bill, providing for full holidays every Saturday during June, July, August and September, encounters strong opposition throughout the State.

Lake Superior Ore Output.—The annual table giving the total output of the iron mines of Lake Superior for 1888, published by the *Mining Journal*, shows that the rail shipments were the largest ever made, and swell the total for the year to 5,023,279 gross tons, the biggest output in the history of the mines. Of this the Marquette range shipped 1,921,525; Gogebic, 1,424,762; Menominee, 1,161,039; Vermilion, 511,953. The largest producers were the Minnesota Iron Companies' mines (Ver-

million district), 457,841; and the Norrie (Gogebic), 412,196. The total output of all the mines since the discovery of ore here is 40,811,861 tons, of which the Marquette range has shipped 2,713,419; Menominee, 8,594,087; Gogebic, 3,586,876; Vermillion, 1,498,209 tons. The Lake Superior mine, at Ishpeming, is credited with the largest product, 4,435,356, and the Cleveland, also at Ishpeming, next with 3,889,150.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, February 6, 1889.

Although not as irregular as during the preceding week, prices for spot Copper have varied somewhat widely on a moderate volume of trading apart from one or two large transactions. The syndicate agents are credited with having taken up one block of 200 tons at £77. /5, and they have since kept standing bids of £77. 10/. No advance on £75 has been made for futures, however, and it is a somewhat remarkable fact that there have been very few buyers despite the considerable discount from spot figures. The stock of good merchant brands in the hands of the syndicate increased some 2000 tons last month. The accumulation is cited as evidence of the accuracy of late reports of inability of smelters to dispose of their output to consumers. A considerable portion of the furnace material purchased from the syndicate thus continues to go back into their hands in the form of Bars.

Quite a good business has been done in furnace material latterly, included in which is 500 tons American Matte at 14/6, to arrive in Liverpool. An additional 300 tons at the same price is rumored.

Some little excitement has been caused by a transaction in Cueva Mora Matte, in which the terms of contract between the producers and the syndicate were evidently disregarded. It appears that a cargo was sold direct at 15/. The syndicate agents claimed the lot as theirs under contracts made at 13/, and endeavored to obtain an injunction against the delivery being made to the purchaser. In this they were unsuccessful, hence a momentary excitement and general interest as to the final outcome.

No new facts are obtained from reliable sources with respect to developments in the formation of the proposed English syndicate. There is also an absence of news regarding the success of the alleged negotiations for an extension of contracts with mining companies.

Block Tin experienced a better demand during the early portion of the week, and prices improved under the influence of the favorable monthly statistics and reported small shipments from the Colonies. Some stimulus also came from the result of Thursday's sale at Rotterdam, where 24,000 slabs Banca and 1500 tons Billiton were placed at a parity of £97 15/. in London. Under sales to realize and a contraction of the demand, however, prices subsequently receded about £1. 15/, again stiffening up to-day.

The Tin-Plate market has been quiet, owing mainly to the considerable margin between sellers' and most buyers' ideas on prices. Makers hold out firmly, however,

and have secured their figures on sales involving immediate deliveries. The output is still on a large scale, but on other works that have been standing idle for a long time are soon to be started up.

The negotiations toward forming the proposed combination of Steel Rail manufacturers have thus far been unsuccessful, although the largest firms express willingness to combine on the plans mapped out. Several of their number are, in fact, refusing to enter contracts at the present time, they believing that overtures now made to opposing firms will ultimately result in the formation of the syndicate and a considerable rise in prices. As it is, there seems to be little or no possibility that business can be done except at fully 5/ advance on last week's prices. Steel Blooms are also held at an advance, £4 being now generally quoted.

Scotch warrants have ruled rather weak, until within a few days' time, under free selling on the part of the "bears" and realizations by late buyers who are said to have become disgusted owing to evidence that the bears were not selling "short," but on orders given by makers holding warrants. Apart from this the market has been devoid of special feature and on makers' Iron there is nothing new to report. Middlesboro' Pig is showing increased firmness. Hematites have increased 6d under the influence of the strong market for Steel, and the same cause has led to 2/6 advance on Spiegeleisen.

Scotch Pig.—There has been a fairly active business, with some irregularity in prices, but no radical changes.

Cleveland Pig.—Business has increased in volume and the market shows greater firmness. No. 1 Middlesboro', G.M.B., 36/6; No. 3 do., 34/.

Bessemer Pig.—The demand has continued good and the market is stronger at 6d. advance. West Coast brands, mixed numbers, 45/6, f. o. b. shipping point.

Spiegeleisen.—For this material the market is strong at 2/6 advance, with demand brisk. English 20 % quoted 82/6 f. o. b. N. W. England shipping point.

Steel Rails.—Makers generally ask 5/ advance, and are very firm. The demand continues active. Heavy sections quoted at £4. 5/, and light sections £4. 10/ @ £4. 15/, f.o.b. at N. W. England shipping points.

Steel Blooms.—Demand is moderate, but prices are held higher and firmly. We quote £4 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—The demand for these continues brisk and prices remain firm. Bessemer, 2½ x 2½ inch, £4. 3/9, f.o.b. at N. W. England shipping point.

Steel Slabs.—Makers hold for higher prices, but the demand is moderate. Bessemer, £4, f.o.b. at N. W. England shipping point.

Old Rails.—Sellers firm on price, but the demand moderate. Tees quoted at

£3. 5/ @ £3. 6/, and Double Heads, £3. 8/ @ £3. 10/, c.i.f., New York.

Scrap Iron.—A quiet market reported, with prices steady. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Crop Ends.—There is little doing in these, but holders are firm. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

Tin Plate.—The market rather slow, with prices steady on prompt deliveries. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/3 @ 15/6
IC Bessemer Steel, Coke finish	13/6 @ 13/6
IC Siemens	13/6 @ 13/6
IC Coke, B. V. grade	12/ @ 12/6
Charcoal Terne, Dean grade	12/ @ 12/6

Manufactured Iron.—There continues to be a fairly active business, with prices firm for the most part. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d. @ 8 2 6
" Common	" 5 15 0
Staff. Bl'k Sheet, singles	7 12 6 @ 12/6
Welsh Bars (f.o.b. Wales)	5 0 0 @ 5 2 6

Tin.—The market fairly active at the lower prices, showing more firmness at the close. Straits quoted to-day at £97, spot, and £97. 10/ @ £97. 15/ for three months' futures.

Copper.—The market still unsettled and irregular. Nominal prices are: Chili Bars £77. 10/ @ £78, spot, and £75 three months' futures. Best Selected, £79.

Lead.—Demand has continued slow and prices show no material change. Quoted at £12. 7/6 for Soft Spanish.

Spelter.—Prices rule very steady, but trade is moderate. Quoted at £17. 17/6 for ordinary Silesian.

CHILI.

VALPARAISO, December 7, 1888.—Exports, Copper included, Chilian products have been excessively quiet, to some extent unfavorably influenced by the prospect of a short wheat crop. Copper.—In consequence of the more staple exchange market and the greater steadiness in the Metal in England fluctuations have been but trifling, sales not exceeding 25,566 quintals at \$27.05 @ \$27.30, f.o.b., the latter figure equaling, with 30/ freight per steamer, £76. 10/8. Exchange, 90 days' sight on London, 28½d.—Weber & Co.

WEST INDIES.

PORT OF SPAIN, TRINIDAD, January 4, 1889.—Asphaltum.—Boiled has been steady at \$14.4 and Crude at \$6.84 a ton, f.o.b., inclusive of export duty. There have been exported from this island last year 49,677 tons, compared with 42,157 in 1887 and 35,920 in 1886. Exchange on London, 90 days' sight, \$4.77 @ \$4.83.—E. P. Masson.

EAST INDIES.

MANILA, January 28, 1889.—Hemp—Has been quiet at \$16.05 @ picul, against \$9 same time last year, equaling \$1 ton cost and freight £56. 17/6, against £32. 2/6 in 1888. There cleared for the United States since last cable 12,000 bales, against none last year; since January 1, 36,000, against 13,000; there remain loading for do., 29,000, against 7000. The clearances for England since January 1, have been 12,000 bales, against 34,000; loading for do., 10,000, against 4000; cleared for all other ports, 2000, against 3000; receipts at all ports since last cable, 18,000, against 8000; and since January 1, 47,000 bales, as compared with 34,000 in 1888 and 32,000 in 1887. Freight.—\$7.50 against \$5. Exchange.—6 months sight on London 3/8¼, against 3/8.—Ker & Co., per cable direct, to their agent, Mr. Charles Nordhaus, 89 Water street, New York.

PENANG, December 21, 1888.—Tin—Receipts for the fortnight have amounted to 5000 piculs, of which Europeans took 1900 and Chinese 5000.

The price opened at \$37.40 $\frac{3}{4}$ picul, at which Chinese bought, subsequently gave way to \$36.67 $\frac{1}{2}$, closing at \$36.70, at which the Chinese are again buying.—*Schmidt, Kusterman & Co.*

SPAIN

BILBAO, January 19, 1889.—*Iron Ore.*—A good demand has been noticeable during the week, some cargoes of Rubios bringing 7 $\frac{1}{2}$, the quotations for the same being 7 $\frac{1}{2}$ @ 7 $\frac{1}{2}$, while Campanil has to be quoted 8 $\frac{1}{2}$ @ 8 $\frac{1}{2}$, the latter being rather scarce. There has been a large export movement in Ore during the week, plenty of steamers having arrived to take their turn at the drops. Export so far this year 202,147 tons, against 194,425 same time last year. The total shipments of Iron Ore last year did not exceed 3,631,593, against 4,198,696 in 1887. Of these shipments, 39,956 tons went coastwise, against 28,274 in 1887. *Pig Iron.*—There were shipped last year 1,903,220 kg. abroad, and 1,247,140 coastwise. The export from Spain of Metals of all kinds during the first 11 months of 1888 have been as follows:

	1886.	1887.	1888.
Tons.	Tons.	Tons.	Tons.
Calamine.....	25,009	21,873	24,643
Pyrites.....	621,834	701,841	756,941

Pig Iron.....	46,882	102,798	66,722
Precipitate.....	24,794	25,500	26,453
Quicksilver.....	541	1,122	892
Pig Lead.....	103,149	131,637	118,737

Total.....4,614,028 5,898,718 5,189,796
—*Bilbao Marítimo y Comercial.*

BELGIUM.

BRUSSELS, January 26, 1889.—*Iron.*—The blast furnaces have succeeded in screwing up the price of Forge Pig, and in consequence thereof the rolling mills are about to raise their figures for Finished Iron. The advance in Pig being 2 francs, and 1250 kg. being required to make 1000 kg. of Iron, the probability is that Finished will now be advanced 5 francs by the syndicate. Athus has raised the price to 4.70 francs for his Forge Pig, at which it has been selling currently.—*Moniteur des Intérêts Matériels.*

GERMANY.

HAMBURG, January 26, 1889.—*Iron.*—Pig Iron has been lively and tending upward in Rhenish Westphalia. There has been considerable animation in Spiegel, both for domestic use and export, sales having been made all the way to July 1 at 59 marks $\frac{3}{4}$ ton for 10 to 12 $\frac{1}{2}$. Thomas and Bessemer have remained steady, the syndicate selling Forge Pig at 46 @ 55 marks, and Foundry at 54 @ 61. Luxembourg may be quoted 35 @ 42, English Bessemer, 45 $\frac{1}{2}$ $\frac{3}{4}$ ton. While Finished Iron is lively for domestic consumption, so it is neglected for export. Hoop Iron has been doing tolerably well, and so have Plates, which have been advanced 5 marks $\frac{3}{4}$ ton. The Wire branch is still in a poor plight and selling at an actual loss in consequence of competition. Machine shops and car works continue in good position. Wire Rods are quoted 105 @ 107 at Dortmund, and Steel Rails 120 @ 130. All metals are quiet but firm.—*Borsenhalle.*

SWEDEN.

STOCKHOLM, January 24, 1889.—*Iron Ore.*—The total cost of the Lulca-Ofoten Railroad, which will measure 496 km. in length will be 20,000,000 crowns of 28 $\frac{1}{2}$ American. In the estimate submitted to the Government in connection with the proposed sale of the said railway to the latter, the company fixed the cost at 27,000,000 crowns. In view of this discrepancy and the demand of the company that its Iron Ore should at all times be free from export duty, the hesitation of the Government to buy the line does not cause surprise.—*Dagbladet.*

Fauber's Electric Action Door Bell.

A view is herewith given of a door bell which has just been put on the market, and for which a patent has recently been issued. The inventor has combined in this device utility with simplicity, and has succeeded in producing a very satisfactory door bell, which can be sold at a very moderate price. The mechanism is ingenious and simple. The button pushes in like the button of an electric bell, and operates a hammer with a double head, which strikes the bell alternately on either side. One full pressure upon the push-button causes six strokes of the hammer on the bell, and a coil spring of the choicest piano spring wire forces the push-button back into position and furnishes the power for six more strokes, making 12 strokes by simply one pressure. The push button drives before it a stout wire, which

Care of Steam Boilers.

Some instructions relative to the care of the Belleville boiler, issued by the French Navy Department, will be found useful, wholly or in part, by those having charge of other forms of boilers:

1. When a boiler is not in use it should be kept full of water.
2. Whenever a boiler is thrown temporarily out of use, either at sea or when arriving in port, it should be filled with water as soon as the fires are hauled.
3. To be assured that the boiler is completely filled, water should be admitted until it escapes through the safety valve.
4. The boiler should be examined at regular intervals, to ascertain whether any of the water has escaped.
5. If a boiler is to be inspected internally, it should be filled with water when

Fauber's Electric Action Bell.

pushes a steel pin through an irregular slot in the heavy brass plate. The pin is secured firmly to the pivoted end of the hammer, and as it follows the serrations the hammer vibrates and strikes its double head alternately on the bell. The barrel, which is a part of the main or foundation casting, is passed through a $\frac{1}{4}$ -inch auger hole in the door or casing and two screws fasten the frame on the inside. The rosette is then put over the push button and two screws hold it in place. The bell is adjustable to any ordinary thickness of door, say from 1 $\frac{1}{4}$ inch to 3 inches, and, when desired, connections or extra length wires are furnished for casings. If extra length wires were put in every package it would make them too bulky, hence they are only put in when called for. The bells and rosettes are packed singly in pasteboard boxes and labeled, and these are packed in larger telescoped boxes and in wooden cases. H. H. & C. L. Munger, 142 Lake street, Chicago, are sole agents for their sale.

the fires are hauled, and the water should not be discharged until everything is ready for the inspection. This rinsing operation tends to remove corrosive substances from the interior surfaces.

6. When under way, at least 1 pound of powdered carbonate of lime for each pound of cylinder oil used should be put into the well from which the feed pump draws its supply.

7. The use of vegetable and animal oils for cylinders, pump, and all parts in communication with the condenser or hot-well, should be avoided. Mineral oil alone should be used, and the engineer should ascertain, by analysis, whether the oil free from all mixture with animal vegetable fats.

The strike at the car works of the Lima Car Mfg. Company, at Lima, Ohio, which has been in progress for some weeks, has been declared off, and the works are again in operation.

Hardware.

There are on all sides evidences of increased activity, and a fair volume of business is doing. Merchants throughout the country were in many instances later than usual in placing their orders, and as a consequence there is in several lines more or less difficulty in obtaining goods as promptly as desired. Prices are substantially unaltered, there being only a few minor changes. It is to be noted that export trade is especially satisfactory and promising, the indications pointing to a continued increase in its volume.

Cut Nails.

The New York market is reported generally to be in a little better condition, although prices are unchanged at \$1.80 to \$1.90 for carload lots and \$1.90 to \$1.95 for small lots from store.

Wire Nails.

The improvement noted in the tone of the market in Wire Nails continues, and while there has been no quotable advance prices are somewhat firmer, and the extreme prices which were named immediately after the breaking up of the combination have been withdrawn. The manufacturers are in nearly all cases well supplied with orders, and are consequently not making special efforts to book others except at advanced prices. Quotations are \$2.80 for carload lots at factory. Small lots from store are offered at \$2.50 to \$2.60.

Cut Nails.

The regular monthly meeting of the Western Cut Nail Manufacturers' Association was held at the office of the Benwood Iron Works, in Wheeling, W. Va., on Wednesday, the 30th ult. The attendance was only fair, about a dozen firms being represented. The card rate was changed from \$1.90 to \$1.95, subject to the usual discounts.

Miscellaneous Prices.

Under date February 1 the following revised prices of Lead Pipe, Sheet Lead, &c., were announced:

	Per pound.
Lead Pipe.....	6 cents
Block Tin Pipe.....	45 cents
Sheet Lead.....	6½ cents
Tin-Lined Pipe.....	15 cents

Dover Stamping Company, Boston, Mass., have reduced the price of their Dover Egg Beaters, which are now sold at \$1.50 per dozen.

Our readers will observe that Boston and Lockport Block Company, Lockport, N. Y., for whom the Henry B. Newhall Company, 105 Chambers street, New York, are agents, in their advertisement on page 45 illustrate Reed's Hay Fork Pulley, calling attention to its special feature as a self-oiler. It is made in two sizes, Nos. 45 and 60, the former taking regular sized rope and No. 60 being made with an extra opening to pass knots. The self-oiling feature is illustrated, showing the simplicity of the device, and the excellence of the Pulley is alluded to. No. 45 is listed at \$5.50 per dozen and No. 60 at \$7.50 per dozen, subject to a discount of 50 and 7½ per cent. They are packed in barrels of 5 dozen each; weight, 40 pounds to the dozen.

The File market is acknowledged by all the manufacturers to be in an unsatisfactory condition, on account of the extremely low prices which are prevailing, the prices being, in fact, lower than ever before, the market having fallen away somewhat during the last few months. There is, however, a great deal of irregularity, ranging from the comparatively high prices quoted by concerns whose position in the market

enables them to obtain higher prices than their competitors, to the extremely low prices offered by others, and which are regarded by many of their more conservative competitors as below the cost of production. In this condition it will be seen that manufacturers who have an acknowledged position in the market and are able to get good prices are to be congratulated, while those who find it necessary to offer low prices in order to dispose of their goods find the situation especially unsatisfactory. The severe competition thus existing between the cheaper grades makes it difficult for those occupying the middle and higher levels to advance prices, and the effect in slightly weakening prices is to a certain degree felt. With the advances which have occurred in the price of Steel, it is the more surprising that there should have been the continual shrinking in the price of Files. What the outcome may be remains to be seen. Severe competition and low prices have the effect of discouraging some of the manufacturers, and if the present state of things continue it is not unlikely that some will withdraw from the market, thus to a certain extent diminishing the production and possibly preparing the way for a more satisfactory condition. There is, however, no immediate prospect of the accomplishment of this. In case there should be an advance in prices it is probable that some manufacturers who have withdrawn from the market would again enter it, and there seems to be little probability that the production can be limited to the regular requirements of the trade. This condition of things illustrates the desirability of a reputation for excellence of product, as there are some manufacturers who, in spite of the very low prices obtained by many of their competitors, are selling their goods in fair quantities at remunerative prices, and doing, notwithstanding the general demoralization, quite a satisfactory business. A more conservative course on the part of manufacturers who are making unremunerative prices would obviously improve the situation.

In regard to the revised list of Steel Skeins, to which reference was made in our last issue, it should be stated that several of the manufacturers did not attend the meeting and have not adopted the new list, so that at the present time there is no uniformity in lists on these goods.

McIntosh, Huntington & Co., Cleveland, Ohio, are calling attention to a lot of best second-growth shaved single-bit Axe Handles, which they are offering at \$2 per dozen.

L. S. Starrett, Athol, Mass., issues a circular describing his new Divider, No. 86, which is furnished with auxiliary caliper legs, which, together with a common pencil, may be used interchangeably with the arms, forming a variety of useful combinations. In a circular, dated 1st inst., it is stated that the discount on his list is 25 and 10 per cent., except the following tools, the discounts on which are as follows:

Spring-Bowed Calipers and Dividers.....	dis.
Micrometer Caliper Scale, No. 28.....	dis., 25 %

It is also stated that new Micrometer Gauges soon to be put on the market will be sold at discount 25 per cent.

Kingery Mfg. Company, 9 West Pearl street, Cincinnati, Ohio, issue a circular relating to their Economy Ice Cream Freezer, in which a cut is given showing its construction. These circulars are furnished for distribution by dealers to their customers. They name the following net prices on the Freezers:

2-quart.....	per dozen, \$10.56
3-quart.....	" 12.60
4-quart.....	" 13.80

Manufacturers of Augers and Bits have been considering what action can be taken with a view to securing a more satisfactory condition of things in this line, and a meeting will be held to-morrow for this purpose.

The market on Bright Wire Goods is in a somewhat better condition, some of the extreme prices having been withdrawn. The ruling quotations are, however, still very low, and referred to as yielding little, if any, profit.

Prices of Wood Planes have reached a very low point, beyond which it is not thought likely that they will much farther recede. The competition between the manufacturers is well maintained.

The following is the price list of Fauber's Electric Action Bell, of which a description is given on page 212, and for which H. H. & C. L. Munger, Chicago, Ill., are sole agents. It will be noted that Bells and Rosettes are listed separately. The list is subject to a discount of from 25 to 30 per cent.:

	Per dozen.
No. 31—3-in. Pressed Gong, Nickel Plated, without Rosette.....	\$13.00
No. 32—3-in. Bell Metal Gong, Polished, without Rosette.....	16.00

No. 42—4-in. Bell Metal Gong, Polished, without Rosette.....	21.00
(Bells packed singly).	
No. A—Rosette—Imitation Bronze.....	2.00
No. B—Rosette—Genuine Bronze, No. 1 finish.....	3.75
No. C—Rosette—Genuine Bronze, No. 3 finish.....	3.75

Saddlery Hardware in Philadelphia.

A harness-makers' association has recently been formed in Philadelphia, the object of which, as stated by them, is to compel the wholesale Saddlery Hardware houses to cease retailing goods or selling to consumers, and their demand to this effect having been made upon such houses has been by some of the leading concerns refused. It appears that it has been the custom in that city for the wholesale houses to retail to a certain extent in connection with their jobbing business, the principal articles so sold being Horse Covers and Lap Robes, a line of goods not usually carried by the harness-makers, though other goods were also retailed. This condition of things was naturally more or less antagonistic to the interests of the latter class, and the association formed to prevent this practice refused to purchase goods from any of the houses who will not bind themselves not to sell under any circumstances to consumers, a demand which, as intimated above, has been refused by such houses as Jesse Lee & Sons, Conrad B. Day & Co., Yerkes, Jones & Co., and Geo. B. De Keim & Co.

It is quite probable that there is some grievance in connection with the practice in question which should be rectified, but the system of boycott which has been determined upon by the associated harness-makers is not only objectionable on account of its interference with trade usages, but is not likely to accomplish the desired result, and if the measures already adopted are adhered to, it is probable that some of the wholesale houses will be disposed to open retail establishments of their own, and thus become formidable competitors with members of the association. But, as reflecting more accurately the situation, we give below extracts from several letters relating to the matter, as the principles involved in the controversy are of general interest, from their relation to trade methods and their bearing upon the question as to the control of business, which it is feasible to secure by organization among interested parties. Writing on this subject, a promi-

nent house, after referring to the circumstances under which the demand is made, state their position as follows:

We have always sold our goods to any one who will pay our prices for them, and shall continue to do so as long as we can find customers. We have heretofore protected the harness-makers, to whom we made a liberal discount from retail prices. If we are to be boycotted because we will not consent to the Harness Makers' Association regulating so much of our business as to dictate to us whom we shall sell to, while they buy from whom and where they please, including the manufacturer who supplies the jobber, we may be led to adopt a different course.

For a long time past the manufacturers of Saddlery Hardware and all horse materials have solicited the trade of the harness-makers of this city, who in return patronize them even at the same, and sometimes higher, prices than the jobbers would sell the same articles for. While they want to obligate the wholesale houses not to retail or sell to consumers, they claim the privilege of buying from whom and where they please and where they prefer. We have no idea that the arrangement will be lived up to for any length of time by the jobbers who have agreed to the terms of the association. From time immemorial Saddlery and Harness Goods have been retailed by the jobbers, and it will be almost impossible to avoid retailing, as three-fourths of the harness-makers buy their goods in that way.

A more full statement of the situation is given in the following letter, in which, it will be observed, an intimation is given that in case the effort is continued by the harness-makers, some of the wholesale houses will resort to aggressive measures for their defense:

Some weeks ago several retail harness-makers of this city, claiming to represent an organization called the 'Harness Makers' Protective Union, called upon us and handed us a paper for our signature, whereby we were to agree (1) not to sell to consumers, and (2) not to sell to any dealers but harness-makers. The utter absurdity of the second proposition was so apparent that it was afterward withdrawn, and we were requested to accede to the first proposition only. Had it been a mere matter of obliging we could readily have done this, for our sales to consumers amount to but little, as we in no way seek retail trade and are not equipped to look after it; but during the 35 years we have been established in this same location our house has become known and more or less persons persist in coming here for goods—particularly fine imported Saddlery and specialties—which they know we keep. We saw, however, that there was a principle at stake and that if we at all recognized the right of outsiders to make rules for the management of our business we were only at the beginning of trouble, and that we might involve ourselves in a contract which it would be impossible to keep and which we could not honorably break. We accordingly declined to sign the agreement or to deal with the association or any of its committees. We hold that differences between a house and its customers should be settled solely by the parties concerned, and that the interference of others, who are either competitors or who never deal with the house in question, is purely a piece of impertinence. We also decline to be used as a club to beat the heads of the real offenders, whoever they may be.

It has been asserted, and we believe with perfect truth, that the retail dealers have been injured by some wholesale houses selling to consumers at the same prices as to the trade. This is a wrong which calls for a remedy, but it must be settled between the parties concerned and not by formation of organized conspiracies to boycott houses which have nothing to do with the actual grievance and decline to be made parties to it. We find already that some of the more reasonable men in the union are perceiving that the action taken is inequitable and unbusinesslike and are putting the blame on the more ignorant members of the organization, who each had a vote and were ready to carry any resolution to bulldoze the wholesale houses.

In the West the movement had some success, as the practice of combining retail departments with wholesale houses does not seem to have become established, but here in the East, where so many large wholesale houses have retail departments which in no way interfere with their jobbing trade, it has become so well established that it is impossible to root it out, and the possible effect of this boycotting may be to make some of the jobbers open up regular retail departments for local trade, thus making themselves dangerous competitors to the boycotters.

Another well-known house writes as follows:

A committee of five members called upon us and presented a petition requesting us not to sell goods to any one except the harness-makers. Our trade being limited to a few of them, of course we could not consider their demands, but wrote we would give them our whole business for its equivalent. To this they made no reply. You can readily understand that we cannot, in justice to ourselves, allow any outsiders to run our business as long as we have our bills and expense account to pay.

Items.

In addition to the statement made in our issue January 17 by the Putnam Nail Company, Neponset, Boston, Mass., in regard to their prices and the method of marketing their goods, they further advise us in regard to deliveries, stating that the Western boundary of their delivery is Omaha. They will, therefore, allow Omaha freight or its equivalent on direct shipments in not less than 10-box lots from either storehouse, Boston or Chicago.

Sheldon Axle Company, Wilkesbarre, Pa., under date January 31, contradict emphatically a report which has obtained currency in some of the papers to the effect that they have temporarily suspended. They characterize it as entirely without foundation in fact, and so far from suspending temporarily state that they have been running continuously since the first day of September without shutting down their works except for accidents that are liable to occur in any manufactory. As the dispatch in question might be so construed as to refer to financial distress, they state that the company are entirely solvent and prosperous, with an excellent prospect for their future success.

Silver & Deming Mfg. Company, Salem, Ohio, have issued an illustrated catalogue and price list, which is exceptionally complete, attractively printed and well arranged. It is a volume of 224 large pages, fully illustrated, and containing a good deal of matter of interest to and for the convenience of their patrons, such as telegraphic cipher code, rules and tables relating to hydraulics, with other information concerning Pumps. The extent of their line of Pumps is indicated by the following classification: Cistern, House Force, Shallow Well, Wind Mill, Power Force, Double-Acting Force, Rotary Force and Miscellaneous, and also Well Pump Standards, Cylinders or Working Barrels, Pump Fixtures, Hydraulic Rams, &c. The catalogue also includes a line of Fittings, Pipe-Fitters' Tools, Well Tools and Supplies, &c., with Drills, Wagon-Makers' Tools, Sausage and Meat Choppers, &c. The catalogue is a very creditable one and represents their important line in a way that will be appreciated by the trade.

The National Tube Works Company's Chicago branch, Charles A. Lamb, local manager, has issued a very artistic calendar designed and engraved by John A. Lowell & Co., of Boston. The subject of the illustration, which occupies the major part of the calendar, is "Pussy's Dream," a cat being represented asleep, surrounded by shadowy forms of mice engaged in various antics.

The Ridgway Refrigerator Mfg. Company, of Philadelphia, Pa., have issued their 1889 catalogue representing their line of Refrigerators, with illustrations of the different patterns and a full explanation of their patent system. The air in their Refrigerators circulates over metallic troughs which are located in the cold-air flue, and as these troughs are exposed it is described as coming in contact with the flowing water in them, which absorbs impurities and carries them out of the Refrigerator. The fact that the Refrigerators are guaranteed absolutely dry is a point on which special emphasis is laid. The trade of the com-

pany was until the last few years comparatively limited in the extent of country covered by it, but they advise us that they are now sending Refrigerators to all parts of the country and many to Europe, and are now negotiating for a further increase in trade with other foreign points. For the coming season they have largely increased their facilities for manufacturing the goods.

Horton, Gilmore, McWilliams & Co., 172, 174 and 176 Lake street, Chicago, have taken up Bicycles, Tricycles and Safety Machines as a special department of their business. They claim to have as large a stock of these goods as any house in the country who make them their exclusive business, including every variety of wheeled vehicle in this line. They will put on the market this season a new full ball bearing 30-inch Safety Machine, known as the "J. M. Horton," which they claim to be the best ball-bearing machine made, having a number of features not found in other makes. This pattern will be controlled by them exclusively, as they have contracted to take the entire product of the factory at which they are made. The firm are putting themselves in line with the movement now making rapid headway in favor of Safety Machines. They will have a half ball-bearing machine called the "J. M. Horton, Jr.," and will also have a complete line of ladies' and misses' Safety Machines, besides two new Safety Machines for boys. Their catalogue of Bicycles, which will soon be out, will embrace, in addition to the above, a full line of the new lever gear Tricycle and a one-chain misses' Tricycle, with center gear, making in all 15 new machines for the season of 1889. They have greatly improved their high grade full ball-bearing Bicycle, introducing many new features in its construction, and their boys' and youths' Bicycles have been brought up almost to the standard of the machines used commonly by men.

Jacob Born, of the firm of Rice, Born & Co., New Orleans, one of the most prominent Hardware merchants in the South, died last week. He was widely known and esteemed, and, by his ability and energy, was instrumental in building up a large and successful business.

The S. A. Haines Company, 90 Chambers street, New York, have been organized, carrying on the business of S. A. Haines, and thus representing directly a number of manufacturers of leading lines and specialties with which the trade are familiar. They include the following houses, among which it will be observed that the National Wire Mat Company are a recent addition, the agency having been lately assumed by the company:

BELLEFONTE IRON AND NAIL CO.
L. M. DAYTON.
TOWNSEND, WILSON & HUBBARD BOLT CO.
JAMES MCKAY & CO.
LOGAN & STROBRIDGE IRON CO.
I. S. SPENCER'S SONS.
DILLE & MCGUIRE MFG. CO.
NATIONAL WIRE MAT CO.
NORFOLK SHEAR CO.
E. JENCKES MFG. CO.
STARR BROS. BELL CO.
H. CHAPIN'S SONS.
NATIONAL RIVET WORKS.
CHARLES F. HENIS CO.
THE LUFKIN RULE CO.
STEEL PULLEY AND MACHINE WORKS.
NEW JERSEY BRUSH CO.

Mr. Haines is to be congratulated on this new departure, and the company will have the best wishes of the trade for their success. In a few days Mr. Haines will start upon a trip, during which he will visit many of his friends among the leading houses of the West and Southwest, soliciting their orders for the goods of the above-named manufacturers.

The firm of W. H. Hilligas & Co. Hardware merchants at Naperville, Ill.

was dissolved last week. W. H. Hilligas has bought out his partner, Louis Reiche, and continues the business.

The F. P. Scott Hardware Company, of Denver, Col., are reported to have been burned out on the 2d inst., with a loss of \$80,000, insured for \$40,000.

Western Block Company, Lockport, N. Y., a new concern which has recently commenced the manufacture of Wood and Wrought Iron Tackle Blocks, have issued an illustrated catalogue and price list showing the variety of goods of the Anvil brand, which they are putting on the market.

An extremely pleasant incident occurred on Saturday afternoon, February 2, at the works of the Auburn Mfg. Company, the well known and extensive manufacturers of Agricultural Hand Implements, at Auburn, N. Y., and one which it is a pleasure to record on account of the long and faithful services of an efficient officer and as an instance of the harmonious and kindly feelings which should exist between such and the employees under their charge. C. E. Stevens, the treasurer and manager having been connected with that institution for a period of 20 years, it was deemed a suitable occasion to manifest the regard and esteem in which he is held by the employees, and he was accordingly surprised at the close of the day's work by the presentation, in a neat speech by one of their number, of a very large and elegant Turkish rocker in mahogany, and upholstered in the finest quality of frise plush of same color, and manufactured to order especially for the event. The recipient was completely surprised, and though visibly affected thanked the donors heartily in a few brief remarks, at the close of which "Havanas" were dispensed and indulged in while the company dispersed.

Dover Stamping Company, 88 North street, Boston, and Cambridge, Mass., have elected the following officers: Edward H. Whitney, president; Joseph Moulton, clerk; Horace N. Loveland, treasurer. The board of directors is composed of the above and Thomas Ferrald and A. O. Swain.

The trade will observe among the special notices one signed "M. H." The advertiser, we are informed, represents an old-established and reliable firm, who are desirous of securing agencies for Philadelphia of goods working in with their own, particularly that of a manufacturer of Electrical Supplies.

The Enterprise Mfg. Company, Philadelphia, Pa., issue circulars relating to the Enterprise Lawn Mowers for 1889, their Cork Puller and their Family Outfit of Sad Irons, which are furnished in cases containing a set of Mrs. Potts's Cold Handle Sad Irons, a Polishing Iron and a girl's Iron, either nickel-plated or plain polished.

The Medford Fancy Goods Company have removed to their new location, 44 and 46 Duane street, New York, where, with their five-story building, they are given greatly improved facilities, which will enable them to give prompt attention to orders. They have issued a circular of unique and effective design, in which this change of location is announced, and also call attention to it in their advertisement on page 79.

The Fieldhouse & Dutcher Mfg. Company, of Chicago, who were slightly embarrassed last fall, have satisfactorily arranged with their creditors by passing their business into the hands of a board of trustees, composed of the following well-known manufacturers: E. H. Cole, of Eaton, Cole & Burnham Company, New York; J. R. S. Boardman, of Ronalds & Co., New York; Joseph C. Platt, of the

Eddy Valve Company; A. L. Murphy, of the Conshohocken Tube Company, and O. R. Hodge, of the Dubuque Brass and Metal Company. The trustees will continue the business for three years for the benefit of all concerned. W. F. Kyle, of New York, has been engaged by the trustees as general manager, and took charge of the business on the 17th of January. Mr. Kyle is thoroughly conversant with every detail of the business, having been secretary and manager of the McNab & Harlan Mfg. Company, 56 John street, New York, whose works are at Paterson, N. J., for 25 years, withdrawing from active duties in connection with that company in June last. He has had intimate business relations with the Fieldhouse & Dutcher Mfg. Company for many years, and is a personal friend of the senior member. He makes some sacrifice in transferring himself to Chicago from his home in Brooklyn, and deserves success in his efforts to improve the condition of his trade associates. The Fieldhouse & Dutcher Mfg. Company have been carrying a very heavy stock of Pipe for Gas and Steam Fitting, Brass Goods and Plumbers' and Steam Fitters' Supplies, which are in limited demand, because of the exceedingly mild weather which has prevailed throughout the West this winter.

L. L. Chadwick's 1889 catalogue of Monroe Bros.' Patent Indurated Fibre and Stoneware Lined Refrigerators, Cleveland, Ohio, for whom Cordley & Hayes, 37 Barclay street, New York, are agents, has been issued. The advantages of these Refrigerators are mentioned, and attention called especially to some new designs for the coming season. Some of these goods are lined throughout with indurated fibre, the advantages of which for this purpose are referred to, while others are lined with stoneware. Besides illustrations showing the different patterns put on the market, a number of testimonials are given in regard to the merit of the article.

Simmons Hardware Company, St. Louis, Mo., issue a circular describing the Everlasting Patent Lock Wedges, of which they are exclusive manufacturers under C. J. Grellner's patent. The circular, which has four pages, is devoted to a description of these Wedges, showing their construction in detail and the principle on which they work, illustrations also being given of the different patterns which they make, including Axe, Hatchet, Short Hammer, Long Hammer and Sledge Wedges, all of which are made in different sizes, the dimensions of which are given. This Wedge, as many of our readers are aware, is made of malleable iron, and has on one side a half-round groove or channel terminating into an opening through the wedge. The lock piece made of half-round wire and beveled at one end is driven into the groove after the wedge has been inserted in the handle in the usual way, and is then driven home. The construction is such that the lock piece is compelled to turn through the wedge, and projects into the wood on the other side, thus fastening it very securely.

E. C. Meacham Arms Company, St. Louis, Mo., have issued their No. 390 price current, which bears date January 26. It relates to their usual varied line of Arms, Ammunition, &c., and has prefixed their discount sheet, giving key to quotations.

As will be seen by the announcement on page 80, Henry G. Cordley and James E. Hayes, under the firm name Cordley & Hayes, have associated themselves together in a general commission business. Mr. Cordley was the late general manager of the Union Indurated Fibre Company, and Cordley & Hayes succeed to their business at 37 Barclay street, New York, and 46 Federal street, Boston. They will repre-

sent the United Indurated Fibre Company, Portland, Me., and Lockport, N. Y.; Watertown Indurated Fibre Company, Watertown, Mass.; Oswego Indurated Fibre Company, Oswego, N. Y.; Fiberite Mfg. Company, Skowhegan, Me., and L. L. Chadwick, Indurated Fibre-Lined Refrigerators, Cleveland, Ohio.

The Diamond Wrench and Tool Company, Portland, Me., have issued an elegantly printed catalogue for 1889, in which they show their line of Diamond Wrenches, illustrating the different patterns, their Screw-Drivers and Hammers, Hatchets, Braces and other goods, many of which embody special features. In their circular to the trade they allude to the fact that they have a model factory, fully equipped with modern machinery, and are constantly increasing their line.

The trade will observe the advertisement occupying page 92 of the Lawrence Curry Comb Company, 204 East Forty-third street, for whom John H. Graham & Co., 113 Chambers street, New York, are agents. The company report an excellent demand for their Perfect and Steel Perfect Curry Combs, and refer to them as meeting with marked favor by the trade.

Reference is made in another column to the terrible conflagration which visited Buffalo, N. Y., early last Saturday morning, which wiped out of existence some of the best business blocks in that city. At one time it was supposed that the building of Sidney Shepard & Co. would inevitably be destroyed, and dispatches were sent out during the progress of the fire to that effect, so that in the newspaper accounts it was quite generally stated that this house had been burned out. We are glad to be able to state that such is not the case, as there was a vacant space between them and the fire, which, with the lulling of the wind, saved their property, their building bounding the burned district on the east. Their stock and building are practically uninjured, and their business continues as heretofore without any interruption whatever.

Silver & Deming Mfg. Company, Salem, Ohio, have established an office and sales-room at 72 John street, New York, which is in charge of Richard F. Day, who has a wide acquaintance, especially with the export trade, to which the company are paying particular attention.

Lockwood, Taylor & Co., Cleveland, Ohio, have organized themselves into a joint stock company under the name of Lockwood-Taylor Hardware Company to continue the business formerly done by them as a partnership. John C. Henry and W. C. Talmadge, who have been with the house for many years, become stockholders. The officers of the company are as follows: C. B. Lockwood, president; J. Q. Riddle, vice-president; B. L. Bennington, secretary, and M. Taylor, treasurer. The company allude to their capital and facilities as much increased, and solicit a continuance of the patronage of their customers.

P. J. Conroy & Co., Clearview, Philadelphia, Pa., have issued their 1889 catalogue and price list of Refrigerator and Closet Door Fasteners, Hinges and other Refrigerator and Building Hardware. The Conroy Fasteners, Cast Brass Hinges and Hasps, Cast Bronze Drawer Pulls, Bar and Rail Brackets are shown, and Cold Chisels, Detachable Meat Hooks and other goods are represented, with list prices. They state that they have built a large factory and greatly increased their facilities for manufacturing.

A. M. Ross & Co., Ilion, N. Y., issue a circular describing their Shovels, Scoops, Spades, &c., among which the Remington

Shovel occupies a prominent place. They also allude in another circular to their assortment of Wood and Iron Beam Plows, both steel and carbon, Planters' Hoes, Force Pumps, Hay Tedders, Mowers and Rake Extras.

January 1, 1889, Owens & Barkley, Maysville, Ky., dissolved their business partnership, H. C. Barkley retiring, and the firm becoming Frank Owens Hardware Company, with a capital stock of \$25,000 paid in. In announcing his withdrawal from the firm, Mr. Barkley refers in appropriate and courteous terms to the dissolution, and commending his former partner, Mr. Owens, and the Frank Owens Hardware Company to the patronage and support of the customers of the house, and it is pleasant to note that a partnership which continued without change for 25 years is terminated with the best of feeling on both sides. The new concern, which carries on the business with the familiar trademark, "O. & B.," will have the best wishes of the trade.

Exports from Hamburg to the United States of Hardware, Metal and Metal Goods during the quarter ended December 31, ult., were valued at \$11,324, as compared with \$17,607 for the same quarter of the previous year, showing a material decline. Exports of general merchandise, exclusive of the items named, from Hamburg to the United States increased from \$1,494,000 to \$1,629,000.

In his advertisement on page 60 J. W. McDonald, Cheboygan, Mich., illustrates his patent improved Saw Tool. This implement is intended for use in feeding cross-cut and one-man Saws, and is referred to as a perfect Jointer, Saw-Set, Tooth Gauge, Set Gauge and Swaging Hammer combined in one.

The St. Louis Steel Range Company, St. Louis, Mo., issue a circular giving a number of testimonials in regard to the Joy Range of their manufacture.

The New England Specialty Company, North Easton, Mass., issue an illustrated catalogue of their Hardware specialties and patented novelties. It relates to a line of Screw-Drivers, Can Openers, Kitchen Knives, Mincing Knives, Tack and Family Hammers and similar goods, and also to Shuttle Spring Blanks, Bobbin Catches, Spinning and Speeding Levers, &c.

The National Tubular Axle Department of the National Tube Works Company, 64-70 Federal street, Boston, Mass., issue in attractive form copies of some recent letters relating to the Axle, in which their customers refer to its excellence and its adaptation to a large variety of uses.

Lufkin Rule Company, Cleveland, Ohio, issue a series of blotters representing some of their leading rulers, and also their Steel Tapes recently put on the market. They also send out on a card samples of rolled forged Boot Calks, the toughness and wearing qualities of which are referred to. They are manufactured by a new patent process, which turns them out of uniform size.

Exports.

PER SHIP REPORTER, JANUARY 25, 1889,
FOR MELBOURNE, AUSTRALIA.

By A. Field & Co.—280 dozen Whip Handles, 68 dozen Hardware.
By Wheeler & Wilson Mfg. Co.—628 cases Sewing Machines.
By Rand Drill Co.—3 boxes Wire Fuses, 2 boxes Batteries, 1 box Wire.
By Singer Mfg. Co.—1007 cases Sewing Machines, 231 cases Sewing Machine Oil.

PER BARK MARY S. AMES, JANUARY 30, 1889,
 FOR PORT NATAL, SOUTH AFRICA.

By Arkell & Douglas.—24 Plows, 24 sets Spokes, 18 sets Fellos, 1 bundle Sash Cord, 3 gross Shade Rollers, 1020 pounds Sash Weights, 110 kegs Nails, 25 boxes Horse Nails, 5 dozen Barrows, 300 dozen Handles, 1 bundle Sash Cord, 2500 pounds Sash Weights, 5 cases Pumps, 35 boxes Horse Nails, 1 dozen Churns, 1 dozen Washing Machines, $\frac{1}{2}$ dozen Washing Machines, 30 dozen Brooms, 14 Agricultural Implements, 8 dozen Axes, 2 dozen Picks, 3 Stoves $\frac{1}{2}$ dozen Sewing Machines, 8 Corn Shellers, 1 dozen Meat Cutters, $\frac{1}{2}$ dozen Sausage Stuffers, 22 $\frac{1}{2}$ dozen Locks, 6 pairs Springs, 3 cases Agricultural Implements, $\frac{1}{2}$ dozen Corn Shellers, 3 dozen Barrows, 1 case Plow Parts, 3 dozen Axes, 77 barrels Fellos, &c., 2 dozen Hatchets, 4 Bells, 30 dozen Axes, 40 dozen Picks, 39 cases Plows, 180 dozen Brooms, 1 dozen Washing Machines, 60 dozen Tools, 153 cases Plows, 40 Plows, 600 feet Hose, 1 case Planes, 1 dozen Bench Screws, 4 dozen Saws, 3 dozen Rakes, 1 dozen Meat Cutters, 3 Sausage Stuffers, 1 dozen Forks, $\frac{1}{2}$ dozen Plows, 4 cases Fruit Jars, $\frac{1}{2}$ dozen Step Ladders, 5 dozen Axes, 3 dozen Traps, 3 gross Axle Grease, 20 cases Plows, 3 dozen Axes, 12 dozen Locks, 2 dozen Scales, 1 dozen Stoves, 6 dozen Saws, $\frac{1}{2}$ gross Traps, 23 cases Plows, 2 Forges, 500 feet Hose, 2 dozen Strops, 4 cases Hardware, 5 packages Pumps, 3 cases Hardware, 5 cases Pumps, 1 case Castings, 12 cases Plow Fittings, 72 Churns, 24 Plows, 80 dozen Brooms.
 By W. H. Crossman & Bro.—6 cases Hardware, 62 pounds Oil Stones, 1 case Hardware, 20 dozen Handles, 11 cases Hardware, 57 pounds Oil Stones, 100 pounds Nails, 9 dozen Hammers, 6 dozen Hoes, 2 dozen Axes, 7 dozen Hatchets, 1 dozen Barrows, 9 Churns, 35 dozen Handles, 20 Churns, 1 dozen Corn Shellers, 250 Handles, 11 Stove Trucks, 3 dozen Cultivators, 9 Corn Shellers, $\frac{1}{2}$ dozen Hay Cutters, $\frac{1}{2}$ dozen Mangles, 5 cases Hardware, 10 cases Hardware, 30 sets Axes, 9 Washers, 9 crates Wringers, 6 dozen Traps, 1 dozen Pumps, 2 dozen Axes, 15 dozen Hatchets, 30 Packages Carriage-Ware, 50 Trucks, 83 cases Plow Parts, 15 Hand Carts, 14 cases Slates, 3 Corn Shellers.

Tendencies in Trade.

Referring to the discussion which has been carried on in regard to the position of the jobbers as between the manufacturers and retailers, we have the following letter from one of the most prominent and experienced Hardware merchants of the West, whose views are entitled to especial weight:

I have read most of the letters you have published on "The Tendencies of Trade." These letters are conflicting; they are reflections of opinions of writers from the standpoint of self-interest—in many instances inspired by their personal wishes or aspirations.

It is a fact, doubtless, that at the present time there is a conflict going on between the old and the new manufacturers, the old ones, as a rule, adhering to the jobbing trade, the new cultivating the re-

tail trade. Sometimes this is on account of preference of jobbers for old brands, but more frequently by reason of two bodies attempting to occupy the same space at the same time, and invariably failing to do it. It is natural that the wholesalers should give preference to the brands which are well established rather than take up new ones which are unknown, and yet the letters on the subject are not free from statements to the contrary.

That goods can be more cheaply distributed through the jobbing houses admits of no denial, as the jobbing houses can advertise and sell hundreds of articles with one equipment of employees cheaper than hundreds of manufacturers can do the same thing with expenses of equipment hundreds of times repeated, so there can be no reasonable doubt about the permanence of wholesale jobbing houses located in the centers of trade.

The efforts to ignore established usages of trade are undertaken by the newer manufacturers for the purpose of dividing the trade with the older ones. Capital seems to be obtainable for almost any line of manufacturing, without reference to the amount already invested in it, on the mistaken theory that there is no limit to the demand for manufactured articles nor to the growth of the country, and that new men and methods will readily push out the old; but in most cases such theories and methods are disappointing. New methods are not necessarily improved ones, and therefore there are long periods of depression and only short periods of prosperity in manufacturing enterprises.

Until the actual requirements of the country can be closely estimated, and the manufacturing capacity kept more nearly in correspondence therewith, there will result unnatural and expensive competition, from which grows the discussion and conflict to which the letters referred to relate. To say that the wholesale jobbing trade will be permanently disturbed is to say that overproduction will be permanent, and that capital will continue to be wasted in the vain effort to make overproduction profitable.

In regard to the difficulty experienced by manufacturers in introducing their goods through jobbers, we have the following from a well-known Philadelphia house, in which they refer to their experience in this matter:

In reference to the trade between the manufacturers and retailers we have to say that our original intention when we started to manufacture our goods was to place them in the jobbers' hands for distribution, but as we found that jobbers were averse to explaining and introducing new goods we changed our plans and directed our attention to the retail trade. We are free to say that we think [this change benefited us, as when a retailer offers goods for sale he must thoroughly understand them and know in what points new goods are superior to old, &c., and no one can or will post him as thoroughly as the manufacturer. This does not apply to jobbers in the same measure, as their salesmen sell goods by name, number or on their reputation, and it is only necessary that they should have the "right" price in order to sell the goods and take the profit after they are introduced. We feel confident since our trade has been established direct with the retailer that the merits of our goods have been fully explained to each and every purchaser, and we propose to continue offering our goods in the same channel.

The Sparrowpoint Railroad, connecting Steelton, the Pennsylvania Steel Company's new manufacturing town, with Baltimore, has been completed, and trains will be run to Union Station next week.

New Departures.

The London *Ironmonger*, in its first issue of the present year, under the heading "New Year's Resolutions," refers in the following terms to such resolutions, so far as they relate to changes in business methods, new departures, increased enterprise, &c.:

The majority of business men are given to sober reflections upon the possibilities of another year at its commencement, and most of them arrive at the conclusion to do something or other differently, to make some entirely new departure, or to leave something undone which had been done previously. They not only "take stock" of their tangible goods and chattels, but indulge in mental retrospects and prospects which may or may not have visible results in the year which has just commenced. It is good that such should be the case. There are few men or few businesses which are not capable of some improvement, and the beginning of another year is an appropriate time for that improvement to be inaugurated. The emendation may be in respect of vital principles, or it may merely refer to working details. It may involve absolutely new departures, and therefore unknown difficulties or unforeseen successes, or it may merely touch the fringe of existing practices, and mean neither risks nor gains of importance. Whatever its magnitude at the moment or future possibilities may be, however, it is obvious that the "good resolution" should be the outcome of grave deliberation and of careful thought. The majority of personal "good resolutions" made at this season of the year come to grief because they are made too hastily—conceived on the spur of the moment, and uttered in words or recorded in writing without due deliberation or proper consideration of all that they involve. In business affairs there is probably less danger of these untoward results, if only because the business instinct in most men is better trained and in better subjection than the mere personal likes and dislikes. That there is room for "good resolutions" in respect of most businesses is pretty certain. Some concerns are so well organized throughout that there is really very little room for profitable change or improvements, but we fancy that in the majority of medium and smaller grades of businesses there is ample room for "good resolutions" in respect of general organization, regularity, enterprise and the working out of details. Bookkeeping and balancing accounts, to select an odd instance, are not always so perfect as they might be, and the quantity of old stock on hand is not so satisfactory as would have been the case had last year's management and buying-in been conducted on a better basis. The display of goods, to take another example, might also be done much better in hundreds of ironmongers' shops, and the general arrangement of the interiors of such establishments is probably capable of considerable improvement. These, with many other points, will suggest themselves to any man who is really desirous of keeping pace with the times and developing his business. They are all good subjects for "new year's resolutions," and will, we trust, be so thought out as to yield excellent results during 1889.

The trade resources of Venezuela are highly extolled by Mr. Scott, United States Minister to that country, who recently arrived in New York City from Curacao. Referring to the probability of closer connections in the future between Venezuela and the United States, he said: "Venezuela would afford a magnificent outlet for American trade. They are in need of all American products and machinery there. They have none whatever and know nothing about them. They would have to be taught how to use our machinery, but once they were made to see the advantages of it well the country would become a magnificent market for them, especially ice-making machinery. But Congress would have to send a commission there to secure substantial guarantees, because each succeeding administration repudiates all agreements of their predecessors. Without arrangements of the character referred to Mr. Scott would not advise Americans to assume risks in that country. The actual ruler is Guzman Blanco, who dictates the policy of the country.

There is some talk of a new wire rod mill in Eastern Pennsylvania.

Paulmier's Patent Key Fastener.

This ingenious contrivance applied to a lock, manufactured by S. H. Paulmier, Madison, N. J., is represented in the accompanying illustration, which indicates its utility. From this it will be seen that inside the lock, in the position shown in the small cut to the right, a gravity guard

Paulmier's Patent Key Fastener.

is placed so constructed as to permit the unobstructed entrance of the key, while the key, after it has been turned in the lock, is turned by the pressure of the guard to one side or other of the keyhole, so that it is not liable to drop out on the jarring of the door, an annoyance which, with other locks, is often troublesome. The simplicity of the device and the efficiency with which it does its work, as well as its comparative inexpensiveness, are points that are made in its favor.

The Planet, Jr., Celery Earther.

This machine is manufactured by S. L. Allen & Co., 127 and 129 Catherine street, Philadelphia, Pa. Its general features are indicated in the illustration herewith given. It will be seen that it narrows or widens to suit rows from 18 inches to 4 feet apart, and the rear ends of the wings can be used low at first earthing and

The Planet, Jr., Celery Earther.

raised as the season advances and the celery attains larger size. It is referred to as working best immediately after the cultivator has loosened the soil and made it fine. It is referred to as also useful in hilling potatoes and other crops in a

similar manner. Sweet potatoes especially, it is said, can be bedded or hilled up very neatly.

The Canton Lawn Rake.

This rake, illustrated herewith, is manufactured by the Gibbs Lawn Rake Company, Canton, Ohio, for whom John H.

Graham & Co., 118 Chambers street, New York, are agents, and is designed to meet the demands of the trade for a cheap, light, durable and efficient rake, embodying the important features of their Gibbs lawn rake, which has met with such favor. From Fig. 1 it will be seen that the form of the teeth is such that when the rake is

Fig. 1.—The Canton Lawn Rake.

in working position they comb instead of scrape the lawn and do not injure the sod. The manner in which they are inserted in the rake head is also shown in Fig. 2. It is pointed out that to unload the rake it is necessary simply to push it backward without raising it, one motion cleaning it

The First Railway in China.

Shanghai correspondents describe the successful opening in August last of a railway 86½ miles in length, from Tientsin and the port of Taku to the coal region where the Kaiping mines are located. The Viceroy officially inspected the line, which is operated on the American system, and at various stations officials met the train arrayed in colored silks, firing salutes in honor of the distinguished visitor. The ovation tendered differed widely from the scenes witnessed some years ago, when the unfortunate Shanghai-Woo-Sung line was torn up and thrown into the sea. It is predicted that this new road will eventually introduce one of the

Fig. 2.—Manner of Inserting Teeth.

largest and most profitable railway systems in the world. The line just completed was built under the superintendence of C. W. Kinder, well known in England and America, and comprises some fine specimens of engineering work. One of the bridges is across the Peh-tang River, which consists of one swing span 60 feet wide, ten of 50 feet, and five of 30 feet, in all 720 feet of iron, with iron girders and stone abutments. Altogether this bridge will compare favorably with any in America or England. There are many other splendid bridges among the 50 along the

line, one especially at a place called Chung-Hang-Chang, built in America, and forming a very handsome, light, though strong, structure, with a span of 40 yards, which can be widened by a peculiar arrangement to admit a double line when it becomes necessary. Of the four engines running one was obtained from America. Already an immense and paying goods traffic has been developed, and bales of foreign piece goods may be seen transported on the railway and reaching their destination for distribution in a few hours, where a few months ago they only arrived after as many days' travel in cargo boats, or on mules and camels.

The three commercial exchanges of Philadelphia have organized a permanent committee of five to foster the commerce of that port. No concealment is attempted of the fact that the foreign trade of Philadelphia is in a state of decadence. Exports of wheat, for example, declined from more than 9,000,000 bushels in 1887 to about 2,500,000 in 1888, 20 per cent. more than in Baltimore in the same period.

An adjourned meeting of the New England Water Works Association will be held at Young's Hotel, Boston, on Wednesday, February 13.

Drop-Forged Tack Claw.

J. H. Williams & Co., 9 to 15 Richards street and 8 to 26 Bowne street, Brooklyn, N. Y., have recently added to their line of drop forgings a tack claw, which is represented full size in the accompanying illustration. It is forged from steel and tempered, its form and the shape of the handle being shown in the cut. Attention

carriage. It costs about \$10,000 to erect it. The testing of the Thurlow, Pa., steel gun, at the naval proving grounds, will take place about the middle of February.

New Spring Hinge.

The new spring hinge illustrated herewith and recently placed on the market by the Henry C. Hart Mfg. Company, De-

troit, Mich., is designated as the Reliable No. 20 Surface Spring Hinge, and embodies some new features in construction as well as in design. Its principal point of difference from other hinges of the same character is that the manufacturers have substituted for the usual coiled wire springs a flat spring made of tempered steel and concealed by the leaves of the hinge. The advantage of this flat steel spring over the coiled wire spring is that it takes up very little space and is completely protected from the weather. It is

*Drop Forged Tack Claw.*

is called to the shape of the claw as especially adapted to the work for which it is intended, the satisfactory leverage which is secured in lifting the tack, and the fact that the handle is concaved on both sides, thus giving the requisite strength and a good grip without unnecessary weight. Besides the convenience of the form, the fact that there is no handle or ferrule to work loose, and the durability of the tool, are points which are made in regard to it. It is offered to the trade at a price which permits its being retailed at 25 cents, and

give particular attention to the cheap production of steel on a small scale.

The Howard Door Check.

The accompanying illustration represents a very simple device for holding a door open at any angle. It is intended to be screwed on the door, near the bottom, so that the swinging arm can touch the floor. One screw fastens it to the door. When not in use the arm is turned upward, a lug on the side of the wheel preventing it from revolving completely around. It can be thrown into position to hold the door by a touch of the toe. The arm being slightly eccentric in shape, it can be made to press as tightly against the floor

*New Spring Hinge.**The Howard Door Check.*

as possible. But one size is made, and it has a total spread of 4½ inches. It is constructed of malleable iron, handsomely polished, and nicked. The sale agents are H. H. and C. L. Munger, 142 Lake street, Chicago.

it is expected that this comparatively low price for an article of its excellence will insure for it an extensive sale.

Representatives of the South Boston Iron Works are engaged at the naval proving ground, opposite Annapolis, in placing in position a pneumatic gun carriage, on which to test the regulation 8-inch steel gun. The carriage is to be worked with compressed air, and it is claimed that by this method a great saving would take place as against the ordinary gun carriages now in use, as one person can manipulate the improved pattern, whereas four or five persons would be required for the old-style carriage. Should the experiment prove satisfactory, it is said the Government will very likely adopt the new style

described as made from the best quality of material, carefully tempered, thus giving an advantage over the wire springs, which are apt to vary in hardness and elasticity. The hinge is so constructed as to throw the door either open or shut. The weight of the door is referred to as supported by the knuckles of the hinge. The manufacturers refer to the hinge as meeting with favor wherever offered, and from its attractive appearance and durability likely to meet with a large demand.

L. G. Laureau has disposed of his interest in the firm of Gordon, Strobel & Laureau, and has opened an office in the Brown Building, Fourth and Chestnut streets, Philadelphia. Mr. Laureau is prepared to give advice on all matters relating

The associations of millers in the Northwest, representing the winter wheat and spring wheat sections, respectively, are contemplating a "campaign in favor of American flour." Attention will be directed particularly against Cuba and Brazil. The millers propose to make a systematic attempt to shut out Cuban sugar and tobacco unless American flour is admitted on the same basis as that of other countries. In Brazil English mills and English capital are being encouraged by the imposition of an import duty on American flour, while wheat is admitted free, and the winter and spring wheat associations propose to amalgamate under the organization of the national association to retaliate, if possible, by shutting out Brazilian coffee.

The Gem Curling Iron.

A new curling iron is illustrated herewith, which is intended for curling or frizzing hair. This is not entirely devoted to female vanity, as two sizes are made, the small size, or Little Gem, being intended for curling gentlemen's mustaches. It is made of steel, with a wooden handle.

The Gem Curling Iron.

The steel rod to be heated is connected with the handle by means of a perforated tube or air chamber, which lessens the transmission of heat to the handle, keeping it always cool. The action of the cresp is regulated by a strong spring, and it is operated by a wooden button, which is also thus constructed to prevent the transmission of heat to the thumb or finger. It is very light, easily manipulated and inexpensive. The manufacturer is G. L. Thompson, 86 Market street, Chicago, and it is sold to the jobbing trade by H. H. & C. L. Munger, 142 Lake street.

Baggage Protector.

The illustration given below represents a baggage protector made by the Ames Sword Company, Chicopee, Mass. The chain is 31 inches in length. The lock is a $\frac{1}{2}$ -inch padlock with six levers. It is in-

Baggage Protector.

tended for securing hand baggage in railroad cars, fastening bicycles, &c. It will be seen that there is a clevis-drop fastened through the center of the padlock which turns easily upon it and to which the chain is attached. The goods are furnished either in brass or nickel plated.

The Baldwin Locomotive Works have recently sent to the National Museum, at Washington, a miniature model of the locomotive "Old Ironsides," which was built by Matthias Baldwin in 1832. This was the first locomotive built by Baldwin. The workmanship is in all respects a perfect reproduction of the original. An inscription on the model states that this locomotive made 60 miles an hour. This was of course for but very short distances. In the same collection, illustrating the history of the locomotive, is the original John Bull.

Judge Brewer's decision in the Chicago, Burlington and Quincy case dissolving the preliminary injunction against the Iowa Railroad Commissioners covers the case of the Chicago, Milwaukee and St. Paul. The Chicago *Tribune* says of Judge Brew-

er's decision: "The new rates are to be enforced, but there is no danger that hardship will be inflicted on the railroads. The law which the carriers have been fighting provides that rates may be abandoned whenever it is proved that they are unreasonably low, and the burden of making such proof is properly placed on the parties that alone can furnish the needed in-

formation—viz., the railroads themselves. A rate adjusted to give returns on pretended capital never actually invested is unreasonably high and extortionate."

Crimper and Extractor.

Bailey, Farrell & Co., Pittsburgh, Pa., are about to put on the market a shot-shell crimper and extractor combined, which is shown in the accompanying illustration, Fig. 1. It is named the Eureka Fig. 2 represents a loaded cartridge and the style of crimp made by the crimper. The circular of the company refers to the fact that many sportsmen load their shell with two or

Fig. 1.—Eureka Crimper and Extractor.

three wads one size larger than the bore of the gun, the object being to retard the powder at the moment of explosion and obtain greater pressure, and thus get better penetration and pattern, and they make the point that by using one wad only on the powder and crimping the shell above this wad with the Eureka crimper the same pressure can be brought against the powder with as desirable results, at the same time economizing wads and gaining capacity in the shell for larger loads, or the charge generally used in a 10-bore can be shot out of a 12-bore. This implement crimps all sizes of paper shot shells from No. 20 to No. 8 rapidly, and with the exercise of little power. The weight is 4

confined almost exclusively to England. For petroleum and its products the whole world is the market. Germany, England, Belgium, Netherlands, British East Indies, Japan, China, Brazil and British Australasia taking the lead in the order mentioned. For cotton, England is the only large consumer, Germany and Belgium excepted. The United States of Colombia, British West Indies, Hayti, British Possessions in Africa and Chili take the bulk of the refined sugar trade, England always excepted.

New York business circles receive an important accession to their personnel from the retiring members of Cleveland's ad-

Fig. 2.—Shell Crimped by Eureka Crimper.

ministration. The utility of the crimper for crimping blank shot-gun cartridges loaded with powder and wads only is referred to in the manufacturers' descriptive circular.

Exports of American manufactured cottons from San Francisco to China, which exceeded 12,000,000 yards during the year 1887, have been entirely diverted by the Canadian railroads and Vancouver route.

Mr. Cleveland becomes partner in a law firm, and ex-Comptroller Trenholm becomes president of a security company. Secretary Fairchild and Daniel S. Lamont, Cleveland's private secretary, become officers in a new trust company in this city, associated with Roswell P. Flower and others. Mr. Whitney will also reappear in the ranks of New York's active citizens.

CURRENT HARDWARE PRICES.

FEBRUARY 6, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

THE IRON AGE

THURSDAY, FEBRUARY 14, 1889.

The Nash Gas Engine.

Several important considerations governed the designing of the engine of which we present a perspective and sectional drawings. It was aimed to operate the engine with a combustible mixture always of uniform proportions; to provide for governing; to supply the mixture as fast as used; to prevent the premature ignition of the charge; to prevent the flame in the

through the mixing valve shown in Fig. 3, which is placed externally as represented in Fig. 2. This valve automatically regulates the relative proportional supply of gas and air to the cylinder, so that the charge is of uniform quality and density. Air enters through the opening at the bottom, while the flow of gas is regulated by the valve *f*. In the interior are two valve ports of unequal area, with which a double-seated valve, *i*, operates by its weight verti-

trolled by the valve *k* operated by the governor *n*.

The ignitor *b*, Fig. 1, and shown enlarged in Fig. 4, is based upon a new principle. The igniting jet of combustible mixture is caused to rotate in the circular chamber *r*, into which it enters through a passage tangentially placed. This forms a vortex of plane which is positive in its action and simple. The valve itself, *B*, is made of steel, and is

THE NASH GAS ENGINE, BUILT BY THE NATIONAL METER COMPANY OF NEW YORK.

power cylinder from being communicated back to the supply reservoir; to prevent the leakage of the supply valve from fouling the supply for the engine; and to provide for the admission of the charge, its ignition, prevent the fouling of the supply, and prevent the back passage of the flame by a poppet valve.

The combustion or power chamber is formed partly in a separate hood and communicates at one side of the latter with the supply valve port. The forward end of the power cylinder opens into a casing of the base, which forms a compression supply chamber of which the piston is the compressor. In this chamber work the connecting rod and crank, and into it the combustible mixture of gas and air is drawn during the upward stroke of the piston

cally to control the flow of gas through the smaller valve and the flow of air through the other. It is evident that the relative quantities of air and gas drawn in by the suction created by the upward movement of the piston will be in accordance with the size of the air and gas openings. The valve is made of sufficient weight to greatly overcome the gas pressure, so that any slight variations in the latter will not materially affect the proportions of the parts of the mixture.

From the supply reservoir the mixture passes upward through a passage clearly shown in Fig. 1. Its admission to the combustion chamber above the piston is controlled by a valve of the poppet type, having an ample bearing seat. The quantity of gas admitted at each stroke is con-

hardened and ground to size. It moves in a reamed hole in the case, being so loosely fitted as to drop of its own weight, and yet making a gas-tight joint. Since the valve is perfectly balanced as to gas pressure, it moves without friction, and therefore requires a very small quantity of oil—just sufficient to prevent it becoming dry. The valve is made long, and the lower part has a bearing in that part of the case kept cool by a water jacket. As oil is only applied to the lower end, very little can work up to the hot end where the ignitor is heated; hence the formation of gummy oil is prevented and the valve seldom needs cleaning. In actual use it has been found that the case and upper end of the valve never come into metallic contact, as, on account of the looseness of fit

at that point, a scale of hard carbon is formed over the surface of each, which protects them from abrasion. The valve is positively operated by an eccentric on the shaft. The piston connection, shown clearly in Fig. 2, is unique in design, as it is not "pin connected," and as it operates without friction. Held rigidly to the piston is a hardened and ground steel block, against which the end of the connecting-rod, which is also hardened, rests. The rod has no sliding movement; it simply rocks on the bearing pin. It is held in place by a yoke, and as the pressure on the piston is always downward the yoke is not subjected to strain.

The engine ignites its charge at each revolution, and the amount of the charge is controlled at each stroke by a governor, as before mentioned, so that the regulation is as close as for a steam engine. An examination of a card taken from this engine shows a remarkable resemblance to

plosive mixture. The fly-wheel is stationed between two bearings formed in the single base casting, and hence the alignment of the shaft is always true. The working parts are inclosed and protected from

The engine shown in the engraving occupies a floor space of 25 x 85 inches, is 41 inches high, and will develop 2 horsepower. This engine is the invention of L. H. Nash and is manufactured by the

DETAILS OF NASH GAS ENGINE, BUILT BY THE NATIONAL METER COMPANY OF NEW YORK.

the card of a steam engine. The pressure at the beginning of the stroke is moderate and the line of the expansion is well sustained throughout the entire stroke. There is no sudden shock, and the pressure on the working parts is as easy as if steam were the motive fluid instead of an ex-

dust, and at the same time they are readily accessible by swinging covers. Owing to the high speed attained by the engine, and also to the fact that the piston receives a positive impulse at every stroke, it is especially adapted for work requiring uniform speed, such as electric lighting.

National Meter Company, of 252 Broadway, New York.

It is reported that the Chapin Mine, on the Menominee range, has been leased for 30 years for a cash consideration, and subject to a royalty of 40 cents a ton.

Pipe and Nipple Machine.

The accompanying engravings represent a combined pipe and nipple machine built by the Bignall & Keeler Mfg. Company, of St. Louis. It is adapted to mill use and common job shop work; it cuts and threads both pipe and nipples from $\frac{1}{4}$ to 2

inches inclusive; no change, except of the grippers, is required for either service. The machine need not be stopped to change the pipe, as a simple lever movement opens or closes the chuck at will. Fig. 2 is a longitudinal sectional elevation, broken away, when used as a pipe gripper; Fig. 3 is a front view of the same. The jaws or grippers *a* are fitted radially to the pipe *b*, at right angles to each other, within the carriers or holders *c*, which are arranged in front of the head *d* of the chuck, and are formed in one piece (re-

spectively) with the front end of the levers *e*, which are pivoted in the head *d*, and carried by the chuck. The rear ends of the levers are coupled together by springs, not shown, and are provided with rollers, *f*, for riding over the cone *g*, which surrounds the spindle *h*, and is moved to and fro along the latter for operating the jaws, which are turned by the chuck. The rear ends of the levers are coupled together by springs, not shown, and are provided with rollers, *f*, for riding over the cone *g*, which surrounds the spindle *h*, and is moved to and fro along the latter for operating the jaws, which are turned by the chuck. The rear ends of the levers are coupled together by springs, not shown, and are provided with rollers, *f*, for riding over the cone *g*, which surrounds the spindle *h*, and is moved to and fro along the latter for operating the jaws, which are turned by the chuck.

is prevented by pins bearing against the shoulders *m* of the screws, so that when the latter are turned the jaws will be moved to or from the pipe as required. The outer end of the shank *k* is flush with the outer end of the carrier, and is formed with a key, by which the screw may be turned. When the cone *g* is moved along the spindle by its clutch in the usual manner for diverging the rear arms of the levers, the jaws of the grippers are brought toward the pipe and the rear portions of the gripping edges of the jaws are caused to bite into and grip the pipe somewhat in advance of, and therefore to a greater extent than, the front portion of the edges, and the pipe is more firmly held than when the grippers close upon the pipe at right angles. To increase the gripping force the inclination of the cone at its highest pass is lessened so as to gain more power on the levers at that point. By turning the screws the jaws can be speedily adjusted to different sized pipes. By the use of four jaws in lieu of two, as usual, the pipe is set truer as the grippers close upon it. The slides used for holding the pipe steady while cutting off are operated by a crank and right and left screw on the work side of the machine.

When the machine is used as a nipple chuck, nipple grippers are inserted in place of the pipe grippers, the rest of the chuck being as described. By using four nipple grippers, or quarter sections, the nipple is readily released by operating the chuck with the lever movement and allowing the nipple to drop.

So great is the demand upon the resources of the various shipbuilding yards in the Delaware River and at Wilmington that contracts for early delivery cannot be made. It is stated that the United States and Brazil Mail Steamship Company are

Fig. 1.—Perspective View.

PIPE AND NIPPLE MACHINE, BUILT BY THE BIGNALL & KEELER MFG. COMPANY OF ST. LOUIS MO.

levers in the usual manner. The rear edges of the jaws are formed with lateral ribs, and are fitted within grooved recesses, *i*, formed longitudinally in the faces of the carriers *c*, these recesses corresponding in shape to the jaws. The jaws, thus constructed, can be adjusted longitudinally in the recesses by means of adjusting screws, which engage internal threads in the outer ends of the jaws, the shanks *k* of the screws passing through circular openings in the outer ends of the carriers *c*. Longitudinal movement of the screws

unable to procure bids upon two steamers which they want unless willing to wait two years for them to be finished. The ships recently negotiated for include one for the Mallory Steamship Company and two for the New York and Cuba Mail Steamship Company, which will be built at Roach's yard, one for the Morgan Line, and two for the Red D Line, contracted for a William Cramp & Sons, and a steel steamer of 5000 tons displacement, which a Scotch firm is building for the Pacific Mail Steamship Company.

unable to procure bids upon two steamers which they want unless willing to wait two years for them to be finished. The ships recently negotiated for include one for the Mallory Steamship Company and two for the New York and Cuba Mail Steamship Company, which will be built at Roach's yard, one for the Morgan Line, and two for the Red D Line, contracted for a William Cramp & Sons, and a steel steamer of 5000 tons displacement, which a Scotch firm is building for the Pacific Mail Steamship Company.

Tire-Heating Furnace.

In this furnace the tires rest upon two parallel grooved shafts placed over each side of the fire. The upper parts of the tires are held separated by a wire frame, as shown in the cut. The outer end of each shaft is provided with a sprocket wheel, over which passes a chain leading from a suitable driving shaft. By this means the tires are kept revolving slowly, and each is brought constantly in contact with the fire. The oven itself is heated sufficiently to keep them all at a proper temperature. As fast as one is removed another is put in its place, the heating going on faster than the tires can be put on the wheels, and without the least danger of burning. The fire-box is adapted to burn either coal or wood. This furnace, known as the Duffey, is made by Bradley & Co., of Syracuse, N. Y.

The Blast Furnaces in Allegheny County.

In the future, in our monthly report of the condition of the blast furnaces of the country, we shall reduce the number of coke stacks credited to Allegheny County from 20 to 18. This has been made necessary by the fact that two of the three stacks operated by Laughlins & Co., at Pittsburgh, have been dismantled. These two stacks were blown out some weeks since for the purpose of being relined, and work had already been commenced when one of the stacks fell in, and it was

of about 500 tons per day. This entire amount, or nearly all of it, will be consumed by the firm named above, who are interested in the furnaces. The two stacks which have been dismantled were erected in 1861, and have been in continuous operation since 1882 on one lining, which is certainly a remarkable record. In that time it is estimated that the two

their history. The two stacks of Shoenberger, Speer & Co., are turning out nearly 5000 tons per month. One of them will be blown out in the near future for relining and will also be fitted up with new stoves of the Massicks & Crooke's design. The new Soho Furnace, of the Moorhead-McCleane Company, was put in blast on November 15 last, and thus far

RATCHET DIE STOCK, MADE BY CURTIS & CURTIS, BRIDGEPORT, CONN.

stacks have produced very nearly 500,000 tons of pig iron.

Clinton Furnace, formerly owned and operated by Graff, Bennett & Co., but later operated by a syndicate of creditors of that firm, was banked last month, and will probably not go in blast again for some time, if it ever resumes again. It is a very old furnace and cannot produce over 325 tons per week under the most favorable conditions. Carrie Furnace, of

has made an excellent record. For the month of January just closed it produced 5676 gross tons of pig iron. Unless something unforeseen should occur the output of pig iron in Allegheny County for the present year will be considerably larger than ever before in its history.

Ratchet Die Stock.

The illustration presented herewith shows a ratchet die stock which has just been brought out by Curtis & Curtis, of Bridgeport, Conn. The hub, which is threaded at diametrically opposite points to receive the handles, is free to revolve upon the central stock. In the hub is a pawl, pressed inward by a spring, to engage its inner end with suitably formed teeth upon the stock. The pawl may be turned a half revolution, so that the hub and stock may be held to revolve in either direction desirable. During the reverse movement of the handles the hub, of course, turns independently of the center. The ratchet allows the tool to be worked without changing hands, and thus avoids all loss of power and dead centers.

The scheme for the training of mechanics approved by the Master Builders' Exchange, of Philadelphia, provides for the education of boys in a mechanical trade school until they have obtained a certificate of proficiency and a service for a term of practice with an employer, this term to be at least one year less than the usual term of apprenticeship by virtue of the holding of a certificate of proficiency granted by a mechanical trade school. The completion of the education of the mechanic is to be acknowledged on the part of the employer by the granting of a certificate from the association of builders, setting forth that the holder has passed through the prescribed course at the trade school and the term of practice with an employer, and is entitled to be received by all builders as a journeyman. With similar schools established in New York, Philadelphia and Boston, this system will, it is believed, in time afford a substitute in part for the old form of apprenticeship, and be of advantage to both the young men and their employers.

It is reported from Duluth that large works for the production of aluminium are to be erected in that city, but such stories are to be received with reservation, at least until it is positively known that the metal can be manufactured profitably.

DUFFEY TIRE-HEATING FURNACE, BUILT BY BRADLEY & COMPANY, SYRACUSE, N. Y.

then decided by the firm to dismantle both of them, the work having been almost completed already. The new stack completed by this firm in the early part of last year is in operation, and is producing about 250 tons per day, which is all consumed by the American Iron and Steel Works of Jones & Laughlins, Limited. Work on the new stack is progressing rapidly, and it will probably be ready for blast by the middle of March. It will also have a capacity of about 250 tons per day, giving the firm a total production

the Carrie Furnace Company, continues in blast and is making a good record. This firm are also building an additional stack, which will probably be ready for blast not later than April next. It will have a capacity of about 200 tons per day. The nine stacks controlled by Carnegie Bros. & Co., Limited, and Carnegie, Phipps & Co., Limited, are all in blast and producing nearly 60,000 tons of pig iron per month. The two stacks of the Isabella Furnace Company are in blast and producing more pig iron than ever before in

The Bugaboo of Trusts.*

BY ANDREW CARNEGIE.

We must all have our toys; the child his rattle, the adult his hobby, the man of pleasure the fashion, the man of art his master; and mankind in its various divisions requires a change of toys at short intervals. The same rule holds good in the business world. We have had our age of "consolidations" and "watered stocks." Not long ago everything was a "syndicate;" the word is already becoming obsolete, and the fashion is for "trusts," which will in turn no doubt give place to some new panacea, that is in turn to be displaced by another, and so on without end. The great laws of the economic world, like all laws affecting society, being the genuine outgrowth of human nature, alone remain unchanged through all these changes. Whenever consolidations, or watered stocks, or syndicates, or trusts endeavor to circumvent these, it always has been found that the result is after the collision there is nothing left of the panaceas, while the great laws continue to grind out their irresistible consequences as before.

It is worth while to inquire into the appearance and growth of trusts and learn what environs produce them. Their genesis is as follows: A demand exists for a certain article beyond the capacity of existing works to supply it. Prices are high, and profits tempting. Every manufacturer of that article immediately proceeds to enlarge his works and increase their producing power. In addition to this the unusual profits attract the attention of his principal managers or those who are interested to a greater or less degree in the factory. These communicate the knowledge of the prosperity of the works to others. New partnerships are formed, and new works are erected, and before long the demand for the article is fully satisfied, and prices do not advance. In a short time the supply becomes greater than the demand, there are a few tons or yards more in the market for sale than required, and prices begin to fall. They continue falling until the article is sold at cost to the less favorably situated or less ably managed factory; and even until the best managed and best equipped factory is not able to produce the article at the prices at which it can be sold. Political economy says that here the trouble will end. Goods will not be produced at less than cost. This was true when Adam Smith wrote, but it is not quite true to-day. When an article was produced by a small manufacturer, employing, probably at his own home, two or three journeymen and an apprentice or two, it was an easy matter for him to limit or even to stop production. As manufacturing is carried on to-day, in enormous establishments with five or ten millions of dollars of capital invested, and with thousands of workers, it costs the manufacturer much less to run at a loss per ton or per yard than to check his production. Stoppage would be serious indeed. The condition of cheap manufacture is running full. Twenty sources of expense are fixed charges, many of which stoppage would only increase. Therefore the article is produced for months, and in some cases that I have known for years, not only without profit or without interest upon capital, but to the impairment of the capital invested. Manufacturers have balanced their books year after year only to find their capital reduced at each successive balance. While continuing to produce may be costly, the manufacturer knows too well that stoppage would be ruin.

His brother manufacturers are of course in the same situation. They see the savings of many years, as well perhaps as the capital they have succeeded in borrowing, becoming less and less, with no hope of a change in the situation. It is in soil thus prepared that anything promising relief is gladly welcomed. The manufacturers are in the position of patients that have tried in vain every doctor of the regular school for years, and are now liable to become the victims of any quack that appears. Combinations—syndicates—trusts—they are willing to try anything. A meeting is called, and in the presence of immediate danger they decide to take united action and form a trust. Each factory is rated as worth a certain amount. Officers are chosen, and through these the entire product of the article in question is to be distributed to the public at remunerative prices.

Such is the genesis of "trusts" in manufactured articles.

During the recent Presidential campaign it suited the purpose of one of the parties to connect trusts with the doctrine of protection. But trusts are confined to no country and are not in any way dependent upon fiscal regulations. The greatest trust of all just now is the Copper Trust, which is French, and has its headquarters in Paris. The Salt Trust is English, with its headquarters in London. The Wire-rod Trust is German. The only Steel-rail Trust that ever existed was an international one which embraced all the works in Europe. Trusts, either in transportation or manufactures, are the product of human weakness, and this weakness is co-extensive with the race.

There is one huge combination classed with trusts which is so exceptional in its origin and history that it deserves a separate paragraph. I refer to the Standard Oil Company. So favorable an opportunity to control a product perhaps never arose as in the case of petroleum. At an early stage a few of the ablest business men that the world has ever seen realized the importance of the discovery, and invested largely in the purchase of property connected with it. The success of the petroleum business was phenomenal, and so was the success of these people. The profits they made, and, no doubt, as much capital as they could borrow, were fearlessly reinvested, and they soon became the principal owners, and finally, substantially the only owners, of the territory which contained this great source of wealth. The Standard Oil Company would long ago have gone to pieces had it not been managed, upon the whole, in harmony with the laws which control business. It is a hundred to one whether it will survive when the present men at the head retire; or perhaps I should say when the present man retires, for wonderful organizations imply a genius at the head, a commander-in-chief, with exceptionally able corps commanders no doubt, but still a Grant at the head. To those who quote the Standard Oil Company as an evidence that trusts or combinations can be permanently successful, I say wait and see. I have spoken thus freely of that company because I am ignorant of its management, profits and modes of action. I view it from the outside as a student of political economy only, and as such have endeavored to apply to it the principles which I know will have their way no matter how formidable the attempt made to defeat their operation.

We have given the genesis of trusts and combinations in their several forms. The question is, Do they menace the permanent interest of the nation? Are they a source of serious danger? Or are they to prove, as many other similar forms have proved, mere passing phases of unrest and transition? To answer this question let us follow the operation of the manufacturing

trust which we have in imagination created, salt or sugar, nails, beams, or lead or copper; it is all the same. The sugar refiners, let us say, have formed a trust after competing one with another through years of disastrous business, and all the sugar manufactured in the country in existing factories is sold through one channel at advanced prices. Profits begin to grow. Dividends are paid, and those who before saw their property vanishing before their eyes are now made happy. The dividends from that part of a man's capital invested in the sugar business yield him profit far above the capital he has invested in various other affairs. The prices of sugar are such that the capital invested in a new factory would yield enormously. He is perhaps bound not to enlarge his factory or to enter into a new factory, but his relatives and acquaintances soon discover the fresh opportunity for gain. He can advise them to push the completion of a small factory, which, of course, must be taken into the trust. Or, even if he does not give his friends this intimation, capital is always upon the alert, especially when it is bruited about that a trust has been formed, as in the case of sugar, and immediately new sugar manufactories spring up as if by magic. The more successful the trust, the surer these off-shoots are to sprout. Every victory is a defeat. Every factory that the trust buys is the sure creator of another, and so on, *ad infinitum*, until the bubble bursts. The sugar refiners have tried to get more from capital in a special case than capital yields in general. They have endeavored to raise a part of the ocean of capital above the level of the surrounding waters, and over their bulwarks the floods have burst, and capital, like water, has again found its level. It is true that to regain this level a longer or a shorter period may be required, during which the article affected may be sold to the consumer in limited quantities at a higher rate than before existed. But for this the consumer is amply recompensed in the years that follow, during which the struggle between the discordant and competitive factories becomes severer than it ever was before, and lasts till the great law of the survival of the fittest vindicates itself. Those factories and managers that can produce to the best advantage eventually close the less competent. Capital wisely managed yields its legitimate profit. After a time the growth of demand enables capital to receive an unusual profit. This in turn attracts fresh capital to the manufacture, and we have a renewal of the old struggle, the consumer reaping the benefit.

Such is the law, such has been the law, and such promises to be the law for the future; for, so far, no device has yet been devised that has permanently thwarted its operation. Given freedom of competition, and all combinations or trusts that attempt to exact from the consumer more than a legitimate return upon capital and services write the charter of their own defeat. We have many proofs that this great law does not sleep and that it will not be suppressed. Some time ago, as I have stated, the steel rail manufacturers of Europe formed a trust and advanced the price of rails to such an extent that American manufacturers were able for the first and perhaps for the last time to export steel rails to Canada in competition with the European. But the misunderstandings and quarrels, inseparable from these attempted unions of competitors, soon broke the trust. With vindictive feelings, added to what was before business rivalry, the struggle was renewed, and the steel rail industry of Europe has never recovered. It was found that the advance of prices had only galvanized into life concerns which never should have attempted to manufacture rails; and so that trust died a natural death. During the

* Extracts from a paper printed in the February number of the *North American Review*.

great depression which existed for several years in this country in the steel rail trade many anxious meetings were held under circumstances described in the genesis of trusts, and it was resolved that the plan of restricting production should be tried. Fortunately reaction soon came. A demand for rails set in before the plan went into operation, and, as a matter of fact, no restriction of product was ever attempted, and the steel rail industry was thus saved from a great error. We have recently seen the lead trust of this country shattered and its chief owners bankrupted. The newspapers a few weeks ago were filled with accounts of the convention of the growers of cattle in St. Louis, resolved to break down the combination of slaughterers and shippers in Chicago and Kansas City. No business was poorer in this country for many years than the manufacture of nails. It was overdone. To remedy this the manufacturers did not form a trust, so far as the sale of product was con-

insurance and hardware, and 20 more articles; but the fitting epitaph for these ephemeral creations is

"If I was so soon to be done for,
I wonder what I was begun for!"

We may exclaim with Macbeth as he watched the shadowy descendants of Banquo filing past, "What, will the line stretch out to the crack of doom?" But as with Banquo's procession, so with trusts, it is comforting to remember that as one approaches another disappears. They come like shadows, and so depart.

The people of America can smile at the efforts of all her railway magnates and of all her manufacturers to defeat the economic laws by trusts or combinations, or pools, or "differentials," or anything of like character. Only let them hold firmly to the doctrine of free competition. Keep the field open. Freedom for all to engage in railroad building when and where capital desires, subject to conditions open to all. Freedom for all to engage in any

brief season indeed, unusual profit upon actual capital invested either in transportation or manufacture, so long as all are free to compete, and this freedom, it may safely be asserted, the American people are not likely to restrict.

Electro-Plating Machines.

An interesting story is told by the two engravings which are placed side by side on this page. That to the left represents the initial step in the employment of electricity for the deposition of metals, while the other illustrates the result obtained by nearly half a century's travel along the path pointed out by the first. The first machine developed a current of electricity obtained from steel magnets—an invention founded upon the great discovery of Faraday—and was perfected and first successfully worked by Prime & Son at their large silver-ware works, Birmingham,

THE FIRST ELECTRO-PLATING MACHINE.

THE LITTLE WONDER.

cerned, but they restricted production. A certain percentage of their machines was kept idle. This percentage was increased from time to time, and only the quantity made that the market would take at a certain price. But the result was that there were soon more machines in America for the manufacture of iron nails added to the works than the demand for nails will require for many years to come, and this combination of nail manufacturers went the way of all trusts, and left the business in a worse plight than it was in before.

The Sugar Trust has already a noted competitor at its heels. The Copper Trust is in danger. All stand prepared to attack a "trust" or "combine" if it proves itself worth attacking; in other words, if it succeeds in raising its profits above the natural level of profits throughout the country it is subject to competition from every quarter, and must finally break down. It is unnecessary to devote much attention to the numerous trusts in minor articles which one reads of, a new one appearing every few days and others passing out of existence, because they are all subject to the great law. The newspapers charge that trusts exist or have existed in wall paper, shoe laces, lumber, coal, coke, brick, screws, rope, glass, school-books,

branch of manufacturing under like conditions.

There can then be no permanent extortion of profit beyond the average return from capital, nor any monopoly, either in transportation or manufacturing. Any attempt to maintain either must end in failure, and failure ultimately disastrous just in proportion to the temporary success of the foolish effort. It is simply ridiculous for a party of men to meet in a room and attempt, by passing resolutions, to change the great laws which govern human affairs in the business world, and this whether they be railway presidents, bankers or manufacturers.

The fashion of trusts has but a short season longer to run, and then some other equally vain device may be expected to appear when the next period of depression arrives; but there is not the slightest danger that serious injury can result to the sound principles of business from any or all of these movements. The only people who have reason to fear trusts are those foolish enough to enter into them. The consumer and the transporter, not the manufacturer and the railway owner, are to reap the harvest.

It is not in the power of man to exact for more than a brief season, and a very

England. The original machine was constructed by Woolrych in 1844, and was the first magnetic machine that ever deposited silver on a practical scale. It is preserved at the works of Prime & Son as a valuable and interesting relic. It is related that Faraday paid a visit with some London friends to the works, purposely to see this application of his discovery in practical operation, and expressed his great delight at witnessing so early and extensive an adaptation of his discovery so favorably carried into practical use. This machine was worked for many years, and was finally superseded by one made by Hanson, Van Winkle & Co., of Newark, N. J. The Woolrych machine stands 5 feet high, is 5 feet long and 2½ feet wide. The manufacturers state that the Little Wonder requires only one-tenth the power needed by the other, and that it will deposit ten times as much metal in a given time. It was designed to meet the demand for an inexpensive, simple and powerful source of electricity for plating. All parts of the machine are accessible, there is no danger of a reversal of current, and with the rheostat or resistance on the machine the current can be regulated so as to plate from a single article to a large tank full of work.

Successful Profit Sharing.

The second year's experience of the Springfield (Mass.) Foundry Company in sharing their profits with their employees shows results much more satisfactory than did the first year. The present dividend was 8 per cent. of the total yearly wages, while the first was 2½ per cent. Regarding the quality of the work executed, there have been fewer poor castings and more better ones. This would appear to overthrow the opinion held by many that it is useless to try to obtain better work by offering the men a portion of the profits, because the conscientious workman will do his best for the firm any way, while the shiftless one cannot be induced by any consideration to alter his methods. It is further argued that, as the shiftless one is certain of obtaining his share of the profits at the end of the year, he really has no inducement to improve, except the satisfaction he would feel at having performed his full duty; and, as he has never been subjected to such a sensation, he is ignorant of its value, and, therefore, not likely to strive for it. If the employer does not adopt profit-sharing for business reasons, he must do it out of pure philanthropy—a qualification not frequently found in relations like these. When he knows he is paying good wages he is not apt to present the recipients of these wages with a portion of his profits in a lump sum at the end of the year.

In the circular issued by the Springfield Company they state that "a noticeable improvement has been manifested in the work and general conduct of our employees during the past 12 months. The average weight of castings has been increased and the proportion of poor work reduced. We have also noticed an increasing interest in the success of the business and a willingness to fulfil every requirement, even though it might be slightly unusual." The company suggested the advisability of the men taking certificates bearing 5 per cent. interest and holding them as a provision against a rainy day, thereby establishing a sort of private sick fund.

A careful account was kept of bad castings, and the loss from this cause was so great that had the castings all been good and marketable "we could better afford to pay you 9 per cent. dividend than we can now to pay 8." The loss on every pound of imperfect casting more than balances the profit on 7 or 8 pounds of perfect castings, this being the case because the margin of profit is so small compared with the whole cost of production. "If our system of profit sharing," they say, "is worth anything at all it must effect more and more reduction in the proportion of imperfect castings every year. This was one of the principal objects of our adoption of the plan, and unless the coming year shows a very material improvement in this regard we shall be obliged to discontinue the sharing of profits altogether. We cannot go before our stockholders and expect them to consent to a division of profits among men who every year lose hundreds of dollars for themselves as well as their employers. And all for lack of care and judgment! We furnish you with the best molding sand we can buy, the hottest of iron, melted from the finest brands of pig to be obtained in the market; our tools, flasks and other appliances are as nearly perfect as they can be made and our foundry is above the average as regards light, convenience and comfort. These conditions do away with almost every reasonable excuse for bad castings and leave scarcely any cause except carelessness, laziness and inattention to your trade. We find no fault with the quality of your good castings. On the contrary, we are

able to say it is first-class, almost without exception. These castings speak for themselves and well merit the excellent reputation they have obtained. They show what you can do. Why not do a little better and have all your work as good?"

Two important changes were made by the company in the rules: only those employed during the whole 12 months will participate in the profits. The second change concerns the molders, who, since they can do much more than any of the others towards reducing the proportion of bad castings, are to receive an extra dividend of 1 per cent. if the reduction should be large enough to warrant it.

The New Watervliet Arsenal.

Chief Engineer Anthony Victorin, United States Ordnance Department, has practically completed the working plan for the new \$700,000 great gun factory at the Watervliet Arsenal, and the contract will soon be ready for letting. The plans involve a radical departure from anything ever attempted in this country. The great gun works of the world, Krupp's, Armstrong's, and Whitworth's, all devote their energies to other branches of metal manufacture, and such appliances as they possess are to a degree designed to be useful for purposes outside of gunmaking, and have been accumulated as demanded by occasion. At Watervliet every piece of the amount of machinery required will be built from special designs by the Chief Engineer.

The factory is to be erected about in the center of the walled-in field of 109 acres constituting the armory reservation, midway between the Delaware and Hudson Railroad in the rear and the Hudson river in front, and contiguous to the Erie Canal, which traverses the lower portions of the grounds at West Troy. A branch railroad will run from the D. and H. main track right through the middle of the shop, across the canal by a new bridge, to the river front, making it available for connection with the three sources of transportation, and including a siding running into the building.

The gun shop will be 983 feet long, with a width of 128 feet on the north wing and 158 feet on the south. Each wing is to be 400 feet long, and between them will be a central structure covering the rest of the room, to hold two 200 horse-power engines—one for service in each wing—office, tool-room, machinery for assembling the guns, and a shrinkage pit 50 feet deep, with three levels, 20, 35 and 50 feet below the ground.

The north wing, which will be finished first, because Congress has not given money enough for the whole, as economy would have dictated, will be formed of a central structure 75 feet wide and 50 feet to the eaves, connecting through arches 12x28, with an annex 25 feet wide on each side running the length, in which the minor mechanism will be stowed.

This north wing is to be utilized for the construction of cannon from 8 to 12 inch bore, the kind now considered most useful by the Ordnance Board. To this end it will accommodate 15 lathes, ranging from 70 to 105 feet in length, all specially constructed. Manufacturers who bid will be expected to follow out the general design, submitting their own improvements. The lathes in the annexes must largely be newly designed for economical handling of the hoops and breech mechanisms.

Overhead will run two 80-ton traveling cranes, and 30-ton cranes will run on suspended tracks in the annexes. The lift of the large cranes will be 35 feet from the floor. The building will be a single story throughout, of a maximum height of 75 feet. It will be of brick and iron, covered with slate. The south wing will contain

a like number of lathes, but will be given over wholly to the manufacture of 16-inch bore breech-loading rifles. Here Mr. Victorin believes an average of 20 can be made in a year, or 25 at a pinch. The same production of 8, 10 and 12 inch guns is allowed for the south wing.

It will take two years to complete the shop for which these plans are now ready—that is, the center and north wing. The south wing could be built as quickly if there was enough money.

Under ordinary circumstances it requires a year to build a big gun, though when this shop is complete the department feels sure that it can be done in nine months. The steel comes to Watervliet from the Bethlehem foundry, rough forged, oil-tempered and annealed. The work of finishing has been going on for a year at Watervliet under adverse circumstances, but with excellent results. In August, 1887, the department sent Mr. Victorin to the arsenal to rig up a gun-shop out of such materials as he could find and set it going. He did it in three months, and, thanks to that move, one 8-inch rifle is now at Sandy Hook, where it has endured over 200 firings and borne every test, while another 8-inch, one 10-inch, and 25 field pieces of 8½-inch bore are almost ready for use. The engineer found at Watervliet two 400-foot sheds of brick built in war time for storehouses. He pulled the ceiling and partition out of one and made a shop of it. Everything in the room is a makeshift, but a pretty good one. The big crane and accompanying derrick were made of a couple of cylindrical posts found at Frankfort Arsenal; the tracks and trusses and crane out of old gun carriages. A shrinkage pit 24 feet deep and 8 inches in diameter was dug out of the rocky floor, an expanding furnace and 60 horse-power engine put in, and in November, 1887, the gun-makers employed went to work, using a 92-foot lathe with 120-inch swing, and a 70-foot with 83-inch swing.

The range of these new 8 and 10 inch rifles is ten miles—equal to that of the best European gun, better than almost anything afloat, and their effective range is eight miles. But the defensive poverty of this country was never more painfully shown than in the fact that it possesses but one carriage fit to accommodate a modern gun. This is holding up the new 8-inch at Sandy Hook. The carriages for the old cast-iron guns are made mostly at the Watertown arsenal. Not one of their patterns will do. A 10-inch gun of Watervliet pattern is 28 feet long, 28½ tons weight, loads with 575-pound shot and 180 pounds of powder; an 8-inch is 24 feet long, weighs 14½ tons, and uses 105 pounds of powder to propel a 280-pound ball. A 16-inch gun should weigh about 50 tons. The charges in all instances are rather heavier than those used abroad. The steel breech-loading field pieces are 7 feet long, 3½ inches bore, use 8½ pounds of powder to a 13½-pound ball, and can hit things three miles off. They weigh but 800 pounds—about one-quarter less than the old brass howitzers. Except for weight of metal carried, these field pieces are about as effective as the old 15-inch columbiads, and can be fired about 25 times as fast. When the big shop is done this impromptu factory will be used for the manufacture of the light field pieces and steel breech-loading siege guns of 5-inch bore and 7-inch howitzers. The old cast-iron cannon are clumsy in comparison with these deadly steel tubes. An 8-inch cast-iron piece, such as grace the harbor forts of New York, carries a 68-pound shot with 28 pounds of powder, with an extreme and uncertain range of four miles, representing a collective energy of 1477 foot pounds, against 6880 developed by its steel rival.

Radial Drilling Machine.

This drill, in which several new and important features appear, is manufactured by the Putnam Machine Company, of Fitchburg, Mass. The machine has a combination of the two standard systems of driving-belt and gear. The cone has four changes, and the idle pulleys are mounted on eccentrics in such a way that the belt may be tightened without stopping the machine. The back gearing, instead of being at the cone pulley, is placed on the arm, this arrangement not only reducing the parts, but also saving power, as the moving parts and bearings are reduced. The head is moved by a rack and pinion gear, and can be firmly held to the arm at any desired point by means of a friction-clamp operated by a lever. Under the collar of the vertical lifting screw is a ball

must be completed within eight months, but where they are to be built is not yet known. The largest of the guns are 15-inch caliber and the extreme range of fire is one mile. The bid of the gun company was \$395,500.

The Coke Wages.

As we predicted in *The Iron Age* of last week, the threatened coke strike in the Connellsville region has not taken place, and, with one or two exceptions, all the works in the region are in operation. In addition to this, we report that the H. C. Frick Company have signed the scale, the same it has been paying for over a year, which is 6½ per cent. higher than the wages paid at the other works in the region. It is to remain in force until January 1, 1890, but contains a provision

Furnace coke, \$1.25; to dealers, \$1.35; foundry coke, \$1.50; crushed coke, \$2.20; all on board cars at ovens, per ton of 2000 pounds.

Competition of Prison Labor.

The competition of prison labor is a subject treated very cleverly by one of our contemporaries, who endeavors to dispel from the minds of labor organizations the delusion that free labor is injured by the labor of convicts under any proper management. The writer says:

Suppose the 3000 able-bodied men in the prisons of the State were distributed among various productive occupations as industrious and law-abiding citizens. Who would suffer by it? Their production would support themselves, and perhaps help to support others.

RADIAL DRILLING MACHINE, MANUFACTURED BY THE PUTNAM MACHINE CO., FITCHBURG, MASS.

thrust bearing. In the machine illustrated the distance from the face of the column to the end of the arm is 6 feet 2½ inches. The arm has a vertical traverse of 36 inches, and the drilling head has a radial traverse on the arm of 42 inches. The spindle has a range of 16 inches, is counter-balanced and has a quick return by rack and pinion, which is always in gear; it also has hand and automatic feeds of six changes—three for drilling and three for boring. The portable drilling table is accurately planed on all sides; has T slots on top and sides, and is formed with a vertical V groove for holding square or cylindrical work. The base plate is 9 feet 8 inches long, 44 inches wide and 6½ inches thick; it has anchor holes for foundation bolts, T slots, guide hole for boring bars, and is planed on top and bottom.

The Secretary of War has awarded contracts for seven dynamite guns of the pneumatic pattern, similar in construction to that recently tested at Fort Lafayette; three of them to be located at Sandy Hook, two at Fort Schuyler and two at Fort Warren, Boston harbor. The guns

which will permit that concern to revoke the scale on March 15 next unless a uniform scale is adopted throughout the region. There has been no improvement in the demand for coke, and but few works in the region are being operated full time. Four days in the week seems to be the rule. In view of this, it is safe to say there will be no advance in prices for some time, and a slight reduction in the near future is not improbable. There are 77 coke plants in the Connellsville region, and the week ending on February 2 showed 12,551 ovens in operation, 710 idle and 720 in process of erection. The production for that week was estimated at 103,233 tons. During the previous week there were 12,626 ovens in operation, and they turned out 110,958 tons of coke. The shipments for the week before last aggregated 5600 cars, consigned as follows: To Pittsburgh and river points, 1400 cars; to points west of Pittsburgh, 3100 cars; to points east of Connellsville, 1100 cars. The figures for the previous week were: Pittsburgh, 1550; West, 3250; East, 1150; total, 5950. The prices ruling at present are as follows:

Would it be an advantage to the rest to sequester these 3000 men from labor and support them in idleness? If so, why not 10,000 or 100,000? If it would not be an advantage, supposing them to be free men, why is it an advantage when they are sequestered within prison walls for crime? If it would be better for all concerned that they should work and earn their own living if they were at large in the community, why is it not better that they should do so in prison? As a financial matter for the State, of course, it is best that convicts should be self-supporting. As a matter of health and discipline, of physical and moral improvement for themselves, it is admitted to be better that they should be employed in productive industries. As an economic matter for the community, including all workingmen, it is equally an advantage. There is no possible gain in setting apart a percentage of the able-bodied population to be supported in idleness by the rest.

A \$500,000 fire-proof building will be erected in Newark, N. J., by the Prudential Life Insurance Company.

The "Perfect" Radiator Valve.

A radiator valve designed to overcome the common objections of leaky stems, by which carpets and ceilings are often damaged and other considerable injury occasioned, has just been put upon the market by Curtis & Co., 140 Centre street, New York. In Fig. 1 a general view of the Perfect radiator valve is shown, while its internal construction is illustrated in Fig. 2. The special feature of this valve is that it is made without stuffing box, packing or ground joints, the metal diaphragm shown in Fig. 2 taking the place of those and preventing the leakage of water. The diaphragm is made of phosphor-bronze, which, as is well known, is a very strong and durable alloy. By the use of this diaphragm and by means of the lever-arm arrangement, a slight movement is sufficient to open the valve. The valve shuts off with a pres-

Fig. 1.—General View of Valve.

The Farm Value of Crops.

The aggregate value to producers of the five principal cereal crops at the average farm prices, as ascertained by the Agricultural Department, for the two years has compared as follows:

	1888.	1887.
Corn.....	\$677,000,000	\$646,000,000
Wheat.....	385,000,000	310,000,000
Oats.....	195,000,000	200,000,000
Rye.....	14,000,000	13,000,000
Barley.....	33,000,000	29,000,000
Total.....	\$1,304,000,000	\$1,198,000,000

Here is an increase of more than \$100,000,000 in the amount realized by farmers from the sale of their cereals. The abund-

Fig. 2.—Sectional View.

THE "PERFECT" RADIATOR VALVE.

sure behind it, making it absolutely tight at the seat. It is stated that a test of two years has established the reliability of this device, and has proven the fact that it will not leak. The manufacturers further state that the valves open and close easily. The Perfect radiator valve is made in ten different styles, of $\frac{1}{4}$, 1, $1\frac{1}{2}$, and 1 $\frac{1}{2}$ inch size.

G. W. Hunt, one of the principal contractors and railroad builders of the Pacific Coast, has been spending some time in Chicago recently, arranging for future operations. He is now completing the Seattle, Lake Shore and Eastern Railroad, with his headquarters at Walla Walla. D. C. Black, formerly with the Morden Troy and Crossing Company, of Chicago, is now acting as Mr. Hunt's secretary, and accompanies him on his Eastern tour.

The New Jersey Central is to have a new steamer for the accommodation of the Sandy Hook business during the coming season, to be named the Sandy Hook. This steamer will be 270 feet in length and 48 feet in width, with a draft of 9 feet forward and 10 feet aft. She is to be a

ant hay crop adds to the favorable character of this showing.

Extending the comparison for the two years to other important classes of production, the potato crop forms an important item. For 1888 the yield has been nearly 200,000,000 bushels, as compared with 134,000,000 bushels in 1887; but the average farm price, as reported by the Department of Agriculture, is 40 as compared with 68 cents per bushel, and this fall in price decreases the aggregate value of the crop to producers to about \$80,000,000, as compared with more than \$90,000,000 for 1887. In other vegetables and fruits the yield has been abundant and the prices lower, the greater yield and lower price probably leaving little difference between the aggregate value of the crops of the two years. The meat supplies also have been very large, and the price at first hands somewhat reduced. The Agricultural Department estimates the wool clip at 269,000,000 pounds for 1888, compared with 333,000,000 for 1887. The cotton crop, according to latest indications, is likely to differ but little from that of 1887 in aggregate value to growers. There is no means of extending the comparison to

all these items with the approximate accuracy attainable in reference to the cereals, but there is ample evidence that the aggregate value of all the products of the farms for 1888, as realized by the producers, has been very materially greater than for 1887, and that to this extent the present situation is better than a year ago, and the agricultural interests more prosperous. The effects of such an improvement necessarily extend to every class of the community.

The Carload Lot Cases.

There is reason to believe that the so-called carload lot cases will be decided by the Interstate Commerce Commission very soon. As the matter stands, the plea of the complainants is virtually covered by the following brief statement:

We complain especially and particularly of an unjust discrimination in freight charges as between carloads and less than carloads, on the following specific articles: Coffee, cider, sugar, paint, liquors, prunes, crockery, salt and pickled fish, canned goods, soda and saleratus, pickles, salt and molasses, and generally of the unjust discrimination by means of carload rates on any sort of freight where the normal unit of shipment is the commercial package. If the theory, urged *pro re nata* by the railways, that the amount of difference in the tariffs for different quantities of these specific articles can be justified and should be determined by the actual difference in the cost of transportation, be accepted by the commission, then it is of uttermost and essential importance to the public who pay the charges that the actual difference in each particular case can be accurately and precisely ascertained before the theory be applied to the tariff. It is our contention, therefore, that inasmuch as the burden of proof is upon the railroads to justify these differences for quantity in freight rates, they should be held strictly to the issue, and should be required either to furnish definite information upon the alleged great difference in the cost of transportation—which they confess and everybody knows to be impossible—or to defend their rates upon some other theory, and the respondents have had nearly a year since the complaints were filed to ascertain the facts.

The defendant railroad companies, in reply to this, allege that the difference in cost of transportation of large and small shipments justifies the discrimination in rates. This assertion is supported by general arguments, but without detailed exhibits of actual cost of service in the various classes of which complaint is made.

The Senate Committee on Claims last week heard a delegation of iron mill men in support of a bill now pending in both Houses of Congress. The bill proposes to repay the importers of steels, chiefly in the Allegheny and Mahoning Valley districts the difference between a duty of 45 per cent., which was collected, and one of 35 per cent., which they claim a decision of the Supreme Court holds to be the correct duty. The amount involved is about \$600,000. W. S. Groome, of the firm of J. F. Bailey & Co., New York; R. F. Downing and H. E. Collins, of Pittsburgh, addressed the committee. They were unable, however, not being lawyers, to cite the Supreme Court decision upon which they rest their claim, and a postponement was had in order to enable them to present it to the committee.

The New York, Susquehanna and Western Railroad will extend its coal shipping facilities, and, as a step in this direction, it has begun the erection near Two Bridges Station, N. J., of a large system of coal shutes, covered by a building 1000 feet long and having a storage capacity of 200,000 tons. Two Bridges is 63 miles from New York.

The contract for constructing a dry dock at the Philadelphia Navy Yard was awarded to J. F. Simpson & Co. at their bid of \$548,700.

THE WEEK.

The navigation of the Hudson River at Newburg was closed by ice on Thursday, February 7, and ice began to obstruct the bays on rivers on Long Island Sound, for the first time this season.

The Dock Board have authorized their chief engineer to remove all vestiges of the site of West Washington Market by moving back the shore line 200 feet, and extending two piers 620 feet into the river for the accommodation of ocean steamers. The docks rent at from \$25,000 to \$45,000 per annum.

Ex-Consul Sewall, of Samoa, contends for a vigorous policy, representing that the seizure and deposition of Malietoa was in pursuance of a deliberate plan on the part of Germany to obtain control of Samoa; that this step is only the precursor of measures to secure foreign supremacy in the Hawaiian Islands, Lord Salisbury being a party to the scheme, and that no protest from the United States will turn Germany from the course it is steadily pursuing.

After spirited discussion, the Nicaragua Canal bill passed the House with unexpected unanimity, the vote standing 177 to 60. The event was signalized by a burst of applause unusual in that body, warranting the inference that the Panama Canal failure, together with events in Samoa, have assisted very much in removing objections to the bill and have invested the subject with a new interest. The bill as passed contains every provision which the promoters of the enterprise desired. The United States is not committed to any pecuniary liability on account of the company, but it requires the company to make a yearly report, giving such detailed statement of their affairs and of their assets and liabilities as may be required by the Secretary of the Interior. This provision, in connection with the reservation by Congress of the right to amend the act at any time, gives the company the benefit of the moral support of the United States in all their legitimate undertakings. The Senate agreed to the conference report, and the bill now goes to the President for his approval.

It is computed that the car-drivers' strike in this city cost \$1,700,000, of which \$1,500,000 was sustained by the retail trade. The loss of the car companies is put down at \$117,000 and the strikers about \$50,000.

A false report that a car-building firm in Detroit had received a large order was followed by a "deluge of letters" from iron firms and supply companies desirous of bidding for the work, which fact was construed as an indication of general dullness and low prices in the iron trade.

A feature in the enlarged Philadelphia Mint, for which Congress appropriated \$200,000, will be a marble tower 40 feet square.

A large freight and transfer station, probably the largest in America, will be erected in the environs of Pittsburgh for a syndicate representing railroads on either side of the Ohio river, and by means of a bridge secure uninterrupted transportation. Another great union depot is to be built at Pueblo, in Colorado, for the Missouri Pacific, Rio Grande and other companies. The structure will be of red sandstone and cost about \$250,000.

The oil producers of Pennsylvania are encumbered with an accumulation of 3,500,000 barrels of the crude article, which they expect to sell eventually for nothing less than \$1 per barrel.

The Hudson Street Electric Railway, to extend across the city from the Fulton

ferry to the Cortlandt street ferry, is expected to be in operation May 1, the right of way on the west side having been secured, and all the requisite materials are contracted for. It will run 20 cars.

The American Institute is losing money, as the result of its annual exhibitions in this city. At the annual meeting of the trustees in this city last week the surplus in the treasury was nearly \$15,000, but a member of the board stated that expenditures during the last five years had exceeded the receipts to the extent of \$35,000, and that in five years more the surplus will be exhausted.

American stoves are so far superior to those in common use in large parts of Europe that manufacturers here might reasonably expect to find markets abroad sufficiently ample to absorb all their possible surplus. But a difficulty exists in the inferior coal consumed on the Continent. Not long ago a Pittsburgh manufacturer shipped a lot of stoves to Germany, and being informed that they failed to give satisfaction learned after investigation that the coal used produced many clinkers and slag. The better grades of coal were too expensive for general consumption. A variety of artificial substitutes can be had, but as a rule economy is consulted rather than comfort.

The proposal of the United States Government, through Secretary Bayard, to bring about international co-operation for the reduction or abolition of tonnage dues on shipping has resulted in complete failure, excepting as information may have been gathered for the guidance of the incoming administration. The replies received to overtures in furtherance of the general object show a disinclination to entertain the proposal, mainly for the reason that the "favored nation" clause of existing treaties would prevent the abolishment of all charges in the case of the ships in one country and not of those in another. Several countries have no merchant marine in the foreign trade, and consequently there could be no reciprocity.

The proposed railroad to parallel that of the New York and New Haven Company would afford an acceptable addition to traffic facilities, however much it may be opposed by certain special interests. Some of its advocates are directors in the New York and New England Company.

Yellow fever is making progress in Brazil, and the open winter on our Atlantic Coast affords a reasonable admonition that the disease may extend northward during the approaching summer.

The Alaska Commercial Company have paid into the United States Treasury since the "Seward purchase" was completed \$8,000,000. Russia received for the whole country \$7,200,000.

The price of American wheat being materially affected at times by the crop in India gives interest to facts concerning the agricultural progress of India. Efforts which are making through an agricultural department established at Bengal to improve the quality of wheat indicate the probability of increasing competition from that quarter. In 1872 India rose to the second place as a feeder of Great Britain, and in 1877 the relative positions as concerns the United States were maintained, but trade returns for 1888 show a startling revolution in the figures. Russia has taken first place, sending 21,896,000 cwts. as against 5,523,000 cwts. during 1887, this increase being almost entirely at the expense of America, the falling off in the imports from the United States amounting to 15,857,000 cwts., while India has exported within 825,000 cwts. of the preceding year; and it is worth noting, as pointed out by Sir James Caird in the London

Times, that this change of basis in supply has been accomplished without in any material degree advancing the price of bread in England.

English manufacturers complain that the exceedingly low wages of German operatives make competition almost impossible. The North British *Mail* says: "Among the operatives in Saxony weekly wages have fallen in a most marvelous manner—indeed, it appears that while the better-class operatives in the mills are obtaining 10 marks per week for their labor, others devoted to the less skillful operations are actually not receiving more than about 5½ marks per week. It is almost impossible to conceive that this state of things can get any worse."

In Japan, as in China, events are impending which must give shape to the future policy of those empires and have a direct bearing upon their relations with other Governments. While it is probable that the recent progressive tendencies of China have already provoked reaction, as evinced in the recent hostility to foreign influence, the Mikado of Japan is leading off in the direction of more radical innovations. Seven years ago, in response to popular petition, he resolved to call a National Assembly in 1890 for the purpose of organizing a constitutional government. In accordance with this purpose the draft of a constitution was prepared and recently was submitted to the Privy Council, consisting of 20 members, besides eight Ministers of State as ex-officio members. Five princes of the royal family and seven other members, representing the people, but appointed by the Mikado, made up this council, of which Ex-Prime Minister Ito was chairman. The Mikado assumed to establish the constitution by his own power. The Liberal, or Progressive, party was in favor of leaving it to the Assembly, while the Government party, composed chiefly of nobles, opposed this. The latest information is that despite all obstacles the constitution was promulgated last Monday, inaugurating a new era in the empire. Count Ito will be entitled to rank as the Washington of Japan.

A dynamite bomb, placed under the north foundation wall of the malthouse of Daniel Stevenson's boycotted ale and porter brewery, at the corner of Tenth avenue and Fortieth street, by some unknown miscreant, exploded with terrific force on Friday afternoon. The solid rock on which the malthouse is built was torn up to the depth of 30 inches, and a hole was blown into the 24-inch foundation wall. For 200 feet in a northeasterly direction every house was more or less injured by the concussion.

The Pacific Guano Company, of Boston, capital \$1,000,000, made an assignment to John C. Ropes. It had extensive facilities in South Carolina and at Wood's Holl, Mass. Glidden & Curtis, the company's selling agents in Boston, were carried down in the crash. John M. Glidden is president of the Ohio and Western Coal and Iron Company.

The freight rates on iron articles from Pittsburgh to all points between St. Paul, Minneapolis and Minnesota Transfer were advanced last week from 2 to 3 cents per 100 pounds. White lead and paints were also advanced about the same.

It is reported that contracts have been closed between a large ore company in Cleveland and the Northern Steamship Company, owned by President Hill, of the Manitoba Railroad Company, for the transportation of ore freights for the next season from the head of Lake Superior to Lake Erie ports at \$1.25 a ton.

MANUFACTURING.

Iron and Steel.

The report that the plant of the Elba Iron and Bolt Company, Limited, at Pittsburgh, recently started up under lease by Henry Darlington, of that city, had closed down for an indefinite period is without foundation. The works are being operated full time in all departments.

By direction of Manager Wick the plant of the Warren Steel and Iron Company, at Warren, Ohio, was closed down last week for an indefinite period. The management recently received an offer to remove the works to Girard, but whether this caused the shut-down or not is not known.

It is announced that the plant of the Cartwright Iron and Steel Company, formerly known as the Alikanna Rolling Mills, at Steubenville, Ohio, is being extensively improved and will shortly be put in operation. The product will be taken by the National Tube Works Company, of McKeesport, Pa.

Application has been made for a charter for the Duquesne Forge Company, of Pittsburgh. The company is composed of R. S. Smith, Alex. McKim, John Bissell and others, who have purchased the plant and interests of the Miller Forge Company, Limited, located at Rankin Station on the Baltimore and Ohio Railroad, about 10 miles from Pittsburgh. Plans are being prepared for some extensive improvements. New machinery will be put in and some new buildings will be erected so as to nearly double the present capacity of the works.

Fred Bishop has resigned his position as superintendent of the plant of the Warren Iron and Steel Company, at Warren, Ohio.

The plant of the Virginia Nail and Iron Works Company, of Lynchburg, Va., is situated about 8½ miles above Lynchburg, on the Richmond and Allegheny Railroad. The works consist of a blast furnace, 65 x 12 feet, equipped with two iron-pipe stoves; Weimer engine, three cylinders, 48 x 36 inches, driven by water-power; a rolling mill, 20-inch muck train, 18-inch plate train and 10-inch bar and guide train, seven double puddling furnaces and one M. V. Smith gas heating furnace, and a nail factory with 46 machines. The metal is run from the blast furnace into large ladles mounted on cars, which are run over tracks, turn-tables, &c., to the puddling furnaces, and poured by tipping into the furnaces. The ladles are controlled by worm-wheels, on which are marks to regulate the charge. About 40 minutes are saved in making a heat over the time required to melt the pig iron and make it. Having water-power, the gas not needed for the stoves is piped over to the Smith furnace, and the company can heat for both the plate and the bar trains. The ores come from above and below the works along the river, limestone from Indian Rock, on the R. & A., and coke from either the Norfolk and Western Flat coal-field or the Chesapeake and Ohio New River region. The arrangements for the molten metal and the gas for reheating are of the simplest kind. The ladles are run down an incline by the side of the blast furnaces so that the metal can be run into them. The gas is conveyed in an 18-inch plate-iron pipe from the down-comer into the mill, which is just below the blast furnace.

Morris P. Canfield and Robert A. McKean, of Pittsburgh, having secured the title and good-will of the Pittsburgh Construction Company, have associated themselves together under the name of the Pittsburgh Construction Company, for

the purpose of carrying on the constructing and engineering business in all its branches. They have also been granted license by M. V. Smith to construct the Smith regenerative gas furnace and producers. The new firm are located in the Hamilton Building, in the above-named city.

On January 1 of this year the Steel Car-Wheel Company of Boston started a small Bessemer plant, which was built for them last year by James P. Witherow, of Pittsburgh. The plant consists of a 3-ton tilting converter. The product will be a metal patented by the company, and will be chiefly used in making car-wheels. The works of the company are at the corner of First and I streets, Boston.

Work has been commenced on the erection of the new plant of the Union Steel and Iron Company at St. Joseph, Mo., and it is expected to be ready for operations by May next. M. V. Smith, of Pittsburgh, is consulting engineer for the company.

The Green Nail Works, at Tiffin, Ohio, were totally destroyed by fire on the morning of the 6th inst. The loss is estimated at \$50,000, with no insurance. The plant had but recently commenced operations.

A company to be known as the Dickson Car-Wheel Company have been incorporated to manufacture car-wheels at Houston, Tex.

The Standard Rolling Mill, at Minneapolis, Minn., has been torn down. It was idle in 1887 and 1888. Its annual capacity was 1200 net tons of bar iron. The only other rolling mill in the State, the Capital Iron Works, at St. Paul, was also idle in 1888.

On account of a lack of orders, the rolling mill of the Kittanning Iron Company, Limited, at Kittanning, Pa., has closed down for an indefinite period. The firm manufacture muck iron principally, which is consigned to Pittsburgh. The blast furnace of the company continues in operation.

R. Heckscher & Sons' Swede Furnace, at Bridgeport, Pa., of which Alfred Walters is superintendent, has eclipsed its former records by making 604 tons of pig iron last week.

The Scranton Steel Company, at Scranton, Pa., rolled 252 rails, 56 pounds to the yard, in one hour. So far as is known this beats the record for rolling in that length of time considerably. With heavier rails, of course, the tonnage, too, would have been exceptional.

Park Brothers & Co., of Pittsburgh, have recently completed an additional large open hearth steel furnace.

The Etowah furnace, at Gadsden, Ala., we are advised by Rogers, Brown & Co., made 850 tons in the seven days ending February 5, and is now averaging close to 130 tons per day, 85 per cent. of which is foundry grades. John Dowling, for many years at Rising Fawn, the best known furnaceman in the South, is superintendent. Col. R. B. Kyle, of Gadsden, is president.

A rumor is in circulation that the Joliet Steel Company have notified their men of a 12 per cent. reduction. The management deny this, and state that not a word has been said in regard to a reduction of wages. The mill closed on the 9th inst. for three weeks for repairs, as is usual once a year. During the shut-down the management will consider with the employees the question of adopting the sliding scale, or a rate of wages based on the price of rails—rising as rails rise and lowering in like proportion with the falling in the price of rails.

The Midvale Steel Company, of Philadelphia, Pa., have been awarded the con-

tract for furnishing all the tires to be used on the New York Central and Hudson River Railroad and the West Shore Railroad during the year 1889.

The rail mill of the Cleveland Rolling Mill Company, at Cleveland, Ohio, has been started up, the men accepting a reduction of wages.

On Saturday, the 9th inst., notices were posted on every furnace in the Mahoning Valley, Ohio, notifying the employees of a 10 per cent. reduction in wages, to take effect on March 1, next. An advance of 10 per cent. was made last November, but the furnacemen claim that the present prices of pig iron will not justify them in paying it at present. It is thought the men will agree to accept the reduction.

The Brooke Iron Company, at Birdsboro', Pa., on Saturday gave notice of a reduction in puddlers' wages of 25 cents per ton, from \$3.25 to \$3. The mills at Pottstown and other places recently made similar reductions.

The Bethlehem Iron Company, of Bethlehem, Pa., have called a general meeting of the stockholders on Tuesday, February 19th, at 12 o'clock noon, for the purpose of making and adopting by-laws. On the same day there will also be a special meeting of the stockholders for the purpose of voting for or against an increase of the capital stock from \$2,000,000 to \$3,000,000, or to such amount not exceeding \$3,000,000 as may be approved at said meeting.

About 100 men in the Bessemer department of the Otis Iron and Steel Company, Cleveland, have been laid off on account of a falling off in orders.

The new plant of the Muncie Nail Company, at Muncie, Ind., is nearly completed, and all departments are expected to be at work before the 1st of March. The product will be merchant bar, steel nails and muck iron. They have 16 puddling furnaces, four heating furnaces and capacious annealing furnace. Their machinery includes a 20-inch train of rolls, a plate train, muck train and 50 nail machines. They also have a complete foundry for iron and brass castings, and a cooper shop for the manufacture of kegs, use natural gas throughout the mill, and will employ about 200 hands.

Edwin Mickley, superintendent of the mining interests of the Thomas Iron Company, of Hokendauqua, Pa., for the past 32 years, has resigned his position, to take effect on March 1, next.

The Lewis Foundry and Machine Company, Limited, Pittsburgh, have the contract in hand for a new rolling mill to be located at Rome, Ga. The same company have just shipped to Anderson, Ind., the machinery for a Garrett rod mill, with all of the latest improvements made by Mr. Garrett.

For the five weeks ending on February 2 the two stacks of the Isabella Furnace Company, at Etna, Pa., produced 15,526 gross tons of pig iron.

Hanson, Van Winkle & Co., of Newark, N. J., the first to introduce in this country dynamo-electric machines for depositing metals, have published a large catalogue of their electro-plating and polishing material and machinery. They fittingly introduce their catalogue with an illustrated description of the Woolrych electro-plating machine built in 1844, and then show the improvements found in the machines of to-day. After fully describing their products they close with an extended list of users of their machines and materials.

Machinery.

The Milton Mfg. Company are refitting their rolling mill at Milton, Pa., and are putting in nut and washer ma-

chinery. Heretofore they have made only bar and hoop iron. The company were reorganized in 1888, and now consist of S. J. Shimer, president; E. S. Shimer, secretary and treasurer, and G. S. Shimer, superintendent.

L. D. Pollard has been succeeded by Hoskins & Shepardson in the manufacture of engines, boilers, iron and wood working machinery, special saw-mill machinery, &c., at 14-18 South Canal street, Chicago. The new firm is composed of E. J. Hoskins and D. A. Shepardson. The establishment is of long standing, having been founded in 1868.

A. B. Bowman, St. Louis, Mo., reports his January business as being considerably more than January of 1888, and, judging from the number of orders already received, this month will well stand a comparison with the corresponding month of last year. His sales include engines, boilers, planers, lathes, &c. He has also one or two large lots which are under negotiation, but which he expects to close in a few days.

Shultz Belting Company, St. Louis, report an active state of affairs so far as they are concerned, and say they have no reason to complain for want of business. They have lately received a number of large orders from the South and Southwest.

W. P. Davis Foundry and Machine Tool Works, of North Bloomfield, N. Y., has opened a salesroom and office at 169 Mill street, Rochester, for the sale of machine tools, engines and boilers. This will facilitate the making of quick shipments by various routes. The North Bloomfield works will be run as usual; now they are run on full time and with a full force of men. In a short time Mr. Davis will bring out a large key-seating machine entirely new in design and well suited for large machine shops.

The Skinner Chuck Company, New Britain, Conn., have increased their capital stock from \$12,000 to \$36,000. The additional capital was called for by an increase in the business, which has been established less than two years. The company advise us that they are at present behind their orders, but with the increased facilities now being obtained hope to be able to meet the demand promptly.

Gould & Eberhardt, the tool builders, of Newark, N. J., write us as follows: We report recent shipment of Eberhardt's patent automatic gear cutters and drill presses to the noted tool shops at Koping, Sweden, and also to Kharkoff, Russia. This we take as an indication of the increasing favor with which the better class of American tools are looked upon in foreign countries.

We have received an inquiry from Wm. E. Peck, 17 Cedar street, New York, as to where to buy machinery for the manufacture of buttons of all kinds.

We have received a communication from Robertson, Lloyd & Co., of Durham, N. C., in which they state that they want a "shop machine for cutting threads further back on the axle" than usual. "In this section, where sand is so abundant, the boxes of wheels are very soon so badly cut that washers will not stop wheels from rattling, and the idea is to cut the threads of spindle further back."

The Goulds Mfg. Company, of Seneca Falls, N. Y., wish to communicate with manufacturers of noiseless gears.

Hardware.

About two weeks ago the employees of the wire department of the Braddock Wire Company, at Rankin Station, Pa.,

were notified of a reduction of 17 per cent. in wages. A meeting of the employees was called at once, at which it was decided to resist the reduction, with the result that that department was idle for several days. The matter was finally compromised by the firm withdrawing the original demand and proposing a reduction of 8 per cent., which was agreed to by the workmen, and operations were again resumed. The reduction does not affect the employees of the roll department.

The W. G. Avery Mfg. Company, Cleveland, Ohio, have recently increased their facilities for turning out their hardware specialties, and hope to be able to fill orders promptly.

During the past year Malin & Co., Cleveland, Ohio, moved into new quarters and built machinery which doubled their capacity, so that they are now in a position to meet the enlarged demand for their goods. The full capacity of the shop, they advise us, is 2000 feet of wire per minute, or over 3,000,000 spools a year. In addition to their manufacture of wire they are making arrangements for the manufacture of other patented wire specialties which they expect before long to put on the market.

At a recent meeting of the stockholders of the Bryden Horse Shoe Company, of Catasauqua, Pa., the following Board of Directors was elected to serve for the ensuing year; David Lydig, New York; Justice Cox, Jr., Philadelphia; Charles K. Barns, Philadelphia; J. W. Fuller, Catasauqua; W. P. Hopkins, Catasauqua. At a meeting of the directors held subsequently Charles K. Barns was elected president, Oliver Williams, treasurer and secretary, and T. F. Fredericks superintendent.

Miscellaneous.

The Perry Stove Company, Nathan B. Perry, president, and John T. Perry, secretary and treasurer, announce that they have purchased from the firm of Perry & Co., of Albany, their foundry property on Van Rensselaer Island, and their machinery, equipment and the good-will. They will continue to manufacture the Argand stoves and ranges.

The Clearfield Coal Company, Tylers, Clearfield County, Pa., have just started their new washing plant. About a year ago their old plant burned down. The company decided to build again on a much larger scale, increasing the number of coke ovens from 80 to 100, with a new set of the Stutz crushing and washing machinery, having a capacity of 800 to 400 tons daily. S. Stutz, who also built the old plant in 1882, has since made many improvements. The coal makes a fine coke, which finds a ready market. A. K. Jacobs, C. E., is superintendent, and has charge of the works.

The Duty on Steel Rail Crop Ends.

Assistant Secretary Maynard has informed a firm of New York importers that the question recently decided in the Supreme Court in the case of Robertson against Perkins, was simply to the effect that as steel was a metal specified in the tariff acts, steel rail crop ends cannot be classified under the provision for "metal unwrought not specially enumerated or provided for." The question as to whether such ends or pieces of steel rails are dutiable as "steel not specially enumerated or provided for," or as "scrap steel," was not, he says, presented in that case, but was covered by a previous decision of the Court in the Schlesinger case. This decision, he says, is the basis of Department's ruling of February 14, 1887, that such merchandise having been in actual use in making the rails, is dutiable under the provisions for "scrap

steel." The Department therefore declines to apply the decision in the Perkins case to certain steel rail crop ends heretofore imported.

Ore Roasting at Lebanon.

C. W. Davis, Jr., when connected with the Katahdin Charcoal Furnace, in Maine, was forced by the necessity of making a chilling iron from ores high in sulphur to make a long and exhaustive study of the question of thoroughly roasting iron ore. Starting with the Westman kiln, the Davis-Colby kiln was finally developed. This has lately been put up at the Colebrook furnaces of Robert H. Coleman, at Lebanon, Pa., where one of the 24 Giers kilns was remodeled. Mr. Davis introduced some modifications in the design of the kiln as built at Katahdin, the principal features of novelty being that the furnace gas is introduced in two zones, one below the other, each, of course, having its own supply of air for combustion. The ore is charged in an annular space left between the lined shell and the center flue, which is carried up and into a draft stack. This facilitates the charging of the ore. At the Colebrook furnaces the furnace gas was taken from the down-comer at a point before it enters the hot-blast stoves, by a 15-inch pipe, which is carried over the stock-house to the kiln, a distance of about 250 feet. A slide valve in the pipe was open only to the extent of leaving a 5-inch sector, the quantity of gas thus available being, it is reported, sufficient to roast about 75 tons daily, after the kiln had been heated through thoroughly. We understand that the roasted ore carried about 0.5 per cent of sulphur. We understand that five more kilns have been ordered, and that, besides, three large kilns, 20 feet in diameter and 20 feet high, are to be built at Cornwall.

The Ohio and Western Coal and Iron Company filed an assignment in this city on Monday to James A. Hall, without preference. The deed of assignment conveys to the assignee all the lands, furnaces, buildings and appurtenances of the company, subject to a mortgage to the Boston Safe Deposit and Trust Company. The deed is signed by Chester Griswold, vice-president, and George C. Thomas, secretary. The president, John M. Glidden, was of the firm of Glidden & Curtis, of Boston, who failed last week, and their failure precipitated the assignment of the company. According to *Bradstreet's* reports the Ohio and Western Coal and Iron Company is a reorganization of the Standard Coal and Iron Company, which was sold out under foreclosure in 1883, and was bid in by D. N. Stanton, Thomas T. Mason and George Chapman, who held it as trustees pending the organization of the Ohio and Western Coal and Iron Company. This company was incorporated under New York State laws, October 25, 1883, with a capital stock of \$5,000,000, and bonded debt of \$3,500,000. *Bradstreet's* reports of April 28, 1887, said the company is not "understood to be earning its interest account as yet, and it is being nursed along by those holding its securities, which are largely owned by banks, savings banks and trust companies. Its future depends on the disposition of its managers." According to the company's annual report on January 16 the liabilities were \$3,309,000, of which the bonded debt was \$2,399,000, and other debts, with collateral security, \$910,000. The assets consist of 7000 acres of coal land in the Hocking Valley, Ohio, valued at \$400 to \$500 per acre; about 300 houses, 3 large stores, 400 railroad cars, 4 miles of track, 3 coal mines fully equipped, 4 furnaces and a large amount of miscellaneous equipments.

The Iron Age

New York, Thursday, February 14, 1889.

JOHN S. KING, - - - BUSINESS MANAGER.

Our Imports of Iron and Steel.

The Bureau of Statistics has just issued its December report, showing the imports of merchandise for the calendar years, from which we compile the following table:

Imports of Iron and Steel, Gross Tons.

	1888.	1887.
Iron Ore.....	586,756	1,194,801
Pig Iron.....	196,892	467,522
Iron Scrap and Old Rails..	44,799	313,405
Steel Scrap.....	9,179	26,532
Bar Iron.....	31,745	36,219
Iron Rails.....	21	241
Steel Rails.....	60,989	137,588
Cotton Ties.....	30,305	21,675
Hoop, Band Scroll Iron.....	256	69
Steel Hoops, sheets or plates.....	23,411	24,004
Steel Blooms, Billets, Slabs or Bars.....	103,687	310,551
Sheet, Plate and Taggers Iron.....	6,239	7,153
Tin Plates.....	297,832	283,836
Wire Rods.....	101,812	149,368
Wire and Wire Rope.....	3,169	2,899
Anvils, Axes and Forgings	1,177	1,316
Chains.....	829	914
Totals.....	912,322	1,783,282

Excluding ore, there has been a falling off in the tonnage of our imports from 1,783,282 in 1887 to 912,322 tons in 1888. Omitting the tin plates, since we do not yet make in this country, the decline has been from 1,499,446 tons to 614,460 tons. It is probably best, however, to take into account the iron ore. Assuming that its iron contents average at least 50 per cent., we have a decline from 2,100,000 tons of iron and steel, in the raw and partly manufactured state, to about 910,000 tons. This is statistically a very rough way of putting it, but it gives numerical expression to a very important fact. Its significance would be emphasized if it were possible to show to what extent purchases for future delivery have been made a year ago and now. From a close study of the markets we feel convinced that the quantities of foreign material purchased during the past few months are very small indeed. The importations during the current year promise to be very small, and it may be truly said the market is practically in the hands of our manufacturers. Were the demand this year to be only as large as it was in 1888, then our home works would be called upon to produce enough to cover the falling off in imports. Unless there is a very sudden and a very material drop in prices abroad, of which there is not the slightest prospect now, there will be no danger of an invasion of foreign material. That fact in itself counts for a good deal. It leaves us to adjust by ourselves the balance between supply and demand. The former is, at present prices, critically near a sharp curtailment, while the latter is aided by the vigorous stimulant which admittedly low prices always prove.

Consumption during the year 1888 was certainly surprisingly large, considering the condition of the rail trade. Taking

into account production, the imports, and a very slight apparent decrease in stocks, the quantity of pig iron absorbed was not less than 6,689,399 gross tons. Let it be conceded that the odd 89,399 tons are Bessemer pig not accounted in the report of stocks unsold but accumulated by the rail mills; then we have in round numbers a consumption of 6,600,000 gross tons. We believe that the low prices now ruling will aid the growth of consumption of the thousand small articles which go into the hands of the masses, and which, though singly small, make up the great aggregate which surprised those who last year kept their eyes riveted on the rail trade. An improvement is possible without that branch of the industry, and the year 1889 may prove it, in spite of all gloomy prognostications. We have gone a little too fast lately and are now suffering for it. But it does not by any means follow that an adjustment may not be quickly made and the spring see a revulsion of feeling. Competition from abroad is certainly not to be feared, and that, of itself, is an important gain.

Unrestricted Reciprocity.

Stirring events are believed to be impending in Canada, as an outcome of the long-continued agitation on both sides of the boundary line in favor of improved commercial relations with the United States. The signal for action is the promised retirement from public life, at the end of the present parliamentary session, of Sir John Macdonald, Premier, leader of the Government party for the greater part of the last forty years. He is to be succeeded by Sir Charles Tupper, now Canadian Commissioner in England. Already R. W. Scott, the opposition leader in the Senate, openly declares in favor of unrestricted reciprocity. To the same effect, and still more significant at the present juncture, is the declaration of Sir Richard Cartwright, who, like Sir John, is a veteran statesman, and has for many years maintained a struggle against the conservative forces representing the Crown. In the Parliament at Ottawa, 7th inst., Mr. Cartwright gave notice of his intention to move the adoption of the following resolution:

That it has become a matter of extreme importance to the well-being of the people of the Dominion that the Government and Parliament of Canada should have the power of negotiating commercial treaties with foreign powers, and that an humble address be presented to Her Majesty praying that she will empower her representative, the Governor-General of Canada, to enter, by agent or representative of Canada, into direct communication with any foreign states for the purpose of negotiating commercial arrangements tending to the advantage of Canada, subject to the prior consent or subsequent approval of the Parliament of Canada, signified by an act.

This is interpreted as meaning that the independence of Canada shall be so far recognized by the Imperial Government that the Dominion shall be empowered to negotiate directly with Washington in regard to commercial relations without the intervention of the Crown. As the question stands, public opinion is much at variance, so that, while not a few advocate the removal of all barriers to traffic, others are protectionists in the strictest and most radical sense, others still clamor for "reciprocity," "commercial union,"

or "annexation," according to their individual proclivities or special interests. Withal, the opposition have no recognized leader. Sir Charles Tupper, as a member of the fisheries conference, gave evidence of being a skilled diplomatist, and, being yet in his vigor, is looked upon as well qualified to grapple with any question that may arise.

The Precious Metals in 1888.

Silver opened last year in the London market at 44½d per ounce and never again attained that figure during the whole twelvemonth, the lowest point reached being 41½d on May 19. Thence the course was upward, and it rapidly recovered to 42½d, continuing with few fluctuations until October and November, when the range was 43½d to 43½d, the year winding up at 42½d, the decline for the year thus being 2d. The course of prices is best shown in the following table:

Average Price.

January.....	44½	July.....	42½
February.....	44	August.....	42
March.....	43½	September.....	43½
April.....	43 11-16	October.....	43 1-16
May.....	43 1-16	November.....	48
June.....	42 1-16	December.....	42½

The average for the year being 42½d.

Previous Yearly Averages.

1876.....	52½	1882.....	51½
1877.....	54 13-16	1883.....	50 9-16
1878.....	52 9-16	1884.....	50½
1879.....	51½	1885.....	48½

1881.....	51 11-16	1887.....	44½

The price on February 9, 1889, was 42½d.

There has been an active demand for gold in London, especially for Brazil, the Argentine Republic, Spain, Russia and the Cape of Good Hope. The total export from London during the year was £14,250,000, against £8,700,000 in 1887, while the import was £15,000,000, against £10,000,000. The silver movement was considerably less, the export not exceeding £7,500,000, as compared with £7,620,000 in 1887; while there was imported £8,000,000, against £7,690,000. To supply with gold the countries named the United States had also to be drawn upon heavily, causing a general gold drain, which brought about a material advance in the discount rates in Europe, and during November was looked upon with some apprehension in Wall street.

Germany was last year the country that escaped the gold drain more than its neighbors, the local demand there being chiefly for the yellow metal, while but few 20-mark pieces were exported. It was different in France, the bank losing 100,000,000 francs. The situation of monetary matters was quite unfavorable there as regards silver, a good deal of it being shipped to that country from Italy and Belgium, so that an accumulation in the vaults of the banks of France took place to the amount of 1,228,000,000 francs. The bank now holds, included in the above amount, no less than 300,000,000 francs of Belgian and 250,000,000 Italian 5-franc pieces, with which it can do nothing for the time being under the arrangement with the Latin Union so long as the latter is not dissolved. In fact, the Bank of France has been seriously hampered at times in its dealings with French bankers and merchants owing to these 550,000,000 francs being blocked up

in a foreign coin, for which it cannot enforce reimbursement in available gold coin.

In England the metallic gold reserve declined last year, reduced to francs, from 498,000,000 to 484,000,000 francs, despite the \$750,000 excess of import above given. The total import and export movement of gold during the past 30 years exhibits some interesting changes, having been in millions of pounds sterling as follows:

	Import.	Export.
1858-1861.....	69.8	58.4
1862-1866.....	93.9	65.8
1867-1871.....	87.1	59.8
1872-1876.....	103.8	84.7
1877-1881.....	69.1	80
1882-1887.....	60	66
Totals.....	492.7	414.7

In Italy the national banks and banks of issue had last year an increase of 86,000,000 francs in gold, but the Government absorbed 44,000,000 francs in the same coin, leaving as security 44,000,000 of old Bourbon silver dollars. The amount of 5-franc pieces held in bank on December 31 last was 56,950,000 francs, of which 8,780,000 francs were coins of other nations belonging to the Latin Union. Spain has been a buyer of gold for the coinage of new alfonso's.

The Imperial Bank of Russia held at the close of 1888 28,463,000 roubles in gold, and only 7,290,000 roubles in silver. In the United States there were coined last year \$32,000,000, silver, exceeding the gold coinage of the year by a trifle, the amount of silver dollars accumulated in the Treasury now amounting to \$315,000,000, while the total amount of gold held in the country is \$700,000,000, of which the Treasury holds \$325,000,000. The United States produced last year \$34,000,000 of gold and \$55,000,000 of silver. In 1887 the gold production was \$38,000,000, and that of silver \$53,000,000. It does not appear likely that the Bland bill will be repealed this year, and the coinage of silver under its provisions will continue. Therefore the producers and holders of the white metal appear safe enough. At the same time, the report of the British Commission has raised the hopes of bi-metallists, and there is quite a clamor on their part, both in Germany and England, in favor of a renewed attempt at negotiation between those two countries to arrive at some agreement about the re-establishment of a silver standard alongside of the gold standard. We doubt whether any thing practical will result from this renewed agitation of the silver question, since the majority of the solid financial men in England feel convinced that the renewal of the silver standard is impracticable. Whatever the hopes and assertions of English and Continental bi-metallists may have been, it may be taken for granted that England will decline a representation at a new international coinage congress, and without England nothing can be done.

The Western people are anxious to build up new industries, and are not disposed to wait for the slow process of natural selection or the fitful action of private enterprise. A bill was introduced in the Wisconsin Assembly last week providing for an appropriation of \$15,000 to establish and maintain a station, with the necessary mulberry orchards, &c., to give a thorough trial of the practicability of silk culture in that State. A strong sentiment in favor

of the movement is reported to exist among the citizens. In the same week a bill was passed by the Kansas House of Representatives to encourage the manufacture of sugar in that State by enabling municipalities to vote bonds to aid in the construction of sugar factories. Any city of the second class is to be permitted to subscribe not over \$20,000, and any city of the third class, or township, or village, \$10,000. The voters are to pass upon the question at any general or special election. So strong is the popular sentiment in favor of this stimulus to the manufacture of sugar in Kansas that the bill was passed in opposition to the advice of leading lawyers, who insisted that the measure was unconstitutional.

Comparative Freight Rates on Coal.

The Interstate Commerce Commission are now busy hearing the evidence in the complaints of Coxe Bros. against the Lehigh Valley Railroad. The first complaint, that undue advantage in rates is given the Lehigh Valley Coal Company, has no great interest for the general public. The second complaint involves a question of importance to all users of coal. It is charged and admitted that this carrier, like all other coal roads, makes a large difference in freight rates between anthracite and bituminous coal. Coxe Bros. claim serious damage from this distinction, which they allege to be an unjust discrimination against themselves and in favor of all miners of soft coal. They demand that both kinds shall be carried by the railroad at the same tariff per ton per mile.

The question of comparative freight rates upon two articles which are more or less competitive, while a new one in the United States, has been already raised abroad. A case much like the present one was decided some 15 years ago in England. The Caledonian Railway had different rates for different descriptions of coal—a gas-coal rate and a common-coal rate. A colliery owner who shipped cannel coal, which was charged the higher rate, brought an action against the company. It was shown that gas produced from splint, or common coal, was inferior in quality and quantity to that produced from an equal amount of cannel coal. The court held, however, that splint and cannel coal had enough of gas producing quality in common to be competitive, and the cost of carriage being the same they must be transported at the same rate per ton per mile. If we accept this decision as conclusive it follows, of course, that Coxe Bros. must win their case, and that a higher rate upon anthracite is an injustice to it and an unfair favor to bituminous coal.

These English cases cannot, however, be unquestionably accepted as governing principles in this country. The English Railway Commissioners have been led into too much dependence upon mere cost of service as a test of all disputed cases. It will not do to say that because two shipments cost the carrier the same money that therefore the rates should be the same. Such a theory would compel dry goods and iron to be transported at the same tariff per ton, as is the rule in Germany. Our whole American system has been built up on the opposite theory of

value of service, that each article should be charged what its transportation was worth to the owner. A striking instance of the application of this theory is the tariff charged on ore bullion between Denver and Omaha. If it assays less than \$100 to the ton the rate is 25 cents; if it assays more than \$100 per ton, but the shipper is willing to agree to put that valuation upon it in case of loss, the rate is 35 cents; if shipper forwards at the actual valuation exceeding \$100 the rate is 75 cents. The attempt is here clearly made to have the railroad share in the profits accruing to the owner of the high-priced ores. The English decisions condemn this style of tariff making, and not a few of our own writers think it savors of confiscation, but, nevertheless, it is in accord with the principles to which our national railroad prosperity is largely due. The reason why so many of our cheap goods can be carried at such low rates (half the average European rate) is because the shipments which can afford a higher rate are charged accordingly.

If the rule of value of service be applied to the present contention, the justice of the claim that anthracite of all sizes be carried as low as bituminous becomes more than doubtful. It is true that the use of hard coal for manufacturing has decreased greatly, but much of this is owing to other causes than excessive freight rates; indeed, the changes in tariffs followed the changes in trade, and not *vice versa*. More and more is it apparent that for manufacturing our reliance is upon bituminous coal, and it is to be feared that any arbitrary arrangement of freight rates upon any other theory would only result in higher rates and higher prices upon steam-producing coal to our already burdened manufacturers. If an average must be struck, freights on the lower and cheaper qualities must be raised.

This applies more particularly to the larger sizes of anthracite now used almost exclusively for domestic purposes. As to the smaller kinds—such as buckwheat, and even culm—there is no doubt that their consumption for steam raising could be largely increased were they carried and sold at prices competitive with soft coal. It may be said that the solution of the difficulty may lie just here—that the carriers recognize a distinction between anthracite for domestic and for manufacturing use. Such a plan might relieve the miner of his surplus now stored about the mines, while at the same time granting a wider choice to certain factories and works. But to ask or expect that all sizes and kinds of coal, of whatever price or for whatever use, shall be carried at one and the same rate would be to put back the usefulness of our railroads to the crudeness of early times.

An encouraging feature of the Western trade situation is the increased business now reported by the railroads. Freight officials connected with the lines radiating from Chicago, particularly to the West and Northwest, state that their business has picked up rapidly in the past two weeks. The average improvement in the quantity of freight carried on these lines is estimated at 25 to 30 per cent. This is a very decided gain and the change is visible in every quarter affected by railroad interests. Freight solicitors were

but recently as importunate as sellers of second-hand clothing, while now they are recovering their usual dignity and do not plead for the business of small shippers. The decreased tonnage on some of the leading Western lines affected them so seriously that they were obliged to curtail the number of freight trains very heavily, thus reducing their employees and adding to the number of idle persons in the country. These trains are being restored as rapidly as the demand for freight room warrants, and a beneficial effect cannot but follow over a very broad expanse of territory. Manufacturers of railroad supplies are watching the changing conditions eagerly, believing that only a slight improvement is needed to encourage the railroads to make extensive repairs.

The post office appropriation bill represents a total of \$86,600,000, and among the items are upward of \$19,000,000 for railway service, as compared with the paltry sum of \$855,000 for foreign mails. A more liberal system for the encouragement of ocean mail transportation, looking to the ultimate benefits to be derived from the extension of our foreign commerce as a result of rapid and direct postal communication rather than to the costs of maintaining the service, is a subject which there is reason to believe will receive attention at an early day. The revival of American shipping, building up foreign markets and providing adequate facilities for communicating with foreign ports are interests that are one and inseparable. While other commercial nations are reaching out over the seas in all directions, establishing trading stations and founding colonies, merchants and manufacturers in the United States cannot afford longer to rest satisfied with passive inaction.

New York Exports for 1888.

The details of the Custom House statistics relating to the exports from the port of New York during the year ending December 31 show that there were shipped mowers and reapers valued at \$1,496,457; plows and cultivators, \$480,511; brass and manufactures of brass, \$202,214; clocks valued at \$1,028,427; 22,809 tons of copper ore and copper matte, \$2,781,419; copper, ingots and bars, 30,809,278 pounds, to the value of \$4,785,131, and other items as follows:

	Quantity.	Value.
Pig iron (2,240 pounds) tons.	735	\$15,677
Band, hoop and scroll iron, pounds.	57,855	2,214
Bar iron, pounds.	354,920	8,953
Car wheels, No.	8,188	74,675
Castings, not elsewhere specified.		111,902
Cutlery.		90,728
Firearms.		553,776
Ingots, bars and rods of steel, pounds.	301,300	12,822
Locks and other builders' hardware.		1,050,923
Machinery, not elsewhere specified.		7,011
Nails and spikes, cut.	8,325,600	8,567
Nails, wire, horse-shoe, tacks, &c., pounds.	1,161,522	124,405
Iron plates and sheets, pounds.	4,465,454	185,534
Steel plates and sheets, pounds.	38,238	2,097
Printing presses and parts of.		120,323
Steel railroad rails, tons.	5,000	173,451
Saws and tools.		1,329,555
Sewing-machines and parts.		1,325,959
Locomotives, No.	33	223,708
Stationary steam engines, No.	245	182,550
Steam boilers and parts of engines.		162,066
Stoves, ranges and parts.		190,979
Wire, pounds.	12,758,916	442,841
Iron and steel, all other manufactures of.		1,458,987

The Blast Furnaces

February 1, 1889.

As was to be expected, the demoralization in the iron and steel trades during January has led to some restriction of output, although thus far the relief is not great. It has come chiefly in the direction of blowing out of furnaces making Bessemer pig connected with rail mills. Thus the Bethlehem Iron Company entered February with only two of their seven stacks in blast, while the Union Steel Company, of Chicago, put out the three of their furnaces which had been at work for some time past. In all, the reduction of output of anthracite and coke furnaces combined is from 142,064 tons weekly on the 1st of January to 137,089 on the 1st of this month. A number of our correspondents, whose plants are ready to resume, report that they will allow them to remain idle while the markets are in the present condition. Others are not likely to make long-time purchases of raw materials at present prices, so that should their furnaces begin to work badly they can put them out without any complications of contracts entered into. One of the closest students of the situation, with exceptional facilities through his location for watching the drift of events, while acknowledging that for the first time in many months he is piling up iron, expresses the belief that a better feeling will prevail within 60 days. In fact, the first indications of it are said to be manifest even now.

For the anthracite furnaces we have the following data:

Anthracite Furnaces February 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	24	11	8,491	13	9,788

December 1, 1887.....	122	39,487
November 1.....	124	40,028
October 1.....	123	39,440
September 1.....	125	38,338
August 1.....	129	37,930
July 1.....	138	40,742

In New York and New Jersey no change has taken place. In the latter State the figures for the capacity at work have been increased in accordance with the higher position, as a producer, occupied by the Andover Furnace, in the Lehigh Valley. Bethlehem, as already noted, is running only two furnaces. In the Schuylkill Valley Marion blew in on the 10th, and Norway on the 16th ultimo. One of the Pioneer furnaces was to be blown out early in this month. The small furnace, which has not been running for some time, is to be rebuilt. On the Upper

Susquehanna the same plants are producing, to which was added, on the 10th ultimo, the Marshall, which has been remodeled and re-equipped.

In the Lebanon Valley No. 2 Sheridan has chilled. One of the Bird-Coleman stacks is still undergoing repairs. Otherwise the district is busy, as usual.

The coke furnaces opened February with the following status:

Coke Furnaces February 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	3	1	1,191	2	2,100

February 1.....	126	57,735
January 1.....	143	57,735
December 1, 1887.....	144	57,735
November 1.....	151	57,735
October 1.....	152	57,735

In the Pittsburgh district Clinton is out, and two Eliza furnaces have ceased operations. This, however, has been more than counterbalanced by the heavy output of the Edgar Thomson furnaces, which have been producing close to 10,000 tons a week in January, not counting the furnace which is on Spiegel and ferro. In the Shenango Valley Neshannock, which stopped on the 28th of December, is still out. Rosena continues its heavy product, having made in January close upon 1200 tons of iron in a week. Nothing new is reported from the Juniata and Conemaugh valleys except that No. 2 Rockhill is to begin work during the latter half of this month. Among the furnaces grouped under "miscellaneous" one stack has stopped for repairs.

In Maryland Catocin is banked, and is stocking up on ore. In West Virginia the majority of the plants were running light in January. In the Mahoning Valley Grace resumed in January, but, on the other hand, Thomas lost stock-house and hoisting-house by fire on the 10th ult. They are being rebuilt of iron, and production was expected to begin again on or about the 20th of this month. In the Hocking Valley there have been no changes. We may note, however, that B Floodwood has done some very good work, making an average of a little over 1000 tons of iron per week, which is far above the record of any other

furnace in the district. In the Hanging Rock region Sarah blew in on the 23d ult. and Wellston was also added to the list of producers during January.

In Illinois the three large furnaces of the Union Steel Company have stopped, thus reducing the active capacity of the State by about 2800 tons a week. In Wisconsin Minerva is out. In Missouri one of the stacks of the St. Louis Iron and Steel Company has blown in.

In the South Kentucky shows a lessened output through the blowing out of No. 1 Ashland. In Alabama Mary Pratt has gone out for repairs. On the other hand, Williamson was blown in toward the end of the month.

The Tennessee Coal and Iron Company are running every one of their completed furnaces in Alabama and Tennessee, nine in number, and producing at the rate of 23,000 tons per month. Trussville and the second De Bardeleben are the only two new furnaces which will begin work in the near future.

The status of the charcoal furnaces on the 1st of the month was as follows:

Charcoal Furnaces February 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.

There are no new developments in New England or in New York. In Pennsylvania we may note that Pine Grove Furnace has blown out, to be relined from the foundation to the tunnel head. The heating surface of the hot-blast stove is to be enlarged, and a system is to be introduced of enriching the gas for the hot oven and the boilers by the addition of oil spray under heat and pressure. In Maryland No. 1 Maryland Furnace is to be put into blast at an early date. In Virginia Walton stopped on the 11th ult. In Kentucky Hunnewell ceased operations on the 20th. In the Hanging Rock region the number of producers has been lessened by the blowing out, for a new hearth and general repairs, of the Bloom Furnace.

In Michigan Martel stopped on January 5, leaving only 11 stacks producing. Official reports from every one of them show the January output to have been 15,906 gross tons, some of the furnaces doing particularly good work. In the South La Grange went out for repairs, while in Alabama Tecumseh is again at work. The Old Alcalde Furnace, at Rusk, Texas, blew in on January 24. On the whole, the tendency is toward a smaller output of our charcoal plants for the present. The opening of navigation will, however, later on lead to a resumption of operations by a number of furnaces in the Northwest.

A Pittsburgh Board of Trade.—A committee, consisting of some of the most prominent citizens of Pittsburgh, have

sent a circular letter to a large number of business men of that city, asking their co-operation in the formation of a Board of Trade, such as exists in other large cities. The committee believes that the city of Pittsburgh, owing to its vast industries and great mercantile developments, demands an organization of this kind. It is proposed to secure a central location and erect a building thereon similar to those used by boards of trade in other cities, and of sufficient size to accommodate the Chamber of Commerce and the Grain, Coal, Coke, Builders' and Grocers' exchanges. The recipients of the letters are requested to give their views on the subject, and at the same time say how much money they would be willing to subscribe to such an enterprise.

Copper Production in U. S. in 1888.

PRELIMINARY STATEMENT.

David T. Day, geologist in charge, Division of Mining Statistics and Technology, Washington, has issued the following preliminary statement of copper production and consumption in the United States in 1888, by C. Kirchhoff, Jr., agent U. S. Geological Survey:

From returns obtained from the majority of producers, and checked and supplemented by full reports from nearly all the refiners in the country, the following preliminary estimate of the production of copper in the United States is compiled:

Total Copper Production in the United States.

The production is even now proceeding at a greater rate, and a very considerable increase is expected should prices continue at or near the present level of about 16½ cents for Lake copper, unless the French syndicate and the mines whose product it has contracted for agree upon some reduction of output. It is reported that on January 1, 1888, the stock in the hands of the

syndicate in this country was 59,000,000 pounds. This includes fine copper in matte and ore in transit and at works, with the exception of some Anaconda material.

Of the total quantity of copper produced in the United States in 1888 about 158,000,000 pounds was refined in this country.

Consumption.

Consumption has undoubtedly fallen off, although not to the extent which was probably widely expected. Reports from 109 consumers—among them nearly all the great copper and brass rolling mills and the leading brass founders, including also large new concerns which did little or nothing in 1887, like the Tamarack and Osceola Mfg. Company and the Hartman Steel Company—reports from these works show an aggregate consumption of new copper in 1888 of 76,124,641 pounds, against 82,458,378 pounds in 1887. This indicates a falling off of 7.68 per cent. The true effect of high prices is, however, more correctly appreciated when the fact is taken into account that the very rapid rate of increase in copper consumption of former years has been overcome. In 1887 this increase amounted to 14 per cent. The condition of general business in 1888 was favorable enough, so far as the consumption of metals in this country was concerned. The quantity of lead and spelter absorbed showed the effects of a natural growth, and leaving out of account the lessened consumption of steel rails, the quantity of iron and steel which found its way into the hands of purchasers was normal. These facts admit of drawing the inference that the cessation of a natural increase of and the substitution therefor of a notable decrease in the consumption of copper in the United States was due directly to the abnormally high price for the metal established through the operations of the French syndicate. It must be distinctly stated that the figures for the consumption given do not cover more than a part of the quantities absorbed in the United States. They are believed, however, to represent very closely the true ratio which would be reached were it possible to obtain the complete data. The principal ground for this belief is the fact that all the important industries into which copper enters as a raw material are represented in the returns by the majority of the concerns, large and small.

Southern Pig Iron Freights.

The Queen and Crescent route has issued Tariff No. 11, of rates on pig iron, which took effect on February 1. We give below the rates to the principal points, per ton of 2268 pounds:

Pig Iron Warrants.

OPINIONS OF THE TRADE.

One of the leading topics of discussion among iron makers, commission merchants and others interested in the iron trade has been the plan of creating American pig iron warrants. With the object of affording an opportunity to ascertain the attitude of different branches of the trade, and in various sections of the country, *The Iron Age* has called upon a large number of leading pig iron makers, iron manufacturers and commission merchants to express their opinions. Beginning, then, first with the manufacturers of pig iron, we print below

What Southern Makers Say.

The managing director of a large Southern iron company puts himself on record as follows:

The main benefit of pig iron warrants would be in providing a market for iron when prices are, from any cause, unduly depressed. The great want now is cash buyers for iron to be delivered promptly, and if a system having the approval of the financial world could be adopted it would offer a form of investment much more secure than many forms now in favor, such as stocks and bonds, the real value of which is in a good many cases not above question. I believe there are a great many capitalists in the country who have more or less interest in and acquaintance with the iron industry, and when iron is low in price these would be glad of an opportunity to invest their money, and would do so with less hesitation than it requires to buy some of the paper investments that are always being temptingly offered.

There have been sold to the public in the past two or three years through the medium of the Stock Exchange and through financial houses many millions of dollars of stocks and bonds of iron enterprises that promise to turn out very poor investments. How much better it would have been if this financial current could have been diverted into iron itself, where there would be an opportunity of profitable investment. Certainly the principal would be safely invested, if nothing more. It is evident that those who have invested in the stocks and bonds of these iron enterprises will fare badly. When investors learn of the misfortunes that have overtaken some of the Sheffield adventures and a late one at Nashville there is reason to fear the effect will be disastrous to other investments of like character that are not based upon a solid foundation.

The institution of the warrant system in the pig iron trade would do much to check the tide of disaster arising from the unwise and hasty investment of capital in joint stock companies in the iron trade, by affording capital an opportunity to take a part in carrying iron stocks for the furnaces which they themselves have not the means to hold. Sooner or later the truth will be made known regarding the manufacture of pig iron in this country. I think there has been very little profit in the business, even to those best situated for its economical manufacture, and that iron has generally been sold without profit for some years past. Such an institution as you mention will be the means of letting daylight into the trade, and I believe it would have a wholesome effect if the public generally should get acquainted with the business through the warrant system. I believe it would prevent unwise expansion, and result finally in putting the iron manufacture upon a solid foundation once more.

I know there are a great many objections to the proposed warrant system, but such objections are not made by those who take a broad view of the question, nor will they stand if critically examined in the light of large business experience. One of the principal objections is that if the public become buyers at low prices they will also appear as sellers when prices are advanced, and such stocks will be thrown on the market, thus preventing a rise. I do not take any such view of it. This country has grown wealthy in the past 20 years, and there is an abundance of money which should be wisely distributed in all the channels of trade. In no other business is it true that the producers have to bear the whole burden of manufacturing and distribution and take all the risks of credit, as is done in the iron trade. The introduction of public capital would be of vast assistance in this respect, and 1,000,000 tons or 2,000,000 tons could be easily carried, and would form a reserve stock which would not be thrown upon the market unless there was a great rise, and then, in all probability, the public would let go very slowly. A reserve stock of 1,000,000 tons would not, in my judgement, prevent a fair rise in price of, say, \$5 per ton when trade conditions were favorable. It might prevent a \$10 advance, which would perhaps be undesirable. It would form a great balance-wheel sorely needed, preventing such very low prices as we have had in the past four years; also preventing the foolish speculation of which we had a sample in 1880. From every point of view I can only commend the scheme as one of great good to the iron trade. In fact, I believe that those who most earnestly advocate it now, even from selfish motives, have but slight conception of the benefits that will arise from it when it is properly understood, and it will take some years before they realize it.

The president of a Southern works, interested in furnaces and rolling mills, writes:

I am inclined to think that the operation of the warrant company would be beneficial, rather than otherwise, to the producers of pig iron. One difficulty now is that there is no elasticity to the trade. You can gather what I mean from this: Supposing the cost of iron to be \$18 at the furnaces. If this can be put in storage for, say, 25 cents per ton, and warrants issued to the amount of, say, \$10 per ton, which can be used as collateral for getting money, it will obviate the necessity of the furnaces selling ahead to any such extent as they do at this time. The furnaces could easily carry \$3 per ton, or the difference between the security value of the warrants and the cost of the iron, whereas they could not carry the whole \$18, and are compelled to realize whatever the price is in order to meet maturing obligations. This would enable furnaces to hold their iron when prices were below cost, and use warrants as collateral, and thus be relieved without sacrificing their product, as they are compelled to do now. Very few furnaces have any working capital, especially in the South, and are unable, according to the present conditions of things, to borrow money in the cheaper centers, and they cannot carry their immense output on the limited banking capital at the trade centers here; whereas, the storage warrants would enable them to go to the Eastern markets and borrow money, and thus carry on their business without, as I said before, this enormous loss. I believe, further, that it will enable the furnaces to get together and determine approximately on a price at which they will sell, whereas, this is impossible under the present mode of selling through agents, as the furnaces have little control over prices the way things are now and have been.

Agents who have no interest in the concerns are hawking the iron about, and it is not infrequently the case that agents for the same company are bidding against each other for the trade, and this without the knowledge of the companies themselves. The furnaces try to avoid this by having agents in different trade centers, and allow them only to operate in certain territories; but, by connivance and one scheme and another, the agents get around this, and the furnaces are made to bear the burden. It costs now 35 to 50 cents per ton to sell iron through agents, the latter taking no risks; and the result is many sales are made to parties not deserving credit. The furnace companies are unable to prevent it, not being on the ground nor acquainted with the parties. I believe that the storage system would have the effect to wipe out this whole abuse, and where iron is shipped from storage yard we shall have no difficulty about quality or short weights. I can see no trouble resulting from making iron a medium for speculation, and believe if it has the same result upon iron as it has on cotton, oil and other mediums, my impression is it will have a tendency to steady the market, as it will undoubtedly increase stocks and give us better control of the American market than under the present order of things. On the whole, I am heartily in favor of the scheme, and believe furnace proprietors throughout the South are of the same opinion. I see no reason why this arrangement should not be as popular in the North as here with the furnaces that make iron for the trade.

A furnace company in the Birmingham district say:

It seems to us that if the surplus iron now being made were placed in yard instead of being put on the market the immediate effect would be beneficial. If a considerable part of the output of furnaces were absorbed for, say, several years, prices might be high enough to stimulate production beyond the consumptive wants of the country, and if this should happen with a large stock of iron in yards the effects might be disastrous. In other words, we believe that the immediate effect of the warrant system would benefit the producers, and good results might follow for several years. But whether the permanent interests of iron producers would be benefited by having a large stock of iron in yard represented by warrants in the hands of speculators remains to be seen. We are not disposed to regard the movement as a good one.

The manager of a very important concern puts himself on record as follows:

Our company have believed that the movement would be beneficial, and have consented to join in it to such an extent as may seem desirable to us in the future. I do not myself believe it will be beneficial. I form this opinion from the following facts and opinions: In Scotland a warrant is a warrant, and there is an end of it. It calls for the delivery of a fixed quantity of iron of one uniform grade, of any "g. m. b.," or good merchantable brand, at a fixed place. There is therefore nothing for an investor to do but to bear in mind the fluctuation of prices, and to know whether at any given time the price is high or low. This undoubtedly leads to a large investment in Connal's warrants at times of cheap iron. Under the plans of the American company, a buyer of warrants must be prepared to know the different market values of every separate brand, and the relative freight rates to consuming points from each separate storage yard, and the relative values of every separate grade of iron. This practically presupposes sufficient technical information to rule out every outside buyer, and to leave the market in the hands of consumers who already know these matters.

Now, if consumers would buy the iron they use, or a large part of it, in the form of warrants, it would be an advantage to the producers, for they would get their money more quickly, and without risk of loss; they would have sufficient commission to pay the expense of yarding the iron; they would have no disputes as to shortage or quality after the iron had passed into the control of the buyer. For the converse of the same reasons the buyers would not be likely to buy much iron in that form, and probably none at all as long as they could get what they want from the producers. It would, however, at a time like the present be an advantage to a consumer to buy a supply for two or three years, and carry it on these warrants at a low rate of interest. Unless, therefore, the consumers can be induced or impelled to buy the warrants, I think the scheme will only amount to a means for enabling producers to hold their product and borrow on it when prices are low. I do not think this is good for the market, as it will keep weak makers in blast when they ought to go out. We have seen this in Scotland, where furnaces have gone steadily on for years, losing money and storing their iron, and turning the warrants into cash with which to meet maturing bills. The accumulation of stocks in private hands and consequent lessening of make is the most natural corrective of a demoralized market, and I fear the warrant system would tend to avert the prompt application of this medicine when needed.

One of the largest manufacturers of iron in Virginia holds the following views:

The names published as being behind the movement should give it great solidity, commercially and financially, and if the scheme could be carried out just as outlined, and all the makers of pig iron would agree to go into it, it would undoubtedly be for the benefit of all. The plan is imperfect in that it does not indicate what method is to be taken with those who do not choose to go in, while the reference to the beautiful results of the operations of the Standard Oil Company seems ominous. It is at least unfortunate. Those who recollect the "freezing out" of the oil operators who refused to come under the Standard yoke in the early days of that enterprise (?) cannot look forward with any relish to a possibility of the application of the same methods to their own undertakings.

At the time that coal oil fluctuated so wildly in value the variation in the price of pig iron was nearly as great, when the nature of the two commodities is considered. The probabilities of seeing iron go to \$70 per ton seem no greater now than they do of seeing petroleum go to \$7 per barrel. The geographical relation of furnaces to each other—the situation of each in relation to its supply of materials—differences in product and different systems of grading—all seem to suggest difficulties that must occur to every one. These, however, could probably be, in a great degree, overcome by so powerful a combination as the one sought to be established. In this power lies the danger, and I hope every iron maker who values independence and the right to carry on business in his own way will put every possible obstacle in the way of this odious scheme.

Another Southern maker writes:

We make only charcoal iron, which will for some time find its own market. Generally speaking, I should think the scheme advantageous to the large new plants favorably situated to manufacture at the lowest figures, and who have immense quantities of product to take care of. The law of supply and demand will in any event ultimately give them the market, to the exclusion of the less favorably situated, but I think the proposed system would

hasten this result by stimulating production without reference to consumption. I would expect lower and constantly declining prices so long as accumulation continued, until a very nice balance between production and consumption was reached, and the accumulated stock in store should remain nearly constant, or such an aggregate figure as to prevent consumers' feeling uncomfortable as to supply.

A prominent Southern ironmaster writes as follows:

I do not regard the system of pig iron warrants with favor. Anything that tends to make speculators of producers must necessarily work great injury to the trade in general, and eventually ruin the manufacturer who undertakes to store his product and borrow money on it. If the furnaces store their product, of course the stock of iron increases, and so long as this is the case prices will decrease, and beyond doubt end in a panic that would ruin every furnace that had borrowed money on its product. If manufacturers desire to become speculators they had best close up their shops and carry on the business through the most approved channels.

Anthracite Pig Producers.

From furnacemen in Eastern Pennsylvania, New Jersey and New York we are in the position to present the following expressions of opinion. One of the makers on the Hudson River writes:

From the names connected with the project I should judge one object in view was to float heavy investments in blast furnaces in a section of the country where the building of them has been excessive for a few years past. It has now gone so far that the question has to be met. Where a market for all this production of iron is to be found at remunerative prices, and where is the money to come from to keep these furnaces in operation? I am unable to say what effect the use of such warrants will have on our pig iron business, but it seems to me that this country is too large to carry out such a scheme. Pig iron will not stand much expense to the maker for transportation, salaries, commissions and interest. In my judgment the better way is to put out part of the furnaces and make iron only to supply the demand.

B. G. Clarke, president of the Thomas Iron Company, writes:

My most serious objection, as an iron maker, is that it will enable parties to continue the making of iron and piling it in excess of the requirements of the country when the demand is not equal to the supply. The price, necessarily, is much affected, and if it were possible for the warrant company to control the output of iron for an indefinite period, and therefore put up prices of iron, it would induce parties to build new works and increase the supply beyond the requirements of the country. Dealing in warrants, as a rule, is simply gambling, like selling puts and calls. The warrants sold in Scotland are not for the delivery of the iron for use, but for speculation. A Scotch warrant is 500 tons, two-thirds No. 1 and one-third No. 3. Users of our iron would not buy on these terms. Rolling mills and pipe makers use No. 2 and No. 3. Foundrymen use No. 1 and No. 2 only; consequently a warrant would not suit either of the above parties.

The active member of a very large Northern concern deeply interested in the anthracite pig iron manufacture writes:

In reply to your inquiry as to effect on our business of a speculation by the public in the proposed pig iron warrants, I would say that I think it would more likely prove an injury than a benefit to us. As matters are now prices are regulated by the laws

of supply and demand practically, while if warrants are to be dealt in largely and the product of our furnaces sold many times over fictitious values might prevail. As in railroad stocks, oil certificates and cereals cliques might be formed by outsiders who would raise or lower our prices as their temporary profits might seem likely to accrue. With a large surplus stock of iron on hand the market could easily be "beared" and higher prices would be difficult to obtain with so much iron always for sale and ready in stock to be delivered. Even now, because we are thought to be accumulating a little iron, prices drop, and it strikes us they would always be maintained with a well known large surplus in stock. As against the theory that a surplus would prevent sudden advances and reactions in boom times, it would seem likely that it might prove just the contrary, for with a promising market speculators would buy up the surplus and "corner" it for the rise, and, as in the case of some railroad stock "squeezes," prices would go way above the limits that would follow a sudden demand simply from consumers. Customers might even have to face a corner both in the English and our warrants, for capital only would be required to accomplish the result, so completely would the warrants represent the surplus on both sides. But I do not apprehend any great sudden rises in the future, such as we had in 1879, if trade is left to itself, for the number of idle furnaces ready to blow in on short notice is much larger than ever before and supplies of fuel and ores are greater, and capacities to meet any sudden demand for them far in excess of the period when we had our great boom of 1879.

From the Schuylkill Valley comes the following:

I believe that the issue of pig iron warrants will have the effect to prevent ruinous prices and help the weak manufacturers of pig iron, and, so far, affect my interest favorably. On the other hand, it will enable weak parties to continue in blast, and keep up the overproduction that now exists, and, to some extent, counteract the advantages. Overproduction is the main cause of our trouble. The plan of issuing warrants will, no doubt, bring much outside capital to help to carry the surplus iron, and in that way steady the price. I do not propose to use their storage yards, but yet hope that the system might produce favorable results in steadying prices.

From the same district comes the following letter:

One of the representatives of the American Pig Iron Storage Warrant Company spent several hours with us last week trying to induce us to favor their plan, but we refused for the present to allow them to use our name. They propose to loan money on the very best kind of security, and you are bound to them for 20 years. As one of our directors remarked, "It is very nice for the cats, but bad for the mice." We have borrowed money on pig iron, and may have to do it again, but we shall expect to do it on better terms than offered by the warrant company. It may be a good thing for some of the Southern furnace companies, but most of the older concerns in the North, I think, can get along without their help. If I could see how their system would steady or stiffen prices it would receive my favorable consideration. I shall be glad to see any movement that will check the Thomas or any other company in what seems to be needless reductions in prices.

An old established firm of iron makers in Eastern Pennsylvania take the following ground:

We are opposed to all combinations of capital or labor, and to all kinds of trusts

whether sugar, oil or pig iron. We believe in legitimate trade governed by demand and supply. One of the greatest curses of the manufacture of pig iron is want of capital, and we believe the "iron storage warrant company" will only aggravate this by carrying those along who cannot sell or take care of their output. Nobody has any business to go into pig iron making without the capital and facilities to produce same cheaply. For over 45 years we have never blown out a furnace on account of bad markets, but steadily piled the pig iron until wanted, and we never lost any money by the operation.

The Mahoning Valley Makers

make the following points, the first saying:

Our impression is that the iron storage warrant company will be used mostly by Southern companies, and instead of putting their iron on the market below cost to raise money, they will use storage warrants, and in that way the price of pig iron will be equalized and keep about the same. We are in favor of low-priced pig iron and low-priced raw material. We notice that when prices are low there are many more uses for iron, which makes the consumption large. The warehouse company will have a tendency to keep prices low—that is, if they are patronized very much by pig iron men. We do not think the Northern furnaces will do it very much, as they have had facilities of this kind during the last few years in the different warehouse companies established in the North. As we understand the Southern furnace companies are mostly bonded, and that interest must be paid, they will in dull times use the warehouse company to raise money to pay their interest as it comes due. Our opinion is that the warehouse company will have a tendency to keep prices low, and as we have no foreign outlet, on account of high-priced labor, as England has, there will be much trouble if stocks accumulate.

Another leading maker in that section writes:

I do not believe the establishment of such a storage warrant company would be for the best interests of the pig iron manufacturers of this section. Viewed from the standpoint of a banker or money-lender, it is easy to see why so many strong and influential stockholders have given their names to the enterprise. All the advantages of the scheme are in their favor, and if they can find people enough to put up iron and borrow money they will be successful, as under their prospectus they simply take iron into their keeping and issue a warrant, for which the producer is obliged to pay. The furnace companies in our vicinity have no trouble whatever in borrowing what money is necessary to carry accumulated stocks without going to the expense of paying an arbitrary storage and carrying charge, outside of the interest, for the privilege of so doing. We can easily see how it would be a temporary advantage for furnace companies whose financial condition is weak, as it would enable them to keep their plants in operation and pile up iron, with a hope that a rise in the market eventually would let them out. The argument used by the promoters of the scheme, that an accumulation of stocks to the amount of 1,000,000 or 2,000,000 of tons would be a safeguard against great fluctuations in the market, is very deceiving in its import. Every legitimate manufacturer knows that when the stocks of iron in the country increase, it is always the occasion of low prices, and a great argument used by the buyer to keep prices down. We had a most forcible example of this in the large amount of Marshall iron that some years ago was put in the storage company's hands in the city of Pittsburgh. Storage certificates were

issued on this iron on which the banks loaned money. It had a depressing effect on the market, for whenever a quotation was made on iron some one who had loaned money on the certificates, and was tired of carrying it, would sell it at a sacrifice. The banks were the only ones who were benefited by the movement, and to the manufacturer it was "a thorn in the flesh" until it was all sold. We do not see how it is possible for any well organized and sound financial concern, who expect at all times to pay 100 cents on the dollar, and give to their stock-holders a reasonable interest on their investment, to pay a storage charge and encourage a scheme that will ever be a wet blanket upon the trade. The large productive pig iron capacity of this country as it now stands will prevent any great fluctuations in the price of this commodity, and we believe the best way to bring about an improvement in the iron market is to curtail production rather than to adopt any measure whereby inducements are offered to produce something that is not wanted. In conversation with many of the prominent iron manufacturers of the Mahoning Valley, it is the general sentiment that the success of the warrant company would seriously impair business here.

Still another large producer in the Mahoning Valley puts it as follows:

We think that the creation of pig iron warrants would be a good thing for the South, and consequently a good thing for the entire country. Southern iron is, as you know, almost uniform in quality, and the term "Southern iron" is almost generic; therefore it would be much easier handled. Our Southern friends have large interest accounts, nearly all of them have their property bonded, and are obliged, in order to realize, to pay fixed charges, whether the earnings warrant it or not. I know of a recent large sale made at a low price, and the agent expressly stated that the money was needed to pay the coming interest. It would be impossible in the North to get up any general scheme of this kind, as there are so many varieties of iron made, and the Northern furnaces, as a rule, are in a very good financial condition, and do not need to hypothecate their product in order to raise money.

A producer in the Hanging Rock region says: "We think pig iron stored and held for warrants would have about the same effect on the market as surplus stock held in any other way. We are not well enough posted in regard to the plans of the company lately organized to speak more definitely. We are disposed to regard the movement unfavorably."

One particularly interesting point is the possible effect which the plan of introducing an American warrant system—it successful—might have upon the business of

Iron Commission Merchants.

Some of the leading firms at the principal distributing points have written to *The Iron Age* on the subject, the first four letters being from

NEW YORK MERCHANTS.

A firm dealing largely in iron writes:

To buy and sell pig iron warrants on brokerage is one thing; and to sell pig iron on commission, as furnace agents, is another; and they are very wide apart, although both lines of business may be readily done by one house. While at first glance we were unfavorably impressed with the idea as published in *The Iron Age*, our later information leads us to believe that the establishment of the American Pig Iron Storage Warrant Company will be a decided benefit to the producers, in that it will enable them to hold their iron

for a fair price; and to the consumer, in that its tendency will be to relieve the market of violent fluctuations and thereby enable them to hold to a more uniform and satisfactory price for their finished work. The commission merchants will meantime, doubtless, continue to sell to consumers largely on the old basis to which the listing of warrants will be no bar. We understand that the warrant company is an established fact, and believe that the commission merchants who first realize it, and take advantage of the new system, will get the most benefit out of it.

A prominent member of the trade writes:

I cannot see that the interests of the business of the commission houses will suffer by the introduction of warrants, as they will probably be of 100 tons each, and many furnaces will require their aid to dispose of the warrants, and want loans on them.

Stroud & Co., of New York, write:

The effect upon the business interests of commission merchants of a successful introduction of pig iron warrants as a speculative medium would so largely depend upon circumstances that it is hard to say at this time what the result would be. The effect upon the business of the pig iron furnaces is more apparent, and in our opinion it would prove detrimental. One of the arguments used in favor of the scheme is our chief argument against it—the accumulation of a large stock, which, in our judgment, would be a constant menace to the market. It would be held largely by speculators, who would regulate the price of iron according to their own sweet wills instead of in the interest of the iron manufacturers. The only furnaces which would profit by it would be those whose owners cannot well afford to "blow out," and these are the very men who in times of depression would go on adding to the already large stock on hand, instead of being compelled, by the operation of the natural laws of trade, to stop work or reduce their output.

An increase in the stock of pig iron would always be a signal for a raid upon the market by the speculative "bears," and should favorable conditions appear on the commercial horizon it would be the speculative "bulls" who would reap the benefit in nearly every instance, and not the furnaces. In short, while such a scheme would certainly enable the furnaces to obtain financial aid at times when they need it, we claim that that advantage is more than offset by the undoubted facts that it would be the means of increasing the production, thereby increasing competition, which with the constant menace to the market of a large stock on hand would enable the operators in warrants to cut down the profits of the furnaces. It must be borne in mind that when a furnace sells its iron to a speculator it thereby creates a competitor in the market for the sale of its own iron.

One of the oldest firms in the business writes:

We observe in *The Iron Age* the programme of the specious Pig Iron Warrant Association or company, apparently supported by many ornamental names, sprinkled here and there with a good many others with their own axes to grind. A very hazy, sentimental feeling seems to pervade the play-bill laid out for the public, and that some Dousterswind process is all that is needed to better the condition of prices and prospects of Southern pig iron. According to Swank, there were only 350,000 tons of pig iron in stock in the United States, of which 112,000 tons were charcoal. The Southern furnaces could not expect an advance of over \$8 a ton at their own works when

they state confidently they can make it for \$9 and \$10 a ton. The great obstacle to the success of the scheme is that all pig iron is not of the same value; that the quality varies greatly, and the location of the iron will make a great difference in the market value of the iron. A furnace turns out Nos. 1, 2 and 3. The No. 1 is used for foundry purposes, Nos. 2 and 3 by mills to make bar iron. The iron founder does not buy the lower grades, and No. 1 is too expensive for the mill men. Iron, besides, has a different value at Birmingham, Louisville, St. Louis, Chicago, Pittsburgh, Philadelphia, and New York and Boston. The whole make-up of the scheme is like a body of brass and legs of clay; it will not stand close criticism, and the prospectus is like some pretty calicoes—nice to look at, but will not stand scouring. In our opinion, the company will not succeed until there are large stocks needing their assistance to finance. At present no change will take place by their operations. We would further add that the value of a warrant issued for iron of the kind we describe and at the places we name would not have a uniform value, and hence, we think, would not likely get on the Stock Exchange. Even the Iron and Metal Exchange in New York has been a complete failure, greatly from the causes above described, and no sales are now effected there.

PHILADELPHIA FIRMS

Contribute the following opinions:

We are inclined to the opinion that so far as the present relations exist between the consumers and commission men there will be no change. The question will at once arise whether it will be more advantageous for a consumer to purchase his requirements from a regularly constituted furnace agent or from a speculator. Were all brands of pig iron equally adapted for all purposes, the conditions might be somewhat changed. There might be an additional field opened in the sale of warrants on a brokerage. We do not apprehend that makers of standard brands will have any necessity to take advantage of the warrants, as those brands are always in demand in excess of the supply.

A leading concern writes:

So far as this firm is concerned, we do not think that the business of the American Pig Iron Storage Warrant Company will affect us in the least, as the furnace companies we represent will not take their business out of our hands. Several of the furnaces that we represent have been doing business for a long time on precisely this basis, and have the yard wherein the iron is stored leased to this firm, and from time to time, as their wants require it, we raise money on these storage-yard warrants. We think in a general way that the successful operation of this company will have a very beneficial effect upon the pig-iron business, as we hope that it will steady prices. As far as the speculative part of it is concerned, we hope not to see too much of it done, as we think it is a bad thing to have as solid an article as pig iron be a medium for speculation.

We shall in next week's issue of *The Iron Age* publish additional letters from producers, commission merchants, and from leading consumers.

The success of the open-hearth cast steel gun built by the Standard Steel Casting Company, of Thurlow, Pa., and tested last week by Government officials at Annapolis, Md., has revived some interest in the ill-fated Bessemer gun, made by the Pittsburgh Steel Casting Company, of Pittsburgh, which burst during the test-

ing at Annapolis some two months ago. In an interview on the subject of built up and cast guns, Mr. W. Hainsworth, superintendent of the Pittsburgh Steel Casting Company, expressed his views as follows: "I am glad that the Thurlow gun stood the test, and think that it will come out of the star-gauging test all right. When I undertook to turn out a Bessemer gun I understood that great elastic limit was necessary. The failure of the gun was due to the hardening of the breech, which caused internal grain. We tempered ours to give it greater elastic limit. The Thurlow gun was annealed, but not tempered, and they were wise to leave it in its natural state. Its success establishes the fact that a Bessemer gun can be made and stand a good test when properly annealed, but not tempered. We will not cast another gun now, but if the Government should issue proposals for steel cast guns we would be on hand."

OBITUARY.

CORNELIUS H. DELAMATER.

On Wednesday of last week the founder of the Delamater Iron Works died of pneumonia, at his residence in this city. Mr. Delamater was born at Rhinebeck Heights, N. Y., August 30, 1821. When he was three years old his parents moved to New York, where, at the age of 14, he entered the hardware house of Swords & Co. Two years later he entered the Phoenix Iron Works, where his father was cashier and confidential adviser. When 20 years old he formed a copartnership with Peter Hogg, under the firm name of Hogg & Delamater. This firm continued until 1857, when, Mr. Hogg retiring, the Delamater Iron Works were started on the site now occupied at the foot of Thirteenth street, this city. The unusual mechanical ability developed by Mr. Delamater made him an all-important factor in the establishment, which afterward increased with such wonderful rapidity. During the Rebellion he performed a very essential part, as it was through his large wealth and the great resources of his works that the Monitor and Dictator were built in so short a time. He also built the Iron Witch, the first iron steamboat that ever ran upon the Hudson. He contracted to build 30 Spanish gunboats in eight months, at a cost of \$60,000 each in gold, and although the insurgents interposed many serious obstacles by litigation in the courts, the boats were delivered in seven months from the date of the contract. The machinery for all the boats was built at his own works, in addition to all the regular work that was done. The hot-air engine of John Ericsson, as a substitute for steam, was first introduced in the Ericsson, which was built entirely by Mr. Delamater, by whom the incidental experiments were also conducted.

A list of the great undertakings in which Mr. Delamater was interested, and to the development of which he lent his thorough mechanical knowledge, would be simply an enumeration of the initiative work which the Delamater Iron Works have taken in aiding the advancement of practical mechanics during the past quarter of a century. Having quick perceptive faculties, and being familiar with the requirements, Mr. Delamater was enabled to instantly perceive the merits of an invention, and to closely estimate its financial, as well as mechanical, prospects, and having once enlisted his energies, he knew no discouragement. This characteristic made the works the harbor for those seeking the aid to be obtained from the all-powerful combination of brains and capital. Personally Mr. Delamater was exceptionally popular with his men, as

was shown during the draft riots, when the mob refused to burn his works. As one of the Commissioners of Rapid Transit in this city, in 1876 and 1877, he foresaw what the city needed, and to-day the public are reaping the comforts and pleasures of an elevated railroad system of great value. By the articles of copartnership it is agreed that the works shall be continued by the survivor six months after the decease of his associate, and under this stipulation the entire establishment will be conducted by William Delamater, as the survivor of the firm.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., February 12, 1889

In order to simplify methods of steel inspection under Government auspices to lessen cost and relieve officers at the establishments filling steel contracts the Secretary of the Navy issued the following instructions:

NAVY DEPARTMENT, WASHINGTON, {
February 6, 1889.

Gentlemen: The present method of conducting inspection requires a large force of officers, likely to be much increased as the work increases, and assumes that the Department is to witness and approve of the process of manufacture in the various steel works where the shipbuilders shall place contracts.

The experience already had by the manufacturers should make it possible for them to know, through their own experts, the characteristics of their daily product, and the Department deems that the time has come when it is wise to withdraw largely their men from the works, and leave the responsibility upon the manufacturers, and transfer its testing to the shipyards, and there test the finished material as it is received, and accept or reject as the results may justify.

This matter requires consideration, and a consultation will be had at this Department at 1 p. m. on Tuesday, February 12, 1889, for the purpose of considering and discussing the subject as to the more satisfactory and economical place or places—the manufacturers' works, shipbuilding yards, or both—to conduct the several required inspections of steel materials to be used in the construction of United States vessels, and you are asked to send a representative from your works to confer with the Chief Constructor, the Engineer in Chief, the President of Steel Inspection Board and representatives from shipbuilding yards and steel-makers.

Very respectfully,

W. C. WHITNEY, Secretary of the Navy.

In pursuance of this circular letter, at 1 o'clock to-day the following officers and others assembled at the office of the Steel Inspection Board:

Chief Constructor U. S. Navy, T. D. Wilson (in the chair); Engineer-in-Chief U. S. Navy, George W. Melville; Capt. H. L. Howison, U. S. Navy, president of Steel Inspection Board; R. W. Davenport, Lieut. W. H. Jaques, representing Bethlehem Iron Company; Axel Petrie, representing Midvale Steel Company; William Taylor, of the Spang Steel Works, Pittsburgh; N. F. Palmer, Quintard Works, New York; Chas. Cramp, of the William Cramp & Sons S. & E. B. Company; Mr. Wetherell, Standard Steel Casting Company; Cephus Taylor, Linden Steel Company; Mr. Rowland, Continental Iron Works.

The conference lasted several hours. The gentlemen of the board heard the suggestions offered. They will hold a meeting in a few days to go over the mass of matter and formulate their recommendation in a report to the Secretary of the Navy.

Within the lines laid down in his circular letter the disposition of the officers is to make important changes in this branch. The manufacturers are well satisfied to have matters remain as they are. It is possible that a compromise plan will be recommended which will continue certain work at the works and other portions at the yards.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington street, CHICAGO, February 11, 1889.

Pig Iron.—While the market can hardly be called active, it seems to be gradually approaching that condition. The number of buyers is increasing, and although the demand is mainly for small lots the aggregate forms quite a respectable volume of business. Occasionally a consumer is found with sufficient confidence in the future to provide for his wants for a few months. Several transactions of that character have occurred during the week, ranging from 500 to 1000 tons each. For some of these large orders there was a vigorous competition among local manufacturers, and \$16 for No. 1 Foundry was shaded. The Calumet, Bay View and Mayville furnaces are again in almost complete control of this market in supplying Pig Iron for general purposes, and the Calumet is also making a high-grade Soft Iron branded "Chicago Scotch" which is displacing Ohio Soft Irons. Prices are as weak and unsettled as they have been, with no indication of an early improvement in this respect. Notwithstanding the low prices now prevailing, manufacturers are keeping their furnaces in blast with remarkable tenacity, each probably hoping that some of his competitors may be tired out first. The furnaces thus far blown out in this immediate vicinity have been making Bessemer Iron, and not Iron for the general trade. The Ohio failure which occurred on Saturday was unexpected, as the company was believed to be financially strong. Perhaps the restriction of production so necessary to the recovery of the health of the Iron trade will after all only be brought about in this unpleasant way, by the weeding out of weak concerns. The opinion is freely expressed that the present depression in Pig Iron is another of the inevitable movements toward the permanent establishment of a lower level of prices in this country, and that when an improvement comes our enormous furnace capacity will prevent a return to the best prices of the last period of activity. Prices of Lake Superior Charcoal are apparently as firm as they have been, moderate sales being reported during the week. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, Nos. 1, 2 and 3, \$20; Lake Superior Coke, No. 1, \$16 @ \$17; No. 2, \$15 @ \$16; No. 3, \$14 @ \$15; American Scotch (Blackband), No. 1, \$18.50 @ \$19.50; Jackson County Silvery, No. 1, \$18; other Ohio Soft Irons, No. 1, \$17 @ \$18; Chicago Scotch, No. 1, \$17.50; Southern Coke, No. 1 Foundry, \$16 @ \$16.50; No. 2 Foundry and No. 1 Soft, \$15.25 @ \$15.75; No. 3 Foundry, \$15; Gray Forge and No. 2 Soft, \$14 @ \$14.50.

Bar Iron.—The condition of this branch of trade is about the same as was reported last week. Orders are scarce and prices are nominal at 1.70¢, half-extras, f.o.b. Chicago, for carload lots of good quality Common Iron. Good specifications have been placed at 1.65¢, but thus far this is believed to have been the bottom price made by standard mills. Small lots are selling from store all the way from 1.85¢ to 2.10¢, according to quantity and quality.

Structural Iron.—A few advance orders have been placed for Beams for building purposes, but in other respects very little is doing. Mill lots are quoted as follows, f.o.b. Chicago: Angles and Sheared Plates, 2.12¢ @ 2.15¢; Universal Plates, 2.20¢; Tees, 2.45¢ @ 2.55¢; Beams and Channels, 2.90¢; Store lots are sold

at 2.35¢ for Angles; 2.70¢ for Tees, and 3¢ @ 3.4¢ for Beams and Channels.

Plates, Tubes, &c.—Although large contracts for Plates were less numerous than in the previous week, the general condition of trade was somewhat improved. The boiler-makers are receiving good orders and are free buyers of Plates. Prices are unchanged, small lots from store being quoted at the following rates: Sheet Iron, Nos. 10 to 14, 2.50¢; Sheet Steel, 3¢ @ 3.50¢; Tank Iron, 2.40¢; Tank Steel, 2.60¢ @ 2.75¢; Shell Iron, 3¢; Shell Steel, 3.12¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 62½¢ @ 65¢ off.

Sheet Iron.—The demand for Galvanized is spasmodic, but even yet stocks in warehouses here are not up to the usual standard. Quotations for small lots are unchanged, at 65¢ off for Juniata and 65¢ and 2½¢ off for Charcoal. Black Sheets are quiet and unchanged, at 3.30¢ for No. 27 Common from store, and 2.95¢ @ 3¢, f.o.b. Chicago, for mill lots.

Merchant Steel.—An order for a good quantity of Open-Hearth Spring Steel was placed at quite a low price, and Tire Steel has also been purchased at very low rates. Trade has been mostly confined to small lots, however, for which full prices are obtained. We quote as follows: Soft Steel Bars, 2.10 @ 2.30¢; Tool Steel, 7.75¢ @ 8¢; Specials, 13¢ @ 25¢; Crucible Spring, 3.75¢; Open-Hearth Spring, 2.20¢ @ 2.50¢; Open-Hearth Machinery, 2.30¢ @ 2.50¢; Tire, 2.20¢ @ 2.50¢; Sheet, 7¢ @ 10¢.

Steel Rails.—The sales of the week amounted to about 10,000 tons. Other orders are in sight which will soon be placed. Prices are maintained at \$30 @ \$30.50, according to quantity. The Western manufacturers are deeply interested in the competition now being waged between the Eastern and Pittsburgh manufacturers over Southern business. It is to be hoped that this section, having had its taste of demoralization, will not become involved in the trouble. The Joliet Steel Works have shut down for a few weeks for repairs, which leaves the North Chicago Rolling Mill Company the only active concern here at present.

Old Rails and Wheels.—Sales of Old Iron Rails have been made at points in the interior of the State at \$20.50 @ \$21, and holders insist that they are worth the same price here. On the basis of transactions for deliveries elsewhere, however, it is difficult to figure above \$19.75. Old Steel Rails have been sold in small quantities at \$15 for lengths under 3 feet and \$18.50 for long lengths. Old Car Wheels are dull and are quoted nominally at \$19.

Scrap.—The supply is very abundant, the demand is very limited and most dealers are not attempting to push sales. Quotations to consumers are about as follows, per ton of 2000 lb: No. 1 Railroad Shop, \$20; Track, \$18; No. 1 Mill, \$13 @ \$14; Pipes and Tubes, \$18; No. 2 Mill, \$9; Axles, \$25.50; Horseshoes, \$18; Machinery Cast, \$13 @ \$14; Stove Plate, \$9; Cast Borings, \$8; Wrought Turnings, \$10.50 @ \$11; Coil and Leaf Steel, \$14.50; Mixed Steel, \$10. Dealers are giving \$14 for Mixed Country Scrap.

General Hardware.—The volume of business in Shelf Hardware is not so great as it was in January, some houses reporting a decided falling off in orders. Other establishments, however, continue to be very busy for the season, and consider their prospects bright for a good month's trade. Several large buyers from remote western points have been in the city the past week, and have placed good orders for Hardware, including considerable

quantities of Cutlery. The houses which have been making special efforts of late to build up their Cutlery trade are meeting with very encouraging success, and are intercepting business which until quite recently went East or abroad. Heavy Hardware is in good demand, but only in certain localities, some districts tributary to this market buying very little at present. The houses engaged in this line are carrying over to next season large stocks of Sleighs and materials for Sleighs, for which there has been no sale this winter owing to the lack of snow. Manufacturers' agents are now booking large orders for seasonable goods for future delivery. Copper Rivets and Burs have been advanced to 50¢ off.

Nails.—Manufacturers' agents are receiving numerous inquiries for Steel Nails, and are expecting a good demand shortly, as stocks in second hands are rapidly being reduced. Some orders of considerable size have been placed quietly within the past two weeks by parties who had been supposed to be well supplied, thus strengthening the position of the manufacturers very materially. Jobbers' prices are still the same as those quoted by manufacturers, carload lots being sold at \$2, and small lots at \$2.05. Wire Nails have not improved. Carload lots are selling at \$2.40, and small lots at \$2.45.

Barb Wire.—The demand is good but prices show no change, jobbers quoting 2.80¢ for Painted, and 3.40¢ for Galvanized in mixed carload lots, and 2.90¢ and 3.50¢, respectively, for small lots, with slightly lower rates to best buyers.

Pig Lead.—Prices are a shade lower, some 900 tons having been sold at 3.50¢. Higher values are looked for within 60 to 90 days, with the approach of spring trade and the increased consumption which will take place.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., February 12, 1889.

Pig Iron.—There is very little change to note as compared with the market a week ago. Prices are steady, with some degree of firmness, and while no one looks for much improvement, there is a somewhat general impression that bottom figures have been reached, for awhile at all events. The offerings are liberal at quoted rates, but it is doubtful if concessions could be obtained unless quality was more or less doubtful, or for other reasons not applicable in ordinary transactions. The demand is not of a very satisfactory character, however, consumers taking only such lots as are required within the next three or four weeks. This, of course, is a pretty safe guarantee of the demand being continuous, unless consumption falls off unexpectedly. This is a point upon which there is nothing definite to base predictions, although the trade hope, and profess to believe, it will come out all right in course of a few weeks. There is certainly no reason for a contrary opinion so far as now appears. Nevertheless it is useless to deny that want of confidence is probably the most prominent feature in the market. As an offset to this it may be said that values would easily respond to any favorable influences. Consumers could not buy more sparingly than they have done of late if they are going to run at all, and with the first sign of improvement carload orders would be increased to 50-ton lots, and so on all the way through. Everything depends, therefore, on the amount of business forthcoming within the next 30 or 60 days. As to the probable requirements of consumers, as we said before, there is no basis upon which to form decided opinions. A good deal of disappointment has been met with so far during

1889, and there may be still more before the market takes a right kind of a turn, but the trade are still hopeful that things will turn out favorably. Meanwhile prices have become steady at about \$15.25, delivered, for Gray Forge, \$17 for No. 2 Foundry and \$18 for No. 1. Special brands command from 50¢ to \$1 per ton beyond these prices, and are pretty well taken up at very near to outside figures. Southern Iron is not pressed for sale, although holders would probably shade a trifle on firm offers for good-sized lots. Asking prices are \$17, ex ship, for No. 1, \$16 for No. 2 and \$15 for Gray Forge, with no recent transactions reported.

Foreign Iron.—Bessemer quoted at \$19.50 @ \$20, c.i.f., duty paid, with no demand. Spiegeleisen is quoted \$28.50 for 20 %, with bids for round lots at \$28, same terms.

Blooms.—A fair business is doing at somewhat irregular prices, although quotations are ordinarily about \$28 @ \$28.50 at mill for Nail Slabs; \$29 @ \$30 for Sheet Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for flange purposes; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$42 @ \$44; Scrap Blooms, \$32.50 @ \$34 per "bloom" ton of 2464 lb.

Muck Bars.—Business during the week has been done at \$27, delivered, but holders are inclined to stiffen up to \$27.50, with bids of \$27 declined within the past two or three days.

Bar Iron.—Nothing satisfactory can be said under this heading. The demand is said to be a trifle better in the interior, but prices show no improvement and can hardly be quoted with any degree of exactness. Of course there are all kinds of Iron, and there are all kinds of prices; the difficulty is to adjust the one to the other. Strictly first-class Bars are supposed to be worth 1.8¢ @ 1.85¢; some claim to offer them at a tenth less, while still others claim to offer a good Iron at 1.65¢ @ 1.70¢. Exact quotations, therefore, are simply impossible in times like these, although those whose product is beyond question are holding for 1.8¢ and upward, but a good deal depends on the kind of order that is placed before them. Skelp Iron is quiet, with sellers at 1.75¢ @ 1.80¢, but the demand appears to have been satisfied, as only small lots are being asked for at present.

Plate and Tank Iron.—A very dull market is reported in this department, and while there is undoubtedly a great deal of business to come on the market in the near future, the immediate position is most unsatisfactory. Prices are irregular, although they can hardly be called lower, as orders are not large enough to make concessions worth while. New business is anxiously looked for, however, and to secure something very desirable prices might possibly be shaded from asking rates, which are as follows: 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates, 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.15¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—Although there is no improvement to note in this department, the feeling is hopeful because of the large amount of business which is certain to come on the market in course of a short time. It may come within a couple of weeks, or it may be postponed until next month, but that it will come soon is certain, hence there is less despondency than might be expected after such a protracted period of depression. Prices remain as before, viz: Bridge Plate, 2¢ @ 2.1¢; Angles, 2¢ @ 2.1¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

Sheet Iron.—There is a fair demand for small lots, and prices remain as last quoted—viz.:

Best Refined, Nos. 26, 27 and 28.... 8 @ 3½¢
Best Refined, Nos. 18 to 25.... 2½ @ 3 ¢
Common, ¼¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28.... 4½ @ 4½¢
Best Bloom Sheets, Nos. 23 to 25.... 3½ @ 4 ¢
Best Bloom Sheets, Nos. 16 to 21.... 3½ @ 3½¢
Blue Annealed..... 2.6 @ 2.6¢
Best Bloom, Galvanized, discount..... 62½ ¢
Common, discount..... 67½ ¢

Steel Rails.—The weakness reported at Western mills does not appear to be participated in by those in the East. Prices are, to some extent, nominal, but makers claim that they would let business pass them rather than make concessions, although 5000-ton lots or upward might possibly be accepted at fractionally lower rates if deliveries and payments were especially satisfactory to sellers.

Old Rails.—The market is very quiet, and while holders are firm and prices nominally unchanged there is less disposition to pay the high prices asked—say, \$24 and upward for lots in store. Several lots have changed hands at from \$24 to \$24.50, delivered to mills near-by, with further demand at the inside figure.

Scrap Iron.—The market is very quiet and prices somewhat easier, unless for very choice lots. Quotations about as follows: \$20 @ \$20.50 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice \$22; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26; Old Car-Wheels, \$17 @ \$18, Philadelphia.

Wrought-Iron Pipe.—Business has been fairly active taking everything into consideration, and prices are unchanged. Orders for large lots are still felt to be near at hand, but for the present there is nothing more than the ordinary run of trade. Discounts as follows: Butt-Welded Black, 55 ¢; Lap-Welded Black, 65 ¢; Butt-Welded Galvanized, 45 ¢; Lap-Welded Galvanized, 55 ¢; Boiler Tubes, 62½ ¢.

Nails.—The feeling is a shade better, and cutting is less frequently met with, but the demand, as may be expected at this season, is quite light. Stocks decreasing, and some progress is being made in the effort to restrict production. Prices remain at from \$1.90 to \$2 for store lots.

Cincinnati.

Office of The Iron Age, Fourth and Main Sts., CINCINNATI, February 11, 1889.

Pig Iron.—An improved tone has prevailed in the local market during the week. The inquiries have been numerous, especially for Forge Iron, and there have been some sales of moment, but sellers have assumed a firmer attitude, and, demanding higher prices, have checked the increasing requests of consumers. Foundry Iron, too, has been held more firmly, but it has been less in demand from either speculators or consumers. For prompt delivery Iron of all kinds is obtainable at the close 50¢ @ \$1 per ton less than is asked for delivery embracing six months to a year. Purchasers for speculative account have been less successful than buyers for consumption, there existing a feeling against the former operators. Sales of Foundry Iron, while considerable in the aggregate, have been largely for small amounts. Sales of Forge Iron have consisted of Grey Forge, Mottled and Soft Irons, largely the product of Ohio furnaces. About 5000 tons of these grades have been sold, one lot of 2000 tons Southern Grey Forge selling at \$12.75, cash, and 500 tons ditto at \$13. No. 1 Southern Foundry has been offered at \$14.75, and same brands are obtainable at this rate at the close for immediate shipment, but most

sellers claim to ask \$15, and even more. The following are the approximate prices current here at the close for cash, f.o.b.:

Foundry.

Southern Coke, No. 1 (new classification).....	\$14.75 @ \$15.25
Southern Coke, No. 2 (new classification).....	14.25 @ 14.00
Southern Coke, No. 3 (new classification).....	13.75 @ 14.25
Ohio Soft Stone Coal, No. 1.....	15.00 @ 16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.00
Mahoning and Shenango Valley.....	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.00
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

Forge.

Strong Neutral Coke.....	18.00 @ 18.50
Mottled Neutral Coke.....	12.00 @ 12.25
Gray Forge.....	12.75 @ 13.25

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 26.00
Lake Superior Car-Wheel and Malleable.....	21.00 @ 22.00

Manufactured Iron.—There has been a fair volume of business and a steady market, the change in prices being only in special instances.

Nails.—The demand has been fair and the market has remained steady, but the offerings are liberal. 12d @ 40d sell at \$1.90 @ \$1.95 per keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$1.95, and Steel Wire Nails at \$2.60 @ \$2.65 per keg.

Old Material.—The market has ruled heavy and lower prices have been accepted, Old Rails having sold as low as \$20, but other and lighter weight are held at \$21; Old Wheels have sold to a moderate extent at \$18, cash.

Cleveland.

CLEVELAND, February 11, 1889.

Iron Ore.—Ore dealers are endeavoring to induce furnacemen owning Ore now on the docks to accept new Ore in its place, the latter to be delivered in May. This would enable them to resell the Ore, disposed of at cheap figures last August and September, at an advance of about 40¢ per ton over the figures then obtained. Beyond the 10,000-ton transaction recorded last week there appears to have been no local sales of new Ore. The price obtained for this Ore—\$4.15 per ton for Non-Bessemer Menominee—seems likely, however, to furnish a basis for the establishment of permanent quotations. Several heavy purchasers have said to-day that the range of prices for all standard Ores will be from 25¢ to 40¢ above last season's opening prices. The 75,000 or 80,000 tons of new Ore already sold at Chicago, according to the information received by interested parties here, was at an average advance of 42¢ per ton over the prices at which the same Ores sold at the beginning of the season of 1888. Vessel rates have been somewhat demoralized by the fact that a line of vessels have been chartered to bring Ore from Ashland to Cleveland for \$1.25 per ton during the season. Rival lines claim that the amount of Ore to be carried by these vessels is small and that the Ore is intended to serve as ballast for other cargoes. These charters have had the effect, however, of upsetting the calculations of the lake carriers and will undoubtedly result in a schedule of rates based upon a charge of not over \$1.05 or \$1.10 at the most, from Escanaba to lower lake ports. Real activity in the Ore market is not looked for until there shall have been some improvement in the Pig-Iron situation, which just at present could not well be more lifeless and depressed. None of the large mining companies have thus far fixed prices, although there is very little question as to what these quotations will be.

Pig Iron.—Beyond a limited inquiry for Foundry Iron the market is without life. Such widely varying reports are in circulation regarding concessions by the furnacemen that no authoritative information as to quotations can be given. Small lots of Bessemer Iron are known to have been sold at liberal sacrifices, but sellers generally take a more hopeful view of the outlook. Several local furnaces are expected to go out of blast, temporarily, within the next ten days.

Manufactured Iron.—Several mills have stopped running, and only small and widely scattering sales are reported.

Old Rails.—Sales of Old American Rails, in small lots, are reported at \$22.50 @ \$22.75.

Nails.—Steel Wire Nails at \$2.40 are very firm, as are also Common Steel Nails at \$2.

It is reported at the office of the Chapin Mining Company that about three-fourths of the stock in the Chapin Mine has been sold to Ferdinand Slessinger, of Milwaukee, associated with certain New York capitalists, for \$2,000,000. The sale does not disturb the lease, which has 30 years to run. Nearly all of the stock not purchased by Mr. Slessinger is owned in this city. The Chapin Mine produced last year about 250,000 tons of Ore. The Ore sold at the beginning of last season at \$5, dropped at one time in the autumn to \$4.50 @ \$4.75, and closed at about \$5.25.

St. Louis.

Office of *The Iron Age*, 212 N. Sixth st.,
St. Louis, February 11, 1889.

Pig Iron.—The general conditions remain unchanged. The views expressed by the representatives of some of the leading furnaces that the recent large purchases would have the effect of strengthening the market seem to have been somewhat premature. While the general opinion prevails among those interested in the Iron trade that the market has about reached bottom and an upward turn may be looked for, yet, for some unknown reason, the expected improvement fails to materialize. A number of furnaces have advanced their prices from 50¢ to \$1 per ton, but their object in so doing was to emphasize the fact of their withdrawal from the market at present prices, and the advanced figures are consequently purely nominal. Inquiries are coming in from large consumers, but reported sales are generally for small lots for prompt delivery, which gives the market more or less of a hand-to-mouth character. Prices for such lots for cash, f.o.b. St. Louis, are as follows:

Southern Coke, No. 1 Foundry, \$15.25 @ \$15.75
Southern Coke, No. 2 Foundry, 15.00 @ 15.25
Southern Coke, No. 3 Foundry, 14.25 @ 14.75
Gray Forge, 13.50 @ 13.75
Ohio Softeners, 17.50 @ 20.00
Lake Superior Charcoal, 21.00 @ 21.50

Missouri.

Charcoal Foundry, No. 1, 16.00 @ 16.50
Charcoal Foundry, No. 2, 15.00 @ 15.50

Tennessee.

Charcoal Foundry, No. 1, 17.50 @ 18.50
Charcoal Foundry, No. 2, 16.75 @ 17.50

Connsville Coke, f.o.b. East St. Louis, \$4.70; St. Louis, \$4.85.

Bar Iron.—The mills continue to be kept pretty well employed on orders received from country merchants, who are stocking up preparatory to the spring trade. Prices are weak and sensitive, and low figures are accepted on desirable specifications. Carload lots from mill are quoted at 1.80¢, and lots from store at from 1.85¢ to 1.95¢, according to quantity and quality.

Barb Wire.—There is no perceptible change in this line. Mills are all busy,

and in some cases are running behind on their orders, but prices continue weak and unsettled. There is no basis for ascertaining exact quotations, as each individual mill is making its own. It seems probable, however, that an advance will have to be made shortly, as manufacturers claim there is no inducement in present prices for them to keep their plants in operation, and say it would be more profitable to close down rather than continue selling at the figures now ruling, which remain as last quoted: Carload lots, Two and Four Point Painted, \$2.90; carload lots, Two and Four Point Galvanized, \$3.50, f.o.b. St. Louis; less than carload lots, 5¢ additional.

Birmingham.

BIRMINGHAM, ALA., February 11, 1889.

Notwithstanding the continued depression in Iron generally, the past week has developed encouraging features for the near future in the financial situation. Bankers are more cheerful than they have been for 12 months. A great deal of cash has come into circulation here by means of the sale of several lots of stocks in gold mining companies in East Alabama. So much, indeed, has come from this source that it is regarded as a harbinger of a revival of the flush times which prevailed here several years ago. Though prices in Iron are lower than ever known in this district operations are going along steadily, and a number of the larger plants are preparing to increase their capacity for production. Notable among these is the Eureka Company, of Oxmoor, who will, it is reliably reported, begin within the next month the erection of two 125-ton furnaces. Another new furnace, the building of which will begin next month, is at Bessemer, by the De Bardeleben Coal and Iron Company. In addition to this there are six new furnaces now building in the district. A close calculation shows that, with what there is now in course of erection in this city, by early spring there will be \$1,500,000 worth of building going on. This with the recent renewed inquiry for centrally located real estate largely mitigates the depressing influence of the state of the Iron market. Among the recent enterprises set on foot by the Birmingham people, who, by the way, have not confined themselves to operations immediately at home, is the Benton Land and Iron Company, a corporation just formed at Cleveland, Tenn., for the development of a deposit of Brown Iron Ore averaging 55 % of Metallic Iron and a minimum of 85 feet thickness. The remarkable thing about this Ore deposit is that is one of the rare instances of stratified brown Ore in this country. The enlarged Williamson Furnace here went into blast recently and is now in satisfactory operation. Though only one of the five Sheffield furnaces is running, it is intended soon to blow in the other four, a sufficient supply of Ore having been secured for their consumption.

The Henderson Steel Works went out of blast on Saturday, in order, it is given out, to enlarge the plant, which has been making a daily output of about 6 tons of good quality Steel. Foundries and machine shops keep full of orders and seem to have all they can do for some time ahead.

A rumor has it that Mr. Andrew Carnegie, who was here the latter part of the week with a number of railroad celebrities, making a tour of the South, has bought a large body of Ores, and that he designs, with local capitalists, to test the Ore for Steel properties. Mr. Carnegie, at a dinner given the visitors, expressed himself as greatly surprised both at the solidity of the various enterprises and at the vastness of the resources.

Louisville.

LOUISVILLE, KY., February 11, 1889.

Pig Iron.—The market continues in an unsatisfactory condition, the price of Iron being very low. We have not heard of offerings being made, however, on a lower basis than that reported for the last two weeks. Several of the furnaces that have made sales at bottom figures have withdrawn from the market, having sold what Iron they cared to place for the next 60 days, so that the market has a chance to slightly recover. It is hoped that a different tone will be manifest before the principal sellers in the last decline feel it wise to go on the market again to sell their product. Current quotations:

Southern Coke, No. 1 Foundry, new classification, \$14.75 @ \$15.25
Southern Coke, No. 2 Foundry, new classification, 14.25 @ 14.75
Southern Coke, No. 3 Foundry, new classification, 13.75 @ 14.25
Gray Forge, 13.25 @ 13.75
White and Mottled, different grades, 12.75 @ 13.25
Silver Gray, different grades, 12.00 @ 12.50
Southern Charcoal, No. 1 Foundry, 14.25 @ 14.75
" " No. 1 Mill, 14.75 @ 15.25
Southern Car-Wheel, standard brands, 21.75 @ 22.75
Southern Car-Wheel, other brands, 18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry, 15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry, 19.50 @ 21.00
Hanging Rock, Cold Blast, 20.75 @ 22.75

C. J. Kent and T. N. Mordue, of the late firm of Kent & Mordue, and Graham Macfarlane, late receiver of the Breckenridge Cannel Coal Company, have formed a copartnership for the purpose of conducting a general Iron, Coal and Coke business. They have recently opened a general Coal and Iron yard in Louisville, They are prepared to furnish storage for Pig Iron and other similar material, and issue warehouse receipts for the same. They are owners of the output of some of the best Cannel Coal mines, and will also handle Connellsville and West Virginia Coke, New River Smithing Coal and the best grades of Anthracite and Jellico Coal.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,
CHATTANOOGA, February 11, 1889.

Pig Iron.—There is a very perceptibly bitter feeling prevailing among producers upon the subject of prices, but otherwise the situation is but little removed from that of our last report. It is notable that some of the companies are sold far ahead (one company as much as 100,000 tons), and, consequently, out of the market for some time to come. The storage system appears to be universally popular, and has had its influence in restoring confidence in the future, and the furnaces are much more indifferent about making and accepting offers than they were a few weeks ago; hence it seems very easy to see the reason why a bitter feeling prevails through the producing districts. There has been no further concession in prices, and there are many cases where offers have been made that were refused that would have been accepted a short time ago. One furnace, three days ago, refused 2000 tons No. 2 at \$12.50 at furnace bank, to be delivered from April to July, although they would have taken it for immediate delivery on spot cash. Many producers are firmly of the opinion that prices will advance within the next 30 to 50 days at least 50 cents to \$1 per ton, and there are many conditions existing that would seem to justify this opinion.

Miscellaneous.—A recent trip through Alabama and parts of Georgia has developed the facts beyond controversy that the present year will see many more new manufacturing enterprises started up and completed than any year in the past. We do not refer particularly to blast furnaces,

of which there are a few in course of construction, but rather to minor manufacturing, many of which will be put up with a view of utilizing the products of our furnaces and cognate articles.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
Pittsburgh, February 12, 1889.

River navigation has been suspended for over a week, but, as the winter season is pretty well advanced, it will probably be resumed before long.

Pig Iron.—The market continues unsettled. It is contended by some operators, who are giving the market a good deal of attention, that if prices go much lower a general shut-down of all the furnaces in the Pittsburgh district for 30 or 60 days would have a good effect. Prices have further declined, and it is the belief of many that they have about reached bottom. We quote as follows:

Neutral Gray Forge.....	\$14.25 @ \$14.50, cash.
All Ore Mill.....	15.25 @ 15.50, "
White and Mottled.....	13.50 @ 14.00, "
No. 1 Foundry.....	16.50 @ 16.75, "
No. 2 Foundry.....	15.75 @ 16.00, "
No. 3 Foundry.....	14.75 @ 15.00, "
Charcoal Foundry.....	20.00 @ 24.00, "
Cold Blast Charcoal.....	24.00 @ 27.00, "
Bessemer Iron.....	16.25 @ 16.50, "

Included in the sales reported for the week were 1500 tons Gray Forge at \$14.50, cash; 1750 tons Bessemer at \$16.50, cash, and 700 tons Southern Cold Blast Charcoal at \$24.7, cash.

Muck Bar.—Continues very dull and prices are weak, offering freely at \$27, and sales, it is said, have been made as low as \$26.75, cash. Some large contracts for delivery this month have been repudiated by the buyers on the ground that the quality was not up to specifications; but it is intimated that if the market had gone the other way there would have been no trouble, so far, at least, as the buyers were concerned.

Spiegel.—Small sales of Spiegel, 20 %, at \$28.50 @ \$29, and Ferromanganese, 80 %, at \$56 @ \$56.50.

Manufactured Iron.—The demand for all kinds of Manufactured Iron continues light, and as long as there is a possibility of prices going still lower buyers will hold off. Once the market becomes settled there will no doubt be a considerably improved trade, as stocks, both in the hands of jobbers and large consumers, are known to be light and will soon have to be replenished. Prices continue weak, in sympathy with the raw article. Bars, 1.75¢ @ 1.80¢; Plates, 2.15¢ @ 2.20¢; No. 24 Sheet, 2.80¢ @ 2.85¢, all 60 days, 2 % off for cash. Skelp Iron, 1.75¢ @ 1.80¢ for Grooved, and 1.95¢ @ 2¢ for Sheared. There is a fair business in Skelp this year, but prices continue unsatisfactory.

Nails.—There is little or no change to note in the Nail trade here; there is little or nothing doing, and there is not likely to be much, if any, improvement in the demand here.

Wrought Iron Pipe.—There is a very fair business for this season of the year, when it is usually dull, but there is continued complaint in regard to prices, which are very irregular and unsatisfactory, and until there is an improved demand it is not likely that prices will stiffen up much. We continue to give discounts on large lines as a week ago: on Black Butt-Welded Pipe, 55 and 5 % @ 57 %; on Galvanized do., 50 and 5 %; on Black Lap-Welded, 65 % @ 67½ %; on Galvanized do., 55 and 2½ %; 2-inch Tubing, 11¢ @ 12¢ per foot, net; 5½-inch Casing, 35¢ per foot, net; Boiler Tubes, 65 % off regular list.

Old Rails.—Continue dull, but prices remain about as quoted a week ago, \$23.50 @ \$24 for American Tees. It is the belief of well-informed operators that the

lowest point has been reached, and that as soon as the demand sets in there will be an advance. Rails are worth as much at the seaboard as they are here, and they are higher across the water than at New York, and while this is the case the importations will continue light; moreover, the severe weather of the past week has suspended the work of lifting Rails, and besides the supply in this country is steadily growing less every year and the time is not far distant when Old Iron Rails will be a thing of the past, as there are no new ones being made and have not been for several years past. Old Steel Rails are quoted at \$18 @ \$18.50 for short and \$20 @ \$20.50 for long lengths.

Steel Rails.—Manufacturers continue to quote at \$28, cash, but that means for small lots; large blocks can be bought for a good deal less; but whether the reports from the East are true, that sales have been made here as low as or equal to \$26, we are not prepared to state. It is evident, however, that the mills are all anxious for business.

Billets.—Bessemer-Steel Billets are still quoted at \$28, cash, at which price a sale of 5000 tons of 4-inch was reported. Nail Slabs dull and nominal at \$27.50. Domestic Bloom Ends nominal at \$18, and Crop Ends at \$18.50, cash.

Railway Track Supplies.—Spikes unchanged at 2.05 @ 2.10¢, 30 days, on cars here: Track Bolts, 2.75¢, with Square and 2.85¢ with Hexagon Nuts; Splice Bars, 1.75¢ @ 1.80¢.

Old Material.—The demand continues light and prices weak. No. 1 Wrought Scrap, \$20 @ \$20.50, net ton; Wrought Turnings, \$13 @ \$13.50; Car Axles, \$24.50 @ \$25; Cast Scrap, \$14.50 @ \$15, gross; Cast Borings, \$11 @ \$12; Old Car Wheels, \$19.

New York.

Office of *The Iron Age*, 66 and 68 Duane street,
New York, February 13, 1889.

American Pig.—The Thomas Iron Company report having booked orders from regular customers aggregating 140,000 tons. Of this, 65,500 tons are reported to be No. 2 Plain Foundry and Gray Forge, at \$15.30, the balance being Foundry Iron. The company quote No. 1 Foundry, \$18, and No. 2, \$17. It is, of course, pretty generally understood that the company will protect their trade during the time of the delivery. What effect the figures now named by the Thomas Iron Company will have upon other sellers, North and South, remains to be seen. The cutting lately has not by any means come from Southern producers alone, No. 2 Northern having been offered close to \$16, and also No. 1 at \$17.50, and less. It is possible that this was done in anticipation of an announcement of \$17 and \$16 as the opening price, and as the result of rumors that sales for season delivery had been made at those figures. We quote standard brands, nominally, \$17.50 @ \$18 for No. 1 Foundry, \$16.50 @ \$17 for No. 2 Foundry, and \$15.25 @ \$15.50 for Gray Forge, all at tidewater.

Scotch Pig.—We quote: Coltness, \$20.50 @ \$21; Shotts, \$20 @ \$20.50; Langloan, \$20 @ \$20.25; Summerlee, \$20.25 @ \$20.50 and Dalmellington, \$19.25 @ \$19.50.

Plates.—We quote Iron Tank, 2¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.15¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3½¢ @ 4¢.

Structural Iron.—We quote Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 2¢ @ 2.10¢; Tees, 2.4¢ @ 2.6¢, and Channels and Beams, 2.8¢ on dock for all sizes.

Bar Iron.—We quote: Carload lots on dock, half extras, Common, 1.65¢ @ 1.75¢; Medium, 1.75¢ @ 1.8¢, and Refined, 1.8¢ @ 2¢.

Steel Rails.—We note sales of Eastern mills aggregating about 20,000 tons, chiefly for Southern delivery, at private terms, among which is one lot of 7000 tons for delivery at Emporium, Pa. It is understood that some of the sales have been made by a mill which has now practically filled its allotment, and has for the present withdrawn from the market. From the West comes the report that an Ohio mill has closed for about 8500 tons with Ohio roads, these orders having been in the market last year, and involving a "deal" for the delivery of coal to the mill in question. The situation is still unsettled, and \$27 @ \$27.50 remain nominal quotations at Eastern mill. The report of the Board of Control for February 1 has not yet been issued.

Tool Steel.—The market continues demoralized, and tempting concessions are made to large buyers, both in the way of low base prices and in cuts on extras.

Wire Rods.—No business is reported in foreign Rods, which remain nominally \$42 @ \$42.50. The position of Eastern Wire drawers, under the circumstances, is very difficult, taking into account the low prices on their products.

Old Rails.—We note sales aggregating about 1500 tons of Tees, from American roads, at a price equivalent to \$23.50, on cars at Jersey City. We hear of a sale also of 1000 tons of Tees, delivered in Western Pennsylvania, at \$24.50.

Track Material.—We quote Spikes \$2 @ \$2.10, according to quantity, and Angle Bars 1.80¢ @ 1.85¢, delivered. Of the latter, a round order for a 15,000-ton lot of Rails was placed this week with a Western mill.

Metal Market.

Copper.—Since our last week's report spot Chili Bars and Good Merchantable gave way from £77. 15/ to £79. 10/ this morning, and futures from £77 to £75; sales 1200 tons. The market here has meanwhile been stagnant at nominally 16¼¢ for Lake and 15¼¢ @ 16¢ for casting brands. Early in the week it was again reported that the Anaconda Mine is to receive \$300,000 monthly from the syndicate for remaining idle this year. There have again been afloat both in London and here some conflicting rumors with reference to the position of the syndicate. One of them was that the management was to be transferred from Mr. Secrétan to other members, his course of action lately not meeting with the full approval of the other parties interested. Another rumor asserted that the Lake Superior mines had, so far, declined to accede to the condition made them of curtailing production. The import of American Copper into Liverpool and Swansea for January has been 2728 tons Fine, as compared with 2529 same month last year. The export of Ingot Copper from the United States last year has been 31,664,046 lb, of ingot against 12,847,507 in 1887. The 11 active producing Lake Superior Copper mines turned out last month a total of 4564 tons of mineral, against 3686 tons by eight mines in January, 1888, and 4562 tons by the same 11 mines in December. The January output is equal to about 6,330,000 lb of fine Copper. The closing quotations this morning were 16¼¢ @ 16½¢ for Lake Copper. We print elsewhere the preliminary statistics of the U. S. Geological Survey.

Tin.—At the time we wrote our last report spot Tin was still worth in the London market £97, but has declined since to £94. 12/6 yesterday, while futures gave

way from £97. 15 to £97. 7/6, the sales aggregating 1000 tons. In this market 50 tons February were sold at 21½¢ @ 21¼¢, but later on the market became demoralized, 20 tons March being forced off at 21.10¢, 10 tons April at 21.20¢, and 40 tons May from 21.40¢ down to 21.20¢, the market winding up at 21.10¢ @ 21.30¢ for spot, February and March. The decline is said to have been due in the London market to the heavier shipments from the Straits. The actual shipments from the Straits to the United States in January amounted to 550 tons, as compared with 400 tons same month last year; to England they were 1200 tons, against 3500. The import of Tin into the United States in 1888 was 84,294,185 lb, against 25,334,533 lb in 1887, the re-export being only 123,952 lb, against 308,660 lb. This morning the London quotation is £94. 15/ for spot and £95. 10/ for futures. The spot quotation this morning in our own market is 21½¢. **Tin Plates.**—Our market has been dull and rather weaker, owing chiefly to the marked decline in Pig Tin. We quote, large lines, per box: Siemens-Martin Steel, Charcoal Finish, \$4.75 @ \$5.50; Ternes \$4.12½ @ \$4.25; Coke Tins, \$4.22½ @ \$4.30, and Wasters \$4.12½ @ \$4.15. The import of Tin Plates into the United States in 1888 has been 667,281,988 lb, as compared with 685,792,760 lb in 1887, while the re-export did not exceed 815,318 lb, against 1,080,515 lb in 1887. Liverpool quotes Coke Tins 13/.

Lead.—The position of this metal has been so thoroughly undermined, unsettled and demoralized by what happened during the last quarter of 1888 in conjunction with stagnation in trade, large stocks overhanging the market and the enormous increase in production that it is difficult to sustain prices even at the comparatively low stage they have reached of 3.65¢ @ 3.60¢, at which some 1500 tons were sold in the open market since our last, those of the West being quiet at 3.45¢. Soft Spanish declined in London from £12. 17/6 to £12. 15/.

Spelter.—Only a moderate business has been transacted on the spot at 5¢, or a fraction less, for Common Domestic; still, however, sparingly offered and generally held with firmness here as well as out West, the supply being restricted and only waiting for the expected spring revival in the demand. From London Silesian is cabled £17. 12/6 this morning, while here this brand may be nominally quoted 5½¢ @ 5¼¢.

Antimony.—With a gradually improving London market, Hallett cannot be had for less than 11½¢, for Cookson under 13½¢, for which there remains an active demand with an extremely moderate supply.

New York Metal Exchange.

The following sales are reported:

FRIDAY, February 8.		
40 tons Tin, April.....	21.50¢	
48 tons Lead, March.....	3.75¢	
16 tons Lead, spot.....	3.77½¢	
16 tons Lead, April.....	3.80¢	
SATURDAY, February 9.		
10 tons Lead, spot.....	3.70¢	
MONDAY, February 11.		
30 tons Tin, May.....	21.40¢	
16 tons Lead, spot.....	3.70¢	
TUESDAY, February 12.		
20 tons Tin, March.....	21.10¢	
10 tons Tin, April.....	21.20¢	
10 tons Tin, May.....	21.20¢	
WEDNESDAY, February 13.		
10 tons Tin, spot.....	21.30¢	
10 tons Tin, April.....	21.45¢	

Important coke regions in Central Pennsylvania are being made accessible by the construction of new railroads. Deeds have been recorded at Brookville by the Fisher Improvement Company upon 2600 acres of land located along the Big Mahoning Creek. The sum paid for this is \$169,775.

Coal Market.

The Anthracite Coal market is still handicapped by a production disproportioned to the demand, and prices are maintained with difficulty. Individuals have made sales as low as \$4.25 for Stove and \$4 for Chestnut, alongside. A break by Ario Pardee & Co., of the Lehigh Coal Company, caused a sensation, but was explained as affecting only the production of the private collieries at Hazleton, as the large companies would not attempt to compete. It was also said that the reported 25-cent cut by Pardee was simply retaliation directed against Cox Brothers & Co., whose mines adjoin and who have fixed prices regardless of recognized schedules. Restriction is still the order of the day. For the week ending February 9 the total of shipments from the mines was 460,535 tons, a decrease of 53,000 tons compared with the previous week and over 100,000 tons decrease compared with the corresponding week in 1888. Since January the production aggregates 3,208,819 tons, a decrease of only 44,000 tons compared with the same time last year.

The Bituminous trade is dull. Report says that a Soft Coal trust has been formed to stop the competition between the Kanawha and Monongahela operators, and a movement for reorganization of the Clearfield Bituminous Company is spoken of; also another spur or extension of the Bush Creek Railroad, 12 miles long, to penetrate the Clearfield region.

The case of Cox Brothers & Co. against the Lehigh Valley Coal Company was finished on Tuesday before the Interstate Commissioners, so far as the testimony is concerned, and counsel will submit argument on March 1.

In his examination Eckley B. Cox testified as to the cost of Coal production. The general average in the Lehigh region he placed at \$1.45 ¢ ton. He said that his firm last year produced and sold 1,139,332 tons of Anthracite Coal, from which they made a net profit of less than \$7000. The income from royalties was very large, however.

Mr. Frank M. Kelley, official representative in this city of the Reading Coal interests, has fully entered upon the discharge of his duties at the Washington Building.

The total output of Coal in Tennessee in 1888 was 1,967,297 tons, against 1,715,290 tons in 1886. Total value of Coal mined, \$2,262,391.

Important purchases of Coal lands not far from Pottsville, and south of Broad Mountain, are said to have been made lately by Calvin Pardee, in the interest of the Lehigh Valley Railroad.

Financial.

Accounts relating to trade and finance are more cheerful. The most glaring exception is the collapse of the Western Coal and Iron Company immediately following the failure of the Pacific Guano Company, of Charleston and Boston. The volume of general business is very large, due in no small measure to speculative activity. The aggregate clearings of all principal cities show a gain of 29 % compared with last year. In New York the gain is 35.6 %; outside of New York 18.4 %. Northwestern points are irregular, St. Paul and Minneapolis falling behind, while Duluth, Denver and Kansas City gain largely. Industrial centers at least hold their own. It has been incorrectly assumed that interstate rates would be affected by the reduction of Iowa rates to the Commissioners' tariff. Iowa rates are higher than those of States East, and railroad managers now admit that none but local

rates will be affected. Iowa shippers will demand that all overcharges paid by them pending Judge Brewer's decision be refunded. The sum is claimed to be \$3,000,000. A railroad presidents' meeting relating to the general subject will soon be held in this city. In the case of the North River Sugar Refining Company, charged with illegal combination, Judge Barrett denied the application for a stay of proceedings pending an appeal from his previous order dissolving the company and directing a receivership.

Colonel Lamont, the President's adviser, is to locate in this city after the 4th of March as president of the Avenue C Surface Railway Company. The commutation of the sentence of Jas. D. Fish, former president of the Marine Bank, is followed by the suit of Yates & Potterfield, creditors of Grant & Ward, against Julien Davies, assignee of the firm, to compel him to give an accounting of all his transactions in connection with the affairs of the firm since he accepted the assigneeship, May 8, 1884.

The Stock Exchange markets were irregular, each advance being followed by reaction. On Thursday the Villard shares and New England were the features, with the whole market active and strong. On Friday, among other causes of depression, was the failure of the Pacific Guano Company. The acceptance of over \$3,000,000 bonds by the Secretary of the Treasury served as an offset. On Saturday business was dull. The bank statements had little influence. Transactions in bonds were large. Union Pacific closed at 64, but rose on Monday to 66½, owing to the prospect of Congressional action on the Funding bill. The general list was depressed by a break in Burlington, but closed buoyant, led by the Vanderbilts. The trunk lines were firm on the fact that a meeting of the Executive Committee had been called to ratify the new agreement, and that the presidents would act subsequently. On Tuesday the grangers were unfavorably affected by the news that only 15 out of 22 roads had signed the presidents' agreement. One feature was an erratic speculation in Pullman on the announcement that \$5,000,000 of new stock would be issued.

Government bonds were firm at the following quotations:

U. S. 4½, 1891, registered.....	106
U. S. 4½, 1891, coupon.....	106½
U. S. 4, 1907, registered.....	123½
U. S. 4, 1907, coupon.....	123½
U. S. currency 6s.....	120

Sterling is firm, with posted rates at 4.87¢ @ 4.89¢.

Contracts were signed on Tuesday for the construction of 250 miles of the Charleston, Cincinnati and Chicago Railway, running from Charleston, S. C. via Rutherfordton, N. C., to the Ohio River at Ashland, Ky. The company have already under operation 400 miles of road. The projectors of the scheme claim that this line will make a direct route of 800 miles from Charleston, S. C., to Chicago, or 100 miles shorter than any other line from Lake Michigan to the Atlantic Coast, and that it opens up the richest mineral, timber and coal country on the continent. A. B. Harris, of Boston; Frank Cox, of Philadelphia; Wharton Barker, of Philadelphia; R. A. Johnson of Boston; General Thos. L. Rosser, and other well-known men are interested.

The weekly exhibit of the Associated Banks shows an expansion in loans of \$8,103,900, a loss in cash of \$3,789,100 and an increase in deposits of \$3,816,400. The banks lost \$4,740,200 in surplus reserve and hold \$14,152,975 above legal requirements. By the purchase of \$3,000,000 of bonds on Friday at a slightly advanced price the Secretary of the Treasury liberated nearly all the surplus money accumulated thus far during the month. An

increase of about \$21,500,000 in bank loans within a month is assumed to be evidence of requirements in the street not being warranted by the mercantile demand. Time loans on good collateral were quoted at 8% for 60 and 3½% @ 4 for 90 days and 4½% @ 5 for four, five and six months. Rates are 4 @ 4½% for 90 to 90 days' indorsed bills receivable. Exports of specie during the week were \$477,000 and imports \$186,000.

In several important commodities prices show an upward turn, in pleasing contrast with the drooping tendency noticed for several weeks. Wheat advanced 2½¢ @ 2½¢ above the latest of Saturday for spot, and flour had a better tone. Exports of provisions were again very large, comprising 9,000,000 lb of bacon and 8,000,000 lb of lard from all the Atlantic ports. Prices of cash lard in New York broke several points. Coffee decidedly firm for spot goods. Cotton was stronger on the Bureau report indicating only 6,800,000 bales for the outside crop. In the West the fact is emphasized that an incalculable amount of corn has been saved this winter by mild weather, so that the reserve is larger than for many years. Exports of corn from Baltimore during the week exceeded 4,000,000 bushels. In dry goods jobbers notice a widening demand, but are much exercised by a threatened war in prices, originating in Chicago. Exports of leather are more active. A purchase of tea comprising 52,000 packages was the largest transaction of the kind known in this market.

A significant feature in trade is shown by the official returns of the foreign commerce of this port for the month of January. The imports for this month were larger by \$5,000,000 than for any corresponding month in the history of the port, amounting to \$45,432,699, as compared with \$38,000,000 for the same month last year. The exports were on a corresponding scale, the total, exclusive of specie, being \$184,834,000, showing a gain of \$6,000,000 in the shipments of merchandise compared with 1888. A season of uninterrupted navigation and favorable conditions for railroad transportation serve to explain the extraordinary gains.

Imports of merchandise at this port during the week and since the 1st of December have been exceptionally large for this season of the year. For the week the value is \$10,413,000, of which nearly \$3,600,000 represents dry goods. Since January 1 the total is \$60,470,000, as compared with \$55,825,000 for the corresponding period in 1888 and \$51,420,000 in 1887.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]
LONDON, WEDNESDAY, February 13, 1889.

The market for Block Tin has been unsettled and weak under the pressure of large lots for sale, due, it is alleged, to anticipation of heavy shipments from the Straits. The decline during the week was about £2. 10/, of which 10/ has been recovered the past few days under improved demand.

The Copper situation is without visible change. The syndicate agents still take up prompts at £77. 10/, but seemingly ignore three months' futures. "Outside" offers of the latter are said to be made at as low as £70, in the face of the quotation of £75 as the syndicate's nominal price. It is also stated that a line of 500 tons was offered at as low as £62, sellers' option all the year, without leading to business. Sales of Best Selected English are

said to have been made at £72. While prices are thus paradoxical, and legitimate business at a minimum, the negotiations between the syndicate representatives and the mining companies and other interests concerned in recent projects are shrouded in mystery that tends to additionally complicate the situation.

A larger business is reported in Tin Plate, mainly on the basis of 13/ for B. V. grade Cokes for early delivery. A line is said to have been closed out in Liverpool recently at 12/6. Makers continue to express confidence in a higher market. The stock at British shipping ports is estimated at 299,000 boxes. The exports to the United States last month were 21,000 tons. The Aberdare Company have purchased the Panteg Forge, and are erecting mills there to make Plates. Three mills have been started up at the Pontymister works, and two at the Victoria works. The Old Lodge Iron Works are being converted into a Plate works.

There is no improvement whatever in the American demand for Pig Iron, but the Continental trade is larger, and this, together with a good home demand, has developed a stronger market. The better tone in time has led to freer speculative purchases of Scotch "warrants," under which prices advanced to 42/. Exports to the United States last month were 10,000 tons. On most brands of Scotch Pig prices have advanced 6d @ 1/ during the week. Middlesbro' Pig has sold at 6d. advance, as has also Bessemer Pig, while holders of the latter ask an additional 6d at the close. Spiegel-eisen failed to move at the advanced prices asked last week, and some sellers put their figures back to 80/.

Negotiations in the direction of forming the Steel Rail syndicate are still pending, but up to the present time nothing definite has been accomplished. The price of Rails continues to harden, however, under the influence of an active demand, and makers are now asking a further 5/ rise. Billets are also stronger, with 2/6 advance generally quoted, but Blooms and Slabs have been sold from stock at concessions from the extreme figures asked last week.

Scotch Pig.—There has been a more active trade, particularly in the best markets, and the market is strong.

No. 1 Coltness, f.o.b. Glasgow	52/
No. 1 Summerlee, " "	51/
No. 1 Gartsherrie, " "	49/
No. 1 Langloan, " "	50/6
No. 1 Carnbroe, " "	44/
No. 1 Shotts, " at Leith	49/6
No. 1 Glengarnock, " Ardrossan	47/6
No. 1 Dalmellington, " "	43/6
No. 1 Eglinton, " "	42/
Steamer freights, Glasgow to New York, 4/; Liverpool to New York, 10/.	

Cleveland Pig.—A large business has been done during the week, and the market is strong at 6d advance. No. 1 Middlesboro', G.M.B., 37/6; No. 3 ditto, 34/6.

Bessemer Pig.—Transactions more extensive in volume, with a further 6d advance in price obtained. West Coast brands, mixed numbers, 45/6, f.o.b. shipping point.

Spiegel-eisen.—The demand has been fair, but sellers were unable to secure the advance asked last week. English 20% quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—Prices are up a further 5/, and the market strong, with de-

mand brisk. Heavy sections quoted at £4. 10/, and light sections £4. 15/ @ £5, f.o.b. at N. W. England shipping point.

Steel Blooms.—Trade fair but at somewhat modified prices. We quote £3. 17/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—The demand continues free and prices are firm at a slight advance. Bessemer, 2½ x 2½ inch, £4. 5/, f.o.b. at N. W. England shipping point.

Steel Slabs.—Trade in this line rather slow and prices somewhat irregular. Bessemer, £3. 17/6, f.o.b. at N. W. England shipping point.

Old Rails.—Demand continues rather slow and prices are nominal. Tees quoted at £3. 5/ @ £3. 6/, and Double Heads, £3. 8/ @ £3. 10/, c.i.f., New York.

Scrap Iron.—There is a fair business and prices are steady. Heavy Wrought quoted at £2. 2/6 @ £2. 7/6, f.o.b.

Crop Ends.—The dealings are fair and at about former prices. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

Tin Plate.—Trade has been slow, and prices are barely steady. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/3 @ 13/6
IC Bessemer Steel, Coke finish	11/6 @ 11/6
IC Siemens	12/9 @ 12/9
IC Coke, B. V. grade	13/ @ 13/3
Charcoal Terne, Dean grade	12/ @ 12/6

Manufactured Iron.—There is still a good business in most lines and prices remain very steady. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d. @ 8 2 6
" Common	" @ 5 15 0
Staff. Bl'k Sheet, singles	7 12 6 @ 5 15 0
Welsh Bars (f.o.b. Wales)	5 2 6 @ 5 5 0

Tin.—The market irregular and unsettled, with trading active. Straits quoted to-day at £94. 15/, spot, and £95. 5/ @ £95. 10/ for three months' futures.

Copper.—Very slow trading and prices difficult to quote. To-day's prices are: Chili Bars, £77. 10/ for spot, and £70 @ £75 for futures. Best Selected, wholly nominal.

Lead.—A moderate business at steady prices. Quoted at £12. 15/ for Soft Spanish.

Spelter.—The demand moderate and prices about steady. Quoted at £17. 15/ for ordinary Silesian.

EAST INDIES.

SINGAPORE, December 30, 1888.—Tin.—Our last report was dated December 17, since when the volume of business has been less than usual. Tin has kept very steady at about \$37 per picul, but closes at \$37.25, and supplies are still restricted by heavy floods, otherwise we should have had a large production to deal with. *Gum Copal* is in moderate request and supply at steady prices at \$11 and downward. *Gum Damar*.—No good quality has been offered for sale. *Tonnage*.—Sailing vessel rates have been fairly maintained, while there has been some decline in steam freights to England. There is nothing offering for New York via Canal; the Norwegian bark *Norway* has been fixed via Cape for New York, while the *Antioch* and *Penobscott* are still loading for Boston. *Ex-*

change is firm at 3/2 $\frac{1}{2}$ dollar for 6 months' sight credits. On the 24th inst. the steamer *Bencoue* took for New York from here 3396 piculs of Tin.—*Gilfillan, Wood & Co.*

MANILA, February 4, 1889.—Hemp.—There are buyers at \$16.25 $\frac{1}{2}$ picul, against \$9 same time last year, equaling $\frac{1}{2}$ ton, cost and freight, 255. 3/8, as compared with 232. 2/8 in 1888; there have cleared for the United States since last cable none, against 4000 bales last year; since January 1, 38,000, against 17,000; loading for do., 45,000, against 3000; cleared for England since January 1, 20,000, against 21,000; loading for do., 17,000, against 2000; cleared for all other ports, 2000, against 2000; receipts at all ports since last cable, 18,000, against 16,000; since January 1, 60,000, against 49,000 in 1888 and 41,000 in 1887. *Freight.*—\$7.50, against \$5.50. *Exchange.*—6 months' sight 3/8 $\frac{1}{2}$, against 3/8.—*Ker & Co., per cable direct, through Mr. Charles Nordhaus, 89 Water street, New York.*

SINGAPORE, February 8, 1889.—Tin.—There have been shipped during January from the Straits Settlements to the United States 550 tons, against 400 last year; to England, 1200, against 3500.—*Gilfillan, Wood & Co.*

BELGIUM.

BRUSSELS, February 2, 1889.—Iron.—As had been foreseen, the associated rolling mills have resolved to raise the price of Merchant and Sheets 50 centimes $\frac{1}{2}$ 100 kg. The present price fixed by the syndicate is consequently 13 francs $\frac{1}{2}$ 100 kg. for No. 1, for export, and 12.50 for home consumption, while Sheets No. 2 are 15.50 for both export and home use. Pig Iron is extremely scarce. Athus sold 42,800 tons, to be delivered during the second quarter, at 4.70. This is all his capacity will allow him to turn out. As for Beams, a good current of trade still exists, orders flowing in a steady stream despite the active competition that comes to us from the north of France. The latter have even beaten our makers in the shape of some contracts they made for low quality Beams, f.o.b. at Antwerp at 11.25. They cannot, however, compete with our makers as advantageously in quality next to the lowest, so that frequently they share the execution of third quality Beam orders with our own makers. In this manner the latter bought, f.o.b. at Antwerp, from 12 francs to 12 francs 12 $\frac{1}{2}$. The Dyle-Bacalan Car Works received an order from Holland of 450 cars, but was unable to secure another order for five bridges for Tava, for which Dutch builders got the preference. It is now a positive fact that the cupolas for the Meuse forts will be built by foreign concerns, such as the Gursen, of Magdeburg; the Creusot, the Saint-Chamond, Châtillon and Commeny, but some of our Belgian works participate therein on joint account.—*Moniteur des Intérêts Matériels.*

SPAIN.

BILBAO, January 26, 1889.—Pig Iron.—The amount of Pig Iron turned out in our immediate vicinity aggregated last year 136,200 tons, distributed as follows:

	Tons.
Altos-Hornos.....	8,500
San Francisco (Mudela).....	14,800
La Sociedad Vizcaya.....	26,600
<i>Sold for Export.</i>	
Altos-Hornos.....	13,400
San Francisco.....	25,300
La Sociedad Vizcaya.....	47,200

The Sociedad Vizcaya is the youngest of the three.—*Bilbao Marítimo y Comercial.*

GERMANY.

HAMBURG, February 2, 1889.—Iron.—The Rhenish-Westphalian Iron market has maintained its firmness. Pig Iron has been even more active. This may be said with reference to Spiegel in particular, makers now declining to sell any further amounts deliverable during the second quarter at 59 marks. There has been an uninterrupted but slow upward movement in Forge Pig, which is now 1 $\frac{1}{4}$ marks higher than it was a week ago, the range now being 51.50 @ 53 marks $\frac{1}{2}$ ton, while at Siegen no more can be got at 50. Thomas has been active at 46, Bessemer at 55. Foundry Pig was also better, the range being from 54 to 61; Luxembourg may be quoted 54.50 @ 42 as a range as to quality. English Bessemer is worth 45/. Boiler Plates have advanced 5 marks, and other rolling mill products in proportion. The Wire branch revives comparatively slowly; machine shops and carworks continue doing well, the latter in particular, 12,000 freight and passenger cars having just been ordered for the domestic railways. We quote Wire Rods 106 @ 108, Steel Rails 120 @ 130, and ditto for mines 110 @ 115. Metals are steady and unaltered.—*Borzenhalla.*

The Stove Association.

From the address of George H. Barbour, president of the National Stove Association, we call the following:

Gentlemen.—Another year has passed and we again assemble together for a friendly interchange of opinions and to discuss measures for the general improvement of our business. While it would afford me a great deal of pleasure to be able to say to you that the business at large was upon a substantial and profitable basis, I regret to say that at no time since the organization of this association was there more need of association in the true sense of the term, nor was there ever a time when it seemed so imperative that we should reason together for the purpose of trying to eliminate the evils which have gradually crept into the business, and to endeavor in some way to lay out such plans for the future as will insure fair interest upon the capital invested.

STATISTICS OF THE STOVE TRADE.

From the best information I estimate that the value of the production of stoves for the year 1888, as near as possible, is \$83,000,000. This includes, of course, all grades of cooking stoves, ranges and heating stoves. Your secretary will give you this subject more in detail. It may be estimated that about 23 $\frac{1}{2}$ per cent. of the actual production is a fair percentage of stocks carried over the present year. It would be natural to expect that the average carried over this year would be a little in excess, owing to the very warm weather which has prevailed this season.

While it is somewhat uncertain to predict the future, I state as the best of my judgment that if we have a favorable season's business, meeting with no extraordinary disasters, and go along in even tenor of our way, much higher prices will be obtained for pig iron before the close of the year. I see but one way for any great improvement in this direction, and that is for the furnacemen to curtail their production for a period, by 35 per cent. to 50 per cent.

IS THERE OVERPRODUCTION IN THE STOVE TRADE?

Now, to a greater or less extent, these same conditions may exist with our stove manufacturers. It is generally conceded by those well informed that there does exist to-day, and has existed for several years past, an overproduction. To solve this problem is somewhat of a difficulty. I believe there is hardly any manufacturer who intends to produce largely in excess of what he thinks his trade will absorb. Nevertheless, there are few to-day but carry more or less of an excess of stock. We go along from year to year, thinking perhaps instead of increasing next year we will carry less, but we are disappointed.

THE HOLLOW-WARE BUSINESS.

Let me call your attention to another subject that I deem worthy of your consideration. The hollow-ware business, as probably all will admit, properly belongs to the stove manufacturer. Is he to-day getting any benefit from it? I think not. On the other hand, it has virtually passed out of his hands, and the trade is controlled principally by the wholesale hardware merchants. It would seem that there is but one of two things to do—either the manufacturers of stoves, as a body, should control it, or else give it up. Under present conditions there is no money in it to any manufacturer, but I believe that they can gain this part of their business back, although it may mean a struggle and a loss of money for a short time. I commend this to your attention.

FREIGHT ALLOWANCES.

There is another abuse which has become a very serious matter to all members of

this organization and to all stove manufacturers at large—the allowance of freight and other concessions. They have crept in upon us gradually from time to time, until they are like the "roaring lion seeking whom he may devour." They are a very heavy tax upon any manufacturer, and are increasing instead of decreasing. I am undecided what to suggest in this particular. Their abolition can only be accomplished in one way, in my opinion, and that is by an ironclad agreement among manufacturers, after intelligent discussion by your body.

THE PIRATES.

There is one subject which I touch upon with some reluctance; it is a serious one to every stove manufacturer. It is the subject of pirating our goods. I will not go into the details, to give you the volume of business that has been built up by these concerns, which we term, and correctly, too, pirates. I believe I may safely say there is hardly a leading house to-day whose goods have not, to a greater or less extent, been taken, or parts of them taken, and filed up and offered to the trade in the way of repairs at from 2 to 3 cents per pound less than the original manufacturer's price.

Let me call your attention, going back a few years, to the time when, in one of your meetings, I advocated that every member of your association should meet these prices. I think our members believe that it was a great mistake not to have done it. I do not hesitate to say now, had the leading manufacturers, or the majority of our members, adhered to the basis of price, asking only the pirates' prices, we would have seen to-day no such state of things as actually exists. Now, this is a matter which disturbs nearly all of our manufacturers. The pirate has gradually built up his business year by year, adding largely to his stock of patterns, which has been taken from legitimate stoves, filed up and used.

DOING BUSINESS ON INSUFFICIENT CAPITAL.

Is there not a state of things existing that is full of danger? Are not a good many of our present stove manufacturers endeavoring to largely increase their business upon too small capital? I have reason to believe this condition exists and it would seem to me that any manufacturer who is trying to do this is placed in a position where he cannot very well maintain his prices. The stove business is very peculiar, as every manufacturer can vouch for. He has to prepare early in the year to manufacture his products. Our spring trade for several years past has been gradually decreased by the use of vapor and coal-oil stoves, so much so that he has to carry his products much longer than in previous years, so that the majority of his sales are made in the fall months. It used to be not difficult to date invoices for fall September 1, four months; but now it is often September 15, and not infrequently October 1, so that from the time he commences to manufacture early, or from the first of the year, he has to carry his stock a much longer time than ever before, and I believe it can be truthfully said that it requires 88 to 50 per cent. more capital than it did five years ago, a point too often overlooked. The remedy seems to be in your own hands. Every manufacturer should know his own circumstances best; I refer to the subject that it may have your best consideration, and while this is something outside of this body to act upon, I may induce some one to consider the matter and find out whether these troubles are not brought about by such a state of things as I have mentioned.

Edge Hill Furnace, one of the Schuylkill Valley anthracite furnaces, is about to go out of blast.

Hardware.

There is a fair amount of business doing, but orders are generally limited to moderate lots to meet the early requirements of the purchasers. Stocks throughout the country are generally light, but while there are good prospects for the season's trade buyers are disposed to be conservative in placing their orders. Prices in most lines are unchanged, and are in many instances so low that a good demand would soon result in strengthening the market and perhaps cause some advances.

Barb Wire.

The market in this city presents no new features. Local prices are pretty well maintained, but the transactions are quite limited. The New York quotations remain: Carload lots, 3.6 cents; 3-ton lots, 3.7 cents, and smaller lots, 3.9 cents.

Wire Nails.

Prices of Wire Nails are pretty steady at the low figures ruling, but in some cases current quotations have been slightly shaded. The volume of business is good. We still quote carload lots at factory, \$2.30; smaller lots at store \$2.50 to \$2.60.

Miscellaneous Prices.

The Globe Nail Company, Boston, Mass., are making a new hot forged Horse Nail, which they brand Boston. It is sold from the following list, which is subject to a discount of 20 and 2½ per cent:

No.....	5	6	7	8	9	10	11
	\$0.26	.23	.21	.20	.19	.18	.17

They issue circulars describing this Nail, in which they call attention to its merit, another circular being devoted to their Globe Nail.

Nason Mfg. Company, 71 Beekman street, New York, have issued under date February 5 a discount sheet applying to their illustrated catalogue No. 86, with subsequent revisions. It opens with the following discounts, which are followed by prices on a large variety of goods:

	Discount.
Lap-Welded American Charcoal Iron Boiler Tubes.....	50 %
Wrought-Iron Pipe, On list prices as revised 28d March, 1887: Plain 1½ inch and under, whole lengths.....	57½ %
Plain 1½ inch and over, whole lengths.....	67½ %
Galvanized 1½ inch and under, whole lengths.....	47½ %
Galvanized 1½ inch and over, whole lengths.....	52½ %
When cut to order, advance 5 % on discount, and labor cutting charged extra.	
Extra and Double Extra Heavy W. I. Pipe:	
Plain 1½ inch and under, whole lengths.....	55 %
Plain 1½ inch and over, whole lengths.....	65 %
When cut to order, advance 10 % on discount, and cutting extra.	
Iron Hydraulic Pipe.....	Net.
Heavy Drive Well Pump.....	Net.
Light Galvanized Leader Pipe.....	50 %
Galvanized Adjustable Elbows.....	10 %

Ceiling and Floor Plates.....	67½ %
Blake's Adjustable Pipe Hangers.....	30 %
Malleable Iron Fittings.....	35 %

The manufacturers of Common Carriage Bolts have united in announcing a reduction in the price of the goods, the discount

being made 75 and 10 and 2 per cent., with the deliveries and the discounts on quantities unchanged.

For some time Copper Rivets and Burrs have been selling at lower prices than were justified by the cost of the raw material, but the manufacturers have taken a step toward the correction of this unsatisfactory condition of things by making a decided advance in the prices of the goods, the discount on which to the general trade is made 50 per cent.

The manufacturers of Steel Traps on the 5th inst. advanced the list of No. 1 Traps, without chain, to \$3.75 per dozen, and with chain to \$5 per dozen. This, it will be observed, is an advance of 25 cents on the list. No change has been made in the discount.

The Jobbing Trade.

Referring to the disposition of the jobbers to handle, as a rule, goods that are well known, and also to disregard to a certain extent quality under inducements of price, a New England manufacturer writes:

As far as our experience goes with jobbers versus retailers, we have found that jobbers invariably have sought the lowest prices without regard to quality, and this has prevented their customers from being offered goods they would have preferred had they been able to buy in such quantities as they needed. I have more than once been told by the buyers of large jobbing houses, "We don't care whether the goods are good for anything or not, only make the price low enough and we will give you all our trade. Our orders are mostly mail orders, and if we send them something that looks like a Plane it is all we care, if the price is low enough." Such a course compels manufacturers to make inferior goods, or else do all they can to deal with the retailers direct, who have some interest to keep the best articles.

The following letter, from a well-known Pennsylvania manufacturing concern, relates to their experience in trade and to the advantages of having their transactions largely with the jobbers:

The proportions of orders from retail dealers is, and has been for some time, on the increase, but we have not the remotest idea that we will ever do without the jobber, or ever want to do so. The higher prices paid by the smaller trade are an inducement in those days of small profits, but, on the other hand, where goods are going to the jobber they are mostly packed as fast as made and do not go to bins or shelves. Again, we are far more troubled in the smaller dealers' orders by changes demanded from our regular patterns and by difference in terms by which sizes, styles, &c., are designated. The jobber often acts as a modifier of these demands, as he does not multiply his sizes, &c., any more than necessary. However, this disposition on the part of the jobber keeps him from introducing new goods for us. We want all the trade we can get from jobbers and retailers, but we believe that the manufacturer will best serve his own interests by making a fair distinction between the prices to them. We ought to have said that the increase in our orders from the smaller dealers comes generally from a radius of 200 miles. Outside of this our trade throughout the United States is almost exclusively held by the jobbers.

Items.

The Michigan commercial travelers formed an organization, at Lansing, on the 9th inst., to be known as the Knights of the Grip, and formally withdrew from the National Travelers' Protective Association. Their object is to secure legislation to more fully protect their rights; to secure as favorable rates from the railroads on baggage as other classes of travelers; to secure better hotel accommodations, and to adjust differences between hotel men and members; to elevate the social and moral character of the profession, and to assist in procuring employment for its members. The officers are: President, Albert F. Peake, of Jackson; secretary, L. M. Mills, of Grand Rapids; treasurer, George C. Cooper, of Lansing; sergeant-at-arms, E. L. Bennett, of Lansing; chaplain, the Rev. Charles Fluhrer, of Grand

Rapids; board of directors, L. J. Foster, of Detroit; A. A. Howard, of Coldwater; George F. Owen, of Grand Rapids; W. J. Richards, of Union City; Charles A. Ballard, of Lansing, with a vice-president from each Congressional district. Standing committees were appointed on railroad transportation, legislation, bus and baggage, hotels, relief, employment and the press.

Henry Disston & Sons have sold their Chicago building, having received a handsome offer from other parties, and have purchased a lot 102 feet by 22 feet on the corner of Washington and Jefferson streets, in that city, on which they will erect, under the supervision of H. D. Nicholls, their business manager, a substantial and elegant building, expressly adapted to their purposes.

Freeman Wire Company, St. Louis, Mo., issue a four-page leaflet relating to their Wagon department and showing some of the patterns of Express and other Toy Wagons which they are manufacturing.

Ideal Mfg. Company, Detroit, Mich., issue a circular relating to the Ideal Revolving Lawn and Garden Sprinkler, and the Ideal Favorite and Jewel and the Cyclone Hose Reels and Trucks. These different goods are illustrated and the list prices given.

The Wire Goods Company, of Worcester, Mass., have bought out the plant of the Burditt & North Automatic Blind Fixture Company, together with the various patents and rights pertaining thereto. They will move the business to Worcester and engage in it upon a considerably enlarged scale, and will add it to their already quite extensive line of Hardware. They will be ready to supply the trade for the coming season from their factories at Worcester, Mass.

Fowler & Sons, Buffalo, N. Y., in the recent fire lost their entire stock of Carriage Goods, Woodwork and Heavy Hardware. Their Iron and Steel business, however, being separated from their store, was not affected by the fire, and they are now doing business from that office as usual, and solicit the patronage of their customers and friends for Iron and Steel, of which they have a most complete stock. Their insurance is \$125,000, their loss being put at \$150,000. Their Bolt works at Anderson, Ind., are not affected and continue as usual, so that they are in a position to furnish Common Carriage and Machine Bolts, Lag Screws, Bolt Ends, &c., for which they invite inquiries.

Instead of putting their Steel Tapes on the market nickel plated, as originally intended, the Lufkin Rule Company, Cleveland, Ohio, are making them in solid German silver cases, which are referred to as better wearing than the nickel, an improvement which has been made without advance in price, though involving increased cost.

The trade will observe in the advertisement of Jenkins & Timby, Oswego, N. Y., the illustration which is given of Timby's Burglar-Proof Sash Lock and Ventilator. The points made in regard to it are: The security of the fastening, the ventilation secured by it and its automatic action. We shall have occasion to refer to it again.

The Baker Chain and Wagon Iron Mfg. Company, Allegheny, Pa., report their Wagon Hardware and special Forging departments as very busy, their orders for Baker Single Trace Clips, &c., being heavier than ever before.

The American Mfg. Company, Philadelphia, Pa., for whom the Lloyd & Supplee Hardware Company, Philadelphia, Pa., are agents, have purchased from the

estate of the Heaton & Denckla Hardware Company their interest in the France's Shutter Holder, together with the patents on the same. They will at once arrange for the manufacture of it.

Childs & Jones, Utica, N. Y., issue a price list devoted to Creamery and Dairy Apparatus and Supplies, in which a large variety of these goods is represented.

Studebaker Bros. Mfg. Company, South Bend, Ind., issue on separate sheets the revised price list of their Wrought-Steel Skein and the standard price-list of the S. B. Trade Cast-Steel Thimble Skein, of both of which goods illustrations are given with reference to their special features.

The Ridgway Refrigerator Mfg. Company, 813 and 815 Arch street, Philadelphia, Pa., issue as a supplement to their 1889 catalogue a sheet relating to Refrigerators illustrated in it. They are referred to as a correct combination of a Sideboard and a Refrigerator. The ice-tank slides over the box-lock and drawer, and rests on an iron support. With this construction, if desired, the tank can be taken entirely out and carried to any convenient place to receive the ice, thus doing away with the carrying of dripping ice through the house, or having the carpet soiled by the iceman. The top of the Sideboard is one solid piece without lids, and can be permanently used, as nothing need be removed from the top in order to insert the ice. The drinking water is obtained by means of a disguised spigot. In conjunction with the above features the box is so constructed that a thorough circulation of air passes entirely around the ice-tank. Several attractive patterns are represented, with description and list prices.

The open winter has had a somewhat injurious effect upon the demand for Chain, especially the fancy Chains, but an improvement is observable in the demand for Ship Cables.

Nelson Stelle, formerly Chicago manager for the Union Mfg. Company, of New Britain, Conn., has succeeded F. Gustorf in the firm of H. C. Maley & Co. The style of the firm has been changed to Stelle-Maley Company, incorporated on the 1st inst. Their business as manufacturers' agents will be carried on at the same place, 37 Franklin street. Mr. Stelle has been identified with the Hardware business for nearly 20 years, and is well known to the trade in the West and Northwest. The firm will represent the following firms in the territory tributary to Chicago, including the trade along the Mississippi and Missouri rivers and the Northwest:

E. R. Sexton, Buffalo, Braces.
Lansing Wheelbarrow Company.
J. H. Hoague, Chicopee, Mass., Chamfer Gauges, Tracing-Wheels and Spring Drills.
Wm. J. H. Gluck, Baltimore, Stamped and Japanned Ware.
S. P. Jennings, New Castle, Ind., Handles.
J. L. Wosting, Cast Shears and Snips.
Rock Island Knife and Shear Company, Cutlery.
Chester Mfg. Company, Chester, Conn., Auger Bits.
Empire Saw Company, Port Jervis, N. Y.
M. S. Brooks & Sons, Chester, Conn., Bright Wire Goods.
Keokuk Novelty Company, Sure Shut Spring Hinges.

In addition to the above goods the firm will handle their own manufactures in the line of Escutcheons, Carpet Stretchers, Handles and Family Soldering Irons.

The Maine Mfg. Company, Fairfield, Me., issue an attractive and well-printed catalogue showing their line of Refrigerators, and also Cotton's Patent Lawn Settees, Folding Camp Chairs, Folding Tables, Lapboards and Rockers. As a leading line special attention is called to the Refrigerators, and the following points are

made in regard to them: That no wood is exposed in the interior; that they are zinc-lined throughout; that the cold dry air circulation secures positive dryness; that they have large doors, giving easy access to the interior; and that the floors are flush with the door sills, making them easy to clean. The ice racks are made of galvanized iron and the ice chambers are of extra size. Illustrations are given of the different patterns, with list prices.

George Wheeler, representing John Chatillon & Sons, manufacturers of Scales and Butchers' Tools, 85 to 89 Cliff street, New York, spent some time recently in Chicago and vicinity, and met with gratifying success in taking orders for the specialties of the firm.

Edwin R. Procter, Gibson House, Cincinnati, has devised an ingenious return envelope, which appears to be well suited for use by business men who find it necessary to distribute circulars. It consists of an envelope with the flap lengthened to almost twice the size of the envelope. The back of the flap thus provides room for the printing of a circular. On the front of flap can be printed the address of the sender. For mailing, the flap is folded in two creases and thrust down into the envelope. It then looks like an envelope with a circular enclosed and the flap turned in according to the usual method. The end of the flap is visible in the V-shaped opening of the envelope, with the words printed, "Pull me out." The receiver of the envelope pulls out the flap, reads the circular, writes a reply on it if he desires, and turns the flap over so as to bring the printed address of the sender outside, wets a gummed end and fastens it down, thus making a sealed letter, and returns it to the mails. The inventor publishes a very interesting circular describing a great variety of uses to which this combined envelope, letter sheet and return envelope can be put.

The Standard Fibre-Ware Company, of Mankato, Minn., have established a branch office at 105 Lake street, Chicago, under the management of O. L. Baskin, who will carry a full stock from which direct shipments can be made. The company manufacture plain and decorated Pails, Wash-Basins, &c., from flax fiber. They have issued a variety of illustrated circulars, and are distributing a calendar of artistic design.

The Haardt Enameled-Ware Company, importers and manufacturers of Vienna enameled kitchen utensils and specialties, have established an office at 105 Lake street, Chicago, under the management of Franz Koelling. They issue an illustrated catalogue and price list of their goods comprising 28 pages. This ware is furnished in blue and white, brown and white or all white at the same price. Banded articles are furnished with blue or gold bands at 20 per cent. advance on the list price. Green and red bands are furnished on application. Marbled or veined articles are furnished in light blue, light green, light brown, dark blue and pike gray at 20 per cent. advance on the list price. Fancy hand-painted articles are supplied at 50 per cent. advance on the list. A full stock will be carried.

One of the papers of Springfield, Ohio, has an article referring to the manufactures of the city and the prominent place it occupies in the production of Farm Implements. It is suggested that a syndicate of Springfield manufacturers be formed, who should open a general shipping office in New York and receiving offices in the prominent ports of South America and Europe, with a view to cultivating on a large scale export trade in the large line of Farm Implements manufactured in that city. Reference is also made to the ac-

tivities in the different manufacturing establishments, showing their growth and enterprise.

We are advised that the firms of J. H. King, King & Barlow, Geo. H. Barlow and Brigham & Follett, Cory, Pa., are no longer in existence, but that Barlow Brigham & Follett, Limited, succeed them.

The American Screen Company, Brookline, Mass., issue a circular in which they call attention to some of the advantages of the American Flexible Metallic Frame Sliding Wire Window Screen, alluding also to late improvements of steel or brass slides and metallic handles. The company also make Screen Doors of 1½ stock in either pine or hard woods.

Geo. K. Oyler, St. Louis, Mo., issues a catalogue devoted to the Plow Coulters, Blades and Hubs of which he is manufacturer, giving illustrations of the different patterns, and calling attention to the special features of the goods. It is accompanied by a sheet of prices to the trade.

The catalogue of Mast, Foos & Co., Springfield, Ohio, is devoted to their Buckeye Force-Pumps, Iron Turbine Wind Engines, Iron Fence, Buckeye Senior and Junior Lawn Mowers, &c. In addition to the illustration of the goods, it contains a number of pictures representing their use, with such subjects as "A Country Seat on the Delaware," "Scene in Portugal," "A Characteristic Scene on the Texas Rancho," &c.

Simmons Hardware Company, St. Louis, Mo., issue the "Keen Klipper Herald," which is devoted to lawns, with full descriptions of their Keen Klipper Lawn Mower, the construction and merits of which are alluded to at length. Directions are also given as to how to make a lawn, with other miscellaneous reading matter.

Peters Cartridge Company, Cincinnati, Ohio, have issued their catalogue for 1889, in which, besides illustrating their Cartridges, giving list prices, &c., they present a number of certificates from sportsmen in regard to the excellence of the goods. As relating to a standard line which has made a place for itself in the trade the catalogue is of interest.

May & Co., St. Louis, Mo., call attention in a circular to May's Boiler Compound, which is referred to as removing from boilers all scale of whatever formation, whether deposited from salt or fresh water, and also preventing the deposit of scale by holding the mineral properties of water in solution and preventing foaming and fermentation. It is alluded to as entirely free from acid, having no injurious effect upon the boiler, being easily applied, and securing a saving of power, water, fuel, expense and labor.

Simmons Hardware Company, St. Louis, Mo., illustrate in a circular the Rysdick and the Princeton Armless Road Carts. In calling attention to the former they allude to it as new in principle, symmetrical in appearance, strong and durable in construction, and call special attention to the fact that the weight is thrown altogether on the axle by the use of the Thomas Coil Spring.

J. W. Garratt & Co., St. Louis, Mo., manufacturers of Church, Fire Alarm, Tower, Clock, School, Factory, Depot, Ranch, Ship, Steamboat, Locomotive and other Bells and Gongs, issue a catalogue in which their line of goods is illustrated. The front is attractively printed in bronze, with a representation of the famous Liberty Bell in Philadelphia.

Western Block Company, Lockport, N. Y., is composed of five members who for a number of years have been in the employ

of the Penfield Block Company and Boston and Lockport Block Company. They commenced manufacturing about December 1 and are now in full operation. They run by water power, the excellence of which is referred to, and have a steam plant ready to use in case of accident to water-wheel or connections. They are confining their attention to the manufacture of all kinds of Wood and Wrought-Iron Tackle Blocks and Iron and Lignum-Vitæ Sheaves.

Keeping Account of Stock.

A correspondent of *The Metal Worker* writes to that paper as follows :

I wish to get the idea of the Editor or of the readers of *The Metal Worker* concerning a simple plan of stock-keeping. It should be adapted to the requirements of a retail store, where the goods are numerous and varied. In such cases some items are being exhausted daily, piece by piece, until finally it is discovered that you are out of a certain article unawares. It always happens that there is a demand for just that thing at that time, apparently because you have not got it in stock. Now, a simple plan of keeping account of stock going in and out, it seems to me, would be a barometer to the retailer, valuable both as indicating his wants in the line of stock and the amount of stock on hand. It certainly would be of great value if kept correctly. It is often the case that the retailer in ordering goods goes by guesswork, and thereby orders duplicates of what he has already in stock, and omits much that he is actually in need of, or it occurs that he does not order in proportion to the demand that exists for certain goods. Then there follows the expense of telegraphing, express charges, &c., all of which add to the cost of doing business. A plan of stock-keeping, it seems to me, could be inaugurated which would avoid all this, and, in addition, would pay for the labor spent upon it. It seems to me that stock-keeping should be one of the cardinal features of a well-arranged and well-managed retail store.

In reply the Editor of *The Metal Worker* says :

Our correspondent presents a narrative of experience which is parallel to that of many of our readers. The annoyance of being out of articles, or of having a duplicate lot come in, resulting in a surplus of stock, is experienced more or less by every retailer. Various plans are resorted to for avoiding this, but we doubt if any one has discovered just what will answer the purpose in all cases. We presume that all our readers are open to suggestions on this point, and, therefore, think a discussion of methods can be secured which will be very generally acceptable. In some stores that we know of what is called a "tickler," or reminder, is hung up conspicuously in the office, upon which each clerk or salesman is required from day to day to make memorandum of the goods which he thinks are needed, including the goods which are to be in special demand, and an account of those the stock of which is becoming low. This tickler, or reminder, is variously managed, and is sometimes kept in the form of a book and in other cases it is a slate or a sheet of paper fastened against the wall.

Our correspondent's suggestion, based, as is evidenced by his remarks, upon considerable thought upon the subject, is radical in the extreme. His idea is to have some plan of accounting which shall show what goods are in stock, what is going out and what is coming in. This is a comparatively easy thing to do where the number of articles is small and where the articles are not large. But when it comes to the vast line of goods carried by retail hardware stores the difficulty of managing

such an account satisfactorily becomes apparent. And yet large concerns, handling enormous stocks, virtually do the thing which our correspondent outlines. Take any of the large retail dry goods establishments for example. The business is conducted every day in the year except Sundays and holidays, and it would be impossible to stop to inventory in all departments the goods on hand to make up the profit account. Good accounting steps in and does all this for the retailer. By the system of accounting employed the buyer knows just what is wanted, and in the same way the goods on hand are always shown by the account, rather than as the result of invoicing. In business we are very apt to take good care of cash. We keep an account with cash, debiting it with what we receive and crediting it with what we pay out. From time to time the balance on hand is counted, not, as many might at first suppose, to show what we have on hand, but rather to prove the accuracy of the account which shows what we have on hand. When it comes to merchandise, however, we abandon all accounting in the sense of the cash account, and we buy and sell and go through a long term of months and then take account of stock, see what we have on hand, and thereby determine what we have made or lost. Now, it would seem that good accounting should take care of property whatever may be its shape just as it takes care of cash. We leave these ideas for the consideration of our readers and hope that some discussion will follow.

Arrangement of Stores.

The accompanying illustration, Fig. 807, represents a Sled rack, for a description of which we are indebted to Elsworth & Dudley, Poughkeepsie, N. Y. It occu-

Fig. 807.—Sled Rack.

pies a space on the floor 18 x 30 inches, and is referred to as economical of room and accommodating the goods in such a manner as to secure an attractive display, while they are at the same time convenient of access. The bars on which the Sleds rest are made of $\frac{1}{4}$ -inch round iron.

Exports.

PER BARK ILIA, JANUARY 20, 1889, FOR CAPE TOWN, SOUTH AFRICA.

By Des Brisay & Allen.—61 Plows.
By Coombs, Crosby & Eddy.—90 dozen Axle Grease, 1 dozen Meat Cutters, 12 dozen Hatchets, 2 dozen Tools, 2500 Spokes.
By H. W. Peabody & Co.—2 cases Hardware.
By R. W. Forbes & Son.—11 cases Hardware, 4 gross Axle Grease, 1 package Stamped Ware, 6 dozen Mouse Traps, 1 case Lawn Sprinklers, 15 dozen Brooms, 13 dozen Axes,

$\frac{1}{4}$ gross Shade Rollers, 15 dozen Handles, 47 packages Agricultural Implements, 8 packages Agricultural Implements.

By W. B. Fox & Bro.—1 case Hardware, 2 cases Brooms, 1400 pounds Axle Grease, 1 case Handles, 2000 Handles.

By W. H. Crossman & Bro.—4 gross Shade Rollers, 50 dozen Brooms.

By John Norton & Sons.—12 $\frac{1}{2}$ gross Axle Grease, 15 Ranges, 1 case Fixtures.

By Arkell & Douglas.—1 case Pulleys, 1 case Carriage-Ware, 2 gross Axle Grease, 2 cases Braces and Bits, $\frac{1}{2}$ dozen Lawn Sprinklers, 10 Stoves, 6 dozen Door Springs, $\frac{1}{2}$ dozen Step-Ladders, 500 Broom Handles, $\frac{1}{2}$ dozen Scales, 1 dozen Ladders, 1 case Saws, 14 dozen Handles, 2 gross Shade Rollers, 5 dozen Traps, 6 cases Hardware, 1970 pounds Rope, 1 dozen Feed Cutters, 1 dozen Meat Cutters, $\frac{1}{2}$ dozen Churns, 6 cases Hardware, $\frac{1}{4}$ dozen Churns.

By Strong & Trowbridge.—1 case Handles, 16 cases Axes, 24 cases Axle Grease, 3 cases Brooms, 4 crates Churns, 2 cases Wire Goods, 2400 pieces Stoves.

PER SHIP ROBERT S. BESNARD, JANUARY 31, 1889, FOR SYDNEY, N. S. W.

By W. E. Peck.—31 Clocks, 4 reams Sandpaper, 9 packages Lamp Goods, 31 packages Hardware, 5 packages Plated-Ware, 3 dozen Planter's Hoes, 4 dozen Hay Forks, 7000 Cartridges, 5 Rifle and Tools, 1 case Lamps, $\frac{1}{4}$ gross Mouse Traps, 2 cases Plated-Ware, 9 packages Lampware, 1 gross Can Openers, 20 Rifles, 2000 Cartridges, 1 case Primers and Tools, 31 Clocks, 1 dozen Meat Choppers, 22 packages Hardware, 2 cases Plated-Ware.

By Strong & Trowbridge.—33 cases Handles, 2 cases Firearms, 1 case Tools and Firearms, 2 cases Cartridges, 4 cases Hammers, 1 case Hardware, 2 cases Rifles, 6 pieces Lampware, 2 packages Pumps, 1 case Tools, 13 packages Barrow Parts, 1 case Brooms, 2 packages Whips, 3 packages Hardware, 1 case Carpet Sweepers, 1 case Door Checks, 1 case Padlocks, 1 case Lampware.

By R. W. Forbes & Son.—174 Packages Sewing Machines, 5 packages Sewing Machines and Parts, 1 box Generators, 1 package Hardware, 1 package Hardware, 2 boxes Stubble Cutters.

By H. W. Peabody & Co.—23 cases Steel.

By A. S. Lascelles & Co.—1 dozen Wringers.

By F. Miller & Sons.—2 gross Blacking, 1 $\frac{1}{4}$ gross Blacking.

By Collins Company.—57 dozen Edge Tools.

By Meriden Britannia Company.—2 boxes Plated-Ware, 14 Packages Plated-Ware, 2 boxes Plated-Ware.

By W. K. Freeman.—2 crates Wheels, 12 bundles Whiffletrees.

By Woodhouse & Stortz.—1717 pounds Hardware, 18 dozen Axes.

By W. James.—23 cases Steel Carriage Springs and Parts.

By J. L. Mott Iron Works.—30 Stoves.

By Welsh & Lea.—6 cases Iron Bolts.

By Ansonia Clock Company.—5 boxes Clocks.

By Waterbury Clock Company.—21 cases Clocks, 5 cases Clocks, 3 cases Clocks.

By Russell & Erwin Mfg. Company.—21 cases Hardware.

By Edward Miller & Co.—37 packages Lamp Goods, 44 packages Lamp Goods, 81 packages Lamp Goods.

By V. Basanta.—114,000 Ammunition, 600 dozen Handles, 2 gross Whip Handles, 83 dozen Lamp Goods, 1 gross Barometers, 338 Clocks, 100 gross Paper Caps, 9 Perambulators, 10 dozen Washboards, 48 dozen Hammers, 18 dozen Wrenches, 9 dozen Oil Cans, 12 $\frac{1}{4}$ gross Axle Grease, 10 gross Blacking, 21 dozen Wrenches, 40 boxes Tacks, 3 dozen Money Drawers, 10 dozen Axes, 25 dozen Washboards, 111 pounds Washita Stones, 1 case Planes, 8 dozen Carriage Clamps, 5 $\frac{1}{2}$ dozen Ship Augers, 20 $\frac{1}{4}$ dozen Saws, $\frac{1}{2}$ gross Egg Beaters, 12 sets Sad Irons, 4 dozen Axes, 15 $\frac{1}{2}$ dozen Potato Mashers, 2 gross Wood Spoons, 6 dozen Rolling Pins, 25 boxes Clothes Pins, 48 dozen Springs, 102 $\frac{1}{4}$ dozen Locks.

By Arkell & Douglas.—4 dozen Picks, 10 dozen Axes, 5000 Handles, 30 dozen Washboards, 2 crates Carriage-Ware, 4 cases Bolts, $\frac{1}{4}$ dozen Corn Mills and Parts, 2 $\frac{1}{2}$ dozen Ladders, 4 boxes Lampware, 65 dozen Handled Axes, 25 dozen Axes, 25 packages Lamp Goods, 1 case Hardware, 2 $\frac{1}{2}$ dozen Guns, 8 dozen Tools, 150,000 Primers, 140 pounds Staples, 22 dozen Picks, 2 dozen Lamps, 5 Shellers, 14 cases Handles, 3 cases Bird Cages, 2 cases Skates, 12 dozen Traps, 5 cases Hardware, 2 gross Blacking, 2 dozen Picks, 6 dozen Axes, 3 crates Wheels, 1 crate Wheels, 2 boxes Castings, 5 cases Axes.

By Peters & Calhoun Company.—2 cases Saddlery.

By R. W. Cameron & Co.—60 dozen Axes, 20 dozen Tools, 81 dozen Axes, 2 cases Saws, 3 cases Ruling Machines, 4 packages Machinery, 1 case Skate Parts, 3 cases Skate Parts, 4 cases Roller Skates, 40 dozen Hatchets, 90

dozen Handles, 486 dozen Chimneys, 35 gross Wicks, 15,502 pieces Slate, 1600 pounds Sawmill Machinery.

By *E. W. Harrison*.—18,000 pounds Iron Castings, 1100 feet Leather Belting, 60 packages Iron Machinery, 4000 pounds Nails, 1 box Miners' Lamps.

By *H. S. Chipman*.—2 cases Hardware.

By *Healy & East*.—9 boxes Sawmills, 1 box Emery-Wheels.

By *Singer Mfg. Company*.—1105 Sewing Machines.

By *Bradley & Hubbard Mfg. Company*.—44 packages Lamp Goods, 20 packages Lamp Goods.

By *R. W. Cameron & Co.*—200 sets Car Springs.

By *F. B. Wheeler & Co.*—5130 pounds School Slates, 50½ gross Axle Grease, 1 case Castings, 1 case Clocks.

By *Coombs, Crosby & Eddy*.—8 dozen Handles, 3 dozen Hammers, 2 dozen Hatchets, 35 dozen Blocks, 2 dozen Row Locks, 2 dozen Shovel Handles, 20 gross Shoe Polish, 86 Stoves, 3 dozen Wringers, 53 dozen Carpenters' Tools, 8 dozen Bird Cages, 21 dozen Hammers, 30 dozen Edge Tools, 43 Ladders, 21 Tables, 65 Velocipedes, 1 dozen Carpet Sweepers, 30 dozen House-Furnishing Goods, 9 gross Hardware, 10 dozen Carpenters' Tools, 1 dozen Rakes and Hoes, 1 dozen Churns, 24 dozen Tacks, 10 dozen Axes, 80 dozen Edge Tools, 30 dozen Axes, 12 gross Shade Rollers.

By *Isley, Doubleday & Co.*—12 Carriage Tops, 63 Dashers, 60 dozen Couplings and Yokes, 6 dozen Fifth Wheels, 1 case Nails and Buttons, 4 1-6 dozen Castings, 12½ gross Axle Grease, 12½ gross Axle Grease, 5 gross Axle Grease, 224 pounds Glue, 112 pounds Glue, 6½ gross Axle Grease, 8 dozen Paint Brushes, 250 boxes Clothes Pins, 150 dozen Axle Handles.

By *McLean Bros. & Rigg*.—36 dozen Skates, 150 dozen Lamp Chimneys, 8½ dozen Carpet Sweepers, 18 dozen Washboards, 44 dozen Veneer Seats, 2 gross Lemon Squeezers, 2 gross Oil Cans, 60 Lawn Sprinklers, 2 dozen Braces and Drills, 8 dozen Plumbs and Levels, 14 cases Agate-Ware, 4 dozen Meat Choppers, 24 dozen Hatchets, 2 dozen Broad Axes, 2 gross Mop Holders, 3½ dozen Seed Sowers, 25 dozen Axes, 30 dozen Mouse Traps, 18 dozen Hammers, 3 dozen Miter Boxes, 17 dozen Saws, 24 dozen Cow Bells, 2 gross Lemon Squeezers, 1 gross Nutmeg Graters, 12 dozen Stencils, 1 dozen Lemon Squeezers, 24 dozen Curry Combs, 6 dozen Axes, 24 Dozen Axes, 10,000 Clothes Pins, 54 dozen Axes.

By *W. H. Crossman & Bro.*—6 dozen Axes, 7 dozen Picks, 28 dozen Hatchets, 12 dozen Hammers, 19 dozen Hatchets, 2 cases Hardware, 22 dozen Axes, 57 pounds Nails, 78 Dashers, 16 cases Hardware, 6080 pounds Bolts, 40 Scales, 1000 Handles, 38 dozen Axes, 12 dozen Hatchets, 2 dozen Adzes, 1 gross Mop Handles, 60 Corn Mills, 3 gross Traps, 12 dozen Hatchets, 24 dozen Hoes, 20 dozen Axes, 199 packages Carriage-Ware, 18 sets Axes, 400 pairs Boiler Skates, 31 dozen Axes, 6 cases Carpenters' Tools, 2000 feet Rubber Hose, 2 cases Pump Carts, 24 sets Rifle Tools, 3 gross Egg Beaters, 14 cases Hardware, 48 Rifles, 18 sets Tools, 100,000 Primers, 60,000 Cartridges, 32 dozen Axes, 1 gross Mop Handles, 12 dozen Bush Hooks, 6 dozen Hammers, 1056 pounds Nails, 10 dozen Axes, 24 dozen Handles, 3 cases Hardware, 6 dozen Thermometers, 6 dozen Handles, 5 dozen Tools.

PER SCHOONER JOHN F. KRANZ, FEBRUARY 3, 1889, FOR PORT ELIZABETH, SOUTH AFRICA.

By *Coombs, Crosby & Eddy*.—120 dozen Edge Tools, 36 dozen Handles, 1 Grain Mill, 2 Corn Mills, 3 Corn Shellers, 4 Churns, 2 Corn Shellers, 4 dozen Brackets, 5087 pounds Sisal Rope, 4 dozen Wheelbarrows, 10 dozen Hatchets, 20 dozen Shade Rollers, 3 Hay Cutters, 6 Corn Mills, 3 Scales, 54 dozen Handles, 5 dozen Saws, 1 dozen Ladders, 6 dozen Carpenters' Tools, 1 dozen Sprinklers, 4 Plows, 19 dozen Plow Parts, 1 Corn Sheller, 1 dozen Plow Parts, 4 Agricultural Implements, 2 Corn Shellers, 3500 pounds nails, 4 dozen Plow Parts, 43 dozen Hatchets, 6 Grindstones, 40 Plows.

By *R. W. Forbes & Son*.—40 dozen Pick Handles.

By *New Home Sewing Machine Company*.—150 Sewing Machines.

By *J. Norton & Son*.—5243 pounds Cordage, 3 Carriages.

By *Arkell & Douglass*.—6 Stoves, 9 packages Hardware, 7 cases Stuffers, 3000 Primers, 1 case Wire, 1 Forge, 4 dozen Lemon Squeezers, 14 dozen Axes, 30 gross Clothes Pins, 6 Sewing Machines, 17 cases Agricultural Implements, 1 dozen Handles, ¼ dozen Snaths, 2 cases Hoes, ½ dozen Scales, 3 cases Tools, 3 dozen Bench Screws, 1½ dozen Clocks, 6 Tobacco Cutters, 1 Washing Machine, 12 dozen Axes, 15 gross Clothes Pins, 264 pounds Sash Weights, 1 box Hardware, 5 pounds

Sash Cord, ¼ gross Shade Rollers, 9 cases Agricultural Implements, 3 packages Hardware, 15 kegs Nails, 5 dozen Axes, 12 dozen Handles, ½ dozen Corn Mills, 1 dozen Barrows, 6 dozen Picks, 18 Pump Levers, ¼ dozen Grindstones, 1 dozen Grindstones, 30 dozen Picks, 12 kegs Nails, 10 Scales, 33 cases Slates, 1 case Lawn Mowers, 1 case Lamp Goods, 1½ gross Fruit Jars, 11 dozen Hammers, 1 case Harness, 75 cases Axes, 55 kegs Nails, 54 packages Carriage-Ware.

By *H. W. Peabody & Co.*—5400 pounds Nails.

By *W. H. Crossman & Bro.*—6 dozen Handles, 1 barrel Blacking, 26 cases Plow Parts, 42 cases Slates, 4 gross Shade Rollers, 4 cases Sash Weights, 24 pounds Sash Cord, 15 kegs Nails, 9 Store Trucks.

By *Corner Bros. & Co.*—12 dozen Saws, 6 dozen Clocks, 9 dozen Ladders, 1 dozen Corn Shellers, 200 dozen Broom Handles, 16 Plows, 120 dozen Brooms.

PER BARK SERENE, FEBRUARY 5, 1889, FOR PORT NATAL, SOUTH AFRICA.

By *Corner Bros. & Co.*—30 cases Hardware, 6 Wagons, 78 cases Hardware, 158 cases Agricultural Implements, 22 Wagons.

By *Marcial & Co.*—40 dozen Picks, 4 boxes Hatchets, 2 dozen Spading Forks, 3 dozen Hoes.

By *Coombs, Crosby & Eddy*.—500 Broom Handles, 24 dozen Picks, 2 dozen Edge Tools, 195 pounds Oil Stones, 60 dozen Axes, 7 Ladders, 50 pairs Plow Handles, 5 dozen Carpenters' Tools.

By *W. H. Crossman & Bro.*—10 packages Hubs, 12 cases Spokes, 28 bundles Carriage-Ware, 5 cases Hardware, 4 dozen Axes, 2 cases Hardware, 8 dozen Plow Shares, 70 dozen Hatchets, 104 cases Plow Parts, 2 dozen Wringers.

By *Woodhouse & Stortz*.—18 packages Agricultural Implements, 6 packages Axes.

By *H. A. Caesar & Co.*—40 Axes, 112 Plows and Parts, 32 Plows and Parts.

By *H. W. Peabody & Co.*—8 cases Carriage Hardware, 8 cases Agricultural Implements, 8 cases Agricultural Implements, 748 pounds Nails, 2 cases Edge Tools, 228 dozen Handles, 3 cases Stone, 3 cases Brooms, 7 packages Carriages.

By *Strong & Trowbridge*.—1 case Brooms, 2 cases Clothes Pins.

Our Export Methods.

A recent issue of the *Pittsburgh Chronicle* contains the following remarks by M. Morier, a native of France, who has been for many years a resident of Burmah, and is referred to as an extensive traveler and a keen observer. His comments on the American way of doing business are significant, and his suggestions worthy of consideration:

"While Americans are prone to boast of their manufactures," said he, "and rank them as readily superior to those of any other nation, it is painfully apparent, alike to manufacturer, statesman and traveler, that the excellence of American goods has not received proper appreciation away from home. The export trade is distressingly small when compared with the size of this country. The very nations that lie nearest, and which, for geographical reasons, if none other, should be the recipients of the surplus manufactures of the United States, draw the least upon this country for their surplus. Cuba, Mexico and Central America go to England and Belgium for their commodities rather than to the United States, which is not half so far. Brazil, too, and the South American republics satisfy their wants from the storehouses of another hemisphere. As for Africa and India, American trade in those localities is practically nil. American machinery and some articles of Hardware are exported to a limited extent, and are in demand in a few foreign markets, but textile fabrics and articles of domestic use made in the United States are rarely found in the markets of other nations. Even when sent there and exposed for sale they do not readily find purchasers. Cheap prints and calicoes find their way into Cuba and Hayti, and are worn by the poorer classes. But for the finer grade woollens, cottons and silks there is absolutely no demand."

American manufacturers are lacking in enterprise. They must be willing to assume some risk if they want to effect an entrance into foreign markets. Let them study the tastes and needs of the people of other nations, manufacture a special line of goods for them, then put them on the market and be content to wait for the people to find out their worth. We can't expect a Zulu chief to buy a swallowtail coat and patent leather pumps, no matter how fine may be their workmanship. We must cater to his taste. If he wants a scarlet ribbon and an assegai, there is no use in trying to tempt him with a fur-lined overcoat and a

gold-headed cane. If American manufacturers would but take the cue from England and France, and give the Cubans, the Brazilians and the Chileans something they really want, they would soon build up a flourishing trade.

When I first went to India France had but little foothold there. I determined to secure for her some amount of Burmese trade, and accordingly, during my two years' consulate, I made a close investigation of the people's tastes and whims. I studied their favorite colors with great minuteness, carefully noted the quality and form of their garments, and made clippings of every piece of goods that came to hand. I then sent detailed instructions to French manufacturers as to the exact nature of the goods they should produce. The silks were to be in pieces of 10 feet long and 1 broad, and the patterns and texture radically different from anything French looms had ever turned out. They took the hint and set to work. In a short time the importation of French silk into Burmah had gained enormous proportions.

This is but one instance from many. England, Germany and the Netherlands have employed the same methods in building up their trade. They delight the East Indians with the finest and gayest of silks, and find the Libyans and Senegambians equally eager for rough, coarse cotton. American manufacturers are still in the rear because they fail to study the people to whom they cater.

There are still other reasons for our lack of export trade. Americans have no proper means of transporting their goods to foreign countries. In the past century England has given \$250,000,000 to the support of her merchant marine, besides \$100,000,000 to private enterprises. Her vessels carry her products to every quarter of the earth, while Americans are totally lacking in such facilities. If Philadelphia should have lines of her own to Venezuela, Central America and other Southern countries, I believe there would be a very material increase of commerce.

Insufficient means of transportation is generally conceded to be a vital cause for the lack of American export trade, but every one who has studied the question agrees that Americans are too ready to pour old wine into new bottles, and that so long as they neglect to study the tastes of men of other nations they must continue to be shut out from foreign markets.

The charcoal furnace of the Ashland Iron and Steel Company, at Ashland, Wis., is now in good running order, and is fulfilling the expectations of its builders in exceeding the production of any other charcoal furnace in the world. The size of the stack is 65 feet by 12½ feet, and it is equipped with two Whitwell hot-blast stoves. Its output for the week ending February 2 was as follows:

	Tons.
January 27.....	89
January 28.....	86
January 29.....	90
January 30.....	90
January 31.....	100
February 1.....	95
February 2.....	92

Total for the week..... 642

The average daily product was thus nearly 92 tons. On the 5th inst. the production was still larger than on any day above recorded, running up to 104 tons. The owners expect to be able to keep up this remarkable work. M. R. Hunt is now general manager.

Charles A. Ashburner, mining engineer, of Pittsburgh, and also connected with the Fuel, Gas and Electric Engineering Company, Limited, of that city, has gone to Los Angeles, Cal., to examine gas and oil territory in that section owned by George Westinghouse, Jr., and also to examine certain copper mines in the West.

Messrs. Lodge, Davis & Co., manufacturers of iron and brass working machinery, Cincinnati, Ohio, will open March 1, at the corner of Lake and Canal, Chicago, Ill., a depot for the exhibition and sale of their improved engine lathes, shapers, drill presses, planers, milling machines, &c. They will have a full line of tools on hand and will sell them, free on board cars at Chicago, at factory prices. Mr. E. D. Goodwin, who has been connected with their home office for some time, will be in charge.

The Perfection Padlocks.

The accompanying illustration represents the interior mechanism of the Perfection Padlocks, a line of cast bronzed goods put on the market by the Ames Sword Company, Chicopee, Mass. These locks are worked with a double-bitted key, Fig. 2, turning indefinitely both ways. They are made with eight levers, and from their construction are alluded to as not liable to get out of order or to be picked. It will be seen that the small tumbler holds the large one firmly in

Fig. 1.—The Perfection Padlock, Showing Mechanism.

place. When the key is inserted the first movement withdraws the small tumbler and sets the large one free, and, as the key continues to turn, the other side throws back the large tumbler and releases the shackle, which is thrown back by the spring. When the key is withdrawn and the shackle closed the large tumbler is pressed up first by its spring, and then the small one closes up under and holds it firmly. There are eight tumblers, thus

Fig. 2.—Key to Perfection Padlock.

admitting of a great many combinations. These padlocks are made 2½ inch plain, with spring drop staple and 10-inch chain, or with staple spring drop and 10-inch chain, as desired. Two keys are furnished to each lock.

Proctor's Arctic Safety Bail.

The accompanying engraving illustrates a very simple yet effective device to be attached to cooking vessels in place of the usual wire bail, which is apt to get too hot to be touched with the bare hand. The safety bail is a flexible brass chain, made long enough to allow the lid of the vessel to be removed easily. The chain is passed through the ears of the vessel, and linked together to make it endless. In use when cooking the chain lies on the lid of the vessel and does not get hot, as a thick wire bail is very likely to do. The

dotted line in the cut shows the usual position of a wire bail "in the steam." If the cover of the vessel has a knob or tin strap, the cross strand of the chain engages it and prevents it from slipping off, so that the lid can be used as a strainer. The cover is tightly held, so that the solid

Proctor's Arctic Safety Bail.

contents cannot displace it and fall out. When thus used the safety bail throws the hand so far from the vessel that the heat from it cannot be felt. It is manufactured by Edwin R. Proctor, Gibson House, Cincinnati.

Cronk's Garden Mattock.

This article is represented in the accompanying illustration. It is made by the Cronk Hanger Company, Elmira, N. Y. It is referred to as light, weighing only 1½ pounds, and manufactured of the best hoe steel, with malleable eye and XXX handles. It is recommended by them as

Cronk's Garden Mattock.

superior to a garden hoe for digging burdocks, weeding out and for use in nurseries.

The 6-inch steel gun cast at the Standard Steel Casting Company's works, at Thurlow, Pa., has been successfully tested at the Government proving grounds at Annapolis with 12 rounds, with the full charge of 48½ pounds of prismatic powder and a 100-pound projectile. In this gun the steel was made by the open-hearth process, while the one that burst a few weeks since at the first round was of Bessemer steel. It will require further tests to fully establish the superiority of either method of manufacture.

New Wire Specialties.

The Van Wagoner & Williams Company, 82 Beekman street, New York, have recently added to their line the following wire specialties: Gem Wire Ceiling Hooks, Fig. 1.; Gem Wire Sash Lifts, Fig. 2.; and Gem Wire Door Pulls, Figs. 3 and 4. The ceiling hooks (Fig. 1) have, it will be

Fig. 1.—Gem Wire Ceiling Hook.

observed, braces on each side of the screw to keep the hook in position when clothes are hung on either side of it. These hooks will sustain a weight of 200 pounds and are referred to as very useful for ward-

Fig. 2.—Gem Wire Sash Lift.

robes and closets. The wire sash lift shown in Fig. 2 is described as stronger and cheaper than cast iron, while, at the same time, it is more easily applied. These ceiling hooks and sash-fasts are furnished

Fig. 3.—Gem Wire Door Pull, to Drive.

coppered, walnut bronzed, nickel-plated or brass, as desired, and are packed one-half gross in a box, 12 gross in a case. Two patterns of screen-door pulls are represented in Figs. 3 and 4, one of which

Fig. 4.—Gem Wire Door Pull, to Screw and Drive.

is to drive in the wall; the other, Fig. 4, has one end driven in and the other fastened by a screw.

The Improved Acme Wrench.

The Capitol Mfg. Company, Loomis and Taylor streets, Chicago, have recently made important changes in the construction of the Acme wrench, which is represented in the accompanying illustration. The steel entering into this tool is made specially for the company, and is warranted not to break, bend or spring with ordinary use. The head is drop-forged, and great strength is secured by the double slide. The long nut is alluded to as preventing "stripping" under the most severe strain, and the length of thread gives this wrench a greater capacity than the ordinary screw wrenches. The nut is hexagonal in form instead of circular. The changes which have been made in this wrench are the result of investigations among mechanics with reference to the weak points of wrenches, and the adoption of practical suggestions made by these masters of the bench. The confidence of the company in the excellence of these tools, and their belief that they will meet the most exacting requirements, are thus founded on a practical basis. These wrenches are made in all sizes, from

The Improved Acme Wrench.

5 to 21 inches, inclusive, both bright and nicked. The company's special railroad wrench is made in 12, 15, 18 and 21 inches, and is especially adapted for the heaviest and roughest work. The capacity of the works has recently been doubled, owing to the increased demand for these wrenches.

New B. M. T. Saw.

The new patent tooth B. M. T. Saw, devised by Warren Bundy, Minnesota City, Minn., and manufactured by the Montague-Woodrough Saw Company, 211 and 213 Randolph street, Chicago, Ill., is represented in the accompanying illustration. As shown in the cut, the teeth are arranged in sets of three each and after each set is a recess or gullet for the reception of the sawdust liberated. There are two distinct kinds of teeth in each set, two cutting teeth and one clearing tooth. The cutting teeth are made with the cutting edge on the outer edge of each tooth, and are arranged in step form, with a rise from the body of the saw of about 45°. The cutting edge is on opposite sides in each pair of teeth, so that the bevels face each other, thus making two parallel gashes in the wood. The purpose of the clearing tooth, which is slightly below the points of the cutting teeth and which is formed like a common mortising chisel, with its cutting edge at a right angle to the gash, is to clear away the wood between the two gashes into the recess or gullet before it, thus leaving the next pair of cutting teeth free from obstruction to their work. On drawing the saw back into the gash,

the sawdust is pushed out of the gullet, leaving it clear for the next stroke. The sharp chisel edge of the cutting teeth is referred to as leaving the sides of the wood as smooth as though planed, and, as little set is required, the saving of material is referred to as important, while the ab-

New B. M. T. Saw.

sence of roughness and loose fibers lessens the friction, enabling the saw to work successfully with much less power than the V-tooth saw. With this construction it is claimed that the saw will cross-cut, rip or cut in a miter box with equal facility one-third faster than any saw now

keep in order than others, as with the ordinary teeth it is necessary to file two teeth at a time, making it difficult to have them of exactly the same height, while in this pattern of saw it is explained that, after jointing, the clearing tooth is first filed $\frac{1}{8}$ inch below the level of the cut-

ting teeth, holding the file almost parallel with the blade of the saw and at a slight upward angle, thus clearing the point of the cutting teeth in front and falling below the bevel of the cutting teeth in back. After all the clearing teeth have been filed the cutting teeth are filed to a point one at a time, so that all can be brought to an exact level. When this is done an oilstone laid flat on the side of the saw and run up and down a few times will reduce, it is said, any irregularity in the set and give smooth cutting. The set is given by placing the tooth on a piece of flat steel with a slight bevel on the edge and striking it with the peen of a hammer in such a way as to set only the front or cutting edge, where in the ordinary saw the whole tooth is turned. The company have a special saw-set made for this purpose, which is referred to as doing its work exactly. The circular issued by the company gives a full description of this saw, and illustrates the manner in which it is filed, and the price list.

Weir Steel Bar Lever Harrow.

This harrow, an illustration of which is given below, is manufactured by the Weir Plow Company, Monmouth, Ill. The sections of this harrow cut each 5 feet and 8 inches, and contain each 80 $\frac{1}{4}$ -inch square steel teeth, 10 inches in length. The bars are oval shaped, punched to receive the teeth, which are driven to place

Weir Steel Bar Lever Harrow.

and that no time need be wasted, as at present, by substituting one saw for another. In jig saw work it is stated that the material is cut so smooth that mouldings, &c., are ready for use when they leave the saw. The adaptation of this style of tooth to band saws is also referred to.

It is also pointed out that saws with this pattern of teeth are easier to file and

while the bars are hot, which, contracting, hold them rigid. This is referred to as a very strong, durable and desirable harrow, and, unlike other steel harrows, can be laid flat on the ground without the lever bars on top being doubled and raised above the harrow, making them liable to break and accumulate trash. This harrow is furnished with two, three or four sections, as desired.

Borcherdt's Fishing-Tackle Box.

F. C. Wilson & Co., 239 and 241 Lake street, Chicago, are manufacturing a tin fishing-tackle box which is illustrated herewith. As will be observed, it has a series of pockets, which are the invention of a practical Chicago fisherman named J. C. Borcherdt. These pockets are made of water-proof parchment paper, rein-

Borcherdt's Fishing-Tackle Box.

forced with tape, and are folded into two pieces of tin, one of which is permanently attached to the cover and the other movably attached by a simple turnbuckle, rendering the contents of the pockets readily accessible. Two sizes are made, the smaller having one tray and the larger three trays, with 16 and 24 pockets respectively. Space is also provided in each for two reels, trolling line, &c.

Lowdon Bank Punch.

This article is put on the market by the Lowdon Bank Punch Company, patentees and proprietors, Kansas City, Mo., for whom it is manufactured by the Hoggson & Pettis Mfg. Company, New Haven, Conn., who are also general Eastern agents. It is designed, as will readily be under-

The Lowdon Bank Punch.

stood, to punch out on the check figures representing the amount for which the check is drawn, in order to prevent fraudulent alterations. The machine consists of an outer frame or casing, in front of which is a row of 11 punches, which may be pressed down through corresponding openings in the steel plate below, which answers as the die. Inside the frame is a small carriage, to which is attached the hand lever shown. To the same carriage is hinged a thin plate, which carries two

small rollers. This plate is pressed down by the action of the spring, and may be lifted by the finger when the paper to be punched is placed under it, where it is held between the two rollers and the third one, which is underneath and is called the feed-roller. This feed-roller is turned slightly during the upward movement of the hand lever, and thus the paper is carried forward sufficiently for the succeeding space. The carriage carrying the lever, the guide and feed rolls can be moved along from side to side, so that the lever when depressed will carry down with it the desired punch. In operation, after the paper has been put in place, the hand lever is moved to the extreme left, and depressed, which punches out the \$ mark. As it rises the paper is automatically moved along for the next space by the rollers, and the lever is then moved to any other desired figure, of course carrying the rolls and the paper along with it. It is again depressed, and the operation is repeated until all the figures are punched out, when it is returned to the left and the \$ mark repeated, to prevent other figures being added. The vertical plate in front has slots in its upper edge, into which the lever fits, and as the upper ends of these slots are enlarged to make the lever enter them easily they serve to center it accurately over the given punch, and thus bring the paper into the exact proper position.

The men employed in the limestone quarries in the Mahoning Valley, Ohio, recently made a demand for an increase of wages, which was refused by the operators, with the result that every quarry in the region has been compelled to suspend operations. It would seem that the demand of the men at this time is unjust, as they are making good wages, and the condition of the iron market does not warrant an advance. It is stated that the men themselves have but little to do with the trouble, but that they are acting under orders from headquarters of the Knights of Labor. We learn that one operator in the New Castle district has granted the advance, but he claims that he was compelled to do so on account of a contract to supply the Rosena Furnace, at New Castle, operated under lease by Oliver

The Muhammad Coffee Biggin.

F. C. Wilson & Co., 239 and 241 Lake street, Chicago, are manufacturing a coffee biggin of new design, for which a patent was issued on the 4th of last December. Perspective and sectional views

Fig. 1.—The Muhammad Coffee Biggin.

of the article are shown herewith. In the sectional view A is the coffee-pot proper, B the percolator cup, C the sleeve, *b b* lugs, D perforated cone strainer, E perfor-

Fig. 2.—Muhammad Coffee Biggin, Sectional View.

ated diaphragm, F hood fitting over D, G cover fitting pot and percolator, *f* rod for raising hood F. The flow of water through the coffee is regulated by raising or lowering the hood F, and it is claimed that this is the only biggin in which the flow can be regulated so as to thoroughly reach the coffee. This coffee-pot holds 3 quarts, but is, at the same time, so constructed that two or three cups may be made in it with equal facility to the larger quantity.

Milwaukee capitalists have organized a company to prospect for natural gas at Oak Creek, near Racine, Wis. Gas is flowing quite heavily from a well 120 feet deep, and it is proposed to sink another in a better location not far away. The entire farm has been leased on which the discovery was made, and considerable excitement has been caused among the residents of the immediate vicinity.

CURRENT HARDWARE PRICES.

FEBRUARY 13, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

THE IRON AGE

THURSDAY, FEBRUARY 21, 1889.

A 5,000,000-Gallon Filter.

Although the fact that water can be purified by passing it through certain materials has been long known, the purification of large volumes by mechanical filtration, without resorting to chemicals of any description, has only received close attention during the past few years. Early filters were exceedingly slow in their operation, and the quantity of water passed by them was accordingly very small, so that their capabilities were limited to a narrow range. Now it is by no means uncommon to filter the whole water supply for a city, and to accomplish this with apparatus simple in construction and of comparatively small size. In addition to this, the modern filter, having proved itself to be so reliable in operation and so economical as regards running expense, has entered

sand. The construction and arrangement of the sand and gravel beds will be understood from the perspective view, in which a portion of the shell of one of the filters is broken away. Water enters through the pipe A, its admission being controlled by the valve C. It passes downward through the gravel in the smaller chamber, under the partition, up through the gravel, sand and gravel beds in the larger chamber, and thence through the outlet pipe B. The first screen arrests any large particles which may be brought in by the water; the first gravel bed removes the larger percentage of impurities, while the purifying operation is completed as the water flows through the other beds. As the entire lower portion of the filter serves as a water chamber, the upward flow is distributed in such a manner that each section of the

in a large volume through the filter, no single part of which presents more resistance to its flow than another. One remarkable feature of this filter—which is perhaps the largest ever introduced in a single works—is the small space required. The inside measurement of the room in which it is situated is $27\frac{1}{2} \times 28\frac{1}{2}$; 10 feet would give ample head room. Simple filters of this description have been long in use under the most trying conditions and yet no cause of failure to thoroughly purify the water has appeared. These filters are made by the Hegeman & Oliphant Filter Company, of 112 Liberty street, New York.

Warming Cars With Hot Water.—The Pennsylvania Railroad has about completed the fitting up of a train of five cars

THE LARGE FILTER BUILT BY THE HEGEMAN & OLIPHANT FILTER COMPANY, NEW YORK.

all the great industries to such an extent as to form an important part of the plant.

The filter of the great Spreckels sugar refinery now being erected near Philadelphia is illustrated by the accompanying engravings. This filter really consists of four separate filtering vessels, which receive their supply from the same source and deliver into the same outlet, and yet each filter is entirely independent of its neighbor. Each filter consists of an iron shell, shaped and made like a boiler, and of sufficient strength to withstand any pressure to which it may be subjected when in use. The shells are 5 feet in diameter and 21 feet long. A vertical transverse partition, placed 3 feet from the inlet end, and extending to within 10 inches of the bottom, divides the interior of each into two compartments. Near the top and at the bottom of the partition are horizontally placed screens which divide the smaller chamber into compartments. Between the screens gravel is placed. Extending along the larger chamber are two receptacles for gravel, each of which consists of an upper and lower screen, between which the gravel is held. These screens rest upon cross rods, and either can, when necessary, be withdrawn through the manholes H. Between these two screens is a bed of fine

bed acts to retain the impurities. In other words, there is no useless or idle portion through which the water does not flow.

Provision is made for automatically cleansing the filter, if by reason of the accumulation of impurities upon the first screen its action should be interrupted. The increased pressure arising from the stoppage would raise the safety valve E, which is in the pipe E. This pipe leads from the inlet pipe A down along the front of the filter, into which five branches enter. The branches are located as shown in the longitudinal section, Fig. 2. The upper four pass through the smaller chamber, and at the entrance to the larger each is provided with a so-called "manifold," G, shown in plan in Fig. 3. The water then enters the filter through the pipe E and the manifolds G, by which it is conducted to all parts. The sand and gravel are thoroughly cleansed and any refuse on the first screen is washed through the pipe F to the sewer connections at F'. From the main body of the filter the water passes through the pipe I. It is evident that, since the water passes upward through the large beds of sand and gravel, there is no danger of packing the material, and no necessity for ever forcing the water through, while the removal of impurities is more perfect, as the water moves

with a system of heating by hot water. From the *Pittsburgh Dispatch* we condense the following description of the main features: In the sand box of the engine are placed coils of copper pipes as closely together as possible. Water, originally drawn from the tender, passes through the coils and through suitably arranged pipes in the cars to the rear of the train, and then returns to the coils through another pipe line, the forced circulation being maintained by a small pump. Entering the car, the water passes through a Y leading up through the floor, and then along each side of the car under the seats to the rear. The exposed parts of the pipe are first covered with asbestos, then wrapped in hair cloth, then paper and canvas, which is painted. At each end of the cars is an automatic stop cock, provided to close the pipes and keep the hot water in the cars in case the train breaks in two.

The new edge tool works of the Fall City Malleable Iron and Steel Company, Louisville, Ky., have recently gone into operation, employing about 20 hands and preparing for a full practical test of the Hooper-Clark process. The company will devote their capacity at first to the production of hatchets, axes and hoes.

The Wrought-Iron Pipe Trade of the Northwest.

The consumption of wrought-iron pipe is rapidly increasing in the Northwest, and Chicago is now the most important distributing point in this country outside of Pittsburgh. The local production is quite small, the great bulk of the trade being carried on by outside manufacturers. The Crane Bros. Mfg. Company and the Fieldhouse & Dutcher Mfg. Company, both of Chicago, have plants for the manufacture of butt-welded pipe of small caliber, and the Haxtun Steam Heater Company have a plant at Kewanee, 130 miles south of Chicago, but there is no mill west

population and the constant march of improvement. Within the last five years the whole system of refrigerating on a large scale has been changed, and the production of artificial cold which was substituted has required large quantities of wrought-iron pipe. The salt blocks, as now operated, take a great deal of pipe. Manufacturers of agricultural machinery are using it more and more every year, finding that while it is fully as strong as a solid bar it is much lighter, and it recovers itself when accidentally bent instead of getting set. The increasing number of high buildings in Western cities causes a greater demand for fire-escapes, and all of them are now being constructed with a wrought-iron pipe extending from pave-

pipe up to 24 inches in diameter to meet the demand for large sizes. They contemplate making up to 30 inches at an early day. No other works make wrought-iron pipe larger than 16 inches, except in England, but the large sizes are there made by hand, while the National Tube Works Company use the regular lap-welding process throughout their whole line. The competition between wrought and cast iron pipe is made on the basis of the greater strength, lightness and freedom from leakage of the former. Thus, while a 6-inch cast pipe weighs 33 pounds to the foot, a 6-inch wrought pipe of five times the strength weighs but 8.6 pounds to the foot; an 8-inch pipe shows 42 pounds against 12.8 pounds; a 10-inch pipe shows

Fig. 2.—Longitudinal Section of 5,000,000-Gallon Filter.

Fig. 3.—Plan of "Manifold."

Section through Fig. 2.

of Youngstown, Ohio, making lap-welded pipe or pipe of large diameters. The National Tube Works Company and the American Tube and Iron Company both carry stocks of pipe in Chicago. A. M. Byers & Co. and the Riverside Iron Works maintain resident salesmen, and several other manufacturers of both butt and lap welded tubes have established agencies with Chicago business houses having the proper trade connections. It is estimated that the annual sales of wrought-iron pipe in Chicago and its vicinity now amount to over \$4,000,000, notwithstanding sales made by mills not represented in Chicago and selling by correspondence or through travelers, the extent of which can only be conjectured.

The consumption of wrought-iron pipe in the Northwest, as in most other sections, is increasing by reason of the new uses being found for it, as well as the natural growth attending the increase in

ment to eaves to carry a stream of water to the roof in case of fire. The growth of steam and hot-water heating is also having its effect on the pipe trade, and in numerous cases wrought-iron pipe is being used as a casing for electric wires when buried in the streets.

An important field is, of course, found in the new natural-gas district of Indiana, in which more territory is constantly being opened up, requiring pipe for wells and also for distributing the gas to points of consumption. But a more constant demand for large pipes is expected in the distribution of water through Western cities. Large wrought-iron pipes are rapidly working their way into use for mains. The trade in this one item alone amounted to probably \$1,000,000 last year in the entire country, of which the greater part originated in the West. The National Tube Works Company are paying special attention to this matter, and are making

65 pounds to 16.6 pounds, and the difference continues in still larger sizes. The wrought-iron pipe of the same capacity will thus form a line about four times as long as its cast-iron competitor, weight for weight, while the increase in cost will not cover the whole of the difference. It is claimed that the joint used on the wrought-iron pipe precludes all possibility of leakage. The converse joint consists of a cast-iron sleeve, with concave grooves for the admission of molten lead, a projecting ring in the center of the sleeve of the same height as the thickness of the pipe to prevent lead from running into the pipe, and two slots into which rivets on opposite sides of the pipe engage when it is inserted and given a half turn. The pipes when laid with this joint are given an air-pressure test to insure perfection. These points, together with the difference in freight on the lighter weight, have given wrought pipe the preference over cast pipe in numer-

ous Western cities, particularly in remote localities to which freight rates are very high.

The prospective new uses for wrought-iron pipe in the West are of a similar character to those anticipated in the East. The Boston hot-water house-heating system from a central source of supply is expected to secure a foothold in other large cities, and if it does there will be a heavy consumption of wrought pipe for that purpose. The cities which are now suffering from the soft coal smoke nuisance are

is nearly 500,000 tons of ore. The company making the sale retains several thousand acres on which ore has been found, and their work of development will be begun early in the spring. The Palmer mine has produced over 500,000 tons of ore to date.

New Naphtha Boiler.

Some time since we described and illustrated the naphtha engines and boilers built by the Gas Engine and Power Company,

under the coil. The burner is a circular tube having a gap opposite the entrance and formed with holes along its upper surface. This, the main burner, is first heated by what may be termed an auxiliary burner arranged beneath it, and supplied with gas from a tank. The exhaust gas from the engine is led to a keel condenser. In engines above 16 horse-power the air is supplied by a blower run by belting from the main shaft, this insuring a more perfect combustion and more effective operation of the engine. The jacket covering the coil may be lifted off to permit access to the latter for cleaning.

The Pietzka Revolving Puddling Furnace.

According to Dr. Wedding there are seven of Pietzka's double-heap revolving puddling furnaces at Witkowitz, in Moravia, and seven others are to be added to those now erected at Zawadski. At the latter works the production of one of these furnaces is found to amount to three times that of a furnace of the ordinary type, besides which only six men are employed instead of twelve. The coal used is less by 40 per cent. in the case of the older type of the revolving furnace, and it is hoped that a further reduction of 20 per cent. will be effected in the case of the more improved form of furnace now in course of erection. The repairs are stated to be unimportant. The arch lasts for many months. The fire bridge is repaired every four weeks. The regenerators are cleaned out every fortnight, two hours being found sufficient to effect this. The heating-up of a cold furnace can be completed in five hours. The percentage composition of the producer gas used in the furnaces at this works is about as follows:

CO.	Heavy carb'ns.	Light hydrocarb'ns.	OO.	H.	O.	N.
1.4	0.4	2.3	27.8	8.9	1.4	57.8

The percentage of carbonic oxide rarely falls below 26, and is frequently above 80. It is stated that the loss of metal in this mechanical puddling furnace is somewhat less than in the ordinary one. The following table gives comparative working results of the two furnaces:

Month.	Ordinary furnace.			Revolving furnace.					
	Production.	Tons.	Loss.	Production.	Tons.	Loss.	Production.	Tons.	Loss.
First ..	57.6	9.3	105.6	29.3	6.6	87.3	24.02	44.8
Second	38.6	9.8	106.9	314.4	6.1	65.8	337.0	42.4

These results were obtained from furnaces at the Witkowitz works.

From a number of letters which have reached us it is clear that some of the readers of *The Iron Age* have construed the fact that we published in our issue of February 7 a statement embodying the claims made for the Robert process as an indorsement of it. As we distinctly stated, no representative of *The Iron Age* has yet examined the plant or investigated the process. We made no comment because that did not seem necessary with any one who is familiar with steel manufacture.

The boiler-makers in the Risdon Iron Works, at San Francisco, struck on the ground that certain iron plates being used in the repairs of boilers of the steamship Australia were made abroad.

Fig. 1.—The Burner.

Fig. 2.—Naphtha Boiler.

NAPHTHA BOILER, BUILT BY THE GAS ENGINE AND POWER COMPANY OF NEW YORK.

niously looking for some means of relief, and there will be little obstruction thrown in the way of introducing a system of heating which will at the same time prove satisfactory to the users and beneficial to the community at large. If it also helps the pipe trade, that is the system which will meet with most favor from the pipe manufacturers.

A dispatch from Marquette, Mich., says that General Alger has bought the Pittsburgh and Lake Superior Company's iron mine for \$800,000, including 1800 acres of iron land. The mine has been a continuous producer since 1871, shipping 56,321 tons of ore last year. Its total production

of Morris Dock, New York City, for their launches. Since then several important changes have been made in the construction of the boiler, which is here illustrated. The boiler, Fig. 2, consists of copper tubing coiled as shown, each spiral consisting of four turns. The naphtha is admitted at the bottom instead of at the top as formerly. The burner, Fig. 1, is provided at its upper end with an injector, Q', supplied with naphtha gas through a pipe, P, leading to the boiler, as shown. The current of naphtha on its passage to the burner (which is lighted through the opening A in the retort) draws in air through the flaring opening Q', and the mixture thus formed burns as it issues from the small holes in the burner

Ball Bearings.

The accompanying engravings are intended to serve as suggestions concerning the use of ball bearings. The designs

have little doubt that ball bearings will ultimately be widely used for both light and heavy work, and for slow and quick speeds. Other things being equal, the fact that they reduce the loss due to fric-

being provided with a separate set of machinery, boilers, shafts and screws. Each

Fig. 1.—Applied to Head Stocks.

were made by J. J. Grant, superintendent of the Simonds Rolling Machine Company, of Fitchburg, Mass. An examination will show that Mr. Grant has so chosen his subjects as to embody the three principal features of all bearings, and has endeavored to eliminate the loss of power due to friction in bearings as ordinarily constructed by the use of balls. His designs are applicable to the following cases: A cylindrical shaft revolving in a cylindrical journal, a thrust bearing, and a combination of these two.

In Fig. 1 the ball bearing is shown applied to the headstock of a lathe. In this case the spindle is formed with annular ridges, which serve as both thrust and rolling bearings, the balls being arranged as clearly shown. The two next illustrations are of shafting of slow and quick speeds. In the first the balls are placed as closely as may be in a cylindrical casing surrounding the shaft. In the second case, Fig. 3, the balls are arranged in rings or circles, each ring being separated by a disk, and the shaft being provided with a sleeve. The next drawing is somewhat similar to Fig. 3, except that the balls come in direct contact with the shaft. In

tion to a minimum is acknowledged. Now that practically perfect and uniform balls of tempered steel can be obtained at a moderate cost, their more ex-

Fig. 4.—Applied to Cable Sheave.

side is again subdivided by solid bulkheads into numerous compartments. The ship

Fig. 3.—Applied to Shafting.

tended use in bearings generally seems to be assured.

The new Hamburg steamship *Columbia*, to be put on the line next spring, in some

has a double bottom. The boilers are placed in three water-tight compartments, completely cut off from one another, so that even if two of the compartments should be flooded the boilers in the third would be able to keep one of the engines working. The vessel's speed is guaranteed to exceed 19 knots, or 21½ miles, per hour.

Fig. 2.—Applied to Heavy Journals of Slow Motion.

Fig. 5 longitudinal motion of the shaft is prevented by angular bearing surfaces. As applied to cranes, Fig. 6, and water-wheel steps, Figs. 10 and 11, and jack-screws, Fig. 9, where the object is simply to provide a bearing upon which the load-bearing parts may turn easily, the balls are placed in angular grooves, and support flat bearing plates, except in the case of the crane, in which both upper and lower bearings are formed of angular grooves to receive the balls. The bearing for the upper end of the crane-post resembles that for a shaft. In the case of a worm shaft, Fig. 8, the thrust in both directions is received by balls placed in angular grooves in a collar on the shaft, the second bearing for the balls being formed by the end of the journal box. The ball bearing when applied to a propeller shaft to take up the thrust is shown in Fig. 7.

The subject of ball bearings so briefly outlined in the above text, and so plainly and widely illustrated by the engravings, will bear careful and close study. We

respects represents the most advanced type of steamship architecture. The ship has a length of 468 feet, a width of 56 feet,

and a depth of 38 feet, and is of 10,000 tons displacement and 12,500 horse-power. A longitudinal bulkhead, running from stem to stern, divides the ship, each side

Encouragement of Ocean Shipping.

Measures for the upholding of our steam ocean marine are likely to receive special attention in Congress at an early day. Despite all that has been done, be it much or little, either by Congress or by State legislature, to relieve ocean commerce from needless burdens, the amount of this class of tonnage afloat steadily diminishes, although at a lessened ratio, as shown by the report of the United States Commissioner of Navigation for 1888. It is quite certain that a strong effort will be made to bring about a radical change of policy

Fig. 5.—Applied to Grinding Machinery.

respecting the part which the general Government should take in the maintenance of steamship lines to foreign ports. So long as foreign governments persist in

lavishing large sums in aid of steamship lines on all principal routes of traffic, satisfied that the benefits accruing indirectly to the nation at large return a full equivalent for the amounts thus expended, just so long must Americans, less favored in the manner described, be crowded out from the field. This is a view commonly

our coastwise shipping, he said the extent of its growth "can be appreciated only by a comparison of its effective tonnage at different periods on the accepted basis of computation, which allows 1 ton

that our patriotic pride is changed to a feeling of humiliation. How great this difference is will be seen," he said, "when the statistics of the growth of our shipping in the home trade are compared

Fig. 6.—Applied to Crane.

taken and which seems to have become more firmly established in the convictions of public men.

The number who accept "free ships" as affording promise of an adequate means of relief are comparatively few. Perhaps no better indication can be cited of the prevalent tone of sentiment among the class of men destined to lead in public affairs for some years to come than is afforded by the addresses delivered before the Boston Chamber of Commerce at its annual dinner a few days ago. President Spears, in his opening remarks, said that 80 years ago upward of 100 prominent

of steam vessels to be equal in carrying efficiency to 3 tons of sailing vessels. On this basis our coastwise shipping in 1840 was the equivalent of 1,689,814 tons of sail. In 1869, after it had recovered from the disturbing effect of the civil war, the tonnage of our coastwise shipping was the equivalent of 4,800,892 tons of

Fig. 9.—Applied to Jack Screw.

sail. On the 30th of June last this equivalent tonnage had reached 6,177,475 tons, an increase of 43 per cent. in two decades. Thus to-day we can point with pride to the fact that the home fleet of the United States has a tonnage three times that of the home fleet of the United Kingdom and

Fig. 7.—Applied to Propeller Shaft.

merchants in that city were engaged in ocean traffic representing 700 sail of vessels, not one of whom is known to the trade to-day. Ex-Governor Dingley, of Maine, who has been prominently identified with the shipping interests of that State, followed in response. First, in reference to

five times that of any other nation, and increasing more rapidly than that of any other country on the face of the earth. It is when we turn from our magnificent fleet of vessels engaged in the home trade to the small and diminishing fleet of American vessels in the foreign carrying trade

estimated that hardly more than 600,000 tons were actually engaged in the foreign trade."

Basing his remarks on official statistics Mr. Dingley combatted the assumption

Fig. 8.—Applied to Worm Shaft.

with the official statistics of the decline of our shipping in the foreign trade. Since 1855 American vessels have been carrying each year a smaller proportion of our exports and imports, the decline having been

Fig. 10.—Applied to Water-Wheel Step—Wheel Above Step.

9 per cent. in value and 5 per cent. in tonnage in the six years before the war, and 14 per cent. in value and 18 per cent. in tonnage in the 23 years since the war, until at the close of the last fiscal year our registered tonnage was only 943,784 tons (only 183,897 being steam), of which it is

Fig. 11.—Applied to Water-Wheel Step—Wheel Below Step.

that tariff changes either since or before the war have anything to do with the general condition, our foreign commerce, our exports and imports having never increased so rapidly as during recent years. The adverse change is due, rather, to the revolution from wood to iron and steel in materials, and from sails to steam as a means of propulsion, Great Britain having been enabled through her iron and coal mines and cheap labor to demonstrate the rightfulness of her claim to the supremacy of the seas. Moreover, aside from these natural advantages, by extending aid to steamship lines by means of "postal subsidies" and profitable contracts to builders, the British Government was enabled to defy competition from any other source. Mr. Dingley contended that in the present exigency the shipping question should be grappled with solely on patriotic and commercial considerations.

In looking for practical measures, Mr. Dingley said: "There are some important steps which should be taken without delay. In constructing a new steel navy the contracts should be given to as large a number of existing shipyards and individuals who will establish such new yards as soon as possible, with a view of securing plants for the construction of iron and steel vessels at various points of the Atlantic, Pacific, Gulf and lake coasts. All imported materials for the construction, equipment, repairs and supplies of our vessels for the foreign trade should be admitted with a rebate of duty on proof that they have been used for this purpose, on the same ground that imported materials for the making of articles for export have always been admitted nearly free of duty. The Government should adopt a policy to encourage the construction of steamships for the foreign trade of a character available as swift cruisers in time of war by offering a construction bounty on all such vessels built so as to meet the requirements of the Navy Department. The policy of the Government should be radically changed in making contracts for the ocean transportation of our foreign mails, and mail contracts should hereafter be given out so as to encourage the establishment of American steamship lines, instead of practically discouraging them, as is the case now."

Senator Hoar, of Massachusetts, addressing the Boston Chamber of Commerce, represented that we can expect no large foreign market for our manufactured goods until we can exchange our products with those of other countries in our own ships. Great Britain believes that she can maintain her position as a great manufacturing nation, that she can continue to have the exchanges of the world made and the accounts settled in London, only by maintaining this trade, whether it be profitable or losing in itself. Addresses of like tenor followed from three presidents of local commercial bodies. Altogether, the feeling manifested respecting the prospects for American shipping is regarded as of the most hopeful character.

The Jagger Ironworks Sold.—The Jagger Ironworks, on Martin Garrettee's Island, at Bethlehem, near Albany, were sold at auction by Nathaniel Niles, referee, the plant consisting of two furnaces and including 15 acres of land. Among those at the sale were: Hon. G. Burleigh and B. W. Burleigh, Ticonderoga; J. F. Harris and George D. Harris, Fort Edward; Jesse Billings, Ballston; Paul Cushman, Thomas W. Olcott, and P. J. McArdle, of this city. H. G. Burleigh bid \$10,000; S. W. Rosendale, \$15,000; Fred. Schifferdecker, \$16,000; Burleigh, \$20,000; J. F. Harris, \$25,000; Paul Cushman, \$30,000, and P. J. McArdle, \$30,100. The property was finally knocked down to P. J. McArdle for \$30,100. Ten per cent.

of the purchase money was paid on signing the contract of sale. We are informed by interested parties that the furnaces and sufficient land to operate them can be purchased of P. J. McArdle at a material discount from the amount paid by him.

Legal Decisions.

PARTNERSHIP—FIRM NAME SIGNED TO SURETY BOND.

One member of a firm signed the firm name to a surety bond without the knowledge or consent of the other members, and when the bond was sued upon, payment of the penalty being refused, the defense was set up that the signature was unauthorized. Plaintiff had judgment, and defendants took the case—*Fox vs. Hittson*—to the Supreme Court of Texas, where the judgment was reversed. Judge Walker, in the opinion, said: "The bond was not made in the business of the firm, or in settling up its old business. No acts are shown of either of the other members of the firm to bind them by this bond. They never knew of it until this controversy arose, and therefore could not ratify it. No act or course of business on their part appears in the record from which an estoppel can be inferred, and there is no want of knowledge of the want of authority on the part of the member signing by the obligees in the bond. It is a well-recognized rule that where one member of a firm uses its name outside of the business of the firm, and it is so shown, that it then devolves upon the holder of such obligation to show authority for such use, which may be by direct or circumstantial evidence, or a subsequent ratification will supply authority. It is also well settled that where a firm name is used as surety for a third person, the presumption is that such use of the firm name is outside of the business of the firm, and that in such a case the burden of proving assent, estoppel or ratification lies upon the person asserting the liability of the parties not acting as signatories. The charge below was misleading, and there should have been a new trial allowed on the motion made for it. We reverse the judgment and order a new trial."

COMBINATION TO RESTRAIN EMPLOYMENT.

A corporation was created for these avowed purposes: 1, for the cultivation of music; 2, for the promotion of good feeling and friendly intercourse among professional musicians; 3, for the pecuniary relief of the members of the corporation. In their by-laws the corporation declare that no member should perform in any orchestra or band in which any person who was employed was not a member of the corporation, or should employ any such person, and they required that a residence of six months in the United States should be a qualification for membership. T. was a member, and he was threatened with three fines of \$10 each for employing non-members; whereupon he sued for an injunction to restrain the corporation from enforcing the penalties, and got a judgment. The case—*Thomas vs. Musical Protective Union*—was carried to the general term of the Supreme Court of New York, where the judgment was affirmed. Judge Brady, in the opinion, said: "The effect of the by-law as to employment, which is not necessary to carry out the purposes of corporation, is to create a close corporation and to force each member of the profession to become a member also of the union, unless he prefers to abandon his calling, or seek some locality where he can employ his talents and exhibit his capacity to procure means for his support, or that of his family, if he have any. The by-law as to residence is

arbitrary and inconsistent with the purposes of the corporation; and it operates to proscribe the foreign musician from obtaining employment. There is no response to be successfully made to the charge that such elements are not only against public policy, but antagonistic to the right of every man to earn, by honest labor, lawful in itself, whatever it will command, whether the laborer or artisan or artist be foreign or native born. It would, doubtless, be a clever mode of securing, per force, the advantages of a successful union if the exclusion from labor of all musicians not members of the union could be accomplished, but this may not be done. Unions of a benevolent or protective character should be the result of good feeling and a just appreciation of the rights of others and not arbitrary or oppressive combinations. The inciting motive to join them should be fraternal, and not an apprehension of disaster. It has been justly said that associations have no more right to inflict injury upon others than individuals have to do so. The plaintiff by becoming a member of the union did not bind himself to observe any unlawful feature of the constitution and by-laws. When they are against public policy, and in restraint of trade, and, therefore, illegal and invalid, no assent or acquiescence can bind him."

CONSPIRACY OF LABORERS.

N. and others were indicted for conspiracy to compel certain coal operators to quit working by force of threats and menaces, and the prosecuting attorney used in his argument to the jury a caricature in *Puck*, a comic paper, entitled: "Suckers of the Workingmen's Sustenance," the court having given him permission to exhibit it. A conviction was had, and the case—*Newman vs. Commonwealth*—was carried to the Supreme Court of Pennsylvania, on the ground that the use of the caricature prejudiced this case. The court, in its opinion, said: "With reference to the exhibition of the picture we cannot say that the court was wrong in permitting it. Things of this kind are very much a matter of discretion, and we are not disposed to review them unless we are satisfied that some serious wrong has been done."

War Vessels Launched Last Year.

A careful estimate places the war ships launched by the naval powers of the world in 1888 at 60, while more than 100 were building when it closed. England led with 15 vessels launched and 28 building; France launched 9 and laid down 15; Russia launched 2 and began 10; Germany put 6 vessels into the water and ordered or laid down 4; Italy launched 10 and laid down 18; Austria launched no vessel, but laid down or ordered 3; Sweden laid down 1; Denmark launched 1 and laid down another; China added 4 vessels to her navy and ordered laid down 4 more; Japan ordered 8 and launched 3; Chile ordered a new cruiser in England, and the Argentine Republic contracted for a 4800-ton ironclad; Brazil laid down a cruiser, and even Uruguay has contributed to the navies of the world, launching a small iron gunboat. The minor powers, like Greece and Portugal, have either contracted for or launched small vessels. Turkey has begun the work of building up her navy, laying down one ironclad and several smaller vessels. The United States launched 6 and laid down 6.

Modern steam hoisting machinery is to be placed on the ore docks at Cleveland by the New York, Pennsylvania and Ohio Railroad, and the line from Youngstown to Cleveland will be double tracked, \$1,000,000 having been raised in London for these objects. About \$200,000 have already been expended for freight engines.

Universal Milling Machine.

The cut here presented represents the long and well known No. 1 universal milling machine built by the Brown & Sharpe Mfg. Company, of Providence, R. I. The distinctive features of this machine were patented by Joseph R. Brown in 1865, and the original was first introduced to the attention of mechanics at the Paris Exposition of 1867, when its superiority for certain classes of work was at once recognized. The universal has all the movements of a plain machine, and, in addition, the table is fed automatically at an angle to the axis of the spindle, and the spiral head is so made and connected

68 provided for may be cut without interfering with the divisions obtainable from the index plate. The spindle may be moved through any required portion of a revolution or rotated continuously, and, by the use of the raising block, the spiral head may be set at any angle on the bed. A taper hole, $1\frac{1}{4}$ inches diameter at the small end, extends through the spindle and is fitted to receive the collets and arbors that are used in the main spindle. The front end of the spindle is threaded to receive a chuck. A piece 8 inches diameter and 14 inches in length can be swung between the spiral head and the footstock. An important addition to this machine is obtained by the applica-

are now carefully lined and the clay packed tightly around them. When in line the centers are removed, one after another, and the clay cut out crosswise in the middle of each box. The center is then replaced and the hollow space filled by pouring in babbit. The center and remaining clay are then removed and upon the ribs of babbit (in the middle of each box) is placed the shaft, which is now accurately in line. Finally the space left is filled with babbit. In this way the shaft can be quickly and accurately lined the bearings will be absolutely true and the lining from $\frac{1}{4}$ to $\frac{1}{2}$ inch thicker than the ordinary $\frac{1}{4}$ -inch lining, consequently the shaft itself will last longer.

Electrical Exhibit at Chicago.

An electrical convention was held at the Exposition Building in Chicago this week, beginning on Tuesday and ending to-day, under the auspices of the National Electric Light Association. Much interest has been manifested by manufacturers all over the country, and the exhibition is said to have been the largest and most interesting ever seen at a convention of this kind. One of the most interesting features was an electric street railroad, 800 feet in length, laid in the main hall, by the Thomson-Houston Company. Great progress has been made in this direction during the past two years, and the fact that one company has built within that time 23 roads, all of which are in successful operation to-day, demonstrates beyond doubt that the experimental period has been passed so far as electric street railways are concerned. The Directors of the Exposition Company have manifested a lively interest in the exhibit features and offered every facility to make the convention a complete success. They are desirous of having at an early day, possibly this year, an exhibit that will completely fill the great building and will include everything electrical. They have in mind the railway exhibit of 1890, and intend surpassing it in point of interest and variety. Such an exhibit would be of great benefit to Chicago, as it would be international in scope, and therefore would excite interest the world over; as a drawing attraction it would doubtless pay for the expense incurred, as there is something mesmeric in the very word "electric."

The cruiser Petrel, building at the Columbia Iron Works, in Baltimore, will soon be ready for the official test of speed. While the contract demands that the Petrel shall develop 1100 horse-power she promises to develop not short of 1300 units of horse-power. This would mean \$20,000 additional to the Columbia Iron Works. The hull, machinery and fittings have all been constructed at the Columbia Iron Works, but the steel plates are the manufacture of the Carnegie Works, of Pittsburgh. The engines of the Petrel are compound, there being two cylinders of 25 and 46 inches in diameter respectively. The length of the Petrel is 175 feet, her extreme breadth 31 feet, depth of hold amidships 15 feet 7 inches. Her tonnage is 870. The Petrel is just about half the tonnage of the Yorktown, but her main battery is only two guns less. The Petrel is so far the smallest of the war vessels building for the new navy, but she is expected to rank among the most efficient of the fighting gunboat cruisers. The contract price is \$280,000.

In view of the interest now taken in pneumatic guns for the projection of dynamite, it is to be noted that the first tube used for that purpose was furnished from the Chicago warehouse of the National Tube Works Company. If the guns could be finished as fast as the tubes could be furnished it would require a very short time to equip the seaboard cities with these new weapons of defense.

NO. 1 UNIVERSAL MILLING MACHINE, BUILT BY THE BROWN & SHARPE MFG. COMPANY, OF PROVIDENCE, R. I.

with the feed-screw that a positive rotary movement may be given to the work. The wear of the main spindle is taken up by longitudinal movement and the end thrust is taken by a collar. The knee can be moved vertically 15 inches, and the saddle holding the spiral bed can be moved 6 inches in a direction parallel with the axis of the main spindle. The table is 28 inches long by 5 inches wide, and has an automatic feed of 17 inches. A series of graduations shows in degrees the angle to the axis of the spindle at which the table is fed, and index dials show the vertical and horizontal movements of the knee in thousandths of an inch. The spiral head has indexing mechanism by which the periphery of a piece of work may be divided into equal parts, and the velocity of the rotary movement of its spindle, or of the work, relative to the speed of the feed screw, is regulated by change gears at the end of the bed. Any spiral of the

tion of an overhanging arm for supporting the outer end of the arbor carrying the cutter. The form of this arm is plainly shown in the illustration.

Lining a Long Shaft.—In an elaborate description by H. O. Hofman, of the Dakota School of Mines, on gold milling in the Black Hills, we take the following report of a method of lining shafts which originated with Mr. R. Graham, the millwright of the Homestake Company, and which has proved to be quick and effective. When a shaft is to be lined, the boxes are placed so as to be approximately in line. The lower bearing, which is to receive the shaft, is loosely packed with clay and a wooden center pressed into it. This consists of a semi-cylindrical piece of dry wood having the same diameter as the shaft and about the length of the box. The wooden centers of two or more boxes

New Style Shearing Machine.

The new style of shear here illustrated is especially adapted for cutting either round or flat bar iron. The machine consists essentially of a shear lever moved by a cam on a shaft passing through under the

this—that the same number of rupees would no longer exchange for the same amount of gold as formerly, but would exchange for, or, in other words, would buy as much of any commodity or commodities in India as they ever bought before. What was the relative position of the Eng-

country. He was enabled by this fall in the exchange to take the lower price of £1 10/ per quarter instead of £2 without any loss whatever to himself; in this way he was enabled to undersell them and his rivals in all other parts of the world, and not unnaturally he depressed the market price of wheat in England and the gold-using countries of the world.

SHEARING MACHINE, BUILT BY THE NEW DOTY MFG. COMPANY OF JANESVILLE, WIS.

lever, the shaft being driven by gears from a second shaft carrying the balance-wheel and driving pulley. The knives for cutting round and flat iron are on opposite sides of the king bolt, and both are always in place ready for use. The shears for round knives are made the reverse of the iron, thereby preventing the flattening of the bar in cutting; they leave a round end on the iron. The machine is back-geared ten to one, and all the parts are made strong enough to resist the greatest strain which can be brought upon them. These machines are made by the New Doty Mfg. Company, of Janesville, Wis., in six sizes, the smallest of which weighs 600 pounds, and is capable of cutting 1-inch round iron or 3 x 1/2 flat iron; the largest machine weighs 10,000 pounds, and will cut 3-inch round or 6 x 2 inch flat iron.

Silver and Wheat.

The English controversy as to the effect of the fall in silver upon the relations of British and Indian wheat growers is revived at this time by a speech of Mr. Chaplin at Abingdon, in which he puts in very clear and concise form the reasoning that the decline in the gold price of the rupee had operated as a protection to wheat growers of India. Mr. Chaplin's remarks on that point were thus reported:

The rupee in India, which was formerly worth 2/6, had now, as a matter of fact, fallen in value to very nearly 1/4d, and the fall had led to all the differences of exchange by which their interests were so seriously affected in the wheat-growing industry. However much the rupee of India had fallen in value in relation to gold, in relation to wheat and other commodities in India it had not fallen at all. In other words, what had happened was

lish and the Indian grower at the present time? Under the influence of exchange the Indian grower was realizing just the same amount as he ever realized before, while the English grower, on the other hand,

Fig. 1.

Fig. 2.

Fig. 3.

THE "CHALLENGE" UNIVERSAL CUTTER, REAMER AND FACE GRINDER

was getting less by half a sovereign on every single quarter that he sold. It must be obvious, therefore, that the Indian grower was cultivating wheat at the present time under an enormous advantage as compared with his competitor in this

tween centers, 15 inches, and traverse or cut, 12 inches; face or side cutters up to 8 inches in diameter can be ground.

This machine is made by the Diebel Sewing Machine and Trimmer Mfg. Company, of Philadelphia, Pa.

The Challenge Universal Cutter, Reamer and Face Grinder.

This machine is designed to do every variety of cutter and reamer grinding. Fig. 1 represents the machine arranged for reamer grinding, Fig. 2 illustrates face cutter grinding and Fig. 3 burr cutter grinding. In operation, reamers of any kind and shape are held between the centers of and moved at any speed along the face of the emery-wheel by means of the feed crank G, having a pinion engaging with a rack under the slide D. The adjustment for tapers and bevels is by means of the table E, which is pivoted at its center and has its bearings on the slide D, which is graduated at the arc immediately above the feed crank G, thus insuring absolute accuracy, the centers always remaining in line. The hand-wheel F moves the slide E, to which the work is secured, to and from the emery-wheel. The cutter holder, shown in position in Figs. 2 and 3, and to the left hand at the base of Fig. 1, is secured to the table E, and is so arranged that, by turning the thumb-screw, the cutter can be raised or lowered to exactly the right clearance for "backing off" the teeth. It is also arranged to swivel on its base, permitting the widest range of angle for bevel cutters, as illustrated in Fig. 3, and is graduated for the nicest adjustment. End and hollow mills, placed in a chuck and applied to this device, can be ground without trouble. The twist drill attachment L is very convenient for grinding twist drills and small tools; it is adjustable to any height or angle. The greatest distance from center of spindle to table is 10 inches; the swing, 5 inches; distance be-

THE WEEK.

A heavy tumble in ocean freights has led to a cut in rates on dry goods between the White Star and the Inman lines. The movement was precipitated by the introduction of two cheap-running steamers of large capacity, expressly built for the trade, and under the sharp competition thus arising it is probable that other lines will become involved, and the cut extend to various classes of merchandise. The tendency must be to stimulate a foreign trade that of late has assumed a magnitude beyond all precedent.

Work on the Panama Canal, where 6000 laborers were employed, was stopped on Friday. The Government of Chili offers free transportation to all competent men to engage in railway building under contracts recently concluded with American engineers. There were not many American workmen, but the American Dredging and Contracting Company, which employed most of them, had about 500, whose expenses for transportation homeward will probably be met by an appropriation from the Treasury at Washington.

One-half of the window-glass now used in this country is manufactured in Belgium, and as the importers could not be induced to join in the proposed window-glass trust, the whole scheme is said to have fallen through. There are 1305 pots in the country, and of these 1157 are in operation and 148 are idle. In the Pittsburgh district there is not an idle pot, and 350 are in operation.

The New York Building Bureau reports that the applications for the construction of new buildings the coming spring are much more numerous than usual at this season of the year, and that prospects are more favorable than ever before. The Rouso storehouse, to be erected at 549 and 551 Broadway, will be one of the largest and most extensive in the city. It will have a frontage of 73 feet and a granite and iron front, ten stories high.

Despite the opposition in Congress to the employment of steam printing machines in the Bureau of Engraving, the committees who have had the subject under consideration report adversely to the advocates of hand presses. Steam press-work, it is affirmed, fulfills the highest requirements.

Remarking upon the Senate's substitute for the Mills bill so far as concerns the single item of tin plate, Senator Aldrich said, the duty now collected with the tariff at 1 cent a pound is \$6,000,000 in round numbers. At the rate of duty proposed in the bill, to take effect July 1, 1890, 2.15 cents a pound, the revenue would be \$12,900,000. Unless he was greatly mistaken in the matter of tin plate, we shall be manufacturing nine-tenths of all we use a year after the new tariff goes into effect.

The deplorable condition of the New York State prisons, under the operation of the ill-advised legislation of last summer, received the attention of the Union League Club at its last session, Chauncey M. Depew in the chair, and resolutions were passed in favor of "adequate and liberal provision for the employment of persons confined in the penal institutions of the State in such productive labor as is adapted to the situation in which they are placed." A very decided reaction on this subject has taken place throughout the State.

Encouraged by the success of the technical school in Hoboken, the Industrial Education Association, of New Jersey, are endeavoring to establish training schools throughout the State. Among those in-

terested in the work are: Prof. Charles H. Ham, of the Chicago Manual Training School; Dr. Nicholas M. Butler, president of the Industrial College of New York; the Rev. George C. Houghton, president of the New Jersey College of Manual Training; Charles W. Fuller, State Superintendent of New Jersey, and Wayne Parker, of Newark.

American trade-marks and labels are extensively imitated in Brazil, with the object of introducing inferior goods. The penalty is evaded by a skillful use of the Spanish and French languages.

The estimates of national expenditure in the Dominion for the coming year make a total of \$35,400,000, as against \$36,739,000 last year, \$12,000,000 being interest on the public debt.

Even in its present unfinished condition, the new Capitol at Albany is by far the most costly building of modern times. The original plan of the Legislature was to expend \$4,000,000 in its construction, and with that understanding the corner stone was laid 18 years ago, in 1871. But before it had advanced to its second story it had already cost \$8,000,000, and since then the amount has been increased to \$18,000,000. The Capitol at Washington, from the laying of its corner stone in 1793 up to 1878, had cost only \$13,000,000, including all expenses of repairs, alterations and furnishing during the 85 years. The Patent Office has cost nearly as much, but it has been burned down and rebuilt. The Treasury, of a more expensive design than the Capitol, has cost \$7,000,000. The Palace of Justice at Brussels, described as "the architectural wonder of the century," has been finished at a cost of \$10,000,000.

The port of Cleveland, Ohio, famous for its shipments of iron ore, rejoices in the prospect of having the best ore docks on the lakes, the sum of \$800,000 being now available for modern machinery and other improvements.

The British steamship Chancellor, at Charleston, has made two attempts to load cotton for export, and in each instance the cargo took fire spontaneously, making it necessary to scuttle the ship.

A St. Louis company contemplate running a line of light draft steamers direct between that port and Central America, and 150,000 shares of the stock have been subscribed for by merchants in Venezuela.

There was shipped from Pittsburgh last week 180,000 feet of underground cable for electrical purposes, consigned to parties in Rio Janeiro, Brazil. This is the largest order yet received from a South American port.

President Stevens, of the National Builders' Association, in his address before the convention in Philadelphia, took strong ground in favor of the establishment of trade schools. "As regards the views expressed by the National Association on the apprenticeship system, at its first convention at Chicago, and again at Cincinnati, last year," he remarked, "they seem to have taken hold of the public and been adopted by them. The press of the country has, in many leading editorials, discussed the subject, and is busy molding public opinion. Already steps have been taken that look toward the early establishment of trade schools, and some of our public spirited citizens are devoting their means in support of such enterprises. Notably among these I may be permitted to name Col. R. T. Auchmuty, who, not satisfied with the good accomplished by his New York trade schools, which were established and are supported by him, has offered to the Builders' Exchanges of Boston and Philadelphia a very large sum of money toward the establishment of such

trade schools under the auspices of the exchanges in those cities." No mechanic, the speaker said, should look upon trade schools as a menace to his interests.

The Western packers of canned goods have 83 factories in their association, who are co-defendants in a suit for an infringement of a soldering patent.

Baltimore aspires to build up a grain export trade at that port of a permanent character, and to hold the leading position among all rivals. Since January 1 Baltimore has exported nearly 5,000,000 bushels of corn, and 194,000 barrels of flour while the movement from other ports has been comparatively insignificant. Merchants in Baltimore are now discussing the feasibility of establishing a line of steamers to Brazil, taking out cargoes of flour, grain and provisions and returning with coffee, hides and other South American products. They would doubtless expect to absorb a considerable share of the coffee trade now done in New York, in the same way that St. Louis is endeavoring to divert to Western centers the coffee trade between New York and Central American ports, which for a number of years has rapidly grown in importance. The trunk line railroad companies feel much disturbed by the tendency of the grain trade to take a new route, at least during the close of navigation.

A powerful statement in support of the gold standard was made by Herr Bamberger in the German Reichstag, a few days ago. He held that the present prosperity of Germany was greatly due to the abandonment of bi-metallism, and showed that the country held gold stock, including the bullion in the Reichsbank and private banks and the war treasure in the fortress at Spandau, amounting to 800,000,000 marks, the Reichsbank alone holding 400,000,000. Business, especially finance, was booming, he said, and all countries were coming to Germany for loans. His arguments failed to impress the majority in favor of bi-metallism, and it is determined to push the question to a division of the House.

A well-known expert, who recently visited Utah in the interest of Eastern capitalists, reports that fully 700,000 tons of asphalt now lie deposited in one of the plains near Vernal, and is available for commercial purposes. Ex-Senator Tabor, of Colorado, is interested in the company about to develop the field.

A company headed by ex-Governor Abbott, of New Jersey, is said to have purchased 2000 acres of land near Muncie, Ind., with the design of developing the natural gas advantages of that region.

Apropos of the recommendations of the National Builders' Association, at Philadelphia, in respect of manual schools, President Sheppard, of the Board of Education in that city, says: "The introduction of machinery into all branches of manufacture has changed the whole industrial world. The apprenticeship system of the past generation has become obsolete, and nothing beyond temporary expedient has yet taken its place. Industrial training in connection with our public school system appears to afford the only practicable way of solving the problem thus presented." Philadelphia, President Sheppard says, will need five or six manual training schools in a few years to meet the requirements of the people.

More "boodle" was discovered in the method of leasing the new butcher stands in West Washington Market. A Jerseyman testified that he paid \$500 bonus to an *attaché* of the Finance Department in the City Hall, whereupon the alleged offender was promptly suspended from duty by the

City Comptroller, and the practice thus disclosed was brought to the attention of the District Attorney.

Several propositions for lines of electric street cars are before the Massachusetts Legislature for the sanction of that body.

The new British Minister to Washington, it is said, will be S. Spencer St. John, now Minister to Mexico.

The New England Water Works Association dined last week at the factory of the Chadwick Lead Company, in Boston, and interesting papers were read, as follows: "The Quincy Dam," by L. A. Taylor, of Boston; "A Few Notes on Erosion and Its Effect on the Pacific Coast," by Solon M. Allis; "Experience with a Sandblast," by John L. Harrington and Phineas Ball; "How We Painted Our Stand-pipe," by J. E. Beals, of Middleboro; "How We Placed the Working Beam in the Steamer Puritan," by W. W. Hawes, of Fall River, and "An Experience with a Water Meter," by H. G. Holden, of Nashua.

Minister Preston, of Hayti, suspecting that the steamer Carondelet, at this port, was loaded with 6000 Remington rifles, powder, &c., consigned to the Dominican Consul at Samana, convenient to the headquarters of Gen. Hypolite, the steamer was intercepted by a revenue cutter.

The Mallory Steamship Line, from New York to Galveston, with extensive connections to all points in Mexico, California, Colorado, &c., has contracted for the eleventh iron steamship to be added to the fleet.

Carroll D. Wright was confirmed last week by the United States Senate to be Commissioner of Labor.

A 14-story office building in Chicago, a Gothic structure near completion known as the Owings Building, suddenly fell into ruins last Sunday. The interior was entirely of tile, supported by iron girders. The flooring in the tenth story had shown some defect, owing to the natural settling of the building, and is believed to have fallen, taking in its course the floors below, in a fearful series of concussions. The exterior walls remain undisturbed, giving no indication of the wreck within. The architects are Cobb & Frost, who have the contract to plan the great Newberry Library in Chicago, for which several million dollars have been bequeathed. F. R. Owings, a Boston capitalist, is the owner.

The commission appointed by the Governor of Pennsylvania to devise a plan for introducing manual training into the public schools of that State recommend in their bill prepared for the Legislature the appointment of special instructors who shall have tools and machinery, but it is designed that in time the ordinary instructors shall add the teaching of the manual branches to their present accomplishments. They do not provide for teaching the trades.

The substantial progress in naval construction during the last few years elicited from Senators not identified with the present Administration words of commendation. Mr. Plumb in the course of a debate last week relating to the new cruisers said "he was glad to say (in the closing days of the administration) that the Navy Department had been well administered, not only in the sense that there had been a stimulus given (so far as could be given by executive direction) to everything that went to the up-building of the navy, to procuring the best types of ships, to the stimulation of the highest forms of manufactures, but, more than all that, to the encouragement of the individual genius of the people, and to the doing of the work, not in navy yards (where political

considerations might have influence), but in private yards. He was glad to say that during the past four years the Navy Department had been administered in a practical, level-headed, judicious way. The result was that (quoting a remark made to him by Mr. Hale) he was prepared to believe within ten years the United States would have the best navy in the world—not the strongest navy, not a navy with the most ships, not a navy with the greatest variety of ships—but a navy with the most modern ships, with ships best adapted to the work they would have to do."

Mayor Grant procured the passage of a resolution by the Electric Board of Control that hereafter telegraph trunk lines shall be carried only through the city in subways.

The Central Labor Union in this city, after a boisterous meeting last Sunday, was purged by the withdrawal of the Socialist element, representing several thousand members, mostly Germans. The divisions now are hostile camps, essentially differing in spirit, practice and aims. The interests of labor, it is hoped, as well as the observance of law and order, will be promoted by separate organizations.

The claim of Chas. E. Emery for \$10,000 for services as consulting engineer in 1887 was the cause of a lively meeting of the Brooklyn Bridge trustees on Monday.

The annual report of Commissioner Hotchkiss, of the Connecticut State Labor Bureau, makes some interesting comparisons between the wages paid laboring men in 1860 and 1888, and the cost of the necessities of life in these two years. It shows an average advance in 28 years in the wages of males of 43 per cent., and in the wages of females of 57 per cent. During the same time the increase in the cost of groceries and provisions has been only 10½ per cent., while staple dry goods show an average reduction of 39 per cent.

Capt. F. M. Ramsay succeeds Rear-Admiral Gherardi as commandant at the Brooklyn Navy Yard.

The United States Consul at Rio Grande do Sul reports upon the condition and prospects of trade in Southern Brazil. Most of the vessels crossing the bar go as far as Pelotas and many as far as Porto Alegre, which is the terminus of a railroad penetrating the center of a large German colony at New Hamburg, 26 miles distant. The steamers of 11 different lines, of from 10 to 80 tons burden, leave its docks regularly for all accessible points up to different rivers. Porto Alegre has 44,000 inhabitants, of whom 14,000 are Germans. The chief American goods sold there are kerosene oil, flour, Collin's axes and some stoves for cooking purposes. The whole country is filling up with emigrants from Europe, and will prove of great value to those who have established a trade.

A decision in England by the Lord High Justices of the Court of Appeals gives Edison an absolute monopoly of the incandescent light in that country by upholding his patent. Practically the same points are before the courts in the United States.

M. de Lesseps rejected an offer by the Credit Foncier to advance \$400,000 a month for six months in aid of the completion of the Panama Canal upon the security afforded by the old company's assets. The governor of the institution, M. Christophle, made it one of the conditions that he should act as chairman of the new organization and select two-thirds of the directors. These terms being rejected, it remains to be seen whether any other feasible plan for completing the work can be devised.

MANUFACTURING.

Iron and Steel.

We are informed that the report that the Stewart Iron Company, Limited, of Sharon, Pa., had recently purchased 14 acres of land with a view of enlarging their plant is not altogether true. It is correct that a purchase was made, but it was for the purpose of affording additional storage room. At present the company have no intentions of enlarging their plant.

Emma Furnace, of the Union Rolling Mill Company, Cleveland, Ohio, has been blown out for extensive repairs. The company have a sufficient amount of pig iron on hand to supply their trade until such time as the furnace has resumed blast again.

The No. 2 mill of the Washburn & Moen Mfg. Company, at Worcester, Mass., was badly damaged by fire on Friday night. The mill was used for drawing copper wire and making bale tie wire. The building is 175 x 50 feet and four stories high, with a full basement. The fire broke out in the third story, and burned up into the upper story, destroying the roof, badly gutting the floor below, and considerably damaging the third floor. The entire building was deluged with water. The loss will be in the vicinity of \$80,000, which is covered by insurance.

On Friday, the 15th inst., the employees of the Pottsville Iron and Steel Company's Fishback Rolling Mill were notified of a reduction from 10 to 15 per cent. in wages, to take effect on the 18th inst. The reduction affects about 700 men. It is thought it will be accepted by the men without trouble.

On Friday, the 15th inst., notices were posted on the nail factory of the E. & G. Brooke Iron Company, Limited, at Birdsboro, Pa., asking the 300 employees of the works to accept a reduction in wages to take effect on March 1. The firm recently reduced the wages of their puddlers from \$3.25 to \$3 per ton.

A reduction in the wages of all men employed in the pipe and rolling mills of the Reading Iron Works, at Reading, Pa., has been announced to take effect on Monday, the 25th inst. Common labor is reduced from \$1.15 and \$1.20 per day to \$1, and the wages of all other employees are lowered 10 per cent.

From the South Cleveland (Ohio) *Advocate* of the 11th inst. we take the following: "A conference of the Cleveland Rolling Mill Company's rail-mill employees was held with Superintendent John Walker, last Saturday afternoon. Finally a proposition was made to start the rail mill single turn, the old blooming mill double turn—one turn on rail blooms and the other on billets, providing those making good wages would accept a reasonable reduction. The men working for small wages it was not expected could work for less. The men considered the company's proposition, and, as it was made in good faith to help all concerned, they accepted it. This arrangement will keep the Bessemer steel works running full, employing 325 hands."

H. K. Porter & Co., Limited, of Pittsburgh, builders of light locomotives, made the second annual distribution of a percentage of the profits among their employees last week, and quite a large sum was given to the men.

The St. Louis Ore and Steel Company have been filling the stock houses of their furnaces for two or three weeks, and expect to blow in "C" furnace in about a week. The re-starting of the steel

works depends upon whether the steel rail market improves.—*Age of Steel, St. Louis.*

No. 3 Furnace, of the Pottsville Iron and Steel Company, at Pottsville, Pa., has been blown out owing to the dullness in the iron trade.

A press dispatch from Steubenville, Ohio, under recent date says: "The Jefferson Coal and Iron Company, of Steubenville, have obtained judgment by default against the Cartwright Iron and Steel Company for \$4166, and will immediately commence suit against the stockholders, a large number of whom live in Youngstown, Ohio, upon their statutory liability."

The steel department of the Bellaire Nail Works, at Bellaire, Ohio, is making its regular output under the direct process, the whole product of the blast furnace going direct to the converters.

Some time since announcement was made in these columns that Jones & Laughlins, Limited, proprietors of the American Iron and Steel Works, at Pittsburgh, had decided to pipe natural gas from their own wells, located in Jefferson Township, Washington County, Pa. The firm have completed this undertaking, and are now independent of the local gas companies. The main is 16 and 12 inches, and the firm has three wells of 500 pounds pressure, ample supply for the large needs of the establishment.

P. Minturn Smith, long connected with the Phoenix Iron Company, in this city, has recently assumed the presidency of the Union Iron Works, of Greenpoint, L. I., manufacturers of structural iron-work of all kinds. The offices of the company are in the Aldrich Court Building, 45 Broadway.

Irondale Furnace, at Irondale, W. T., has now been running for some time. A report by A. B. Ropes, engineer of tests of the Southern Pacific Railroad, who use the iron largely for car-wheels, shows the following analysis of No. 8 iron:

Total carbon.....	3.51
Silicon.....	0.721
Phosphorus.....	0.339
Manganese.....	0.130
Sulphur.....	0.019

Mr. Ropes adds: This iron contains much less silicon, phosphorus and manganese than the English brands, and there are no signs of vanadic acid, which was found in all the English irons and weighed with the silicon.

Machinery.

In our last issue a mistake crept into the description of the Nash gas engine, built by the National Meter Company, of New York. We stated that the floor space occupied by the 2 horse-power engine illustrated measured 25 x 85 inches. This should have been 25 x 35. We cheerfully remedy the error, as far as lies in our power, and especially as the engine is small and compact, considering the power developed.

On Monday, the 11th inst., a charter was issued to the Electric Hydraulic Company, of Pittsburgh. The incorporators are J. P. Witherow, R. F. McFeely, H. F. Floy, M. H. Herron and F. J. Edmundson. The capital is \$10,000, divided into 400 shares. It is for the manufacture of electric and hydraulic machinery.

A foundry is projected at East Chicago, Ind., for the manufacture of chilled rolls and other heavy castings and special work not hitherto attempted in that section of the country. A new process will be used in the construction of large rolls, which, it is claimed, will greatly reduce their cost without impairing their strength or durability. The rolls will be cast hollow, and a core of silica will be inserted, which is

expected to form a center of the necessary solidity. The promoters of the works claim that they have thoroughly tested their process and have demonstrated its practicability, while as to its economy there is no doubt. Plans for the foundry building are now in hand.

The Lloyd Booth Company, proprietors of the Falcon Foundry and Machine Works, at Youngstown, Ohio, since adding a roll turning department to their foundry have been prepared to turn out a complete rolling mill outfit, and have now under way an 18-inch mill, which is nearly completed. They have also under way one of their modern designs of squeezers for a plant in Tennessee. With their air furnace they are prepared to furnish their customers with refined iron and steel mixed castings. They have had a good trade in their extra heavy axle and rail shears, weighing 24 tons, having sold three within the past six months.

A. W. S. Smith, of West Oakland, Cal., would like to purchase a machine for the manufacture of excelsior.

Contracts have been awarded as follows by the Secretary of the Navy for furnishing machines and tools for the Mare Island Navy Yard, California: Joseph J. White, Philadelphia, drilling machines, \$875; Universal Radial Drill Company, Cincinnati, counter sinking machines, \$680; George Place, New York, one 250 horse-power engine, \$16,800; Detrick & Harvey, Baltimore, planing machines, \$3520; Bement, Miles & Co., Philadelphia, planing, punching, straightening, bending, countersinking and drilling machines, \$16,020; Niles Tool Works, Hamilton, Ohio, punching, shearing, bending and straightening machines, \$48,598; James W. Soper, New York, Crane foundry rattler, 100 ratchet drills, \$2390, and the Builders' Iron Foundry, Providence, R. I., hydraulic accumulator, \$2700.

The Westinghouse Air Brake Company, through their superintendent, T. W. Welsh, have placed an order with Manning, Maxwell & Moore, of New York, for 214 21-inch lathes for the new shops now being constructed. This is probably the largest order ever placed for this class of machine tools. Manning, Maxwell & Moore naturally feel gratified at the successful result of their competition, not only on account of the size of the order, but also because their tools met the very exacting requirements of the Westinghouse people and were accepted entirely on their merits.

The National Pipe Bending Company, of New Haven, Conn., report that during January they sold over 40 National heaters, aggregating over 4000 horse-power. A large number of these were for electric light plants, including three heaters of 500 horse-power each and seven from 100 to 200 horse-power. They also report the sale of a large number of coils and bends of iron, brass and copper pipe; three of these coils of 1½-inch iron pipe contained 1000 feet of pipe each.

T. R. Palmer, assignee of the St. Paul Iron Company, of St. Paul, Minn., announces that bids will be received by him up to March 1 for the property of the concern, consisting of manufactured and partly manufactured goods, foundry tools and equipment, machinery and real estate.

Hardware.

The Cuyahoga Mfg. Company have been organized at Cleveland, Ohio, for the manufacture of burglar alarm knobs and window alarms. The office of the company is located at No. 61 Grand Arcade Building, in the above-named city.

J. H. Day & Co., Cincinnati, Ohio, had their factory damaged by fire, 12th inst., the loss being estimated at \$4000, which is fully covered by insurance. Their stock-

room, however, was but little damaged, and they state that they have enough of their regular machines and other goods of their manufacture to fill orders until they get their factory in operation again, which they expect will not be over 10 days.

Coleman Hardware Company, Chicago, Ill., report a large demand for their J. G. C. spring hinges, which has compelled them to largely increase the force manufacturing them.

Nes Chain Mfg. Company, York, Pa., announce that they have erected a plant for the manufacture of all kinds of Iron Chain and start operations at once, intimating that they will be ready to supply promptly all orders for shipment March 1 and later. Chas. A. Nes, the managing partner, was connected with John C. Schmidt & Co., and his brother, David S. Nes, is the other member of the firm. Chas. P. Leeper, formerly superintendent of York Chain Works, is superintendent. They issue a price list showing the extensive variety of chains which they are manufacturing.

A new company, known as the Harrisburg Rolling Mill Company, have taken the Lochiel Mills at Harrisburg, Pa., and are putting them into shape for immediate starting up. Among other improvements they have ordered a plant of Ridgway Balanced Cranes, by which they will load the entire product of all the mills with only one man.

The plans of the Passaic Rolling Mill Company, at Paterson, N. J., have grown in magnitude. Besides the open-hearth plant alluded to, the company will build a new blooming mill, and will move its beam train. The new mill completed last year is making universal mill plates. The same engine, of 2500 horse-power, drives also a two-high beam train, the only two-high train in this country. This train is not yet completed. It will make up to 20-inch steel beams.

Ramie culture is being introduced into Lafayette Parish, La., and large decorticators have been erected. Successful experiments prove that ramie can be grown at about the same cost as cotton. A New York firm offers 4 cents a pound for all the fiber that can be grown. Experiments having similar objects are being made in Florida by D. P. Burden, formerly of New Jersey, who is cultivating the Spanish maguery plant, and has recently exhibited some very white and strong fibers. Experiments at Sanford show that after the first year the maguery plants yield 60 tons of leaves per acre every year. From this amount 12 tons of marketable fiber may be obtained. Mr. Burden's estimates of cost and value show large profits to farmer and manufacturer. The most important part of his work, however, appears to be that he has invented a machine for cheaply and effectively extracting the fibers from a large class of Florida plants producing fibers in pulp as distinguished from bark fibers. Wm. D. Kelley, of Pennsylvania, has taken a warm interest in the development of this industry, in hopes of providing an American substitute for manila hemp.

The Government Ordnance Foundry at the old Washington Navy Yard has been turning out some excellent work. The six 6-inch guns for the battery of the cruiser Charleston have been finished and will be tested. They are savage looking appliances of modern war. They will be mounted at once after the test and the vessel will be put in commission without waiting for her two 8-inch guns.

The Iron Age

New York, Thursday, February 21, 1889.

DAVID WILLIAMS, - - - PUBLISHER AND PROPRIETOR.
CHAS. KIRCHHOFF, JR., - EDITOR.
GEO. W. COPE, - - - ASSOCIATE EDITOR, CHICAGO.
RICHARD R. WILLIAMS, - - HARDWARE EDITOR.
JOHN S. KING, - - - BUSINESS MANAGER.

Trusts and Legislatures.

It is becoming more and more evident that a large number of our citizens are not disposed to agree with those, among whom Andrew Carnegie is a conspicuous example, who advocate a *laissez faire* policy in regard to trusts. It may be true that these organizations carry in their inception the germs of a disease which must ultimately lead to their dissolution. It may be true that the consumer will be ultimately avenged by the break-down which must follow the flow of capital into channels made artificially tempting. In isolated cases great manufacturers like Andrew Carnegie may realize that a wise, far-seeing business policy dictates opposition to fusion of interests in the form of a trust, yet the number who hold this view seems likely to decline, for one reason. We believe that organization in manufacturing tends in a direction which will lessen the influence of individuals. The number of firms and families who control large operations is diminishing, while there is a steady increase in corporations with scattered and temporary ownership. Capital is becoming more and more mobile. Family traditions and personal knowledge do not have as much weight in determining investments in enterprises as they did. Many capitalists do not go into manufacturing corporations with the object of staying in the business all their lives. They invest with the object of selling out at a profit as soon as possible. With the growth of this spirit the opportunity for "getting out," on the part of directors, managers and stockholders, through the aid of large temporary profits under trust régime, is much improved. The desire to form trusts grows, the resistance to them by manufacturers themselves decreases. We think, therefore, that there is some justification for the alarm shown by consumers, and it is a poor consolation to tell them that though they may be subject to extortion for a while their time is bound to come. The promise of future compensatory benefits does not mitigate a keen sense of present grievance. The danger is that the irritation and uneasiness created by real or fancied wrongs may lead to harsh and radical measures.

We must look the facts in the face. It is certain that the question of dealing with this new form of aggregated capital is profoundly agitating the public. It is being discussed by thoughtful and earnest students of our economic system, and is being seized upon by selfish demagogues to advance their own schemes. Bills are being brought before our State legislatures in rapid succession. On the same day measures were proposed in the Minnesota Legislature and in the Pennsylvania Senate. In Kansas an act was passed leveled against an alleged combination in beef and pork, and a similar measure has been lately dis-

cussed in Illinois. In New York the agitation has begun some time since, and in Ohio a committee appointed by the General Assembly to investigate trusts has just made a sharp report. In the United States Senate, Mr. Reagan has lately proposed a characteristically sweeping measure. The newspapers throughout the country teem with condemnatory articles, and often sensational reports of oppression and extortion. Let it be conceded that much of what is written and said is very crude and often absurd. Let it be granted that the facts are distorted until it seems a hopeless undertaking to place them in their true light. Yet a deep impression is being made, and any organization which can be possibly classified as a trust in the widest interpretation of the word is held up to public odium and enmity. The movement is undoubtedly gaining both in volume and in strength.

Some of the measures proposed are very harsh. The following summary of the provisions of the bill introduced in the Minnesota Legislature may serve as an example:

The first section makes it unlawful to enter into or maintain any combination or agreement to prevent or restrict the production of any article of commerce or to regulate or control its market price.

The next section makes it unlawful to make or carry out any agreement to produce any article of commerce below a common standard or figure; or to in any way interfere with free and unrestricted competition in the sale of such article; or to pool or combine in such a way as to affect its price. The third section is like the first two. It seeks to prevent indirect combinations through trusts, trustees or other fiduciary agents. The fourth section makes any contract in violation of these sections void in law and equity.

The fifth section goes further and gives the purchaser of any article whose price is affected by trusts the right to plead the act as a defense for not paying for the article. The sixth section declares any officer or agent violating the act guilty of felony, punishable by a \$5000 fine or a two-year imprisonment, or both. Under section 7 a corporation which violates the act forfeits its corporate rights and franchises, and the Attorney-General of his own motion must institute an action for the dissolution of its corporate existence.

Section 8 seeks to prevent corporations which have violated the act from doing business or maintaining suits in the State, and any officer who transacts business, knowing the corporation to have violated the law, is to be guilty of felony. The last section permits associations of laboring men to take action regulating wages, and none of their rights or privileges is to be forfeited under the act.

Bills so sweeping in their provisions are not likely to become laws, and if they do, cannot remain long on the statute books. It is the spirit that makes even their presentment possible which must be dealt with. It is characteristic of much of what is written and said that condemnation does not stop at the trusts proper, but includes trade associations and combinations of all kinds. We have insisted repeatedly that a sharp distinction must be made, and we are pleased, therefore, to find in at least one case that the matter is viewed in this light. The report of the Ohio committee contains the following:

The most common form of combination is the simple agreement, verbal or written, to fix and maintain prices at a certain point. While this form of combination works injustice to consumers by unjustly advancing prices, it is short lived, and because of advantage gained by some members over others the agreement is soon broken. The next form, an agreement on prices the violation of which is enforced by

fines or forfeiture of money deposited, is stronger, but in both of these forms of combinations the principle of self-interest remains, and by reason of the fact that some one of such combination is sure to reap a greater advantage than another, such combinations have within themselves the elements of destruction, and it was this fact which led up to that form of combination called the "trust," in which all the elements of self-interest are eliminated, and each member of the combination, in proportion to his share, receives his proportion of the benefits.

We believe that while it may be just to condemn trusts, it does not follow that severe restrictive measures should be passed against ordinary trade combinations. However much opinions may differ in regard to their efficacy, it is certain that at times they are beneficial temporarily to the producer, and protect the consumer against the incidental dangers which are only too often the outgrowth of cut-throat competition.

The Pig Iron Warrant Scheme.

We print elsewhere the second part of the correspondence relating to the plan of establishing a system of American pig iron warrants, the first part of which was published in *The Iron Age* of February 14th. We appreciate the fact that, being almost wholly anonymous, the evidence loses a part of its weight. The views of men are placed side by side whose opportunities for careful study of an important subject and whose aptitude in expressing their convictions vary as widely as those of an equal number of men in business must necessarily. We may admit that a sacrifice is made when the opinion expressed is divorced from the personality of the writer. It would be absurd to canvass the matter as though a vote had been taken, and say: Ten furnacemen answered "yes," and three replied "nay." The prestige of the three, the magnitude of their business interests, the energy of their individuality might more than counterbalance the greater number of their opponents.

It would be a very difficult task for the one disinterested spectator, the only one possessing the data to measure the forces arrayed, to state his conclusions on the question with which side rest the weight of opinion and the preponderating influence. We may state that men of the highest standing, manufacturers and consumers, who would rank among the first in the councils of the trade, are on both sides of the question. In the entire discussion the point whether the chances for success are good, poor or indifferent has been little raised. As we pointed out, its solution will partly at least depend upon the attitude of the pig iron producers, and it was largely our object to throw light on this point. We believe that we have succeeded quite well. Our inquiries were sent out without any bias, without any attempt to call out principally the views of men whom we imagined to be either in favor of or opposed to the scheme. We may confess to some surprises. Producers from whom we expected unqualified assent have turned out to be opponents of the plan. Others whose interests seemed to lie in another direction have given it their support.

Among commission merchants there is the same diversity of opinion. On the whole, however, we incline to the belief

that a change of heart is likely to come quickest with this interest, so soon as developments should point in one or the other direction. In other words, their business methods probably possess relatively the greatest elasticity, and would adjust themselves to new conditions with the least friction.

To consumers, taking the largest number of replies into consideration, a good many of which we have not printed, the subject seems to possess comparatively remote interest. The majority of those who have studied the subject as it may possibly affect their business are inclined to regard it unfavorably, although there are important and conspicuous exceptions.

One feature must not be lost sight of, and that is that those who are pushing the plan, and many who sympathize with them, are likely to be far more active in their partisanship than the greater majority of those who are against it. Their opposition will probably be limited to passive resistance. They are not likely to rally in a manner which will make their hostility very effective. The scheme, so far as we are able to gauge the situation, must stand or fall upon its own merits. The difficulties are certainly very great. Different phases of them have been pointed out by some of our correspondents. It will depend upon later developments whether or not they will be overcome. The outlook is certainly not very encouraging.

Drawbacks on Exports.

Our tariff laws provide for the payment of a drawback on merchandise imported, subsequently manufactured and exported, to the extent of 90 per cent. of the duty, 10 per cent. being retained by the Government. Exact data on the magnitude of this business rarely reach the public, so that particular interest attaches to the figures lately submitted in a quarterly report of the Bureau of Statistics. For the past four years the figures have been:

Drawbacks on Exports.

Year.	Drawback.	Retention.	Paid.
1885.....	\$3,793,792	\$270,857	\$3,524,935
1886.....	7,822,973	278,619	7,544,354
1887.....	7,557,808	270,976	7,286,832
1888.....	3,108,905	219,548	2,889,357

The principal article on which drawbacks have been granted and on which the retention did not amount to the usual 10 per cent. was sugar, the details being:

Drawbacks on Sugar.

Year	Drawback.	Retention.	Paid.
1885.....	\$6,763,528	\$67,635	\$6,695,892
1886.....	5,703,711	66,908	5,636,803
1887.....	5,535,220	68,718	5,466,502
1888.....	1,097,531	18,413	1,079,118

These figures sufficiently explain the falling off noted particularly in the fiscal year 1888. Turning now to the articles in which the readers of *The Iron Age* are particularly interested, we tabulate as follows the amounts of the drawbacks, the retention being 10 per cent. in every case:

	1885.	1886.	1887.	1888.
Copper.....	\$38,802	\$101,420	\$102,751	\$106,589
Iron and steel:				
Iron.....	32,321	22,736	23,197	27,536
Iron and st'l.	45,010	96,691	34,957	27,015
Steel.....	6,868	24,295	62,973	77,397
Lead.....	35,089	15,156	10,738	11,316
Tin.....	1,271,269	1,365,393	1,232,086	1,082,715

Unfortunately, the articles are not more closely specified in the case of iron and

steel. The bulk of foreign raw material used by American manufacturers to cover export sales are slabs and plates for cut nails, tacks, &c., wire rods for barb wire and wire nails. The tin is, of course, tin plate imported for making the tin cans for petroleum cases, for fruit and vegetable canneries, &c. The bulk of the lead goes for the same purpose, being used for the solder. It is understood, as is natural, that the Standard Oil Company is the chief beneficiary of the drawback system, even the wire nails for the petroleum cases for export being manufactured from foreign stock.

The Development of the Sugar Interest.

There are few articles of prime necessity that have led to so much discussion for 18 months past, not only in the United States but all over the world, as sugar. Like all raw produce this staple had depreciated considerably while overproduction lasted, and some four years ago both cane and beet sugar were selling in the world's markets at a downright loss to the producer. Since then, assisted by low prices and abundant fruit crops, consumption has gradually increased sufficiently to restore the equilibrium between the supply and demand, speculation for a rise has successfully co-operated in mending values, improved processes of manufacture have been applied, and last year has been generally prosperous to the producer of the raw article. An important manufacturing interest has meanwhile been put in a shape showing better returns locally, while checking in its own interest a too rapid advance in the raw staple. We mean the sugar refiners' trust, to which the leading refiners on the Atlantic Coast together with one of the concerns on the Pacific acceded as partners and shareholders. These refiners some time in the fall of 1887 consolidated their interests in the amount of \$50,000,000 of watered capital and managed matters so cleverly that on this capital they cleared last year a dividend of 10½ per cent. Early this month the trust certificates advanced in a couple of days from 75½ to 87½, 20,000 certificates passing out of the hands of original holders on the occasion. There has been much agitation in and out of Congress, as well as in our Legislature, about the legality from a constitutional point of view of this and other trusts; there have been suits to test the matter, but it has as yet not been clearly shown that they can be seriously hampered or upset by legal process.

The effect of the sugar trust's management has been so important during the last year that it has overshadowed other events affecting the staple, not only in this country, but to a considerable extent in Cuba and even in Europe. As it was the object of the trust to exercise control not only over the manufactured article, but quite as much over the cost of the raw staple, the managers of the trust resolved to import for their account the bulk of the sugar needed. In this manner they discouraged the usual importation in the shape of consignments and orders for importers' account. While raw sugar, cane in particular, was thus as much as possible prevented from rising here and in the producing countries, the trust fixed a much higher percentage of margin as the remuneration for refining than had ruled

prior to the formation of this monopoly. Thus where in 1887 their net profit had been ½ cent per pound, they doubled it after the consolidation had been effected, and even secured a larger percentage of profit when, during the summer of last year, an extra demand for refined arose and continued for months. Claus Spreckels at San Francisco and some Philadelphia refiners, while declining to join the trust for reasons of their own, of course reaped all the advantages incident to the course of the market; this, however, has not deterred the former from building an anti-trust refinery on a gigantic scale in Philadelphia. The most remarkable feature in the trade is that in spite of the higher prices consumers of the refined article have had to pay there has been a heavy increase in the consumption:

Sugar Consumption in the United States.

	Tons.		Tons.
1888.....	1,469,997	1883.....	1,164,391
1887.....	1,397,356	1882.....	1,077,949
1886.....	1,399,079	1881.....	1,008,932
1885.....	1,245,574	1880.....	907,109
1884.....	1,265,283	1879.....	881,806
Total.....	6,767,289	Total.....	4,990,277

The average yearly price of granulated (refined) for each of the past ten years has been as follows:

	Per 100 lbs.		Per 100 lbs.
1888.....	\$7.18	1883.....	\$8.65
1887.....	6.02	1882.....	9.35
1886.....	6.23	1881.....	9.70
1885.....	6.52	1880.....	9.80
1884.....	6.75	1879.....	8.81

While, as shown, our consumption has increased rapidly, our own Southern States have also turned out much larger amounts; thus the production during the crop year of 1887 to 1888 was 167,814 tons, as compared with 85,394 tons the previous year, Louisiana alone contributing thereto respectively 157,971 and 80,850 tons. At the same time the Pacific coast of the United States received from the Sandwich Islands alone last year 213,696,000 pounds, against 203,400,715 in 1887. Sugar made from molasses on the Atlantic Coast amounted last year to 58,840 tons, against 60,274 in 1887. Some progress is also being made in developing the beet-sugar industry in California. Furthermore, cultivation is being pushed in Nebraska, although no sugar factory has been as yet erected in that locality. The soil has been found to be well adapted to beet cultivation, which, in connection with the favorable climate, has encouraged a number of German farmers who have settled there to undertake the production of a crop, with the cultivation of which they had obtained experience in Germany. The results thus far have been encouraging, and a specimen of beet sent last autumn to the Bureau of Agriculture, in Washington, for analysis showed so high a saccharine value that capital has already been secured for the erection of a factory.

The weather is reported fine in Cuba, and receipts are increasing, but the disposition of holders is to delay sales for improved prices. There are no offerings yet from the British West Indies, although the crop season has begun. Advices from Brazil speak of the small quantity that is available, and the crop is now estimated to show a deficiency of 90,000 tons, compared with that of last year, hence the above estimate of 250,000 tons for Brazil

may have to be reduced to 190,000. Meanwhile the statistical position of sugar remains favorable, the visible supply in Europe and America, including Cuba, on February 1 being only 1,099,545 tons, as compared with 1,285,199 tons on February 1, 1888, and 1,499,486 tons on February 1, 1887. The present price of fair refining Cuba in New York is 4½ cents. The lowest price for the same we have had during the past four years has been 4½ cents, and the highest 5½ cents. This shows that under the circumstances raw sugar is remarkably cheap just now, and that there is plenty of room for improvement between now and midsummer, should consumption in this country make as good headway till then as has been the case last year.

Percy C. Gilchrist, one of the inventors of the basic process, has lately sent out his usual report, showing the quantity of basic steel made in different countries. In former years Mr. Gilchrist followed the rather awkward system of reporting for the year ending October 31. He has now, fortunately, adopted the calendar year. In the table given below the figures under 1887 are for 12 months, ending October 31, 1887. For 1888 the calendar year is reported.

The Make of Basic Steel.

Producing Countries.	1887.		1888.	
	Total Tons.	With under 17 per cent. carbon. Tons.	Total Tons.	With under 17 per cent. carbon. Tons.
England.....	364,526	238,358	408,594	276,476
Germany, Luxembourg and Austria.....	1,102,496	826,600	1,276,070	1,026,038
France.....	176,500	123,049	222,333	158,223
Belgium and other countries.....	60,950	39,716	46,237	32,300
Totals.....	1,704,481	1,222,732	1,963,234	1,493,032

It will be noted that mild steel continues to be the product which predominates, and that Germany holds its rank as the leading producer of basic metal. In our own country the only concerns which have lately made basic steel are Carnegie, Phipps & Co., at Homestead; the Otis Iron and Steel Company, at Cleveland, and the Pottstown Iron Company—the former two using the open-hearth and the latter the Bessemer converter. In his report Mr. Gilchrist makes the significant statement that about 600,000 tons of slag, containing about 36 per cent. of phosphate of lime, was produced with the steel, most of which was used as a fertilizer.

The architectural iron works at Chicago suffered last year from a decided curtailment of business. This year they are likely to be overrun with orders, if the present outlook is realized. Architects' offices are full of plans of buildings, projected for the coming season, both in Chicago and at outside points all over the Northwest. Estimates are being submitted by the architectural iron works on a very large part of this business, and much more is expected to follow. In some localities the building season will open very early, and contracts have already been placed for the ironwork. It is to be hoped that labor troubles will not intervene to mar the bright prospects. The agitators are at work, however, endeavor-

ing to create dissensions and to foment disturbances, and if they do not succeed it will be on account of the conservatism of the rank and file of the workmen, who are not now so easily influenced as formerly by self-constituted leaders.

CORRESPONDENCE.

Fuel Economy of Heating Furnaces.

To the Editor:—Referring to the discussion in a recent number of your paper on economy of heating furnaces, the writer begs leave to call attention to the performance of a gas furnace designed to give economy on a small as well as on a large output. It has radical changes in construction from the ordinary Siemens or regenerative type, a description of which will be given your readers as soon as the Patent Office has passed fully on their patentability. The furnace referred to has heated frequently as little as 8 tons per single turn, of small and particular shapes of iron for an 8-inch train, without affecting the consumption of coal per ton, it not being charged with metal more than half the time. It has heated ½ ton of ore and 1½-inch iron billets from cold to a wash heat in 8 to 12 minutes. It has been fired from a black heat after standing idle one turn and heated ready for the rolls, a good heat of iron, in 1 hour from the time gas was first generated and turned into the furnace, the gas generator having also been idle and at a black heat. The coal consumption always included nights and Sundays, the furnace usually working four or five nights per week. I quote from a letter from the New Haven Rolling Mill Company, New Haven, Conn., who are using the furnace: "Referring to your gas producers, while running your furnace for about 12 months, we would say: We heated iron for the rolls with an average on one or more weeks' run of 250 to 300 pounds coal per ton."

Owing to the writer being confined in the West on other work during repairs, the furnace has since been rebuilt on the Siemens plan, with the result that the coal consumption on the same work has increased to about the highest figures given by your correspondents for gas furnaces, thus showing that there is still hope of improvement in this class of furnace. It is only fair to say that this furnace was isolated from others of its class, and was largely attended by workmen having no previous experience with gas furnaces. The mason work had no repairs during this time, but, owing to a defect in the draft connections and to errors in burning out, cleaning, &c., some work was necessary on flues and valves. The gas generator was operated at one time 11 double turns without removing ashes, owing to lack of care on part of workmen.

C. M. RYDER.

Findlay, Ohio, February 12, 1889.

Mr. Edward Cabbie, an old and respected resident of Brooklyn, died at his residence, 108 Skillman avenue, February 15, in the sixty-sixth year of his age. Mr. Cabbie was born in Frome, Somersetshire, England. His family there were large manufacturers of wire. Upon arriving in this country 40 years ago he came to Brooklyn, and, in connection with his brothers, he followed the pursuit of his ancestors, and until three years ago was general superintendent of the William Cabbie Excelsior Wire Mfg. Company, in which he was also a stockholder and director. Failing health compelled him to give up entire business connections, and upon the advice of his physicians he visited his native land. The trip, however, did not seem to aid him. Losses in his family undoubtedly preyed upon his mind and hastened his end.

The Mining Engineers.

The opening session of the fifty-third meeting of the American Institute of Mining Engineers was held on Tuesday evening, February 19, at Hardman Hall, Nineteenth street and Fifth avenue, New York, Andrew Carnegie being in the chair. In the absence of Mayor Grant, who had promised to welcome the engineers to New York, Mr. Carnegie spoke the words of welcome. President Wm. B. Potter, of the Washington University, St. Louis, responded on behalf of the institute, and read a paper reviewing the past year's work and the progress of the institute from the time of its organization at Wilkesbarre, Pa., more than 18 years ago, by 22 gentlemen then prominently identified with the iron, steel and kindred trades, until its present state of prosperity and usefulness. There are now on the rolls 1800 names. Professor Potter questioned whether the institute, with this enormous membership, would not become unwieldy, and whether its three meetings held each year in different parts of the country were not becoming more and more given up to excursions and the amusement of its members rather than the serious transaction of business relating directly to the institute and its objects. He urged the grouping of the various interests of the institute, and as a suggestion for such a grouping segregated iron and steel, the precious and base metals, geology and mining, and chemistry. Such a classification, he urged, was simple and natural and would not conflict territorially. Professor Potter also emphasized the importance of presentation at the meetings of more complete and clearer papers, referring to the majority of the papers as now read before the institute as lacking in detail, and in some cases as being not only unreliable, but often misleading.

Secretary Raymond then read a biographical notice of the late Erich C. Schaufuss, contributed by J. H. Bowden, of Wilkesbarre, Pa. Mr. Schaufuss was a member of the institute, and lost his life in a gas explosion in the mine. The circumstances surrounding this accident were of a peculiar nature, and called forth an opinion by Professor Raymond, who cited his own experience in the mine, and spoke at some length on a subject in which his listeners were deeply interested. Dr. Raymond paid a touching tribute to the memory of the deceased engineer, and gave it as his opinion that when the gas ignited Mr. Schaufuss threw himself face downward on the ground to allow the flame to pass over him, and, his clothing catching on fire, thought the flame was still passing over him, lay too long, or, in the confusion of the moment, rushed the wrong way, and was overcome by the after-damp. The explosion was caused by a naked lamp carried on the hat of a miner, who, absurd as the case may seem, was carefully guarding a safety lamp carried in his hand. Dr. Raymond then spoke on "End-Lines and Side-Lines in the Mining Law," using the blackboard to illustrate the subject. He was closely followed by his audience, and his ready and brilliant oratory and graphic illustrations brought out hearty applause at the close. The meeting then adjourned, to meet in the morning, to visit the Edison Laboratory, at Llewellyn Park, N. J., and the Spiral Weld Tube Works, near Newark.

The New York Phonograph Company has received a certificate of incorporation. The capital is \$1,250,000, and the trustees are John P. Haines, of Tom's River, N. J., John D. Cheever, Richard Townley Haines, Noah Davis, William Fahnestock, W. Seward Webb and John L. Martin, of New York City.

Pig Iron Warrants.

OPINIONS OF THE TRADE.

We have received from a few furnace companies letters which reflect the views held by producers, which we present below, a prominent manager in Eastern Pennsylvania writing:

We are not favorably disposed toward the proposed Pig Iron Warrant system. We believe it will result injuriously to producers of pig iron, particularly to those that own their plants and do business chiefly on their own capital. Supply and demand regulate the prices of pig iron, irrespective of individual costs. When the supply exceeds the demand prices fall and reach a level without regard to the average cost, until the losses incurred compel the blowing out of sufficient furnaces to restore the equilibrium. The stoppage of furnaces not only paves the way for an ultimate advance in selling price, but from reduced demand also lessens the cost of raw material. Those furnaces that by location or superior management are able to continue in blast are thus enabled to tide over the period of extremely low prices, preventing too great a curtailment of production and the possibility of an iron famine. The quicker the readjustment between production and consumption is attained the sooner will prices be brought to a fairly remunerative basis. With the present large producing capacity of the country, and the ease with which production may be quickly increased, as shown within the last few months, there is not much danger of prices advancing unduly high from any lack of iron to meet all legitimate demands, unless speculators enter the market and by large purchases compete with consumers and temporarily withdraw large blocks of iron from consumption. By rapidly advancing the price of iron, and with it the cost of production, speculators have always proved injurious to the best interests of the producers. When the reaction comes, iron falls in price much more rapidly than the cost of making can be reduced, and the average result of the "boom" is a loss to the manufacturer. There is an increasing disposition on the part of conservative furnaces to sell their product only to consumers, especially when there is a brisk inquiry.

The warrant storage system, we believe, will encourage speculators to gamble in pig iron by affording increased facilities, and will thus introduce a more or less permanent disturbing influence in the trade. Besides, this system will offer inducements to continue the production of iron when it is not needed, by enabling financially weak concerns and those not economically managed to continue producing when under natural conditions they would be forced out of blast. Such is the general publicity given to the pig iron business, the mere fact that furnaces are producing in excess of the wants of the country is sufficient to weaken prices, even if the iron made is not thrown on the market. We would thus suffer from low prices, and obtain no corresponding reduction in cost from lessened demand for raw material. The blowing out of numerous furnaces assures the buyer that bottom prices are about reached and encourages buying. The storage system, we believe, would be injurious in two ways—lowering prices by encouraging unhealthy and unnatural competition and by increasing the cost of manufacturing. The conditions under which pig iron is made are so various and the circumstances influencing cost so diverse, that any combination to control and adjust the differences is not likely to meet with any enduring success.

We are of the opinion that all interested in the business will ultimately be better off by allowing the laws of supply and demand to regulate the trade without any artificial restrictions.

The efforts of the Philadelphia and Reading Railroad Company, following the panic of 1878, to relieve the furnaces in their territory by purchasing and piling their excess product, resulted injuriously to all concerned. The furnaces, encouraged to continue in blast much longer than the conditions of the trade warranted, lost heavily in consequence, and the railroad company did not escape. For several years after the purchases ceased the furnaces were compelled to compete with their own brands, offered for sale by the railroad company. These large stocks were a constant menace to the trade. Buyers continually made use of them as an argument to weaken prices, and it was quite a relief to all concerned when it was known that these stocks had finally been disposed of. The local aspect of affairs improved almost immediately. If this was the result of a storage system on a small scale and confined to a limited section, what will be the result if a new one on a large scale is extended over the whole country?

From Virginia comes the following:

The plan of the warrant company strikes me as being unfavorable to iron-makers in general, and, therefore, to us. It presents itself to me thus: The changes in the market are no longer to be effected by supply and demand, but are to be placed in the uncertainties of speculation. The statement that the extremes heretofore experienced shall be obviated seems possible, but not if the warrants are made "a medium for speculation." What control can the company then have? The stock of iron is in warrants, which are in the hands of speculators; trade is brightening and they will not sell; furnaces have no stock and advance prices, but before they reap any benefit speculators unload, prices decline and makers can again begin to store their iron on warrants, furnacesmen always getting low prices and speculators the benefit of the advance. We the buzzard and they the turkey, all the time. To talk about making matters better for us by putting prices in the hands of stock gamblers does not seem to me to rise to the dignity of second-class nonsense.

A large concern in the Shenango Valley writes:

I believe that any organization the object or final result of which will be to make the pig-iron product of this country the subject of exchange board speculation and gambling will be an unmitigated evil to the pig-iron manufacturers, except so far as it may furnish convenient certificates of storage, which can be used as collateral for necessary loans. This purpose can be accomplished equally as well, or better, by the organization of responsible storage companies in the different centers of manufacture, as has already been done in Pittsburgh and Cleveland, and possibly at other points.

A producer in Jackson County, Ohio, writes:

My opinion is "the creation of pig iron warrants as a medium for speculation" will unfavorably affect the interests of the legitimate maker of pig iron. Under the arrangement proposed production will go on regardless of consumption until stocks become abnormally large, and the surplus metal in the warehouses will stand a perpetual menace to our business. The further we are removed from speculators and speculative tendencies the better. I speak from the standpoint, of course, of a *bona fide* pig-iron maker, and not from that of the boomer, the speculator or the money

lender, in whose interest this scheme is launched. It will be a sorry day for the producer and laborer of this country when we have in sight one or two years' supply of pig iron, as ingeniously advocated in 'the argument.'

From a large charcoal iron works in Michigan comes the following: "We would be in favor of the plan, as it seems that it would work beneficially to the trade. Pig iron warrants in Scotland and England are transferable and good as any bank paper, bills of lading or cash."

Another large producer in Michigan writes:

I suppose the apparent necessity for the proposed syndicate comes from the fact that there is an overproduction of metal, and that some concerns must have ready money for their output even though the market should be found below what it ought to be. The remedy proposed is to relieve this class of manufacturers by giving them what they want without a corresponding injury to the market. If my premises are correct, it is an open question with me whether the proposed plan would not in the end do more harm than good. If too much iron is being manufactured, those who ought not to be in the business must retire from it, and the sooner they do this the better it will be for those who are so situated, both as to location and capital, as to entitle them to stay in. The plan proposed will increase rather than diminish the output, and keep on their feet—for a time at least—those who should not have ventured in, or who being in would otherwise go out of business. Again, I presume that if enough of the furnaces were provided for in the manner proposed a false market would be the result, and, generally speaking, it seems to me better that the laws of trade should be left to solve the difficulties in question without what, to me, seems a false support. Inasmuch as this company would not have occasion to deal with the proposed syndicate, I believe that the creation of one, if successful, would unfavorably affect our interests. When I say "our interests," I mean the interests of all furnaces so favorably situated as to make a fair profit at the present price of pig iron.

Probably the point which it would be most difficult to determine is

The Attitude of Consumers.

With the exception of the large rolling mills, the cast-iron pipe works, the greatest stove concerns and manufacturers of architectural castings and hardware, the great majority of consumers melt only relatively small quantities of pig iron. To them the cost of raw material is not so absorbing a subject of consideration that they have given much thought to the questions which might affect the trade. Among

THE ROLLING MILLS,

we turn, first, to those of Pittsburgh. A maker of high grades of rolled iron writes:

We have an institution here called the Union Storage Company, which is very prosperous and we imagine does a similar business to the one proposed in your article, as they issue bankable certificates. We doubt if the institution proposed is not an incroachment on the field of legitimate operations of the consumer and manufacturer, and contrary to the natural laws of trade. They may give a field for the man who wants to speculate on margins, but we think that they do not help a properly managed manufacturing business.

A large firm of steel makers state:

We do not see that the introduction of pig-iron warrants as a speculative medium

could have any beneficial result on our business, or in fact on any legitimate business. The less speculation there is in the standard products of the country, the better the business interests will be served, and the less the rights of the public will be interfered with, in our judgment. We do not hesitate to say that storage companies who issue certificates for iron deposited with them are a benefit to people who handle pig iron, and when it is confined to the legitimate business transactions in that commodity no harm can come to trade, but when it is used for speculative purposes we regard it as unnecessary and dangerous.

One of the great manufacturers of Pittsburgh says:

Distances in this country are so great that it is difficult to make a comparison with Great Britain in the storage warrant matter. I am glad to see the experiment tried and am inclined to think it would be a success. It should have the effect of keeping values of pig iron uniform and prevent the wild fluctuations we have been accustomed to, and which do the trade immense harm. Of a great staple like pig iron there should be a greater stock than we have been carrying.

A rolling mill in Eastern Pennsylvania, which occupies a leading position in the trade, sends the following communication:

As a consumer of pig iron, I am of the opinion that the natural effect of the warrant system as proposed by the American Pig Iron Storage Warrant Company will be, for a time, to corner the market and thus advance the selling price; but later to give us a low range of values in that material. It will, of course, be used mainly by the weaker concerns, who have not sufficient capital of their own to carry heavy stocks. The warrant company can only be made a success by securing large accumulations of pig iron stored in different portions of the country. Experience has taught us that large stocks, even when held by the strongest concerns, are a constant weight upon and menace to the market, and inevitably result in lower prices.

A large mill in Eastern Pennsylvania, producing plates and nails, takes the following view of the matter:

We consider any sort of a speculation injurious to business, and it is a matter of hesitation as to whether or not the parties at the bottom of this scheme would not be disposed to use it for speculative purposes. If the effect would be the equalization of the extreme rise and fall of prices we would have no doubt it would be a benefit to general business.

A plate maker in Pennsylvania sends us the following:

We believe that the American Pig Iron Storage Warrant Company, if conducted according to the plans outlined in your issue of the 31st ult., would prove a very good thing to the iron trade generally and to the country at large. Our principal reason for this opinion is the firm belief that a company of this kind would prove a most effectual factor in preventing the great fluctuations in the price of pig iron which are so serious and disastrous to trade.

From the Mahoning Valley we have the following:

Replying to your circular letter of the 1st inst., we do not believe that any medium of speculation would favorably affect the interests of legitimate manufacturers. We do think that a storage company, well organized, and whose charges would be low (for cost of storage at furnaces would be nominal), would be a general benefit to the trade in lessening the

fluctuations of the market by carrying sufficient stock to meet the wants of manufacturers for three to six months ahead.

•The owners of another Pittsburgh rolling mill write:

We cannot see that any benefits are to be derived either to the producer or consumer of pig iron by passing through a middleman or storage company. In our opinion the nearer you can bring the producer of pig iron and the consumer of pig iron together the better for both.

A large consumer of mill iron in Ohio puts himself on record as follows:

I think the creation of a warrant system will promote the accumulation of large stocks of iron, which would be an injury to the legitimate pig-iron producers. The furnace capacity of this country is quite large enough to supply all probable demands for pig iron on short notice and at reasonable prices, without accumulating a large reserve. Furnaces that cannot sell their product at remunerative prices and have not got the capital to enable them to hold their iron had better bank-up.

The manager of another Ohio rolling mill tersely says: Let it come, as it is bound to do before long. Those who desire can use it for financial help, others need not. Time and trial will test its merits.

A concern in New York producing bars and structural iron writes: "We do not think well of the proposed Iron Storage Warrant Company. We believe that it will bring a speculative element into the business which cannot be beneficial. In times of depression in the trade, as it now exists, small concerns, with limited capital, go out of blast, and remain out until trade revives. The new system, as we understand it, would furnish means for these concerns to go on, at a loss to themselves primarily, and aid in continuing the depression, and work injury to the trade generally."

A nail-maker on the Susquehanna states: "We think it will be prejudicial, as it will lead to greater extremes in prices and less stability, as it aids to production on an overstocked market when a diminished production would have a more wholesome effect. It further increases the cost to the producer, plus the charges, and stimulates speculation, for which the warrants would furnish a convenient method. Believing a steady remunerative market the most conducive to the interests of the consumer, as well as producer, we think its adoption a positive evil."

A rolling mill in Ohio sends the following communication: "We have read the plan proposed by Mr. Hull, for the establishment of an American Pig Iron Storage Warrant Company, and readily fall in with the idea. We think that the objections raised to the warrant system by some are more than offset by the many advantages that attend it. We fully indorse the sentiments expressed by the projectors of the plan and hope to see the company on a good sound footing."

Among the largest consumers of pig iron as founders are

THE CAST-IRON PIPE MAKERS.

Among them P. D. Warmer, Chairman of the Mellet Foundry and Machine Company, of Reading, Pa., sends us the following communication:

We are in sympathy with the movement, under the belief that it would estab-

lish a more steady value in pig iron and prevent sudden and unnatural fluctuations in prices. It would also have a tendency to increase or diminish the production in proportion as the quantities in the storage-yards would be increased or decreased from time to time. In short, we think it would bring about a safer condition of things in our trade, as in all others using pig iron in considerable quantities, and also prevent that reckless competition among furnacemen and prove the necessity to other manufacturers of having their business regulated in some such way with their competitors to save themselves from ruin during such times as the present. This, however, has latterly been getting to be pretty well understood by people who have sense enough to get out of the rain. The more people talk against trusts and combinations of either labor or capital the more there will be of them, and the stronger they will become, but when let alone they will work out the best possible results—ultimately for the country at large.

Another large pipe-maker writes us:

"Our impression is that it will be a good thing for both producer and consumer, as it will have the effect of lessening the fluctuation in prices."

A large purchaser of pig iron writes:

In our judgment the key of success in such a movement depends upon the uniformity of quality which the storage company can guarantee for the iron which is covered by their warrants. In saying quality we do not mean grading, but the character of the metal, its constituents and impurities. If they can overcome this difficulty in addition to those that are more simple consumers of iron can become purchasers, but without some such guarantee we do not see how the warrants can become merchantable articles, although they may answer the purpose of speculators. We fear that the fluctuations of the value of pig iron will not permit the annual cost of carriage which we understand has been adopted by the storage company. This, however, is a matter which only affects those who speculate in the warrants. The effect of a large block of metal being in part covered by warrants, and which can be added to or taken from according to the demands of trade, is theoretically good upon the market. To what extent it will be possible for the storage company to overcome the obstacles which surround it time alone can tell, but the removal of the two which we have pointed out we think is essential for its success.

The president of a large Western pipe foundry says: "We cannot see how the consumer can be benefited in the least, but, on the contrary, it will work to his detriment. We cannot help but think that many of the furnacemen will have a desire and disposition to work in harmony with those who actually use their product, rather than with those who use their warrants only for speculative purposes. We suppose that that was the main purpose aimed at in the organization of the warrant company. To err is human, and we may be wrong in our impressions, but we doubt it."

To producers of pig iron, one of the most important classes of customers are

THE STOVE MANUFACTURERS,

from some of whom we have the following letters, the first being from one of the largest and most progressive firms in the trade:

I have good reasons to believe that this subject is not thoroughly understood by those whom it might seem would be in-

terested, and, for proof of this, would say that during the past few days I have had the question asked me by different well-informed gentlemen as to what effect this would have upon the price of pig iron. My answer was, "I cannot see that it will have any effect," and when I came to talk with these parties, and I must admit that I was not thoroughly posted myself, I found that such was the case with those who asked the question. So I undertook to get informed myself, and I find that this is simply a company formed for the following purpose—viz., to grade and weigh the production of any furnace and give a warranty as to the number of tons and the grading of any iron that may be piled up in the yards of the furnace. They give a written warranty to the owner or manager of said furnace, charging for their services 25 cents per ton for the first month, and 2 cents per ton for additional months so long as the iron may remain unsold. A capitalist, or any one having money to invest, makes inquiries about a certain lot of iron, and finds that this warranty held by the furnace gives him the information of the number of tons and the grade, so that he feels safe in investing. After the investment is made if the iron falls below the grade or the tonnage falls short the storage company holds itself responsible. The new company is formed as near like the Pig Iron Storage Warranty Company in Scotland as possible. Now, I fail to see how this is to affect the price of pig iron. It may be that through the formation of this company, which is similar to others that have been previously formed and are in existence, a larger amount of iron may be in store at the close of any year than heretofore, but through the medium of this company it may become somewhat speculative. Parties looking for investments will think that they can make a purchase of these warranty receipts, which are held with more safety. Beyond this I cannot see a point where the pig iron business proper is to receive any real benefits. It may enable pig iron manufacturers to obtain loans much easier by having a certain tonnage of pig iron in their yards, surrounded by a fence, if you please, with a lock and key on the gate, than under former plans.

An Eastern concern writes:

The American craze seems to be for speculation. We are not speculators, and we feel little interest in the proposed scheme for a pig iron storage warranty company. Neither do we quite see how such a scheme can become very successful. If all pig iron were of one quality there would be no difficulty, but with two or three grades from every furnace, and about as many qualities as there are furnaces, there will, we think, be many difficulties to surmount in perfecting the scheme. As to prices, we doubt if they will be affected much either way through what speculation may be done in this line.

A Troy stove-maker sends the following communication:

I am opposed to the plans of the American Pig Iron Storage Warranty Company. I believe that speculation in pig iron by the general public would be injurious both to the producer and consumer, because, although they might be benefited incidentally, its usual tendency would be to increase the cause of abnormal fluctuations in the demand for pig iron, which would be a menace to legitimate trade and a benefit to professional speculators. It has been truly said that pig iron is a delicate barometer for indicating the condition of trade; and the reason is its susceptibility to the influences which regulate trade. Abnormal conditions of trade are made more intense by speculation and the reaction from speculation, and, consequently, a commodity so susceptible and important

as pig iron should be kept as free as possible from its influence.

A large works in the same center write:

It is our opinion that a pig iron storage warrant company would be a valuable adjunct to the manufacturers, dealers and consumers of pig iron, for the reason that it would tend to steady the values of such products in the general markets of the country. We have given no consideration to the speculative value of such a movement, and cannot judge of the effect of any warrants they might issue, excepting that through their medium we should be able to determine prospective values more readily than at present.

One of the most thoughtful of Pennsylvania makers sends the following:

We cannot look upon the contemplated scheme with satisfaction, preferring as we do competition to sumptuary control, and while admitting that competition is attended with evils, yet we are impressed with the idea that centralization will gravitate to greater. We cannot help feeling that such methods of consolidation and restriction are primarily inconsistent with our free institutions and independent individual effort, and will eventuate into selfish and unnatural conditions.

From Michigan comes the following:

We are not purchasers or consumers of pig iron, but buy large quantities of iron castings and tubing. Anything that would cause sudden or marked fluctuations in the price of the crude article would necessarily stand in the way of our making as favorable contracts for our yearly supply as we are able to do in the present condition of the market. We should therefore deplore the introduction of pig iron warrants as a speculative medium.

Western Commission Merchants.

From Pittsburgh we have the following: "I think that the effect of the general introduction of that plan would be adverse to the interests of the commission merchants generally, and would probably drive many of them out of the business, as there would be less need for their advancements, and the warrants could probably be handled by brokers who at present have nothing to do with pig iron."

A second Pittsburgh firm writes: "We have a local organization somewhat of the nature of the storage company, which is prominent and competent, and as we take it the idea of this company you mention is to simply make a national company to do what the local companies are now doing. We do not know of any particular benefit to be derived from the organization of this company you mention, as our local company—namely, the Union Storage Company—is now doing, as far as we know, just what this company you mention would be supposed to do."

A Cleveland firm writes:

If the plans of the American Pig Iron Storage Warranty Company are carried to completion they will, no doubt, be taken advantage of largely by the makers of Southern pig iron. This being the case, it seems natural to suppose that the business of the commission men handling the product of that region will be diminished, owing to the fact that the storage company will enable the furnaces to raise money without putting their metal into the hands of commission men to be sold at any possible price. The storage company will be able to do what the commission man does now, i. e., be able to raise money. The introduction of the warrants as a speculative medium may possibly open to the commission man a new line of

customers others than the legitimate users of pig iron, thus in a measure helping him out of the loss of business occasioned by the storage company entering the field. This last feature, however, will take time to become popular, it strikes us.

A Louisville house says:

The names of the gentlemen connected with the scheme of the American Storage Warrant Company are certainly all those of good, substantial men. The organization seems to be a good thing for the producers of iron who find it necessary to place their iron in storage at their furnaces for the purpose of having warehouse receipts issued to them for the purpose of raising money on the same. This privilege has already been in force for several years past by storage-yards being established at several of the leading markets in the West and South, where they could place their iron in storage and receive warehouse receipts on the same, at a less cost to them than the American Pig Iron Storage Warrant Company offers. I hardly think it will have much effect, if any, on the commission merchants of this section, as I do not believe that any of them will want to speculate in the warrants. However, this may be done in the East—in Wall street. As to its being a success, that depends largely upon the company being able to control the output of all of the furnaces, and how this can be done I cannot say, as the territory to be covered is so large and the interest so great, and there are so many furnaces who do not want their iron tied up with warrants, much preferring to keep it free.

A Detroit firm reports:

We do not think that the successful introduction of pig-iron warrants as a speculative medium would affect commission merchants, for the reason that if a surplus is to be accumulated with no prospect of any material advance in price, the furnaces that sold their iron as made would make more money, and the ones that employed agents would be more likely to dispose of their iron, and others that did not would accumulate the surplus, and in the mean time would be paying interest, thus increasing the cost of their iron far in excess of the amount paid as commission for selling.

A leading Cincinnati firm writes:

We are in favor of anything that will improve the status and prospects of pig iron making in the South. It is quite apparent that something is needed to avoid the extreme fluctuations in prices that result from changing conditions of the market, and from the need of large producing companies to realize promptly on their product, whether the market is favorable or not. It looks as if a storage or warrant system in which the companies would freely join would act as a regulator. It should enable makers to carry their iron in times of depression without concentrating their capital on their iron yard, and in times of high prices it will enable them to get the benefit of the market. At the same time, there are some features that render any large success of the scheme problematical, in our judgment. One is that even under the most favorable conditions the storing and carrying of pig iron is attended with considerable expense. It must necessarily be handled twice. Storage charges must be paid, if the metal is properly looked after. Interest is no small item. Taking these things into account, it is clear that iron must be sold at an advance of nearly \$2 per ton to warrant a producer in putting it into storage and holding it for a year. We think it will prove that most makers will prefer, when they have an accumulation, to close it out at any price that will not involve actual loss rather than speculate on an advance of \$2 per ton.

Another possible difficulty is that the market is not yet quite ready, especially in the West, to do away with the identity of special brands and buy Alabama or Tennessee iron on warrant, without knowing what brand is to be obtained. While Southern makes are similar in character, there is unquestionably a decided difference in quality, carefulness of grading and uniformity. The warrant system would enable furnaces making inferior iron to unload it on the market on equal footing with those making the best iron. This would place the latter at a disadvantage that they would not be apt to submit to long. The natural effect would be that prices for storage iron sold without brand named would have to run about 50 cents below the market for standard irons. As stated at the outset, the workings of the plan will be at first experimental, and it may prove that as its operations come to be better understood these objections will disappear. All, in our judgment, will depend on the thorough care and conservatism of its management down to the smallest details, and on the spirit in which the leading furnace companies enter into it.

One of the great Chicago firms briefly puts the matter thus: "We consider the plan perfectly practical, and it should be profitable to the stockholders, if well managed, and also of benefit to the entire iron trade. The only question in our mind is as to whether one large company is better than local companies for each prominent point."

From a Warehouse Company

long established we have the following:

The negotiable character of the warrants which the American Pig Iron Storage Warrant Company propose to issue will doubtless induce many furnacemen to consider favorably the establishment of a storage yard on their premises, under the charge of this enterprising company. Where the producer needs facilities for disposing of his pig iron promptly at ruling market prices the warrant system will doubtless enable him to realize quickly. This will throw the burden of carrying on a speculative public, who hope to market the iron at the advanced price which the producer, through lack of capital, perhaps, has to forego. A feature of the warrant company, however, which is spoken of as one of its chief recommendations is by no means new. We refer to the facility which is offered producers for borrowing money on their iron to carry it over a depression, or to avail themselves of capital otherwise tied up by future sales. The Philadelphia Warehouse Company, it appears, has been practically doing this business for many years in a quiet way. This company leases ground at the furnace on a nominal rental and has iron stored thereon. Instead of issuing warehouse receipts or warrants and charging storage on the iron thus deposited, they loan the money or credits themselves to the furnace companies, without making charge for storage. By this method a considerable saving is made by the borrower, who only has to pay a moderate commission in addition to the interest the bank or lender would charge him for negotiating his warrant. The capital of this company is \$1,000,000, full paid, with a good surplus, so that, though able to do a large business, they cannot supply the needs of all the many borrowers having this class of collateral; and there will be, no doubt, room for a new, energetic and well-equipped concern such as the American Pig Iron Storage Warrant Company.

An improved system of rapid transit for New York City would cost, it is estimated, about \$30,000,000.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., February 19, 1889.

The parliamentary prospects of the Committee on Ways and Means for the purpose of circumventing the tactics of the tobacco tax repeal leaders have collapsed. The effort to get signatures to a call for a caucus last night developed the fact that Chairman Mills could not secure the majority, so as to have control of the situation. He and his friends, therefore, regarded it as the part of prudence not to attempt to force the fight.

There are now four propositions before the House, three of them from the Committee on Ways and Means.

1. The Mills resolution of unconstitutionality of the Senate substitute, which is simply a subterfuge, as the Senate has never claimed the right to originate revenue legislation, but has the constitutional power to amend. This was established by the fact that the existing tariff of 1883 was a conference measure based upon a House bill and a Senate substitute.

2. The McMullin tariff bill in the line of the Mills bill. In his report from the Committee on Ways and Means Mr. McMullin begins with an attack upon the Senate committee, some of the provisions of which are characterized as entirely inexcusable. The report says that the committee, being unable to agree to any tariff bill which gives no relief to the people, but which increased these burdens, have prepared the accompanying bill, and tender it in the hope that it may be accepted and adopted. While it does not make all of the reductions that the present condition of the Treasury and the best interests of the people demand, it is tendered in a spirit of compromise. Figures are given to show that the bill would reduce the revenues by \$72,133,029. The remainder of the report is made up of an argument in favor of tariff reduction based upon an array of figures showing the value of agricultural products at different periods.

3. The compromise scheme of Breckinridge, embodying all the provisions of the Randall tobacco tax repeal bill. It puts tin plate and wool on the free list, and proposes a woolen schedule by which the rates are reduced correspondingly, and it remedies the present unequal provisions as to woolen and worsted fabrics. It removes the tax on tobacco, and includes the provisions of the bill adopted by the House (the Mills bill) as to tobacco.

4. The Cowles bill with the Randall substitute, repealing all of the tobacco taxes. In their report the majority of the Committee on Appropriations explain that sections 1 and 2 repeal all internal taxes after June 30, 1889, on cigars, cheroots and cigarettes, snuff, manufactured tobacco, the special taxes on manufacturers of tobacco, dealers in leaf tobacco and on peddlers of tobacco. The amount of revenue received from these sources during the fiscal year ended June 30, 1888, was \$30,662,481. The enactment of the bill would reduce the estimated surplus for the fiscal year 1890 from \$53,432,511 to \$22,745,165, a result—whether viewed from the standpoint of an excessive revenue or as a relief from unnecessary taxation upon the people—most desirable. The committee believes that the bill furnishes a practical and simple means of reducing the surplus revenue, as it is evidently impossible, at this late day of the present Congress, to pass any bill involving a complete revision of our whole revenue system. The minority report, presented by Mr. Forney, is confined to a simple recommendation looking to the passage of a substitute bill made up of the sections of the original Cowles bill, repealing the taxes on chewing and smok-

ing tobacco and snuff, all special taxes on manufacturers and dealers, and all taxes on dealers in leaf tobacco; and fixing at \$3 and \$1 the annual tax on cigar manufacturers and dealers in tobacco respectively.

The effect on the revenue under the House bill and the Senate amendments, as shown by the Treasury Department figures, is House bill reductions: Customs, \$50,350,345; internal revenue, \$17,616,234; total, \$67,966,579. Senate substitute: Customs, \$13,976,887; internal revenue, \$33,905,780; total, \$47,882,667. Average ad valorem rates: Existing law, 46.91; House bill, 42.38; Senate substitute, 46 per cent. The effect on metal duties would be: Collected 1887, \$22,524,007; estimated House bill, \$14,991,704; estimated Senate bill, \$30,585,569.

With these conflicting interests in view the prospects of concurrent action are very problematical. The attitude of the Committee on Ways and Means seems to be inspired largely by a personal opposition to Mr. Randall. The latter gentleman, in the meantime, is backed by fully 70 of the Democrats of the House on the internal revenue repeal question. The Republicans are holding aloof, and will not co-operate in the House, although all their members on Appropriations voted with Randall to report the Cowles bill and substitute. The Republicans, anticipating an extra session, prefer to dispose of this matter in their own way.

STEEL INSPECTIONS.

The conference of naval officers, steel manufacturers and shipbuilders in regard to simplification of methods of steel inspections has resulted in a better understanding of the three interests involved in the turning out of ships of war, but will not result in any very material change in the method of conducting the tests of steel. The report of the three officers, Naval Constructor, Engineer-in-Chief and President of the Board of Steel Inspection, has been prepared. It is understood that no very material changes have been recommended. The transportation of material for testing to certain points, and, if unsatisfactory, its return involves expense and delay. A plan is proposed which will divide the labor of tests between the manufacturer and the officer of the Government, which will obviate the necessity of the present large force on that duty. The final tests will be made by the Government, but the heats will be watched by the manufacturers.

THE CAST-STEEL GUN.

The successful statutory test of the open-hearth cast-steel gun, cast by the Standard Cast Steel Company, of Thurlow, at the Naval Ordnance Proving Grounds, has again raised the hopes of the projectors of cast-steel guns, notwithstanding the forlorn showing of the Pittsburgh gun. The two preliminary and ten Government test charges, 100-pound projectile, fired within 38 minutes were entirely satisfactory as demonstrating the feasibility of the manufacture of such guns to stand rapid and continuous firing. The manufacture of the gun required 13 tons of open-hearth steel. Completed it weighed 13,120 pounds. The walls at the breech are $7\frac{1}{4}$ inches thick and at the muzzle $2\frac{1}{4}$ inches thick; length of gun, 193 $\frac{1}{4}$ inches; tensile strength of the metal, 80,000 pounds; elongation, 21 per cent.; reduction, 19 per cent.; elastic limit, 40,000 pounds. With a charge of 48 $\frac{1}{4}$ pounds of powder a conical shell 100 pounds weight has a muzzle velocity of 2000 feet per second. The Government pays \$5300 for the gun. The ordnance experts are much interested in the work of the first gun, but are not yet willing to admit that the system has any prospect of producing an immediate revolution in gun-making, nor that it will seriously interfere with the built-up guns.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St. }
PHILADELPHIA, Pa., February 19, 1889. }

Pig Iron.—The market does not show much change, although the general report is of a somewhat favorable character. There is no pressure to effect sales unless at figures pretty near to quoted rates; while the extremely low-priced lots appear to have been unloaded or withdrawn from the market, and are now held for better figures. There is some irregularity, nevertheless, and statements as to actual selling prices do not harmonize as closely as could be desired. Ordinarily good No. 1 Foundry commands about \$18 at tide; No. 2, \$16.50 @ \$17, and Gray Forge, \$15.50 @ \$16. Some very fair brands of the last named are available at \$15.25, and in some cases No. 1 at about \$17.50, but they are what may be called chance lots, and are not offered indiscriminately. Indeed, as a rule, consumers who want their old "stand-by" irons have to pay quoted rates; and while there are what are claimed to be "equally good" qualities at less money, they are not taken with much avidity. To sum up the whole business in a few words, it may be said that the market is working toward uniformity and steadiness in prices, and that supply and demand are in better proportions than they were two or three weeks back. Prospects as regards demand are fairly encouraging, and while there is nothing to indicate any specially heavy movement, an event of that kind should not cause much surprise, as there is undoubtedly a vast amount of work to come on the market sooner or later. Matters are not sufficiently advanced, however, to warrant very confident predictions, although it is a contingency not to be ignored, nevertheless. There is another feature, however, which should be kept in mind, viz., that Pig Iron makers are adjusting themselves to an era of low prices by reducing cost, in the belief that the conditions favor that course, rather than the expectations of a substantial improvement in selling prices.

Foreign Iron.—Bessemer is nominal as last quoted, viz.: \$19.50 @ \$20, c.i.f., duty paid. Spiegeleisen is quoted at from \$28.25 to \$28.50, c.i.f., duty paid, for 20 %, with a sale of 2000 tons at about the inside quotations.

Blooms.—There is a good demand for all grades of Steel, and while prices are somewhat irregular, they are approximately as follows: \$28 @ \$28.50 at mill for Nail Slabs; \$29 @ \$30 for Sheet Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for Flange purposes; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$42 @ \$44; Scrap Blooms, \$32.50 @ \$34 for "Bloom" ton of 2464 lb.

Muck Bars.—Prices have not been fully maintained, as sales were chiefly at about \$27, delivered. Some of the best makes are held at \$27.50 and upward, but no transactions have been reported at over \$27 since date of our last report.

Bar Iron.—The position has not improved very much up to this writing. Mills in the interior are said to be getting more orders, while local mills are doing fairly on small day-to-day transactions, but there is no improvement in prices. No large lots are being inquired for at present, and while the trade naturally expect a favorable change soon, there are no immediate indications of such a movement. Prices, as we remarked last week, are hardly

quotable. Some mills maintain 1.80¢ @ 1.85¢ as their price for Best Refined Iron, others 1.70¢ @ 1.75¢, with still lower rates mentioned as prevailing at interior points. Skelp Iron is likely to be wanted in large quantities, but there are so many mills waiting for orders that prices are kept at the lowest point yet reached. Last sales in this market were at 1.75¢, delivered, but buyers are holding back, fearing that still lower prices may prevail before things take a good start. Sellers quote 1.75¢, and could not shade that figure without making a loss.

Plate and Tank Iron.—There is no special movement to notice at present. Some of the mills are fairly employed, but they are all open for business at current rates, so that prices do not show much firmness, although they have been crowded to so low a point that it is hardly possible to go further in that direction. The outlook for summer work would be considered very encouraging under ordinary circumstances, but there have been so many delays and so many disappointments that manufacturers prefer the bird in hand, even if it is a poor kind of a one. Prices therefore remain about the same as last week, viz.: 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates, 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.15¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—A moderate amount of miscellaneous orders have been received, but nothing of much importance. Bridge-work is likely to be on the market in the course of a week or two to the extent of 8000 or 10,000 tons, while shipbuilders' and architects' requirements are sure to be large; but in the meantime prices are weak and orders sharply competed for. Quotations are ordinarily about as follows: Bridge Plate, 2¢ @ 2.1¢; Angles, 2¢ @ 2.1¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

Sheet Iron.—There is quite a good demand for Thin Sheets, and some of the leading mills are full of orders for this class of material. Thick Sheets are comparatively dull, but prospects are thought to be favorable for the spring trade. Prices about as follows for small lots:

Best Refined, Nos. 26, 27 and 28....	3 @ 3½¢
Best Refined, Nos. 18 to 25....	2½ @ 3 ¢
Common, ½¢ less than the above.	
Best Bloom Sheets, Nos. 26 to 28....	4½ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25....	3½ @ 4 ¢
Best Bloom Sheets, Nos. 16 to 21....	3½ @ 3½¢
Blue Annealed.....	2.6 @ 2.8 ¢
Best Bloom, Galvanized, discount.....	62½ ¢
Common, discount.....	67½ ¢

Steel Rails.—The market is extremely quiet, but there is a growing impression among manufacturers that the business of 1889 will be very much larger than that of the preceding year. Sales to date are about 25 % larger than in 1888, and the increasing number of inquiries betokens a good deal of business before long. Prices are still somewhat unsettled, but from \$27.50 to \$28 may be regarded as firm quotations in this market.

Old Rails.—Prices are almost nominal as regards this market, as no one seems inclined to pay the high figures asked for the lots that are in store, say, \$24.50 and upward. Sales have been made at from \$24 to \$24.75 for lots delivered to mills a little outside the city, but in view of the low prices quoted in Western markets, buyers are taking only small lots to cover immediate requirements.

Scrap Iron.—The demand is rather slow, and quoted prices not paid with much freedom: \$20 @ \$20.50 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice \$22; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel

Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$23 @ \$24; Old Car-Wheels, \$17 @ \$18, Philadelphia.

Wrought Iron Pipe.—The demand is fair, with unusually good prospects for large Pipe later on. There are some very important matters under consideration, which, if carried out, will give plenty of work during the spring months. Discounts, in a general way, are about as follows: Butt-Welded Black, 55 %; Lap-Welded Black, 65 %; Butt-Welded Galvanized, 45 %; Lap-Welded Galvanized, 55 %; Boiler Tubes, 62½ %.

Nails.—The demand is very light, but there is increasing steadiness in prices, and it is expected that the agreement to restrict production will soon be put into effect. Stocks are decreasing, and prices are steady at \$1.90 @ \$2 for lots from store, with the usual concessions on carload lots.

Edmund D. Smith & Co., 222 South Third street, have been appointed the exclusive sales agents for the Catocin Furnace Company, of Maryland, whose furnaces will again go into blast probably this month. "Catocin" Iron is one of the oldest and best-known brands of Pig Iron in this section, and the United States Government has numerous times stipulated for this make in its specifications for castings. They run entirely on their own ores.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave., }
PITTSBURGH, February 19, 1889. }

Some of the brokers report an increased inquiry, which is usually followed by an increased business, and the indications are that a great many orders will be placed within the next week or two. Within the past few days some of the mills have been started up single turn.

River navigation, after having been suspended for a couple of weeks by ice, has been resumed, and large shipments of all kinds of manufactured goods made. The shipments of Glassware have been unusually large of late, and mostly for the South. It may be stated here that the Glass factories are nearly all in full blast.

The river coal trade continues in bad condition, owing to the markets below being overstocked and very dull, and the prospect for improvement soon is not as encouraging as it might be. The Grand Lake Coal Company, one of our largest river companies, made an assignment within the past week. The liabilities are placed at \$250,000. The Grand Lake Company sold nearly all their coal at New Orleans; and in addition to having a good deal of bad paper, lost heavily by the storm at New Orleans some time ago, having had, according to report, some 500,000 bushels of coal sunk. It is understood that the banks here will lose heavily.

Pig Iron.—In regard to prices there has been no notable change since our last report. Rumors obtain of sales at a further decline, but they are not well authenticated. Bessemer Iron appears to be stronger. There are now but few, if any, sellers under \$16.50, cash, whereas there was a sale a couple of weeks ago at \$16.25, cash. We quote as follows:

Neutral Gray Forge.....	\$14.25 @ \$14.50, cash.
All Ore Mill.....	15.50 @ 15.75, "
White and Mottled.....	18.50 @ 14.00, "
No. 1 Foundry.....	16.25 @ 16.50, "
No. 2 Foundry.....	15.50 @ 15.75, "
No. 1 Charcoal Foundry.....	23.00 @ 23.50, "
Cold Blast Charcoal.....	25.00 @ 25.00, "
Bessemer Iron.....	16.50 @, "

The only sales of Bessemer reported were 500 tons at \$16.40 and 1000 tons at \$16.50.

Muck Bar.—There is little or nothing doing, and in the absence of sales we quote nominally at \$26.50 @ \$27, cash. Sellers generally are asking \$27, cash, and some of them intimate that they would not if they had advance cut under that price.

Spiegel.—Spiegel is quoted at \$28 @ \$28.50 for 20 %, and Ferromanganese at \$56 @ \$57 for 80 %.

Manufactured Iron.—There has been more inquiry the past week, and some large contracts are reported as having been closed; prices, however, continue easy, in sympathy with the raw material. We quote: Bars at 1.70¢ @ 1.75¢; Plates, 2.15¢ @ 2.20¢; No. 24 Sheet, 2.70¢ @ 2.80¢; Skelp Iron, 1.75¢ @ 1.80¢ for Grooved, and 2¢ @ 2.10¢ for Sheared—all 60 days, 2 % off for cash.

Wrought-Iron Pipe.—There is but little change to note in regard to the Pipe trade; there is a very fair business for this season of the year, but continued complaint in regard to prices, which are both irregular and unremunerative. It is difficult to quote prices in the unsettled condition of the market, as each firm make their own prices, and, with a sharp competition, whoever gets the business has to take it so low that there is nothing in it. Discounts are generally quoted as follows: On Black Butt-Welded Pipe, 55 and 5 % @ 57 %; on Galvanized do., 50 and 5 %; on Black Lap-Welded, 65 % @ 67½ %; on Galvanized do., 55 and 2½ %; Boiler Tubes, 65 %; 2-inch Tubing, 11¢ @ 12¢ per foot; ¼-inch Casing, 35¢ per foot.

Nails.—The Nail trade is improving somewhat, but far from being active, or what it should be at this season of the year; a couple of factories here are in operation, Jones & Laughlins and Chess, Cook & Co., but they are not running up to anything like their full capacity. Schoenberger & Co. have made no Nails for several months. Prices remain unchanged, and we continue to quote 12d to 40d at \$1.90, 60 days, 2 % off for cash.

Old Rails.—There have been no sales reported recently, in the absence of which we quote American Tees at \$23 @ \$24; sales, it is claimed, have been made as low as \$23, while some holders are asking \$24. Some of our best-informed brokers are of the opinion that just as soon as consumers commence to buy the market will do better, as the stock, both in first and second hands, is light. Rails are worth about as much at the seaboard as they are here, and as long as they cannot be imported from the other side, there is not likely to be much of an increase in stocks at the seaboard. Unlike almost everything else, the supply is growing less and less every year, as there are no new Iron Rails being made.

Steel Rails.—Heavy Sections are quoted for small lots at \$28 @ \$28.50, cash, but a large order could no doubt be placed considerably below the prices quoted.

Billets, &c.—Bessemer Steel Billets are dull and prices weak; sales reported at \$27.75 @ \$28. Owing to the continued dullness in the Nail trade, there is no demand for Nail Slabs, which may be quoted at \$27.50; Domestic Bloom Ends, \$17.50; and Domestic Rail Crops, \$18.50. No sales reported recently.

Merchant Steel.—There is an increasing demand, and the market is firmer, but prices remain as last quoted. Best brands of Tool Steel, 8½¢; Crucible Spring Steel, 4½¢; Crucible Machinery, 5¢; Open-Hearth do., 2½¢.

Railway Track Supplies.—Business continues light, but an improved demand is looked for soon, as there usually is at this season of the year. No change in prices. Railway Spikes, 2.10¢, 30 days; Splice Bars, 1.85¢ @ 1.90¢; Track Bolts, 2.75¢ with Square and 2.85¢ with Hexagon Nuts.

Old Material.—Trade in all kinds of Old Material continues light, but an improvement is looked for soon, as stocks in hands of consumers generally are light. Prices remain about the same as a week ago. No. 1 Wrought Scrap, \$20 @ \$20.50, net ton; Wrought Turnings, \$13 @ \$13.50; Car Axles, \$24 @ \$25; Cast Scrap, \$14.50 @ \$15, gross; Old Car-Wheels, \$19; Cast Borings, \$11 @ \$12, gross.

George H. Wrightman, formerly secretary of the Hartman Steel Company, Limited, has been appointed Northeastern agent for Carnegie, Phipps & Co., Limited, of Pittsburgh, with headquarters at No. 3 Mason Building, Boston.

Chicago.

Office of *The Iron Age*, 96 and 97 Washington street. CHICAGO, February 18, 1889.

Pig Iron.—The depth of the depression seems to be over, at least in this market. Pig Iron has been purchased very freely and prices are no longer as weak as they were. In fact, advances have been made on quite a number of brands of 25¢ to 50¢ per ton. Southern Irons are not so abundant as they were, and the few brands available from the South are said to be held very firmly at the higher rates asked. The dealers report that almost everybody using Pig Iron has been purchasing within the past two weeks; they seem to be disposed to buy at least the minimum that they will need this year. So many of them have done this that sellers are fearing that in a couple of months there will be no buying at all, and that prices will then drop again, unless business in finished products increases so that much more Iron will be needed than now seems probable. It must be said that in some lines, notably among architectural Iron works, the prospects are very bright for a great deal more work than was done last year. The railroads are buying so little at present that it seems almost inevitable that they must very heavily later in the year, and that the Pig Iron market will be well sustained. The manufacturers of Lake Superior Charcoal Iron are finding an accumulation of Nos. 1 and 2 and are disposed to make slight concessions on these numbers, which has imparted an appearance of weakness, which is a new feature with this class of Iron, as it has been so strongly held hitherto. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Coke, No. 1, \$16 @ \$17; No. 2, \$15 @ \$16; No. 3, \$14 @ \$15; Chicago Scotch, No. 1, \$17.50; American Scotch (Blackband), No. 1, \$18.50 @ \$19.50; Jackson County Silvery, No. 1, \$18; other Ohio Soft Irons, No. 1, \$17.50 @ \$18.50; Lake Superior Charcoal, Nos. 1 and 2, \$19.50 @ \$20; Tennessee Charcoal, No. 1, \$19; No. 2, \$18.50; Southern Coke, No. 1, Foundry, \$16.50; No. 2 Foundry and No. 1 Soft, \$15.75 @ \$16; No. 8 Foundry, \$15.25 @ \$15.50; Gray Forge and No. 2 Soft, \$14.75 @ \$15.

Bar Iron.—The prospect is a little brighter, orders being more numerous than they were and inquiries widening very considerably. The demand seems to be coming from the smaller manufacturing consumers, who are evidently experiencing a heavier demand for their products. Prices are slightly easier and quotations are now about 1.67½¢, half extras, f.o.b. Chicago, for carload lots of good quality Common Iron. Slight concessions are made on this rate for large orders, but manufacturers are disposed to resist attempts to force prices down very considerably. A peculiarity of the present market seems to be the firmness with which a bottom rate is made, as it sometimes occurs that under such conditions as have recently prevailed a very weak seller can be found who will drop his quotations much below those of any of his competitors. Small lots from store are being sold at

1.80¢ @ 1.90¢ for Common Iron, and up to 2.10¢ for Iron of better quality, in small lots.

Structural Iron.—As reported last week, trade is beginning to move a little, but not much activity is expected in this line until March or April. Mill lots are quoted as follows, f.o.b. Chicago: Angles and Sheared Plates, 2.10¢ @ 2.12½¢; Universal Plates, 2.15¢; Tees, 2.55¢ @ 2.60¢; Beams and Channels, 2.90¢. Small lots from store are available at 2.35¢ for Angles, 2.70¢ for Tees, and 3¢ @ 3.40¢ for Beams and Channels.

Plates, Tubes, &c.—A very fair business has been transacted during the week, including quite a number of carload orders. The Boiler shops are now well filled with work, and enough business is in sight to keep them well employed all summer. The dealers in Plates, consequently, feel very cheerful over the prospect. Boiler Tubes are regarded as a very good purchase at present prices, manufacturers' agents here believing them now to be at bed rock prices. Small lots from store are quoted at the following rates: Sheet Iron, Nos. 10 to 14, 2.50¢; Sheet Steel, 2.75¢; Tank Iron, 2.40¢; Tank Steel, 2.60¢ @ 2.75¢; Shell Iron, 3¢; Shell Steel, 3.12½¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 62½¢ @ 65¢ off.

Sheet Iron.—Manufacturers' agents are selling a great deal more Galvanized Iron than last week. The demand is very general, including the cornicemen, car builders, and even the railroads to some extent. Prices of small lots are unchanged at 65 % off for Juniata and 65 % and 2½ % off for Charcoal. Black Sheets are a little weaker, without quotable change in prices, being nominally held at 3.30¢ for No. 27 Common from store and 2.95¢ @ 3¢, f.o.b. Chicago, for small lots.

Merchant Steel.—A fair trade is reported, but no large orders have recently been placed. Quotations are as follows, the lowest prices being for large lots: Soft Steel Bars, 2.10¢ @ 2.30¢; Tool Steel, 7.75¢ @ 8.50¢; Specials, 13¢ @ 25¢; Crucible Spring, 3.75¢; Open-Hearth Spring, 2.20¢ @ 2.50¢; Open-Hearth Machinery, 2.80¢ @ 2.50¢; Tire, 2.20¢ @ 2.50¢; Sheet, 7¢ @ 10¢.

Steel Rails.—Not much business has been transacted since our last report. The orders then in sight are still hanging, and the manufacturers are not feeling particularly bright over the future. Quotations are still \$30 @ \$30.50, according to quantity.

Old Rails and Wheels.—It seems probable now that bottom has been reached, for the present, in Old Iron Rails. Sales have been made at \$20, but other parties willing to buy at this price have not succeeded in securing the Rails. Some sales were made at slightly higher figures toward the close of the week, and it is believed that \$20.50 is now about the price which they are worth. Old Steel Rails have been sold at \$15 for pieces under 3 feet and \$18 @ \$20 for longer lengths, according to their condition. Old Car-Wheels are, nominally, worth \$19.

Scrap.—Material is not so plentiful as it was, and dealers are disposed to maintain quotations. The demand is only for small lots, and market is not being forced to take more. Mixed Country Scrap is still worth \$14. Quotations to consumers are as follows, per ton of 2000 lb: No. 1 Railroad Shop, \$20; Track, \$18 @ \$19; No. 1 Mill, \$14 @ \$15; Pipes and Tubes, \$18 @ \$14; No. 2 Mill, \$9; Axles, \$25; Horse-shoes, \$18 @ \$19; Machinery Cast, \$13.50 @ \$14; Stove Plate, \$11; Cast Borings, \$8.50; Wrought Turnings, \$11 @ \$12; Axle Turnings, \$13.50; Mixed Steel, \$11; Coil and Leaf Steel, \$15; Tires, \$15.

General Hardware.—The demand for Shelf Hardware is very fair and business is improving. While the first half of the month was not particularly rushing, the demand is considerably better now. Orders are coming in pretty rapidly for spring delivery, and the prospects are bright for a good trade later in the season. It is a peculiarity of some sections of the country that the merchants take stock in February, and that naturally restricts business somewhat during this month. No special changes have taken place in prices except a slight decline in Silver-Plated goods and also in Carriage Bolts, but while some lines are thus off a little, others are stiffening, and a general impression prevails that on the whole prices will be higher, rather than lower, and that now is a very safe time to buy goods. There is no chance for speculation, but simply for good business investment. The demand for Heavy Hardware continues good and the merchants are feeling much more cheerful than they were the latter part of last year. Collections are very good.

Nails.—The condition of the Steel Nail trade is about as it has been. Manufacturers' agents are very firm and refuse to make concessions, but jobbers are occasionally cutting the price for small lots when they can accomplish a purpose by so doing. The regular quotations by jobbers is \$2 for carloads and \$2.05 for small lots. The manufacturers of Wire Nails are no firmer than they have been, and jobbers' prices are still receding. Carload lots or mixed carloads can be bought at \$2.35, while \$2.45 is still the regular price for small lots.

Barb Wire.—A very good demand is reported, but prices are no stronger; in fact, the manufacturers do not seem to be trying to advance rates. The fight which has been prosecuted with more or less vigor for the last few years between those who draw their own Wire and those who purchase Wire is being pushed more bitterly than ever, and it is possible that prices will not improve until the trade has passed into fewer hands. The attitude of the manufacturers has pushed jobbers' prices down, and \$2.75 is now named for carloads or mixed carloads and \$2.85 for small lots. Galvanized Wire is offered at 60¢ ? 100 lb in advance of these quotations.

Pig Lead.—Prices have declined to 3.45¢ under sales of 500 tons for delivery in February and March, with manufacturers claiming to be well supplied for at least 60 days. There is a growing feeling that present prices are low and comparatively safe, but buyers are apathetic at present.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,
CHATTANOOGA, February 18, 1889.

Pig Iron.—The situation is but little removed from that reported last week; there is a firmer feeling prevailing, although prices have undergone but little change. Sales are very active, which has resulted in much larger amounts changing hands than usual and there is not the supply on the market that there was a few weeks ago. Southern consumers are buying quite heavily, much more so than usual; in fact, it appears to be the general feeling among all consumers, North and South, that now is the time to lay in stocks for the next few months, and it is very largely being acted upon. What the effect of the storage and warrant system will in the future have upon the prices of Pig Iron yet remains to be seen—as yet the workings of it are not perfected. There seems to be somewhat of a difference of opinion expressed as to the effect upon prices. There are those who think that the storage of large amounts of Iron which is ready for delivery

at any moment will act as a menace to speculation and lead to an advance in prices. Should the furnaces rely upon this avenue of placing their product to a considerable extent, and this may withhold it from the market, it can hardly do otherwise than stiffen up the market to some extent and perhaps place it more on a conservative basis. This appears to be about the general opinion of those who have expressed themselves upon the subject. The question will eventually solve itself in this way. Should production continue to be greater than the consumption and stocks continue to accumulate in the different storage yards, there would be less danger from an extreme depression in prices, as has occurred in times gone by. It will give more time for the less-favored stacks to close up their business without such sacrifice as might otherwise occur. Upon the whole, the subject is being looked upon as a sort of balance-wheel that will act as a regulator of the Pig Iron business.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts.,
CINCINNATI, February 18, 1889.

Pig Iron.—Confidence has gained ground in the local market during the week, and a fair volume of business has been transacted. Statistics show that there is very little accumulation of Iron now, and that production has been reduced to within a close proximation of consumption. Such conviction has given a stronger feeling to producers, and their feeling has been more generally communicated to buyers, who have acted upon such information as is reflected in the demand, which has been well distributed. No large individual sales have been reported, the largest being for 1500 tons No. 1 Southern Foundry at \$15; some have been reported sold at \$15.25. But while foundry grades have sold moderately well, the demand has been more for Forge Iron, 1000 tons Gray Forge selling at \$13, 1000 do. at \$13.25 and 1000 tons Mottled at \$12.50, cash; other lots of Mottled have sold at \$12.25. For Car-Wheel Iron the demand has been active, 5000 tons Southern reported sold on basis of \$25; moderate amounts of Lake Superior Car-Wheel have sold at \$21.50, spot. It is reported that present shipments from Southern furnaces are the largest on record. Generally speaking, a stronger tone prevails, with higher prices asked and obtained in some instances. The following are the approximate prices current here at the close for cash, f.o.b.:

Foundry.

Southern Coke, No. 1 (new classification).....	\$15.00 @ \$15.50
Southern Coke, No. 2 (new classification).....	14.50 @ 14.75
Southern Coke, No. 3 (new classification).....	14.00 @ 14.25
Ohio Soft Stone Coal, No. 1.....	15.00 @ 16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.00
Maboning and Shenango Valley.....	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.00
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

Forge.

Strong Neutral Coke.....	13.00 @ 13.50
Mottled Neutral Coke.....	12.25 @ 12.75
Gray Forge.....	13.00 @ 13.25

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	21.00 @ 22.00

Manufactured Iron.—Generally speaking, the market has been slow, but a few mills have been well supplied with orders, and prices have changed but little.

Nails.—The market has remained quiet and easy, without essential change in prices: 12d @ 40d sell at \$1.90 @ \$1.95 ? keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$1.95, and Steel Wire Nails at \$2.60 @ \$2.65 ? keg.

Old Material.—There has been a moderate demand for Old Rails, with small sales on line of O. & M. R. R. at \$21.50, cash; holders ask \$22 at the close, but buyers hold off. There have been small sales of old Wheels at \$18 @ \$18.50 ? ton, spot.

Birmingham.

BIRMINGHAM, ALA., February 18, 1889.

Pig Iron.—While prices in Iron remain practically unchanged, the feeling is confident and expectation of better things almost buoyant. The money market is easier than for some years, and from what the bank authorities say, it will be fair enough sailing for any legitimate business here for some time. The fact that after the stress of reaction from the boom has done its worst, the large majority of property here is utterly unencumbered, gives great encouragement to those who offer money, and they are more than ready to lend it on reasonable security. The Hull storage scheme has recently been much discussed, but the opinions arrived at are conflicting. One furnaceman said to your correspondent he thought it will help the furnaces by keeping up the price of iron; that if any of them become hard up they could get an advance which would enable them to tide over the pressure. Another's theory was that the lower the prices the better the chances for the advancement of this district, and Birmingham could afford to be independent of the storage schemer. The fact was pointed out that during the depression some years ago the few Birmingham furnaces in operation went along without cessation or embarrassment, and so it is held they will always do in any ordinary contingency. The district, that is including all North Alabama, is distinctly looking up. Progress has been largely made in mixing better grades, both of Coal and Iron Ore. Sheffield by this will be particularly benefited. The furnace at Trussville, this county, to which another will soon be added, will use Coke made from a Murphree's Valley vein of Coal, about 25 miles north of here. The operators who have worked the Pennsylvania Connellsville Coal say this Alabama Coal will make fine clear Coke, as good as can be produced anywhere in this country. The Sheffield people have been getting Coke from West Virginia until recently. Now they are beginning to receive consignments from new ovens in the Warrior Coal fields at Jasper, Walker County, about 40 miles south. There has been no break since the last report in the way of smooth operations in the district. One of the new furnaces at North Birmingham of the Sloss Steel and Iron Company will go in blast during the week.

Cleveland.

CLEVELAND, February 18, 1889.

Iron Ore.—None of the big mining companies has fixed prices, although there is no material difference of opinion as to what these prices will be eventually. Quotations for 1889 can be estimated almost to a certainty. Non-Bessemer Ores will bring 40¢ more ? ton than was paid at the beginning of last season, and Bessemer Ore from 25¢ to 35¢ more. One heavy consumer, when offered Bessemer Ore at 40¢ advance over last year's quotations, promptly offered to pay 30¢, leaving a difference of but 10¢ ? ton between the mine owners and the furnacemen. The Ore men are encouraged just at present by reports of increased demands for Steel Rails and Bessemer Iron, and a heavy buying movement is expected to follow the first announcement of quotations. It is said that 200,000 tons of Ore could be quickly disposed of now on the docks. Instead of this amount, there are less than

35,000 tons of unsold Ore to be obtained, and this is rapidly disappearing. A small lot of non-Bessemer Hematite Ore already on the docks is said to have sold for \$4.10 per ton during the past week. It is now confidently believed that several of the largest mining companies will fix prices within the next ten days.

Pig Iron.—The market has improved in tone. Three or four large manufacturers report a strong demand for Bessemer Iron, and it is thought that the tide has at last turned in the direction of the seller. A number of furnacemen have announced their intention of refusing to make additional concessions, despite rumors to the effect that Mill Iron has sold as low as \$15.25, cash, during the week just closed. Foundry Iron has also been reported a point or two lower, but only scattering and unimportant sales at the reduced figures have occurred. The outlook, as a whole, is decidedly more hopeful and an active buying movement is looked for early in March. A good deal of Iron is unquestionably going into consumption.

Old Rails.—A 1000-ton lot of Old American Rails was offered during the past week at \$21.80, and \$21.50 is probably a fair quotation.

Louisville.

LOUISVILLE, KY., February 18, 1889.

Pig Iron.—There has been no noticeable change in the market during the past week, and prices of Iron still remain at very low figures. Several furnaces have withdrawn from the market, and refuse to sell at present prices, seeming to think that the market must show some improvement in the next 60 days. Foundry Irons sold last week at remarkably low prices, making the prospect look almost as discouraging as ever, excepting that the movement taken by some furnaces in withdrawing from the market may cause better prices. It seems to be the universal opinion of Pig-Iron men that the market will show a change for the better in the near future. We quote for cash as follows:

Southern Coke, No. 1 Foundry, new classification.....	\$14.75 @ \$15.25
Southern Coke, No. 2 Foundry, new classification.....	14.25 @ 14.75
Southern Coke, No. 3 Foundry, new classification.....	13.75 @ 14.25
Gray Forge.....	13.25 @ 13.75
White and Mottled, different grades.....	12.75 @ 13.25
Silver Gray, different grades.....	13.00 @ 13.50
Southern Charcoal, No. 1 Foundry.....	16.25 @ 16.75
" " No. 1 Mill.....	14.75 @ 15.25
Southern Car-Wheel, standard brands.....	21.75 @ 22.75
Southern Car-Wheel, other brands.....	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry.....	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry.....	19.50 @ 21.00
Hanging Rock, Cold Blast.....	20.75 @ 23.75

St. Louis.

OFFICE OF *The Iron Age*, 212 N. Sixth st., }
ST. LOUIS, February 18, 1889. }

Pig Iron.—Shows little or no change, either as regards price or demand, from last week's report. While it is true a number of furnaces in the South have blown out, and others advanced their prices, yet consumers show no disposition to provide for future requirements, and are only in the market to supply the present needs, and seem to think that prices will be all right when they are in a position to become purchasers for future wants. Sales are for small lots, and large buyers seem to be out of the market, for the time being at least. We quote as follows, for cash, f.o.b. St. Louis.

Southern Coke, No. 1 Foundry, \$15.25 @ \$15.75	
Southern Coke, No. 2 Foundry, 15.00 @ 15.25	
Southern Coke, No. 3 Foundry, 14.25 @ 14.75	
Gray Forge.....	13.50 @ 13.75
Ohio Softeners.....	17.50 @ 20.00
Lake Superior Charcoal.....	21.00 @ 21.50

Missouri.

Charcoal Foundry, No. 1.....	16.00 @ 16.50
Charcoal Foundry, No. 2.....	15.00 @ 15.50

Tennessee.

Charcoal Foundry, No. 1.....	17.50 @ 18.50
Charcoal Foundry, No. 2.....	16.75 @ 17.50
Connessville Coke, f.o.b. East St. Louis, \$4.70; St. Louis, \$4.85.	

Bar Iron.—There is no demand to speak of, and small orders are the rule, while large lots still remain "in the near future." The outlook is improving, however, and a number of inquiries have been received for some good round lots, which, if prices are satisfactory, will be closed during the coming week. Irregularity in prices continues and it is difficult to quote with any degree of accuracy, as concessions are frequently made on orders for desirable specifications. Small lots from store are quoted at 1.85¢ @ 1.90¢, according to quantity and quality.

Barb Wire.—The volume of business continues large, and mills are well filled with orders, so much so that in some instances they are a week or ten days behind their orders. Prices show no improvement. Manufacturers think, however, that with the assistance of the spring demand the chances are favorable for some advance over the prices now ruling, which are as follows: Carload lots, Two and Four Point Painted, \$2.90; carload lots, Two and Four Point Galvanized, \$3.50, f.o.b. St. Louis; less than carload lots, 5¢ additional.

New York.

Office of *The Iron Age*, 66 and 68 Duane street, }
New York, February 20, 1889. }

American Pig.—The market is moderately active, and while some authorities in the trade note a slight improvement, facts are continually cropping up, which give the market an appearance of irregularity. Pressure to sell comes from various quarters, both North and South, in foundry and forge grades, and, although the quantities thus thrust upon the market are not large, the fact that low figures are accepted tells. It should be noted, however, that in some cases a small lot is put into so many hands to sell that the impression is created among buyers that large amounts are urgently offering. We hear of concessions in exceptional instances in Gray Forge and in No. 2 Foundry, and are informed that No. 1 can be purchased at \$17.50 for Standard Northern makes; White Southern Iron is still available at \$17 for No. 1. Standard Northern No. 2 can be purchased at \$16.25. The discrepancy between quotations at leading Western points and in the East, on Southern Iron has attracted attention. Taking \$14.75 at Cincinnati for No. 1, and adding the difference in freight, \$1.11, an equivalent of \$15.86 is reached. This is \$1 below the quotations made by Southern furnaces in this section. The only explanation offered thus far is that Southern representatives have not cut deeply because they have feared sharp retaliatory measures by Northern furnace companies. It would seem improbable that so great a disparity could long exist, however, and so long as there is not a marked advance in the West, Southern Iron will be a very serious menace to prices in this section. We quote standard Northern No. 1, \$17.50 @ \$18; No. 2, \$16.25 @ \$17.00, and Gray Forge, \$15 @ \$16, all at tidewater.

Scotch Pig.—We quote: Coltness, \$20.50 @ \$21; Shotts, \$20 @ \$20.50; Langloan, \$20 @ \$20.25; Summerlee, \$20.25 @ \$20.50 and Dalmellington, \$19.25 @ \$19.50.

Spiegeleisen.—We note sales of about 2000 tons of Foreign 20 % at \$26.75 ex-ship

and a small quantity of Domestic 10 to 12, @ \$22.50, delivered at mill in Eastern Pennsylvania.

Plates.—We quote Iron Tank, 2¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.15¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3¼¢ @ 4¢.

Structural Iron.—We quote Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 2¢ @ 2.10¢; Tees, 2.4¢ @ 2.6¢, and Channels and Beams, 2.8¢ on dock for all sizes.

Bar Iron.—We quote: Carload lots on dock, half extras, Common, 1.65¢ @ 1.75¢; Medium, 1.75¢ @ 1.8¢, and Refined, 1.8¢ @ 2¢.

Steel Rails.—The report of the Board of Control for the 1st of February shows that the sales by the mills to that date aggregated 494,441 tons this year, against 394,897 tons reported up to the same time a year ago. This shows an increase of 100,000 tons. We are convinced that now the orders aggregate at least 650,000, the total allotment being 777,968 tons. The shipments in January were only 64,352 tons, of which 41,374 tons were from two mills. Eight works shipped less than 2000 tons each, and six less than 100 tons. The returns of the Board of Control are particularly interesting from the point of view of the territorial distribution of orders. The Eastern mills, which includes the Pennsylvania, Bethlehem and the two Scranton mills, report sales of 213,978 tons; the Pittsburgh district, including Edgar Thomson and Cambria, have 173,640 tons. The Allegheny Bessemer, which does not report, may carry this to 200,000 tons. The three Chicago mills—the North Chicago, Union and Joliet—have, together, 108,823 tons. The same Eastern mills shipped last year 471,747 tons. The two Western Pennsylvania mills shipped 221,309 tons, and the Chicago group 402,686 tons. It will be noted how greatly the Chicago mills have suffered through the deplorable condition of the Northwestern railroads. Practically the great systems upon which they are dependent have not bought even a fraction of their requirements. Altogether there have been few large purchases. The following list embraces all the sales upward of 10,000 tons thus far: Pennsylvania Railroad, 51,148 tons; Union Pacific, 17,000; Erie, 20,000; Pacific Improvement Company, 10,000; Alabama Terminal, 14,123; Chicago, Burlington and Quincy, 11,250; Lackawanna, 10,000; Fort Worth and Rio Grande, 10,000; M. Kennedy, 13,558; S. Kneeland, 12,835; Lake Shore, 12,000; Lehigh Valley, 10,502; Lynchburg and Dunham, 10,000; Missouri, Kansas and Texas, 12,990, and Missouri Pacific, 15,000 tons. The absence of many large systems is noteworthy. The relative position of the three groups of works alluded to in the above has an important bearing in the markets. With possibly one exception, the active mills in the East have business enough to last them for a considerable period. Relatively speaking, they and two of the Pittsburgh mills are sufficiently well supplied with orders to be somewhat indifferent. So far as we can learn, none of the Eastern mills would now accept \$26, which was taken some weeks since. The majority ask \$27 or more, and it is very doubtful whether any lower offer would be entertained.

Old Rails.—We note a sale of 300 to 400 tons of American Tees, for delivery at Norwich at \$22 delivered.

Track Material.—There have been sales of round lots of Spikes, which we quote 2¢ @ 2.10¢. Angles remain weak at 1.80¢ @ 1.85¢, while Bolts and Square Nuts are quiet at 2.65¢ @ 2.75¢.

Financial.

The financial and business outlook has not distinctly improved during the week, although the tone is cheerful on all sides in prospect of more activity at an early day. Several important interests are affected by pending negotiations concerning railroad management and transactions are held in abeyance. Complaint comes from Chicago of much trouble in east bound freight cases from under-billing, false invoicing and other irregular practices, and a reduced margin of profit is advised, so that the indirect and weak lines shall be depressed of their opportunities. Taken together, the exhibit of gross earnings of railroads for January is much more favorable, contrasted with a year ago. The movement of cotton this year is in much larger volume. Commissioner Cooley, speaking of the railroad presidents' agreement, says: "The act to regulate traffic is, on the whole, conservative and beneficial, and its most vigorous provisions cannot inflict upon carriers subject to it so much mischief as the managers voluntarily bring upon themselves by the old abuses of these rate wars." All of the business exchanges will be closed on Friday next, Washington's Birthday.

The Stock Exchange markets were generally strong and active. Much uncertainty was caused by the attitude of the "Q" managers in reference to the agreement of the Interstate Railway Association, which was understood to have for its object the renewal of investments in the extension of Western roads. On Tuesday night President Adams was inclined to believe that all the signatures would be obtained. The same day, in this city, the Trunk line presidents agreed not to continue joint rate or other traffic arrangements with any connecting roads engaged in manipulations and devices which clearly violate recent agreements and the Interstate Commerce law. On Thursday B. & Q. advanced on the news that a quarterly dividend of 1 per cent. had been declared. On Monday a decline in St. Paul and other grangers was attributed to the refusal of the Iowa Railroad Commissioners to substitute the Illinois tariff for their own. On Tuesday the market was dull awaiting news from Chicago. The engagement of \$500 in gold for export had no effect. Jay Gould retired from the Board of Directors of the Delaware, Lackawanna and Western, owing to his health. The stockholders of the Bethlehem Iron Company voted to increase the stock from \$2,000,000 to \$3,000,000.

Government bonds are quoted as follows:

U. S. 4½s, 1891, registered.....	107½
U. S. 4½s, 1891, coupon.....	108
U. S. 4s, 1907, registered.....	128½
U. S. 4s, 1907, coupon.....	129
U. S. currency 6s.....	120

The total amount of bonds purchased to date under the circular of April 17 is \$117,668,450, of which \$51,337,300 were 4 per cents. and \$66,331,150 were 4½ per cents. The cost of these bonds was \$137,723,889, of which amount \$65,925,899 was paid for the 4 per cents, and \$71,797,990 for the 4½ per cents.

The weekly statement of the associated banks showed heavy gains resulting from bond purchases by the Government, as well as from receipts of currency, chiefly from the South. There was consequently a decrease of \$3,142,000 in surplus reserve, which now stands at \$17,293,000, against \$17,937,000 in 1888, and \$15,500,000 in 1887. Loans were slightly contracted. Specie increased \$3,715,400, and legal tenders \$209,700. Loans and deposits are now near the maximum, as compared with any former period.

Money is easy. Rates are 3 % for 60 days, 3½ % and 4 % for 90 days and four

months, and 4 and 5 % for longer dates. There is no change of importance in commercial paper, which is in good demand, and some banks are buying which have not been in the market for a long time. The market for sterling is firm at \$4.87 @ \$4.89½, to which point rates were advanced on Friday, so that it is not unlikely gold may be shipped profitably as an exchange operation for the first time in two years.

The exports from this port continue to show an increase as compared with last year. The total for the week ending today was \$7,798,498, cotton figuring very largely in the shipments. For the corresponding week of 1888 the exports were \$5,472,458.

General trade is quiet, but fully holds its own, compared with one week ago. The aggregate clearings of 42 cities show an increase of 28.5 %. Outside of New York the increase was 15.6 %. New York gained 36.1 %; Milwaukee, 32.6 %; Kansas City, 31.5 %; New Orleans, 28.6 %; Baltimore, 21.1 %; Chicago, 20.2 %; Pittsburgh 19.5 %; Detroit and Philadelphia, 13.6 % each; Boston, 13.4 % and St. Louis and Cincinnati 11.2 % each. Indianapolis decreased 72 %; Los Angeles, 46.1 % and San Francisco 5 %. In our local jobbing trade the movement in dry goods compares well in the amount of business done a year ago, but no rush is looked for before the beginning of March. There is some further cutting of prices, to prevent a diversion of trade to other points. Wholesale grocers notice a good distributive demand, excepting for coffee, which is sluggish. Flour is stiffly held despite a reaction in wheat, which is about 2¢ lower for spot. Reports received from Antwerp stated that the wheat crop in South America is a failure. The movement of corn is free from all the Atlantic ports and the exports of provisions are in excess of the same time last year, comprising 6,584,000 lbs. of lard and 12,500,000 lbs. of bacon. Cotton advanced ¼¢ for spot. As a whole prices have a lower range.

The advance statements of January exports from the United States show the movement under the four principal classes to have aggregated in value \$7,500,000 more than for the corresponding month of 1888, due to the larger movement of corn. For seven months the comparison with the previous year shows that the aggregate value of the four principal classes exported closely corresponds, as follows:

	1889.	1888.
Breadstuffs (7 months).....	\$73,814,700	\$82,501,764
Cotton (5 months).....	149,841,015	148,088,757
Petroleum (7 months).....	29,933,470	27,790,741
Provisions (7 months).....	57,263,581	53,593,081

Total.....\$310,852,766 \$311,924,348

Exports of specie from this port during the week were \$288,000, and the imports of specie \$379,000. Since January 1 the exports are \$3,885,000, as compared with \$3,465,800 for the same time last year. The imports of merchandise at this port during the week were valued at \$9,691,000, of which \$5,875,000, represents dry goods. Since January 1 the total is \$70,162,000, an excess of \$4,500,000, compared with last year.

The New York Board of Trade desires to co-operate with the movement originating in St. Louis to secure the enactment of a national bankruptcy law. The Direct Tax bill, though passed by both houses, hangs fire. There is little prospect of the passage of any revenue bill at this session of Congress. The Legislature of Delaware has passed an act repealing the law which imposed a tax of \$25 on persons selling goods by sample in that State. A new banking institution, to be known as the Cosmopolitan Bank, has been organized under the State laws, and will soon be located in the vicinity of Madison square.

Coal Market.

The Anthracite Coal trade is suffering from a glutted market and the companies struggle in the effort to uphold prices against the competition of large individual operators like Cox Bros. & Co. and Pardee & Co., who are represented as having decided between the alternatives of selling Coal at a concession or shutting down their collieries. "It is stated that Cox Bros. & Co.'s agent acknowledged having sold Broken and Egg Coal recently at \$3.50 per ton or less f.o.b. in New York harbor, and he also said that \$4 f.o.b. had been accepted by his firm for Stove and Chestnut sizes." According to report, the sales agents of the large companies, at a conference last week, seriously discussed the expediency of freezing out individual concerns by making a general slash in prices, but the final decision was to stand firmly in their present attitude. The Reading Company's accumulation at Port Richmond has increased to 225,000 tons, and yet they are unable to load their steam colliers in the absence of orders for Eastern shipment. A "high official" in Philadelphia is quoted as saying that no more collieries will be shut down at present, whatever individuals will do. Not altogether in harmony with this view, a prominent official of the Coal and Iron Company said: "I do not anticipate any change in prices. We are mining too much Coal; not only the Reading but all the companies. It must stop and stop soon or there will be trouble. It seems to me that all the Anthracite Coal miners ought to shut down for two weeks and tri-weekly next March, if need be. This policy was pursued in former years and there is no reason for departure from it now."

Apparently regardless of "trouble" in prospect, the production of Anthracite for the week ended February 16, was 565,505 tons, an increase of 105,000 tons over the previous week, but a decrease of 93,000 tons compared with the same week last year. Since January 1 the total is 3,788,000 tons, against 3,910,000 for the same time in 1888. Reading Railroad's Coal tonnage last week was 97,202 tons, an increase of 58,041 tons.

Bituminous Coal is unchanged, but a sharp competition is looked for in the effort to secure contracts soon to be offered. The percentages of production for shipment at tidewater are being averaged.

Metal Market.

Copper.—In the London market there has been no change in spot Chili Bars and good Merchantable, both remaining £77.-10/, but futures gave way from £75 to £71 yesterday, the sales summing up 1200 tons. Meanwhile in our own market the syndicate renewed its pool sale to manufacturers for a further period of three months, to date from April 1, for a total amount of between 12,000,000 to 16,000,000 lb at the old price of 16½¢. This is the only actual business that has transpired, nothing having been done on the Metal Exchange, where the nominal quotations for futures ranged from 16.95¢ down to 16.75¢ for February to April delivery, nominally. Casting brands are quoted 15½¢ @ 16¢; rumors have kept afloat with reference to negotiations between the syndicate and the Lake Mining Company for modifications in the subsisting contract on the basis of 15 % curtailed production. Furthermore, it was stated that the syndicate intends reducing prices in London, so as to stimulate thereby more liberal consumption. Details have now been received by mail from Paris relating to the panic there in Copper mining shares and those of the Société des Métaux. The drop was at one

time enormous in both, but it fully explained that the financial strength of the Société is unimpaired, the firm of Rothschild and several other powerful financial concerns lending all the aid to the Société which it stands in need of. Thus in reality it does not look as though anything like a collapse of the Société were at hand. The fact is that the Paris Stock Exchange, as well as that of London and leading Continental countries, is so much mixed up with Copper shares that bear raids are almost of weekly occurrence, drawing their substance from all sorts of mendacious rumors and pure inventions. The actual product of the 11 Lake Superior mines in January was 4557 tons, as compared with 3686 in 1888. The accounts from the Calumet and Hecla about the continuance of the fire seemed to have in reality but little significance. Spot Copper advanced this morning from £77. 10/ to £77. 12/6, and futures from £71. 10/ to £72. 10/. Lake closed firm at 16½¢ @ 16¼¢.

Tin.—There has been a further decline in spot Tin in London from £94. 12/6 to £94 yesterday, and in futures from £97. 7/6 to £94. 15/, sales summing up 650 tons. Here the market followed suit by degrees, 10 tons spot being sold at 21.80¢, 10 tons April at 21.45¢, and subsequently 10 tons February and 10 tons April both at 21¢. As per cable from Gilfillan, Wood & Co. to Mr. Ch. Nordhaus, their agent, 89 Water street. The shipments of Tin from the Straits settlement during the fore-half of the current month to the United States have been 500 tons, as compared with 200 same time last year. Since January 1 they were 1050, against 600, and to England 3700, against 4300. There being no change in London, the closing price of spot Tin is 21¢ here. **Tin Plates.**—In Tin Plates on the spot very little has transpired, and that little at rather weaker prices. In futures some orders for Cokes have been placed, yet a considerable quantity are still held back awaiting lower prices in Wales, and these are gradually coming about. We quote, large lines, per box: Siemens-Martin Steel, Charcoal Finish, \$4.75 @ \$5.50; Terns \$4.12½ @ \$4.25; Coke Tins, \$4.22½ @ \$4.30, and Wasters \$4.12½ @ \$4.15. The quotation in Liverpool is unchanged at 18/ for Coke Tin.

Lead.—In the absence of an active consumptive demand the market has been ill sustained, and some 200 tons were sold at 3½¢, the tendency still being downward, speculators for a rise seemingly not having courage enough to take hold of the metal, low as it is. Out West the quotation has ranged between 3.40¢ and 3.45¢. In London during the week Soft Spanish declined from £12. 15/ to £12. 10/, and English Pig from £13 to £12. 15/.

Spelter.—The demand being the reverse of active, and Ores obtainable at some reduction in the West, weakening influences have been brought to bear on the market, so that Common Domestic has to be quoted 4.90¢ on the spot. Production in 1888, as per statement of Mr. Ch. Kirckhoff, Jr., agent of the Geological Survey, is shown to have been 55,913 tons of 2000 lb, Illinois having produced 22,445; Kansas, 10,442; Mississippi, 13,465, and Eastern and Southern States 9561. Gradually the United States are thus becoming quite large producers of Spelter. Silesian declined in London from £17. 12/6 to £17. 7/6, the quotation here being 5½¢ nominally.

Antimony.—Has been moderately dealt in on the spot for actual consumption at 18½¢ Cookson and 11½¢ Hallett.

New York Metal Exchange.

The following sales are reported:

MONDAY, February 18.	
10 tons Tin, February	21.00¢
TUESDAY, February 19.	
10 tons Tin, April	21.00¢

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, February 20, 1889.

The syndicate agents have continued to purchase Chili Bar prompts at £77. 10/, but consumers, it is said, have been buying at a lower price. The official prices for three months' futures have been reduced to £71 @ £72, in the absence of supporting purchases to offset "outside" transactions, but these prices are still a full £5 above what sales are said to have been made at on the street "ex-syndicate." Transactions in sellers' option all the year are reported at £61 @ £68. The market is in a chaotic state, suggesting almost complete absence of speculative support from the syndicate interest, for the time being.

Stocks in public stores increased 6000 tons the first half of February, and the supply of Anaconda Matte in Europe is now said to be at least 24,000 tons. The Chili charters for last half of February, as per telegraph, amount to 1000 tons.

It is reported from Paris that the organization of a new company, to be known as the Compagnie Auxiliaire des Metaux, has been formed, with a capital of £1,600,000, to assist the Société des Metaux. Negotiations are said to be pending between the two organizations for the transfer of a large amount of present Société des Metaux holdings. The total of the latter is said to represent an actual outlay of £11,000,000.

The report also has circulation that a loan of £1,000,000 has been obtained from London and Continental bankers, against which cash warrants have been pledged to a total, it is stated, of over 20,000 tons.

The syndicate agents have accepted upward of 4,000 tons of good merchant copper, on contracts, purchased at £79 several months ago.

The formation of the projected Copper Bank has not progressed, and it seems to be the opinion in most quarters that it is a failure from the present outlook. The difficulty is not so much a matter of financing under certain conditions, as in respect to inducing the large mining companies to adopt measures that capitalists think most advisable. As matters stand the capitalists require that the producers curtail their output and continue on at the original prices. The mining companies, it is said, are willing to accede to the request so far as restricting the production is concerned, but only on the condition that they are compensated.

Prices for Block Tin have fluctuated widely, touching as low as £98. 10/, under the influence of heavy selling. Sales are said to have been large against extensive supplies expected from the Straits, and now about due. There has also been considerable realizing by holders who have carried stocks for some time past. The report has been made that the Chinese have increased the production of late, but this was subsequently denied flatly. Cash purchases have increased in volume considerably during the latter portion of the week, and the market premium on cash Australian has widened out to 12/6.

The Pig Iron market has continued active and a further advance is asked in nearly all sections. Most Scotch brands have been sold at about 6d advance, as have also Middlesboro makes, but no further rise is noted on Hematite. Additional furnaces are starting up under the stimulus of the enhanced prices and brisk demand, more particularly in Scotland. Freight from Glasgow to New York are 1/ higher.

The Continental and English Steel Rail makers are soon to hold another meeting in London, to complete the formation of the proposed syndicate. No further change has taken place in the prices for Rails or Billets, but makers generally are asking 5/ advance over the prices at which Blooms and Slabs were sold last week.

Business in Tin Plates has been comparatively small again. Prices show slight irregularity, but the bulk of the transactions are still at an average of 18/ for B.N. grade Cokes. The Yuiscedwyn Works have started up.

Scotch Pig.—There continues to be a good trade and prices are strong throughout.

No. 1 Coltness, f.o.b. Glasgow	52/6
No. 1 Summerlee, " "	51/
No. 1 Gartsherrie, " "	49/
No. 1 Langloan, " "	51/
No. 1 Carnbroe, " "	44/6
No. 1 Shotts, " at Leith	50/6
No. 1 Glengarnock, " Ardrossan	48/
No. 1 Dalmellington, " "	44/3
No. 1 Eglinton, " "	42/9
Steamer freights, Glasgow to New York, 5/;	
Liverpool to New York, 10/.	

Cleveland Pig.—Trade in this line has continued brisk and prices are 6d higher than a week ago. No. 1 Middlesboro', G.M.B., 38/6; No. 3 ditto, 35/.

Bessemer Pig.—The demand continues lively and the market strong. West Coast brands, mixed numbers, 46/, f.o.b. shipping point.

Spiegeleisen.—A good demand is still reported and prices are very firm. English 20¢ quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—There is still an active demand, and prices are strong. Heavy sections quoted at £4. 10/, and light sections £4. 15/ @ £5, f.o.b. at N. W. England shipping point.

Steel Blooms.—Business moderate, but makers very much firmer. We quote £4. 2/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—The demand continues fairly active at firm prices. Bessemer, 2½ x 2½ inch, £4. 5/, f.o.b. at N. W. England shipping point.

Steel Slabs.—The market very firm, but demand merely fair. Bessemer, £4. 2/6, f.o.b. at N. W. England shipping point.

Old Rails.—Transactions moderate, but generally at firm prices. Tees quoted at £3. 5/ @ £3. 6/, and Double Heads, £3. 8/ @ £3. 10/, c.i.f., New York.

Scrap Iron.—A moderate demand only and prices unchanged. Heavy Wrought quoted at £2. 2/6 @ £2. 7/6, f.o.b.

Crop Ends.—Demand rather slow, but sellers firm. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

Tin.—The market very irregular and looking weak. Straits quoted at £98. 10/ @ £98. 15/, spot, and £94 @ £94. 10/ for three months' futures.

Tin Plate.—Very little change in business or demand, and prices about the same as last week. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/3 @ 15/6
IC Bessemer Steel, Coke finish.....	13/6 @
IC Siemens.....	13/6 @
IC Coke, B. V. grade.....	12/ @ 13/3
Charcoal Terne, Dean grade.....	12/ @ 12/6

Manufactured Iron.—Common Bars are a shade lower. Otherwise former prices rule, and the market continues fairly active. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars.....	£ s. d. @ 8 2 6
Common.....	@ 5 12 6
Staff. Bk Sheet, singles.....	7 12 6 @
Welsh Bars (f.o.b. Wales).....	5 2 6 @ 5 5 0

Copper.—Outside of speculative trading very little doing. Prices are still unsettled and irregular. The nominal prices are: Chili Bars, £77. 10/ for spot, and £85 @ £72 for futures. Best Selected, £78 asked.

Lead.—The demand slow and prices barely steady. Quoted at £12. 10/ @ £12. 12/6 for Soft Spanish.

Spelter.—Trade moderate at slightly lower prices. Quoted at £17. 5/ @ £17. 7/6 for ordinary Silesian.

Detroit.

WILLIAM F. JARVIS & Co., successors to Chas. Himrod & Co., under date of Feb. 18, 1889, report as follows:—**Pig Iron.**—There is scarcely any change in the market since our last report. Lake Superior Charcoal is moving a little more freely, but the majority of buyers still cling to the idea that this grade must come down, in sympathy with the constantly lowering quotations on Coke Irons. Thus far, makers stubbornly refuse to accept orders, unless full prices are obtained; consequently buyers are ordering only for immediate wants. As consumption and production are so nearly equal on this grade, it looks reasonable that, unless some furnace gets hard up, and in order to force buying offers at a sacrifice, buyers, when they can no longer put off placing their orders, will have to pay prices asked; but, if a few furnaces accept less, the majority are likely to follow suit, and ruinous prices will result, and no more Iron be sold than would have been at the higher prices. For the present we quote as follows:

Lake Superior Charcoal, all numbers.....	\$19.50 @ \$20.50
Lake Superior Coke, all ore.....	18.75 @ 19.25
Lake Superior Coke, cinder mixed.....	17.75 @ 18.25
Standard Ohio Black Band.....	18.75 @ 19.25
Southern No. 1.....	17.00 @ 17.50
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	16.50 @ 17.00
Jackson County (Ohio) Silvery.....	18.25 @ 18.75
Old Wheels.....	18.50 @ 19.00

CHILI.

VALPARAISO, December 21, 1888.—**Copper** was at first well sustained, but toward the close buyers withdrew in consequence of unfavorable cablegrams. Sales for the fortnight reached 12,138 quintals, at from \$27.60 @ \$27, the latter equaling £75. 14/ with 30/ freight to England. **Cool.**—A cargo of Newcastle West Hartley fetched 36/ on the spot, while later shipments have been paid 46/8, and are at present held at 45/. **Exchange.**—Drafts on London, 90 days' sight, are bringing 28% d.—**Weber & Co.**

WEST INDIES.

PORT OF SPAIN, TRINIDAD, January 18, 1889.—**Asphaltum.**—Our market has been moderately active and well sustained at \$14.04 3/4

ton for Boiled, and \$6.84 for Crude, free on board, including export duty. Since beginning of the month there were shipped 1503 tons, as compared with 278 tons same time last year, and 975 tons in 1887. **Exchange** on London, 90 days' sight, \$4.77 @ \$4.83.—**E. P. Masson.**

EAST INDIES.

MANILA, February 11, 1889.—**Hemp.**—There have been buyers at \$15.15-16 3/4 picul, against \$9.5-16 same date last year, equaling 3/4 ton, cost and freight, £54, against £33. Clearances for the United States since last cable amounted to 8000 tons as compared with 2000 tons in 1888; since January 1, 44,000, against 19,000; loading for the United States, 38,000, against 18,000; cleared for England since January 1, 28,000, against 21,000; loading for do., 8000, against 11,000; cleared for all other ports, 4000, against 4000; receipts at all ports since last cable, 18,000, against 9000; and since January 1, 78,000 bales, against 58,000 in 1888 and 52,000 in 1887. **Freight.**—\$7.50, against \$5.50. **Exchange.**—6 months' sight 3/8, against 3/8.—**Kerr & Co.**, through their agent, **Mr. Charles Nordhaus**, New York.

PENANG, January 9, 1889.—**Tin.**—Receipts during the fortnight reached 18,000 piculs, of which Europeans took 80,000 and Chinese 5000. The market opened on the 22d ult. at \$36.70 3/4 picul, closing at \$37.80, at which both Europeans and Chinese have continued buying.—**Schmidt, Kusterman.**

SPAIN.

BILBOA, January 26, 1889.—**Iron Ore.**—Very little transpired during the week, sales being limited to a few cargoes of Rubio, which may be quoted 7/ @ 7/3; for Campanil the quotation is 8/ @ 8/3, although it is stated that five companies have clubbed together and refused 8/8, in view of the scarcity of that kind of Ore. There is no impediment to a rapid dispatch of steamers, so that the export is so far ahead of last year, having been since January 1 286,115 tons, against 276,019 same time last year. **Pig Iron.**—There were shipped during the week 2240 tons coastwise and 2525 abroad, the latter by the Vizcaya Company.

February 2, 1889.—The market has continued with a good inquiry without leading to much doing, prices remaining unaltered. There are steamers enough waiting to take their turn in loading, with a joint capacity of 125,000 tons. Total shipments to-day 345,212 tons, against same time last year 359,747. **Pig Iron** has been dull with only 815 tons shipped coastwise.—**Bilboa Maritimo y Comercial.**

BELGIUM.

BRUSSELS, February 9, 1889.—**Iron.**—The Belgian Iron market has continued firm without changing quotations. Consumers gradually subscribe to the higher prices fixed, business thereby continuing its normal course. A good deal of Forge Pig has been selling to arrive at 4.60 @ 4.70 francs 3/4 100 kg., all the way to July 1, a circumstance lending the general market a certain degree of stability, with a likelihood of Finished Iron soon being further advanced in price. The January production of Pig Iron has been 75,640 tons, 32 blast furnaces remaining blown in and 18 blown out. Steel Beams go on gradually superceding Iron Beams, M. Boel, of La Louviere being so far the chief producer. Steel is in good request. The Puyguez Works made a contract for 1500 tons for Switzerland, and 3000 tons for Mexico. All bolt and Steel works have booked orders enough to last them for several months. Negotiations for the renewal of the International Electrical Syndicate have been resumed, but so far led to nothing, the pretensions of one of the Belgian mills being the obstacle. As for the Belgian share in the cupolas for the Meusefort, it may be stated that it amounts to 3,000,000 francs.—**Moniteur des Interets Matériels.**

GERMANY.

HAMBURG, February 9, 1889.—**Iron.**—The improvement in the Rhenish-Westphalian Iron market has continued during the week, there being quite a revival in the Pig Iron demand for a couple of weeks past. The activity in Spiegel (10 to 12 % Manganese), has been such, both for home use and export, that the price has been pushed to 61 marks 3/4 ton. The rolling mill's are quite inclined now to buy Forge Pig to arrive all the way to July 1, stocks having been completely absorbed in the hands of various producers. Siegen is now getting 53 marks, and the syndicate fixed the range at 52.50 @ 54. Foundry Pig is just as lively, White bringing 52.50 @ 53; Bessemer, 57; Luxembourg White, 34 @ 35 and over, and Gray, 40 @ 43; English Bessemer, 45/. Finished Iron is doing well for home consumption, with orders all the way to July 1. Hoop Iron is remarkably active, the general impression being that the tendency in all rolling mill products is bound to remain upward for months to come, hence the general rush to secure at current prices whatever hands can be

laid on. The Wire branch is also gaining at an advance of 10 marks 3/4 ton, both Rhenish-Westphalia and Upper Silesia. Tolerably satisfactory reports are made by foundries and machine shops; they find it difficult to keep pace with the advancing raw material. Car works are loaded down with orders, those for the week summing up 7000 freight cars and 5000 passenger and luggage cars. Dortmund quotes Wire Rods, 116 @ 118; Steel Rails, 120 @ 130; do Sleepers, 120 @ 125, and Steel Rails for mines, 110 @ 115. **Metals.**—Firmness is noticeable in Lead and Spelter, and weakness in Copper.—**Borsenhalle.**

HOLLAND.

ROTTERDAM, February 5, 1889.—**Tin.**—Since the beginning of the month the Tin trade in Holland has been the reverse of brisk, although a good undercurrent of inquiry exists since the last auction of the 31st ult., which established a rise of 1/4 guilder. Holders are not anxious to go on selling at 59.25 for spot Banca and Billiton, and 59.50 futures.

The following statement shows the position of Banca Tin in Holland on the 31st January from the official returns published by the Dutch Trading Company:

	1889.	1888.	1887.
Import in January, Slabs.....	15,000	23,399	12,499
Deliveries in January, Slabs.....	7,950	5,200	14,895
Stock, second hand, Slabs.....	42,940*	36,309	30,796
Unsold Stock, Slabs.....	129,371	73,745	43,424
Total Stock, Slabs.....	172,311	110,054	74,210
Afloat, piculs.....	5,000	3,000	4,000

* Including to-day's sale.

Statement of Billiton:

	1889.	1888.	1887.
Import in January, Slabs.....	3,298	5,500	11,387
Deliveries in January, Slabs.....	4,535	7,083	8,070
Stock, Slabs.....	19,561	14,595	25,888
Afloat, piculs.....	17,000	18,000	12,500
Quotation 31st January:			
Banca, florins.....	58 1/4	98	61 1/4
Billiton, florins.....	58 1/4	98	61 1/4

The preceding combined returns of Banca and Billiton for 1889, compared with those for 1888, exhibit:

	Slabs.	Equal to Tons.
A decrease of the import for January of.....	10,601	331
An increase in the deliveries for January of.....	252	8
An increase of the stock second hand of.....	11,597	362
An increase of the unsold stock of.....	55,626	1,738
An increase of the total stock of.....	67,228	2,101
A decline of the quotation of Banca of florins 30 1/4 equal to £85. 5/ 3/4 ton.		

—**De Monchy & Havelaar**

Long Wire Rope Cables.—The *St. Louis Globe Democrat*, of recent date, prints an interview with Joseph D. Bascom, of the Broderick & Bascom Rope Company, St. Louis, in the course of which he gave the following statement of long cables, all of them being 1 1/4-inch in diameter:

For	Length, feet.	Weight, pounds.
St. Louis, Mo.....	35,400	98,100
St. Louis, Mo.....	30,950	78,762
Omaha, Neb.....	28,900	75,218
Cincinnati, Ohio.....	27,241	70,071
St. Louis, Mo.....	24,250	62,561
Kansas City, Mo.....	23,500	64,235
St. Louis, Mo.....	22,300	57,025

The first rope in the above list is the longest and heaviest rope ever made—35,400 feet. The weight of this cable, with the reel, was 110,000 pounds. Each rope is made in one continuous piece, without splice. The cables are shipped on cars built especially of 140,000 pounds capacity. The company has recently erected a new and commodious factory, which they have equipped with the latest and most improved machinery, principally of their own designing. They are now enabled to manufacture wire ropes of any size and length up to 100 tons weight in one continuous piece, with absolute uniformity of lay under equal strain on each wire, and without twisting the individual wires.

Hardware.

There has been some increase in the volume of business since our last report, and the market continues fairly active, but buyers show little disposition to purchase largely, limiting their orders for the most part to moderate assortments, in which season goods have a prominent place. Prices are exceptionally steady, there having been during the past week no changes of importance.

Cut Nails.

The New York market is quiet, as is usual at this season of the year. It is noted, however, that two mills which have at times been pressing sellers in this market are now shut down. The committee of the association is still at work elaborating the details of the plan similar to that now in force in the Ohio Valley, where it is said to work with general satisfaction. We continue to quote \$1.80 @ \$1.90 for carload lots on dock.

Barb Wire.

The Western papers are publishing, with glaring headlines, such as "Good News for the Farmers," the following Associated Press dispatch, dated St. Louis, February 18:

The discovery has been made here that the control of the Barbed-Wire patents is not vested in any American firm or corporation, because the device of Barbed Wire was patented in France, to Louis Janin, on April 19, 1865. The law of this country, as declared by the United States Supreme Court, is that "A foreign patent for the same thing, or a description of the thing in a foreign publication, is as effectual to void a patent as if the patentee had seen the prior invention, notice to him not being important." If this decision holds, and there is no appeal from it, the claims of certain persons for royalty under the Glidden and other Barbed-Wire patents are void, and all the money paid to them by the Barbed-Wire manufacturers who had no interest in the Glidden patents is believed to be subject to recovery.

The "discovery" to which reference is made in the above dispatch was the publication of the fact cited in a recent issue of the *Scientific American*. Regarding this matter the Washburn & Moen Mfg. Company say in a private letter, from which we are permitted to make the extract, as follows:

We have the paper (*Scientific American*) before us, and have read the article to which you refer. Assuming the facts to be as stated, it is not necessary for us to consider what bearing this might have upon the Kelly patent, because that patent is now expired. Our only interest is in the bearing it has upon the Glidden patent No. 157,124, and we do not think it would affect that in any way. Glidden does not claim to have invented spurs or prongs; indeed, he distinctly disclaims that in his patent No. 150,683. What he does claim in No. 157,124 is a "twisted Fence Wire with a spur Wire bent at its middle portion about it and clamped in position by the other Wire strand," and the French patent in question is no anticipation of the Glidden invention.

The Washburn & Moen Mfg. Company are now pushing the infringers upon the Glidden patent vigorously, with a view to effecting a settlement of the points at issue as early as possible. The Glidden patent will expire in two to three years, and the policy of the contestant is said to be the delaying of proceedings until after that time. The dispatch above printed evi-

dently discloses one of the points on which they will rely for their defense, and which will necessarily consume time in its thorough investigation as a vital point. It is difficult to see how farmers will be benefited if the fact proves to be true as stated, as the price of Barb Wire could hardly be lower, being now sold at cost or under it, and a refund of royalty paid would hardly reach the consumer.

Miscellaneous Prices.

Payson Mfg. Company, 1819-1825 Jackson street, Chicago, Ill., issue circulars with revised price lists showing the addition of some patterns. One of these is devoted to their Payson's Perfect Sash Locks, which are subject to a discount of 60 and 10 per cent. The different patterns are effectively illustrated. Another circular is devoted to their Transom Lifters, the Universal being quoted at discount 45 and 5 per cent., and the Imperial at discount 50 per cent.

Athol Machine Company, Athol, Mass., make seven sizes of American Meat Choppers, as per following list, which is subject to a discount of 30 per cent.:

No.	1	2	3	A	4	B	5
Each ..	\$5	7	10	12	25	50	60

These machines, as well as other goods of their manufacture, are illustrated and described in a convenient pamphlet.

The following is the discount sheet of the Moore Mfg. and Foundry Company, Milwaukee, Wis., in which it will be observed that the different goods of their manufacture are arranged alphabetically. Terms, 60 days, or 3 per cent. discount for cash in 10 days, f.o.b. Milwaukee or Chicago:

	Discount per cent.
Acme Barn Door Rollers.....	55
Baggage Car Door Hangers.....	33½
Brackets, for Rail.....	25
Carriers, for Hand Hoists.....	20
Ceiling or End Pulleys.....	40
Chain, Log Haul.....	25
Climax Barn Door Hangers.....	60
Wood Track ..	55
Differential Pulley Blocks.....	40
Dumb Waiter Pulleys.....	50
Hay Fork Pulleys.....	40
Hooks, Floor.....	40
Hand Hoists.....	20
Stationary.....	20
Log Binders.....	25
Novelty Tackle Blocks.....	50
Snatch Blocks.....	50
Parlor Door Hangers.....	50
Parts for Differential Blocks and Hand Hoists.....	40
Railroad Hangers.....	55
Rail, Double Flange Barn Door, per 100 feet, \$1.50.....	Net
Rail, Extra Heavy, for No. 5 Railroad Hangers, per 100 feet, \$3.50.....	Net
Rail, Channel, for Zenith Hanger, per 100 feet, \$2.50.....	Net
Rail, Wrought Iron.....	25
Rollers, for Heavy Doors.....	50

Arnold & Co., Norwalk, Conn., manufacturers of Stable Fixtures, Truck Casters, Barn Door Hangers, &c., announce the following revised discounts:

Giant Truck Casters.....	dis 30 %
Socket Truck Casters.....	dis 50 %
Stationary Truck Casters.....	dis 50 & 10 %
Best Anti-Friction Hangers.....	dis 60 & 10 %
Boss Anti-Friction Hangers.....	dis 60 & 10 %
Duplex Wood Track Hangers.....	dis 60 & 10 & 15 %
Boss Anti-Friction Roller.....	dis 10 & 5 %
Union Roller.....	dis 70 & 5 %

The Carriage Bolt market is without further change, and manufacturers complain that the recent reduction in the combination prices of the goods leaves but a narrow margin of profit. There is also

reason to think that there is more or less covert irregularity in the prices of the goods.

The market for Augers and Bits appears to be in a somewhat improved condition, and some of the manufacturers have slightly advanced their prices. It is to be noted that Augers especially indicate this improvement.

There is a slight improvement in the File market, as one or two of the manufacturers have advanced their prices about 5 per cent. The quotations of the other makers remain, however, as they have been, and the general price of the goods is unchanged.

Gaston, Weston & Ladd issue a neat catalogue and price list relating to Gaston's Silver Compound, Gaston's Prestoline, Easton's Prestoline Paste, and Lillibridge's Old English Polish, in which these different articles are described, with a statement as to their advantages and their adaptation to the uses for which they are intended. Among them Prestoline, which is a liquid metal burnisher intended for use on metals other than silver and gold, is given a prominent place, and high claims are made for its merit and efficiency. It is described as working rapidly, not gumming in use, convenient and cleanly to use, not soiling woodwork, finely adapted for bronze, nickel and zinc, as well as other metals, and possessing other advantages which commend it to the trade. A similar Polish is put up in the form of Prestoline Paste. A number of testimonials in which the merits of Prestoline are alluded to are given. We give below the prices at which these goods are sold, the lists being subject to a discount of 20 and 10 per cent.:

Gaston's Prestoline.

	Per dozen.
Small Size, No. 0.....	\$1.25
Half Pints, No. 1.....	3.00
Quarts, No. 2.....	9.00
Half Gallons, No. 3.....	15.00
Gallons, No. 4.....	28.90

Gaston's Prestoline Paste.

Small Family Size, 3 dozen in box.....	.60
Large Family Size, 2 dozen in box.....	1.20
Quarter Pound, 1 dozen in box.....	2.00
Half Pound, 6 dozen in case.....	3.60
One Pound, 8 dozen in case.....	6.00
2½ Pounds, 2 dozen in case.....	12.00
Five Pounds, 1 dozen in case.....	22.20
Ten Pounds, ½ dozen in case.....	42.00

Gaston's Silver Compound.

No. 1, Small Size, (2 ounce).....	3.00
No. 2, Regular Size, (4 ounce).....	6.00

The following are the quotations of goods manufactured by A. W. Bishop, Berea, Ohio, descriptions of which are given in his catalogue:

Animal Poke—I. X. L., per doz.....	\$6.50
O. K., per doz.....	5.50
Pioneer, per doz.....	3.75
American, per doz.....	3.00
Buckeye Sash Locks, per gross.....	4.80

Obituary.

Rice, Born & Co., New Orleans, La., send out in appropriate form the following obituary notice of Jacob Born, to whose death we referred in a recent issue; as relating to a prominent Hardwareman who achieved a large degree of success and was held in high esteem, it will be of interest, and it will be especially so to many in the trade who had an acquaintance with him and appreciated his personal qualities:

It is with profound sorrow that we announce to you the death of our late partner, Jacob Born, which occurred at his residence in this city, on Friday, February 1st, at 2 o'clock p. m., of heart disease, at the age of 60 years.

The event, though sudden and unlooked for at the moment, was not altogether unexpected, as his health has been seriously impaired for a year past, and for some months a fatal termination to his disease was known to be only a question of time.

No one knew this better than he, and in consequence this business, which he had made his especial pride, and toward the success of which he had contributed so largely, will suffer no

change now that he has been called to the reward that awaits those who, like him, strive conscientiously to follow the path of duty.

With scarcely any advantages of education in his youth, Mr. Born gradually, step by step, worked his way up in the world, educating himself as he progressed, until he became regarded as one of the leading business men of this city, whose counsel was sought and opinion respected by all classes.

His life offers a conspicuous instance of what can be accomplished by application to business, perseverance, observation and strict integrity, when combined with ordinary economy.

In the hope that his example may be followed by many, we who have shared his counsels, and most keenly feel his loss, join in this tribute of respect to his memory.

Items.

Reading Hardware Company, Reading, Pa., announce that after a period of several months their new buildings are completed. Their new warehouse has been occupied since February 1, and the large iron foundry will be put in operation on or before March 1. They are now placing machinery in their new factory building, so that by March 20 they will be manufacturing goods therein, and state that by April 1 they will be in full operation and in better position to meet the wants of the trade than they were previous to the fire.

Joseph W. Wayne, 124 Main street, Cincinnati, Ohio, issues circulars relating to his varied line of Refrigerators, in which the different patterns are exhibited and the special features of their construction explained. In addition to the assortment of patterns for household use larger ones for the use of brewers, butchers, grocers, &c., as well as beer and wine coolers, are illustrated. He calls attention to the numerous improvements in the finish that have been made in the past few years, new patterns put on the market, &c.

It will be observed that among our special notices is one headed "An Unusual Opportunity," in which a well-established Hardware business is offered for sale. Particulars in regard to the location and the advantages of the opportunity, extent of stock, &c., are given as above.

Huber Mfg. Company, Philadelphia, Pa., issue a price list of the Arrow Brand Augers, Auger Bits, &c., manufactured by Dewitt, Morrison & Kelly. The special features of these goods are fully described, and emphasis is laid upon their quality. The different patterns are also illustrated, with the list prices. Circulars also in regard to the Hardware specialties of the company are inclosed.

Seavey Mfg. Company, 93, 95 and 97 North street, Boston, Mass., issue a convenient pamphlet showing a varied line of Deep Stamped, Retinned and Common Stamped Ware, Japanned, Planished, Coppered and Pieced Tin and Sheet Iron Ware, Registers, and Tinmen's and Kitchen Furnishing Goods. It is fully illustrated with small cuts, which, however, represent the goods satisfactorily, and the pamphlet (100 pages) is indexed throughout, facilitating reference to any desired line.

Chicago Stamping Company, Chicago, Ill., issue a 40-page illustrated circular of seasonable goods, including Freezers, Oil Stones, Challenge Refrigerators, Bird Cages, Water Coolers, &c., with a number of specialties. They issue another pamphlet which is devoted to Milk Cans and Dairy Supplies.

Fred. W. Shear has severed his connection with Bench & Shear, Skaneateles, N. Y., and purchased Mr. Nichol's interest in the firm of Nichols & Foote, Scranton, Pa., the name of the firm becoming Foote & Shear.

Hibbard, Spencer, Bartlett & Co., Chicago, Ill., are sending out two seasonable prices current which have evidently been prepared with especial care and relate

to a varied and interesting line of goods. One is their Fishing Tackle catalogue, January 29, No. 101, in which is exhibited an assortment of Fishing Rods, Reels, Fish Hooks, Trolling Baits, Bass and Trout Flies, and a variety of Fish Lines, including Lines in hanks, Block Lines, Coil Lines, &c. Casting Lines and Leaders, Sinkers, Landing Nets, Fly Books, Rowlocks, Rod Attachments, Mountings and other specialties are also illustrated. Incidental reference is made to Bicycles and Base-Ball Goods. The other price current is devoted to the Ashtabula Steel Goods, Hoes, Scythes, Curry Combs, Sheep Shears, Pruning Tools, Wheelbarrows, Lawn Mowers, Wire Netting, Barbed Wire and a variety of other goods, some of which are novelties adapted to the wants of the spring trade. In connection with these they also send out a price list of Victor Safes, with testimonials as to their fire-proof qualities.

J. B. Field & Co., Detroit, Mich., issue a circular describing the McMurchy Cleaner, which is a cleaner and lead remover combined. It is constructed so that it is self-adjusting to the surface of the inside of barrels from breech to muzzle, and the efficiency of its operation is alluded to.

E. I. Horsman, 80 and 82 William street, New York, issues a price list devoted to Tennis, Croquet, Base-Ball Supplies, Games, Home Amusements, Photographic Outfits, &c., in which are represented a number of novelties, together with well-known goods.

A circular is issued by Cordley & Hayes, 37 Barclay street, New York, general agents for Monroe Bros.' Patent Refrigerators, in which a detailed description is given of their No. 75 Fiber-Lined Refrigerator, with a cut showing its construction and a statement of the advantages possessed by it.

A new issue of the official classification applying to freights between the seaboard and Chicago or St. Louis went into effect 18th inst., and Hardware, which before was second class under all circumstances, is now made second class as before when shipped under owner's valuation; but when "value 5 cents per pound" is written on receipt it now takes third class. This arrangement will be to the advantage of the trade on the shipment of many heavy goods.

M. Mahony, Troy, N. Y., in connection with the Mahony Boilers, Heaters, Furnaces, &c., issues a pamphlet describing his line of Gas Sad Iron Heaters and Sad and Polishing Irons, &c. A variety of Heaters, Sad and Polishing Irons are thus exhibited.

Cordley & Hayes, 37 Barclay street, New York, announce that they have accepted the agency for the sale of the goods manufactured by the Amoskeag Indurated Fibre Company, Peterboro, N. H.

Julius Berbecker & Co., 65 Duane street, New York, in connection with their large line of Brass Goods, Upholsterers' and Cabinet Hardware, Scissors, Shears, &c., are putting on the market a large assortment of Upholsterers' Nails, the manufacture of which they control. This is a comparatively new branch of manufacture in this country, and the Nails thus offered to the trade are made by a new method, which is referred to as securing an excellent result in the quality of the goods at a moderate cost. The establishment on a successful basis of this line of manufacture as a new American industry is a matter for congratulation, and we understand that the manufacturers are in a position without difficulty to meet the prices of their foreign competitors, who have heretofore had the bulk

of the trade, and are, in fact, able also to export the goods to other countries. The catalogue, in which these Nails and a large variety of Upholstery Goods are illustrated, with list prices, is one of interest to the trade.

The Missouri Refrigerator Mfg. Company, St. Louis, Mo., have issued their catalogue for the present year, showing their line of Jewell Refrigerators. Besides the variety of family Refrigerators offered, it represents an assortment of Grocer, Upright, Butchers', Restaurant and Hotel Refrigerators, with which it is announced that they are prepared to furnish at short notice a line of Bar Fixtures, Beer Coolers, Counters, &c. It is stated that, in order to meet the demand for these goods, it has been necessary to more than double their manufacturing capacity and to add a large warehouse.

THE ANNUAL MEETING OF THE AMERICAN SCREW COMPANY

was held February 12, at the office of the company, Providence, R. I. From the report of William H. Henderson, the treasurer, who has occupied this position for 25 years, his connection with the company covering 30 years, it appears that the business of the corporation during that time has more than quadrupled. The number of personal accounts on its books has increased from about 850 in 1860 to 2700, the customers being now in every one of the United States. The total sales from the commencement of the business to December 31, 1888, amount to nearly \$53,000,000, and the total ascertained losses were only \$79,030, less than one-seventh of 1 per cent. of the sales. After a resolution in recognition of the long, faithful and able service rendered by Mr. Henderson as treasurer, it was moved that a testimonial of the company's appreciation be obtained and presented to him by the board of directors. From a synopsis of the report of the president, Edwin G. Angell, we make the following extract:

The report states that the Screws carried over are selling at a large advance over the prices of 1885. The sale of Wood Screws in 1888 was disappointing, partly because of the existence of stocks in jobbers' hands, purchased at extremely low prices. Consumption fell off somewhat, as usual in Presidential years, but stocks, old stocks, are reduced, and consumption has for some time been beyond production. In 1887, under the Screw Association, our sales were made beyond allotment, and we had to pay over to associates a very large sum in cash. In consequence our allotment was increased and we still have to pay, but not so much as formerly. It is doubtful whether such associations are beneficial in the long run. If the statistics made available by the association had been so before the extensive building of machinery brought about by the high prices of 1881 to 1883 inclusive, it is doubtful if we should have had to record the unremunerative business of 1885 to 1887. The demand for Wood Screws is limited, and cannot be enlarged at the will of inventors and capitalists. We have continued experiments in Swaging Screws, and feel warranted in building machinery which will, with what we now have, produce daily half as many Wood Screws as we produced daily last year. Rogers has improved on Harvey's discovery, securing an enlargement of four numbers of the Screw gauge with cheap material, where Harvey enlarged only two numbers, with costly Swedes iron. We have devised machinery also to produce a large head, which Harvey failed to do, which has proved very satisfactory, though at the outset it appeared impossible.

While we hope from the success thus far attained to employ the new processes to advantage in the future, you will understand that up to this time they have been a matter of expense rather than of profit, and therefore have not contributed to the profits of the past year. Those were the result of the business conducted without their aid. The general outlook for the present year is not for the moment favorable. Continued tariff discussion, overproduction of pig iron, growing accumulation of the stock of copper in the hands of the French syndicate, decline of railroad building, appear to affect unfavorably the minds of buyers, and thus far sales in 1889 have been light. The foreign Screw makers recently formed a Union and advanced prices greatly, and our chief competitor

abroad is reported to be making four or five times as many goods as we are. The establishment of a branch factory in Canada to supply this market if Congress reduced the duty upon screws without reference to raw material has proved to have been a blessing in disguise for us.

How to Sell Goods.

Prominent among the features of the Territorial Fair, lately held at Salt Lake City, Utah, were a number of special prizes offered for essays upon different subjects, the evident object being to bring out suggestions looking to the best means of attaining success in various lines of business. Mr. Spencer Clawson, a wholesale merchant, offered a prize of \$25 for the best essay on "How to Sell Goods," which prize was secured by Mr. B. F. Cummings, Jr. The subject treated is of such great interest to a large class among our readers that we give the essay in full herewith:

A moment's reflection will serve to show the infinite importance of this subject. It not only concerns the salesman and merchant, but every member of civilized society; for, as all members of civilized communities are compelled to purchase and consume merchandise, it follows that all are interested in the manner in which the merchandise they buy is sold.

Methods of selling goods may be pursued which are hurtful to the interests of merchant and customer alike, and which result in disappointment and injury to the latter, and a loss of custom and final failure to the former. Or the merchant may pursue a system which, while yielding an excellent profit to himself, will please, gratify and benefit his customers, make them feel that they can do better with him than elsewhere, and so secure their permanent patronage. How to avoid the results of one method and secure those of the other is comprised in the art of selling goods.

The process of selling the goods is intimately connected, indeed begins with, that of buying them; for, as the proverb has it, "Goods well bought are half sold." He, then, who would become a successful seller of goods must first learn how to buy them; and it is an open question among merchants which branch of their calling, buying or selling, requires the longer experience, the shrewder judgment, and the higher order of business ability. As the present purpose, however, is to treat of the methods to be pursued in selling goods, it will be assumed that the stock to be disposed of has been well bought, is suited to the wants of the community, and only awaits skillful and judicious handling by the salesman to yield satisfactory returns to the merchant.

MARKING THE GOODS.

One of the most important matters connected with the mercantile business is the marking of goods. In doing this, three objects should be kept in view: Profit to the merchant, ready sale, and satisfaction to the customer. This last object is often lost sight of, but we insist that a policy on the part of the salesman who does not aim at securing satisfaction to the customer is a short-sighted one, and will ultimately prove disastrous to the dealer. A customer will pay for a suit of clothes a price which will yield to the merchant a fair profit, and yet be content with his bargain; but were a sack of sugar marked to yield half as large a profit, a customer would feel that an attempt had been made to impose upon him. On some kinds of goods, then, customers will willingly allow the merchants a good profit, but others they will purchase only at a very small margin above cost.

It is the duty of the salesman to consider all the circumstances attendant upon this feature of his business, as the amount the capital invested ought to earn, the probable amount of the year's sales, the running expenses of the establishment, the kinds of goods handled, the competition to be met, the class of trade to be catered to, what will and will not satisfy his customers, &c. A volume could be written upon this one feature of mercantile business, but practical experience and native good judgment are the only means by which a salesman can become proficient in it.

Having considered every circumstance which ought to influence him in marking the goods, the salesman should make his prices and then adhere to them. A rumor that a house has two or more prices, according to the customer who is buying, will spread rapidly and soon create a distrust very hurtful to its business. It is unfair, undignified and downright dishonest to make different prices to different customers, other things being equal, such as quantity, time, &c. Uniform dealing one-price houses command a respect and confidence among customers which sliding scale dealers never enjoy.

Careful investigation has shown that in nearly all cases of bankrupt retail dealers a large proportion of the goods on their shelves were unmarked, and hence in a condition of confusion which could not but result in loss and disaster. The retail dealer who puts his goods on the shelves without marking them is tolerably certain to learn by bitter experience sooner or later the folly of his course; and the wholesale dealer who fails to keep a suitable record of prices as the market fluctuates is omitting a vital feature of success.

THE WHOLESALE SALESMAN.

Whether employed in the establishment or home or sent "out on the road" in the capacity of what is called a drummer, the first duty of the wholesale salesman is to make himself thoroughly and perfectly familiar with the entire stock of goods in the department or house in which he is employed. If an article is mentioned he should be able to state instantly whether or not it is in stock. It is of the utmost importance that he should be thoroughly posted on prices, and able to give from memory or his pocket price-book the price of any article the instant it is asked. He should be able to discriminate accurately between brands, grades, qualities, &c., and to explain differences between them to a customer.

Next to having a thorough knowledge of his own stock and business, it is important that the wholesale salesman should be familiar with those of his customer. He should know what kind of a business his customer is doing, what class of people patronize him, and what goods will be most popular among and best suited to the needs of that class. A wholesale salesman should not try to load up a retail dealer with goods not suited to the latter's trade. If this is done the retailer will meet with disappointment and loss, and in consequence of dead stock will be unable to meet his payments. Disgust at his own bad judgment will be mingled with distrust of the salesman who induced him to take the unsaleable goods, and he will thereafter buy elsewhere. Thus the retailer is injured and the wholesaler loses a good customer. All this may happen when the goods causing the trouble are really first-class and sold at a reasonable price; the difficulty lying in the fact that the wholesale salesman either did not know or did not regard what the real interests of his customer required.

All wholesale salesmen of experience understand perfectly well that, having once won the confidence and patronage of a retail dealer, he is influenced to a great extent by their advice and recommendations. It follows, then, that these should be offered intelligently and in the strictest good faith, with an earnest purpose on the part of the salesman to subserve the best interests of his customer. Their interests are identical. The more goods the retailer sells the more he will purchase from the wholesale house which has won his confidence. A bill of goods which is unprofitable for him to buy is unprofitable for the wholesale house to sell to him, and vice versa. In fact, a trunk and branch relationship exists between a wholesale house and the retailers whom it supplies, and the policy of the wholesale salesman should be to cement more and more closely that relationship, and strengthen the ties of confidence and friendship between the two, always having in view the interests of the buyer as well as those of his own house.

It is essential that the wholesale salesman should be thoroughly posted respecting the financial standing of his customer. Upon this point depends to a great extent his success in the art of selling goods. It requires little tact or ability to sell goods to a customer who is bent only on getting all he can on credit, without due consideration of the matter of making payment when due. It may, however, require considerable tact to properly treat a customer whose intentions are honorable, but whose resources, ability or experience are limited. If a buyer is known or suspected to be dishonest, sell to him for cash only. If necessary, tell him frankly that you do not know him to be a man whom you can afford to carry, and that your rule is to extend credit to those only whom you know you can depend upon. If your customer is worthy of credit up to a limit which, however, you do not wish to pass, avoid what, to a good salesman, is second nature, pushing goods upon him. Endeavor to furnish him with what he really needs, and to satisfy him, without going beyond the limit fixed for his credit. But should it be necessary, tell him plainly, but in a frank and friendly way, that at present you do not wish to carry him for more than a given amount. If he is a sensible man, he will take no offense, and if he is not a sensible man, it is unsafe for you to carry him on your books.

Selling goods by traveling salesmen with samples is expensive, but long experience has shown it to be the best method for wholesale dealers in many lines. The sample trunk, if properly prepared and packed, is the wholesale establishment in miniature. By its aid the country dealer is conducted through the big

store in the city, from the basement to the highest story, and is able to make selections as intelligently as if he had paid his fare to the city and was personally present in the establishment he is dealing with. The salesman should see that his sample trunk is complete, neatly and systematically arranged and that the samples correctly represent the stock. He should acquire facility in displaying them, in describing grades, qualities, &c., and in giving prices. The stationary or traveling wholesale salesman should keep complete price books, and post them as often as the prices vary. The memory should not be depended upon without their aid.

THE RETAIL SALESMAN.

Much of the foregoing applies to the retail salesman, especially in regard to familiarity with stock and prices and the giving of credit. He should be perfectly familiar with the goods he handles and with the prices at which they should be sold. If his employer deems it best to give him the "cost mark," as will generally be the case if he proves a good hand, so much the better. He should know exactly where to find any article called for. Time is money to buyer and seller alike, and the time lost by both while a clerk is hunting for some article for which a customer is waiting often amounts to a heavy percentage of its value. It is thus necessary for a retail clerk to be orderly and methodical to a strict degree in handling his stock. He must at once return to their places on shelves or in drawers, &c., the goods he has been showing a customer, and he must do this in such a manner as to preserve the stock in perfect order. A failure to keep the stock in order and the goods in their places and neatly arranged is probably the most common fault of the retail salesman. To avoid it he must put in the spare moments between customers in arranging shelves, drawers, showcases, &c., and in so displaying the goods as to cause them to appear new, fresh, varied and attractive. A retail salesman who can and will keep the goods arranged and displayed to the best advantage will command a high salary and will be a favorite with customers.

A very important auxiliary to the success of the retail salesman is the keeping up of his stock so as to avoid being out of any article. Vigilance and good judgment are required in ordering various lines as fast as they will be needed, but not fast enough to overstock.

The retail salesman, to be successful, must learn to read human nature. He must be able to perceive quickly the sort of person he is dealing with, and to form an accurate judgment as to what sort of an article, and about what price will be likely to suit the customer. Scarcely one customer in ten who enters a store to purchase an article knows in advance exactly what he wants; and it is the province of the clerk to aid him in coming to a conclusion. The art of doing this may be acquired to a great degree of perfection, though not without long practice and experience; and, when acquired, it adds immensely to the value of the services of the salesman possessing it.

QUALITIES NECESSARY IN ALL SALESMEN.

Be industrious; exert yourself actively to show goods to customers and to find what will suit them.

Be patient; preserve perfect equanimity, even though your customer appears trifling, fastidious, or exacting. Sincere efforts on your part to please him will win in the long run.

Be polite; under no circumstances speak to or treat a customer with impoliteness. To do so is to make a mistake inexcusable in a salesman. Your politeness to customers is money to your employer, and is one of the considerations for which you are paid a salary.

Be considerate of poverty; do not try to sell a poor person a more expensive article than he can afford to buy. By so doing you may wound his feelings, and cause him to avoid you in future. Rather try to suit him with an article within his means. If you succeed he will try you again.

Be attentive to small purchasers; if a lady wishes only a spool of silk, and you politely furnish her with the shade desired, she will come to you when she has a larger purchase to make.

Be truthful; never resort to deception in representing the quality of the goods you sell. Truthfulness is in a salesman a virtue which will soon begin to tell in a pecuniary as well as a moral way, for people will flock to the clerk whose word they know they can depend upon respecting the value they are getting for their money.

Be honest; not merely because honesty is the best policy, but because without it life is a failure, though wealth flow in to the amount of millions, and the world lavish its honors and applause. The most hopeless and contemptible of bankrupts is the man who has lost his honesty; and the most useless of all employees—the one who is most expensive while least worthy of a salary, who is most to be avoided by customers and abhorred by merchants—is the dishonest salesman.

Arrangement of Stores.

The Gunn Hardware Company is a flourishing institution of Grand Rapids, Mich. It was founded by W. S. Gunn, who for many years conducted a retail Hardware store in that city, and about three years ago concluded that he would go into the jobbing business. The connection with the retail trade was continued, and a separate building was erected for the wholesale department

with a large, dry and light basement. It was built with the most careful consideration as to the use to which every part of it was to be applied. The basement floor was made thoroughly waterproof by being covered with a layer of cement and crushed stone a foot deep, into which the joists for the floor were laid before it hardened, thus forming a solid support for the heavy goods intended to be stored there. Two rows of inside posts, of iron, were erected the whole length of the building, arranged

a portable shute which enters the basement window. A large elevator runs from the basement to the top floor. The offices, which are handsomely fitted up, are on the second floor, in the front of the building. The remainder of this floor is used for a sample-room. Racks and cases are used according to the character of the goods. Samples of small wares are fastened on long racks extending almost the whole length of the room, the frames of which are A-shaped. Green billiard cloth is

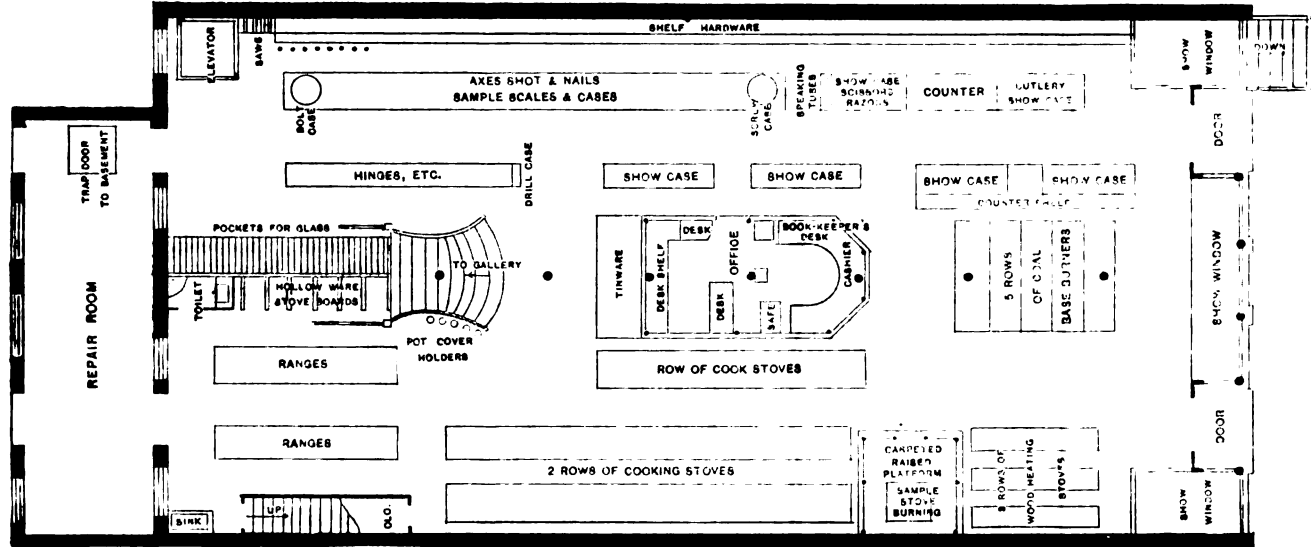

Fig. 308.—Gunn Hardware Company.—Arrangement of Store.

about five blocks distant. The retail store is located at 47 and 49 Monroe street and the wholesale store at 5 and 7 South Ionia street. Shortly after opening the wholesale department Mr. Gunn decided that it would be best for the perpetuity of the business to organize a stock company to conduct it, and the Gunn Hardware Company is the result, of which

14 feet from the sides of the building. The joists were thus of short length, so that they would not sag under the heavy load which they were intended to carry. The windows were also set in front and rear so as to line with the shelving and thus give sufficient light to the center of the stock rooms. The first floor, which is 18 feet high, is used for an iron and steel store,

fastened on the sides of the racks as a background for the goods. This cloth is used, notwithstanding its cost, because it not only makes the display more attractive, but also because goods tacked on it do not rust easily, the cloth background absorbing all dampness. The upper floors are used for stock rooms and packing. Shelving in the stock rooms extends to the ceiling,

Fig. 309.—Arrangement of Gallery.

Edwin F. Uhl, a prominent capitalist, is president, W. S. Gunn is vice-president and manager, Wm. A. Gunn is treasurer, F. W. Berles is a director and A. S. Goodman is secretary. The enlarged operations of the concern have been attended with remarkable success, which is due very largely to the business sagacity and enterprise of W. S. Gunn, who continues to give the business his earnest personal attention. The arrangement of the company's two stores is worthy of detailed description.

The wholesale house occupies a lot 50 feet by 100 feet and is five stories high,

the stock standing on end in racks extending lengthwise through the building, to bring the weight on the posts and heavy girders. This floor is on an exact level with the floor of a car on a siding of the Grand Rapids and Indiana Railroad, which extends along the rear. Space sufficient for a wagon to pass is left between the railroad track and the building. This space is roofed over to protect teams, workmen and goods from rain. Goods are transferred between the store and the cars over heavy planks, but anything intended for the basement is delivered into

but as the ceilings of these rooms are comparatively low little use is made of step-ladders. Rows of shelving extend down the centers of the stock rooms over the heavy girders running between the posts. The neatness with which these rooms are kept is very striking. Every room is connected with the office by a speaking tube, while the telephone is brought into requisition in communicating with the retail house. Surplus stock is stored in three other warehouses, one of which is 50 feet by 200 feet, one story high, with galleries round it, located on the Michigan Central

Railroad, and the others, which are smaller, are along the Grand Rapids and Indiana. In them are stored Nails, Galvanized Iron, Barb Wire and other bulky articles. The lines carried by this house embrace Heavy Hardware, Nails, Stoves, Chains, all kinds of Shelf Hardware, Revolvers and Ammunition, and a large number of Hardware specialties, such as Scales, Churns, &c. They import their Tin Plate direct from Wales.

The retail store, which in all respects but ownership is entirely distinct from the

space 5 x 19 feet, and the corner windows with a front of 6½ feet and a depth of 12½ feet. The goods displayed in these windows are frequently changed, so as to secure variety, and among the displays a line of Heating Stoves may be mentioned, the most showy one having a gas-pipe conducted into it for the purpose of burning gas at night to attract attention. The large, deep windows on either side are inclosed in plate glass on three sides, the fourth side being the wall, which is covered with green billiard cloth. These side

attention is given to the arrangement of these windows to secure efficiency and attractiveness of the display, and they constitute an interesting and important feature in the arrangement of the store.

It will be observed that the cashier's desk and offices are in the center of the store, so as to be within easy reach of the salesmen. They are lighted by a skylight overhead. As indicated in Fig. 808, one side of the store is devoted to Stoves and House-Furnishing Goods and the other side to Hardware, the space being thus about equally divided. The ceiling is 14 feet high, permitting the erection of a gallery around three sides of the store, so as to add materially to the capacity of the salesroom. This gallery, which is shown in Fig. 809, is reached by a broad flight of stairs in the rear of the store. It is 4½ feet wide, and is placed just midway between the floor and ceiling. Shelves extend along the walls, while an ornamental railing is used for displaying goods of various kinds. A one-story addition, 40 x 13 feet, has been built in the rear for use as a porter's room. In it goods are received, Stoves are polished and all kinds of rough work done which would litter up the store. A shop not shown in the illustration is connected with the store, in which tinning, plumbing, gas-fitting and cornice-making are carried on. The floors and stairs of the store are made of red oak, while the counters and showcases are of cherry.

Passing to a more detailed description of the different features of the arrangement, it is to be observed that the shelving on the right-hand side of the store under the gallery, with the exception of two sections, is filled with boxes, the fronts of which are covered with green billiard cloth, each box having samples on front of the goods contained within. One of these boxes is shown in Fig. 811. The goods on this side of the store are divided between the nine sections as follows:

Section 1. Shutter Bars, Sash Fasts, Sash Lifts, Sash Pulleys, Locks and Knobs, &c.

Section 2. Eagle Locks and Locks and Knobs.

Section 3. Padlocks, Door Butts, Locks and Knobs, Keys.

Section 4. Coat and Hat and Wardrobe Hooks, Door Latches and Pulls, Base Knobs, Door Plates, Chest Handles, Measuring Tapes, Cupboard Catches, Window Springs, &c.

Section 5. Shutter Knobs, Upholsterers' Nails, Molasses Gates, Pulleys, Snaps, Bull Rings, Ox Balls, Wrought Iron Goods, Saw Sets, Plane Irons, Dividers, &c.

Section 6. Curtain Rings, Ferrules, Bright Wire Goods, Sash Rollers, Gate Hinges and Latches, Screw-Drivers, Wrenches, Picture Knobs, Nails and Hooks, Foot Scrapers, Spring Hinges, Hog Rings and Rings, &c.

Section 7. Chalk and Masons' Lines, Screws in gross packages, Cartridges, &c., and the following goods in tin boxes, the fronts painted green: Tacks in papers and bulk, Wire Nails and Brads, Blued, Brass and Nickel-Plated Screws, &c.

Section 8. Carpet Stretchers, Nail Pullers, Box Scrapers, Oilers, Chisel and other Handles, Shelf Brackets, &c.

Section 9. In wooden boxes, fronts painted green: Tobacco Boxes, Match Safes, Stove Bolts, Rivets and Carriage Bolts not in Bolt case.

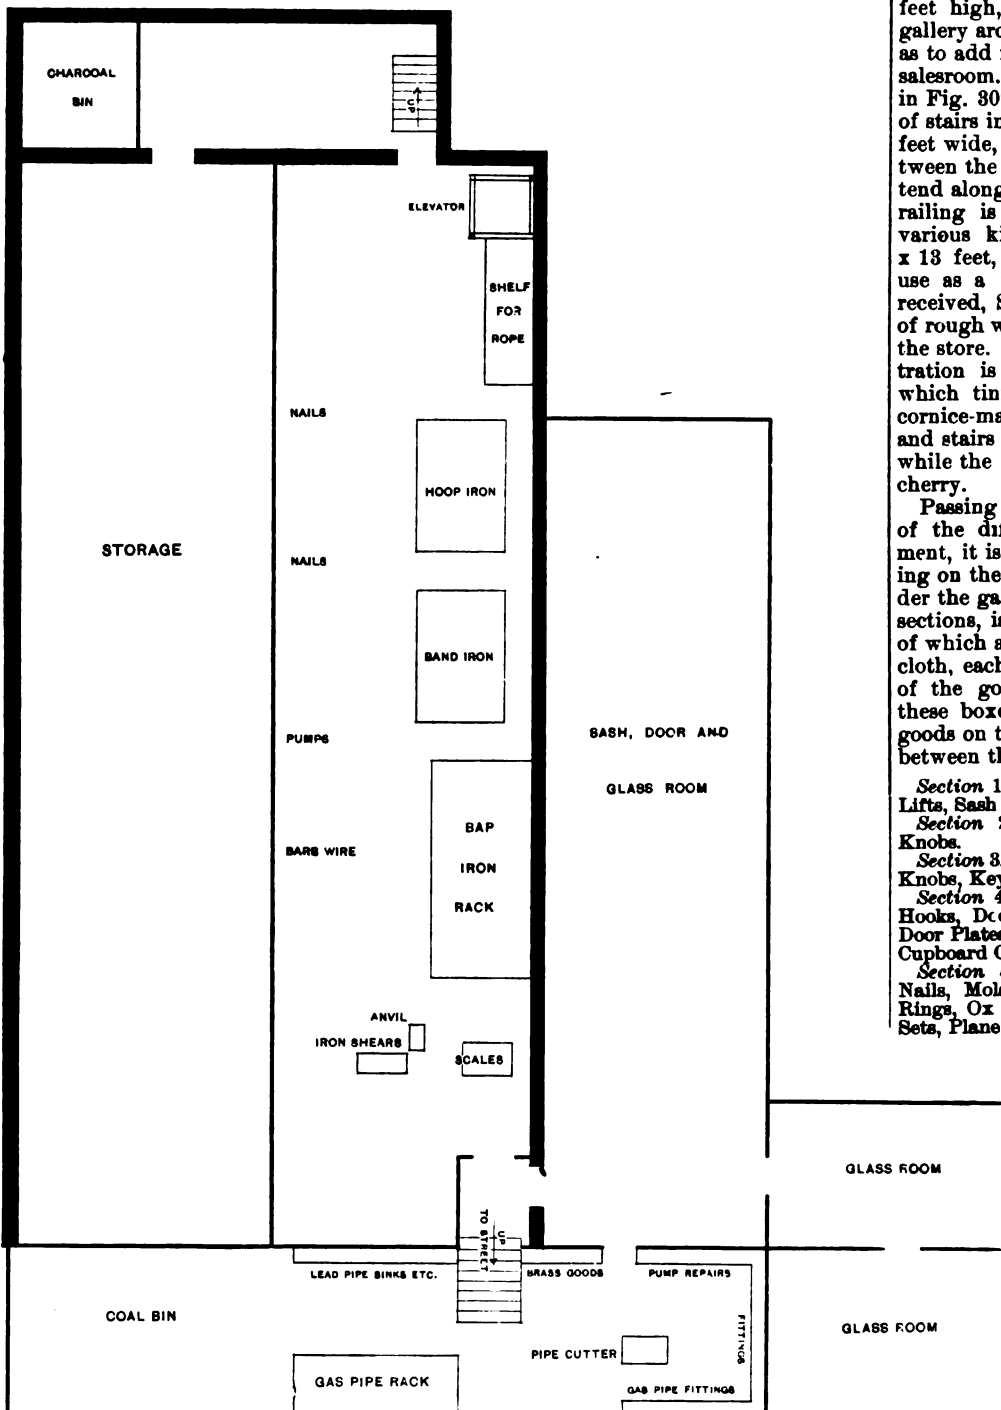

Fig. 810.—Diagram of Basement.

wholesale store, occupies a lot on Monroe street, 44 x 113 feet. Its general arrangement is represented in the accompanying illustrations, Figs. 808, 809 and 810. Not only is the storeroom a double store, but several lofts also are used in connection with it besides the basement under it and under two adjoining stores, as shown in Fig. 810. The arrangement of the store floor is given in the diagram Fig. 808. In this it will be seen that large and attractive show windows are secured, the center windows have a front of 19 feet and floor

windows are carpeted, while the middle one is covered with oil cloth. The window on the left of the entrance is furnished with plate glass shelves supported by brackets, the shelves being filled with Britannia, Granite and Decorated Pearl Agate Ware, Tea and Coffee Pots, &c., the floor being occupied with a variety of Japanned Ware, Coal Vases, &c. The window on the opposite side is devoted to a display of Hardware, of which a large variety of Tools and miscellaneous goods are exhibited. A good deal of care and

The Cutlery showcase near the front of the store on this side is devoted to Pocket Cutlery. The bottom of the showcase is covered with red cloth and has an arrangement covered with green billiard cloth for a display of Pocket Cutlery in the center of the case, as shown in Fig. 312. This showcase is 8 feet long, 2 feet wide, 10½ inches high at front and 11½ inches high at back, inside measurement. The oval boards on which the Pocket Knives are placed are of the following sizes: The lower board 12 inches wide, 20 inches

long and 1½ inches high, the upper board being 6 inches wide, 12 inches long and 1½ inches high. The lower round boards are 16 inches in diameter and 1½ inches in

315 give front and rear views of counter near the front of the store, which is devoted to Tools, while a novel and striking arrangement of other goods is secured on

it will be seen that it is furnished with doors, one of which is shown open, disclosing six compartments for Saws, each 8 x 10 inches. The different sizes of Hand-Saws are thus accommodated, there being separate compartments for each size, with a slip pasted above giving the length of the Saw, its number and the number of teeth to the inch. The space, 13 inches wide the full length of the counter, serves a useful purpose in selecting goods. The showcases on top front the other way, as show in Fig. 314, on one of the prominent aisles of the store. The front of this counter and its two sides have green billiard cloth tacked on them, covering the whole space. Small moldings running vertically 10 inches apart divide this space into panels, in which are fastened samples of various kinds, arranged with a view to ornamentation. Thus samples of Chalk are attached to represent the number of the store, while other goods form stars and other decorative designs.

The fronts of the small drawers—Fig. 311—in which Shelf Hardware is kept, are all covered, as above stated, with green billiard cloth, on which samples are fastened. They are naturally attached in different ways, according to the style of goods to be sampled. For instance, Locks are fastened with round head nickel-plated Screws through the key-holes. Strikes are put on with Screws, and Keys are hung on No. 81 ¾-inch Sargent's Brass Coat Hooks. Knobs are fastened by two links of brass Jack Chain, one end of which is put through screw-holes in the Rose, while the other ends are hung on No. 81 ¾-inch Hooks. Padlocks are hung on No. 81 1-inch Hooks, and other goods are put on with Screws. No. 110 Screw Hooks, Blind Staples, Double-Pointed Tacks, &c., are used, according to the style of the goods. All Japanned Goods that have surfaces suitable have the numbers marked on them with gold ink. Brass Goods are marked with black ink, while others hav-

Fig. 314.—Front of Tool Counter.

high, the upper board being 8 inches in diameter and 1½ inches high. They are covered, as noted above, with green billiard cloth. Pocket Knives are arranged on these boards so as to secure an effective display. The number and prices are marked on the blade of each. They are marked in ink after having been given a coat of shellac varnish covering surface enough for the marks. This prevents the ink from rusting the blades. Other showcases used in the store are 2 feet wide and 18 inches high and have glass shelves about midway between the bottom and top. One of them is filled on the bottom with full assortments of Nicholson's Fancy Files, Oil Stones and Slips; the shelves being used for samples of Auger Bits, Twist Drills, Augers, Hollow Augers, &c. Table Cutlery and miscellaneous Knives, Rules and Revolvers occupy another case, the shelf being devoted to a variety of related lines.

The space under the balcony on the right-hand side toward the rear is occupied, as indicated in Fig. 308, by a Glass rack, which contains over 200 sizes. On the opposite side are bins containing Hollow-Ware, Dripping Pans, Fire Shovels, Shovels and Tongs, Maslin Kettles, Stove Boards, &c. On the floor near the gallery stairway are six open-top cans, Fig. 313, which are used for holding Pot Covers, and are made to fit the different-sized Covers. These Cover holders are 27½ inches high, and have an opening 2½ inches wide running from the top to within 6 inches of the bottom, and are made large enough so that the following sizes of Covers will drop in easily, namely: 9½, 9¾, 10½, 10¾, 11½ and 12 inch. Sample boards on the front of the balcony railing are covered with green cloth, and are filled with a variety of goods such as an extensive assortment of Butts, Bolts, Door Locks, Knobs, &c., complete Bronze and Bronzed Store Door Handles, Latches and Locks, Sash Fasts, Letter-Box Plates, Electric Bell Pushes, &c. Figs. 314 and

the outside, with a very convenient arrangement for carrying a stock of Saws inside. This counter or Saw case is 19 feet long, 40 inches in extreme breadth, and

Fig. 315.—Rear of Tool Counter, Showing Saw Case.

3 feet to top of counter. Two showcases occupy the top, 18 feet long, 27 inches wide and 16 inches high. In Fig. 315 the rear of this counter is shown, from which

ing no surface suitable are marked on green tags tacked near them. Prices are marked on the right-hand side of drawers and boxes.

It will be seen by Fig. 311 that each drawer and box has a Washer $\frac{1}{2}$ inch outside diameter. This Washer is painted white on one side and red on the other, and is hung on a small wire hook on the upper right-hand corner of the front. When the red side is out it indicates that the drawer or box has inside some of the goods sampled, and when the white side

Fig. 311.—Shelf Box.

is out it shows that the stock is exhausted and needs replenishing.

The counter, Fig. 316, near the stairway to the gallery, contains bins which hold Barn Door Hangers, Strap and T Hinges, Machine Bolts, Crosscut Saw Handles, Solder and Soldering Coppers, Chain Links, Screw Hook and Strap Hinges, &c.

Fig. 312.—Counter and Cutlery Show Case.

On the top of this counter are piled Horse Nails, Toe Calks, Bench Vises, Heavy Hammers, Clothes-Line Reels, &c. On the rack above are Shovels, Spades, Scoops, Snow Shovels, Steel Goods, Post-Hole Diggers, &c. A Drill case occupies the end.

Axes are sampled as shown in Fig. 317 on a board 2 feet wide by 3 feet long, which lies lengthwise on the counter with one

Fig. 313.—Pot Cover Case.

end elevated about 6 inches higher than the other. It has a strip nailed across it for the edge of the Axes to rest against, the whole being covered with green billiard cloth.

A feature of this store, which is most striking upon entrance, is the extent to

which sampling is carried. Even the large drawers in which heavy Tools are kept have a sample fastened on them, thus producing a pleasant effect, from the large variety of goods that is thus brought to view, and resulting doubtless in increased

Fig. 316.—Counter, Steel Goods Rack, &c.

business, as customers are enabled to select without difficulty such articles as they may be in need of.

Space occupied in winter by base-burning coal Stoves will soon be filled with Gasoline Stoves, Refrigerators, Ice-Cream Freezers, Water Coolers, Filters, &c., and other seasonable goods arranged on tables, while the room now occupied by wood heating and platform and sample Stoves will be occupied by a Tinware stand now at the rear of office, together with other goods now stored upstairs. The rack for Steel Goods will then take the place of the Tinware stand. By removing other

Fig. 317.—Sample of Axes.

Stoves space will be secured for Tubs, Pails, Churns, Washboards, &c.

In addition to the room shown on the diagram the company have on the second floor their Tinshop, and on the third floor they store light bulky goods, such as Shovels, Spades, Scoops, Steel Goods, Baskets, Bellows, Step-Ladders, Clothes Bars, Tubs, Pails, Tinware, Wheelbarrows, &c.

Exports.

PER BARK ALBERT RUSSELL, FEBRUARY 7, 1889, FOR BRISBANE, AUSTRALIA.

By E. T. Hopkins.—3 Stoves and 1 box of Parts for same.

By Welsh & Lea.—14 cases Iron Bolts, 1 case Carpet Sweepers.

By Collins Company.—128 dozen Axes, 3 dozen Bush Hooks, 40 dozen Hatchets.

By A. Field & Co.—2 dozen Handles, 3 dozen Spoons, 60 Stoves.

By R. W. Forbes & Son.—1 case Lampware.

By B. F. Avery & Sons.—25 packages Plow Parts.

By Lazarus & Rosenfeld.—8 cases Slates, 1 case Hammers, 8 packages Axes, 15 packages Clothes Pins, 40 boxes Axes.

By V. Basanta.—20,000 Ammunition, 40 dozen Washboards, 40 dozen Hatchets, 37 dozen Saws, 9 sets Harness, 65 dozen Washboards, 4 gross Blacking, 12 Scales, 6 dozen Awls and Haft, 18 dozen Cow Bells.

By Coombs, Crosby & Eddy.—2 $\frac{1}{2}$ dozen Saws, 30 dozen Edge Tools, 12 dozen Axes, 4 dozen Carpenters' Tools, 12 Stepladders, 1 dozen Railroad Barrows, &c.; 3 $\frac{1}{2}$ dozen Agricultural Tools, 1-24 gross House-Furnishing Goods.

By R. W. Cameron & Co.—3 Stoves and 1 box Parts for same, 12 dozen Axes, 12 dozen Picks, 6 dozen Saws, 12 dozen Stoves, 36 dozen Hoes, 32 dozen Axes, &c., 3141 pounds Axes, 500 Broom Handles, 3 cases Grindstones, 12 dozen Washboards, 10 boxes Clothes Pins, 4 dozen Tubs and Pails, 12 dozen Hammers, 1200 pounds Nails, 1 dozen Handles, 1 case Guns.

By H. W. Peabody & Co.—3 cases Carriage-Ware, 2500 feet Hose, 12 cases Axes, 5 cases Hardware, 1 case Lampware, 3 cases Hardware, 1 case Agricultural Implements, 1 $\frac{1}{2}$ gross Axle Grease, 36 dozen Handles, 2 cases Picks, 2 cases Lampware, 1 bundle Pumps, 27 packages Hardware.

By A. S. Lascelles & Co.—3 cases Grease, 8 cases Tacks, 1 case Nails, 15 dozen Braces, 17 cases Handles, $\frac{1}{2}$ dozen Scales, 3 cases Hardware, 1 gross Locks, 100 Boxes Clothes Pins, 35 bundles Washboards, 2 cases Hardware, 2 dozen Braces, 1 bundle Brooms, 400 pounds Oil Stoves, 3 Stoves, 20 Oil Stoves, 6 dozen Lemon Squeezers, 16 dozen Axes, 3 dozen Picks, 3 cases Hardware, 6 dozen Axes, 48 dozen Hatchets, 5 cases Hardware.

By Arkell & Douglas.—15 boxes Hardware, 21 cases Handles, 267 dozen Axes, 154 dozen Hatchets, 840 dozen Handles, 1 case Saws, 4 packages Hardware, 100 boxes Clothes Pins, $\frac{1}{2}$ dozen Braces, 11 Trucks, 1 crate Sifters, 10 cases Hardware, 2 gross Axle Grease, 23 dozen Hammers, 100 pounds Oil Stoves, 1 case Air Guns, 6 gross Shade Rollers, $\frac{1}{2}$ dozen Paint Mills, $\frac{1}{2}$ dozen Wringers, 2 cases Bench Screws, 1 gross Blacking, 4 cases Choppers, 1 dozen Scales, 5 cases Hardware, 2 packages Bolts, $\frac{1}{2}$ barrel Blocks, 3 cases Lamp Goods, $\frac{1}{2}$ dozen Ladders, 29 cases Hardware, 100 pounds Nails, 1 crate Wheels, 1 $\frac{1}{2}$ dozen Churns, 1 barrel Hose, 1 box Door Checks, 1 case Upsetters, 10 cases Hardware, 10 cases Agricultural Implements, 5 packages Hardware, 219 gross Wicks, 3 cases Tools, 6 dozen Traps, 34 packages Carriage-Ware, 50 boxes Clothes Pins, 12 cases Clocks, 1 case Tinware.

PER BARK GAERWEN, FEBRUARY 7, 1889, FOR EAST LONDON.

By New Home Sewing Machine Company.—48 Hand Machines.

By W. H. Crossman & Bro.—57 cases Plow Parts, 60 cases Plow Parts.

By Coombs, Crosby & Eddy.—148 Plows and Parts, 2200 pounds Nails, 1 dozen Meat Cutters, 7 dozen Axes, 24 dozen Axe Handles, 6 Road Scrapers, 17 dozen Axes, 120 dozen Carpenters' Tools, 29 pounds Sash Cord, 7 dozen Sash Fasteners, 1520 pounds Sash Weights, 3 Sand Stones.

FOR DELAGOA BAY.

24 Plows, 50 dozen Edge Tools, 30 dozen Brooms, 22 dozen Pick and Axe Handles, 6 dozen Saws, 12 dozen Hammers, 4 dozen Clocks, 5 dozen Handled Axes, 6 Scales, 13 pounds Sash Cord, 4 dozen Sash Fasteners, 950 pounds Sash Weights.

PER BRIG GEORGIE, FEBRUARY 13, 1889, FOR PORT ELIZABETH, SOUTH AFRICA.

By Arkell & Douglass.—21 cases Plows, 25 cases Agricultural Implements, 16 dozen Picks, 80 dozen Handles, 150 dozen Brooms, 93 kegs Nails, 61 cases Axes, 10 dozen Wrenches, 3 dozen Saws, 240 Broom Handles, 10 boxes Clothes Pins, 6 dozen Washboards, 10 boxes Clothes Pins, 60 dozen Brooms, 20 dozen Handles, 4 cases Hardware, 6 dozen Hammers, 16 Plows, 1 dozen Sewing Machines, 3 cases Scales, 1 case Plow Wings, 8 dozen Hammers, 16 pounds Sash Cord, 1 dozen Churns, 1 dozen Sewing Machines, 1-6 dozen Washers, 1-6 dozen Mangles, 24 kegs Nails, 10 boxes Sash Weights, 40 pounds Sash Cord.

By Corner Bros. & Co.—2 cases Agricultural Implements, 1 case Sash Cord.

A. J. Jordan, of Sheffield and St. Louis, manufacturer of fine Cutlery, reports a steadily increasing business. His trade in Razors is assuming large proportions, and he informs us that his AAA1 Razor, or what is commonly known as Triple A1, is steadily growing in favor, and, in fact, has become one of his leaders. The policy he has followed in the manufacture of this Razor is to make it a first-class article, and by the use of the best steel and careful workmanship he says he has built up quite a reputation for it, the result of which is that he is daily in receipt of mail orders for this specialty.

Spooled Wire.

Malin & Co., Cleveland, Ohio, the well-known manufacturers of spooled wire, have lately introduced an article to the trade which they call "A Retail Stock of Spooled Wire." It is represented in the accom-

Retail Stock of Spooled Wire.

panying illustration. It consists of a box containing 147 spools of wire, the box being tastefully painted, furnished with hinged cover and partitioned off to hold the various sized spools. This enables the retailer to carry a small and well assorted stock of brass, copper and annealed and tinned steel wires, varying in gauge from No. 18 to No. 34. The contents of the case are assorted according to the extensive experience of the manufacturers, who probably are in a better position to judge on this point than retailers who have not handled the goods. It is obvious that the wire thus put up in assorted cases has the well-known advantages possessed by their spooled wire, being easy to handle, not liable to tangle, &c. The outer layer of the wire on the spool is coated with shellac, preventing it from rusting or tarnishing, and all spools containing a quarter pound or more are stamped with the number of feet on the spool in addition to the gauge of the wire.

The Chicago Horseshoe Company.

A complete plant is now being erected for the manufacture of horseshoes at East Chicago, Ind., by the Chicago Horseshoe Company, whose main office is in room 535, Rookery Building, Chicago. The officers of the company are as follows: Geo. W. McCook, president; Edward L. Lamb, general manager; Zenas Burns, secretary and treasurer. The plant will consist of a rolling mill and a combination of special horseshoe machinery capable of turning out from 1000 to 2000 kegs of horseshoes daily, with facilities for the enlargement of the productive capacity of the works as the trade secured may warrant. The rolling mill will contain one 22-inch train of rolls and one 12-inch train, with two furnaces to prepare the material for them. Scrap will be the principal material used, embracing both iron and steel. For a special class of shoes it is intended to use combined iron and steel under the Wheeler patents. The product of the works will be shoes of standard patterns, the officers of the company believing that it is well to avoid the

costly and unsatisfactory experience of those who have attempted to make innovations in the forms of horseshoes. They base their hope of building up a profitable business on the character of their machinery, which they believe will enable them to manufacture shoes much cheaper than can be done with other machines.

The machinery is the invention of a man who has had 20 years' practical experience in the manufacture of horseshoes, and those who are interested in the company speak most enthusiastically of its capabilities. A description of it has not yet been made public, but it is asserted that it operates somewhat like the combination of stamps used in dressing ores, so that additions to its capacity are easily made. Each section of the machine is expected to make a finished shoe in four seconds, punched, swedged, concaved and ready for the market. In punching the shoes a wheel or cylinder will be used which is 8 feet in diameter, having punches protruding from its periphery, and as it revolves over the shoes the holes are made with perfect exactness in the proper places. The rapidity with which the product is turned out and the completion of the entire work by machinery are relied upon to reduce the cost of manufacturing shoes. The vicinity of Chicago was selected for the location of these works partly because of its facilities for distributing the product over a very large section of the country and partly because the materials to be used can be had at lower prices than at any other good manufacturing point. The building now being erected for the works will be 700 feet long by 80 feet wide. The construction of the machinery is well under way, and the company expect to be in operation within 90 days.

The Grand Oil Heater.

The A. F. Shapleigh Hardware Company, St. Louis, Mo., are offering to the trade the heating stove for burning oil

The Grand Oil Heater.

which is known under the name of Grand, and represented in the accompanying illustration. It is constructed of sheet iron, has ample mica illumination and is provided with a foot rail, which encircles the base.

The company allude especially to its heating qualities, and the small expense at which it can be run.

New Arctic Ice-Cream Freezer.

The accompanying illustration represents a freezer put on the market by the White Mountain Freezer Company, Nashua, N. H., with branch office 99 Chambers street, New York. It has been put on the market to meet the demand for a low-priced freezer, which would at the same time be of fair quality. It will be observed that the gearing is completely cov-

Arctic Ice Cream Freezer.

ered, so as to prevent anything from getting between the cogs. The tub is bound with galvanized-iron hoops, and constructed with a view of obtaining the desired result with the smallest possible quantity of ice. The can is described as made of the best quality of charcoal tin plate, with cast-iron top and bottom nicely galvanized. Special emphasis is laid on the hinged top, which is also detachable, a feature which is alluded to as not found in other freezers. The gear frame can be tipped back from the edge of the tub, as shown in the cut, allowing the can to be removed or contents examined, or it can be entirely removed if desired. Special attention is called by the manufacturers to the low price at which this freezer is offered, and they also call attention to its quality.

The following figures convey some idea of what it will cost to light the Paris Exhibition: It is estimated that 900 hours of service will be required, and on this basis the following prices have been adopted: For each glow lamp of 16 candle-power, 60 francs; 10 candle-power, 45 francs; for each arc light of 500 candle-power, 500 francs; 1000 candle-power, 750 francs. The motive power will be furnished at the following rates: Up to 500 horse-power-hours, 50 cents per horse-power-hour, and beyond 500 horse-power-hours, 40 cents per horse-power-hour. The total illuminating power of electric lamps is estimated at 1,600,000 candles; and the number and types of lamps at present decided upon are as follows: Jablochkoff candles, 128; arc lamps, 1017; glow lamps, 9080; sun lamps, 16.

Bicycle Padlocks.

The illustration herewith given represents one-third size an arrangement for securing bicycles, tricycles, &c., which is manufactured by the Ames Sword Com-

Bicycle Padlock, One-Third Size.

pany, Chicopee, Mass. The 1-inch padlock has eight levers, two keys, and the chain is 12 inches long. The locks are described as worked with a double-bitted key, as shown, which turns indefinitely both ways, so that they are not liable to get out of order or be picked. The chain is furnished either in brass or nickel-plated. The elegance of the workmanship and the beauty, lightness and strength of the article, together with the low price at which it is offered, are the points made in regard to it. It will be observed that there is a clevis drop fastened through the center of the padlock, which turns easily upon it.

The Sunshine Dauber.

The illustration given below represents the Sunshine dauber, which is put on the market by the Thompson Mfg. Company, Lansingburg, N. Y., and replaces their former pattern of coil handle dauber, which they have discontinued making. The special points in regard to this dauber are that the handle is of such a shape as to secure convenience in operation and prevent the knuckles from coming in contact with the shoe, and that the brush part is a solid knot of bristles. The knot is also alluded to as the right size and shape to spread the blacking on the part of the shoe to be polished without daubing the uppers. The quantity of bristles in each brush is referred to as sufficient, if doubled in the middle and drawn into a common shallow wooden block, to make

The Sunshine Dauber.

two old style brushes and some bristles over. The brush is further described as waterproof, and the bristles can be washed and dried again without injury. The knot also is somewhat larger than in their former coil handle pattern. The durability of the dauber and the low price at which it is offered are further points made in regard to it.

It is announced that the strike of the workmen employed in the limestone quarries in the Mahoning Valley, Ohio, which has been in progress for several weeks, is broken, the men employed at two of the quarries having returned to work at the old wages, while the places of those who refused to return to work have been filled

with new men. A majority of the men were opposed to striking, but were persuaded by the leaders. Several blast furnaces were compelled to bank.

The Perkins Hinge.

This hinge is made under a patent, January 1, 1889, and is manufactured by the New Haven Wire Goods Company, New Haven, Conn. It is designed more especially for use as a cheap hinge for crates, boxes, &c., rather than for doors, although it can be used to some advantage for this purpose. It is pointed out that, unlike

The Perkins Hinge.

cast hinges, this hinge will not break, while it can be produced at a lower cost than others. A variety of sizes will be furnished suitable for light or heavy work. The hinges are made automatically from steel wire. The reasonable figures at which they are offered and their special adaptation to the purposes for which they are intended are alluded to, and it is thought by the manufacturers that, as it is a decided improvement over the cast or wrought hinges now in use, it will readily find a prominent place in the market for such goods.

The Ostrander Door Opener.

This door opener, patented November 6, 1888, and manufactured by W. R. Ostrander & Co., 21, 23 and 25 Ann street,

The Ostrander Door Opener.

New York, embodies some new features, and is illustrated in the accompanying engraving. It is so constructed as to be operated either by compressed air through a pneumatic tube or by electricity with batteries. The manufacturers call atten-

tion to the fact that the movement in a gravity one, and that it is devoid of any delicate springs or delicate mechanism, so that it is not liable to get out of order. It is protected by metal sides to prevent dirt, plaster or chips from interfering with its operation. The movable bolt shown in the cut is a steel drop forging, and the other parts are described as made of the best wrought iron and steel. Especial care has been taken in the construction of the door opener, so as to make it of requisite quality and secure its satisfactory operation. The point is also made that it is positive in operation, and withstands wind and other force and cannot be jarred open. Its mechanism also is such that the opening of the door is not interfered with by pressure upon it, as in the case of other similar devices. The operation of this article has been tested in practical use since the patent was applied for.

A Pittsburgh ironworker named Anthony Barker is the inventor of what he terms an undulating puddling furnace, which is now being constructed at the Kensington Iron Works of H. Lloyd, Son & Co., in that city. It will probably be ready for testing in two weeks. As its name implies, the furnace is so constructed that an undulating motion is given to the iron during the process of boiling. When a heat is to be "balled," the bottom of the new furnace adjusts itself automatically, and the process from that out differs but little from the present method of puddling. The inventor claims that the first cost will only be a little over that of the old style, while it will turn out at least double the weight of iron with one more man. The Barker Undulating Furnace Company, Limited, with a capital of \$20,000, have been incorporated to push the new furnace. Their officers are: A. W. Tyler, chairman; H. Lloyd, Son & Co., general managers; Jeremiah Miller, vice-chairman; James B. Booth, secretary; A. G. Holmes, treasurer, and Anthony Barker, general manager.

Bids for the construction of a submarine torpedo-boat were opened at Washington on Friday. The Columbian Iron Works, of Baltimore, offered to build a vessel of 90 tons under three bids, as follows: \$150,000, guaranteeing a speed of 12 knots on the surface and 9 knots submerged, with 19 hours' power endurance on the surface and one hour submerged; \$115,000, guaranteeing 10 knots on the surface and 8 hours submerged and 15 hours' endurance on the surface, and \$100,000, guaranteeing nine hours on the surface and seven hours submerged. George C. Baker, of Des Moines, Iowa, offered to construct a vessel of 40 tons, with no guarantees except that she could be handled easily either on the surface or submerged.

The financial troubles which have overtaken the Ohio and Western Iron Company form a topic for remark by Western correspondents. A writer at Columbus, Ohio, says a strange fatality has been connected with the property out of which the Ohio and Western grew. James T. Burkey, who committed suicide in a St. Louis hotel, was harassed to the last by thoughts of the fortunes he had lost among the Hocking hills. George Lee, who killed himself in a New York hotel, was haunted in his dying hour by the specter of ruin in the coal fields of Ohio. Royal M. Pulsifer, the founder of the Boston *Herald*, took his own life some months ago, and, though he had many other business complications to pull him down, he, too, had sought the fabled pot of gold that was said to be buried at the foot of the Western rainbow.

CURRENT HARDWARE PRICES.

FEBRUARY 20, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

THE IRON AGE

THURSDAY, FEBRUARY 28, 1889.

Shaping Machine.

The machine which we herewith illustrate in perspective and detail is compact and powerful, susceptible of fine and positive adjustments, practically noiseless, and operates with ease and smoothness. It is driven by straight and cross-belted friction pulleys located on each side of the machine. The power and velocity of the ram are unvaried by change of stroke, which can be regulated while the machine is in motion, its velocity at all times being uniform and under full control of the operator. By a new arrangement of motive parts the machine is self-adjusting as to wear and automatically absorbs power according to the resist-

quickness of the change in direction of the movement of the ram, which will work up to a line and reverse inside of $\frac{1}{4}$ inch. Shafting or bars of any length and up to $2\frac{1}{4}$ inches in diameter can be passed through the machine, under the ram and slotted or fluted at any point, and from $\frac{1}{2}$ to 15 inches in length, without change. The friction box for operating the feeds has a cam let-off and consumes power only at the instant of action. In the accompanying engravings, Fig. 2 is a side elevation showing the gears driving the ram and the feed gears, Fig. 3 is a plan view of Fig. 2, and Fig. 4 shows the construction of the driving shaft. This shaft consists practically of a hollow shaft, within which fits a spindle. To each end of the spin-

low shaft and being secured in the spindle. The spiral gear is thus free to move and to carry with it the inner shaft and also the driving pulleys P, mounted at either end of the inner shaft, and which are adapted to engage with the outer surfaces of the friction pulleys p. This spiral gear engages a gear connected with the driving train. These spirals are of 12° . It is evident from this construction that as the load upon the train increases the spiral gear J upon the shaft will be shifted along the shaft one way or the other, according to the direction in which the ram is moving, and will bring into play one or the other of the friction-wheels p. It is further evident that as the load increases the more powerful will be

SHAPER, BUILT BY THE PUTNAM MACHINE COMPANY OF FITCHBURG, MASS.

ance of the cutting tool—in other words, when the cut is exceptionally heavy and more power is consequently needed to drive the tool, it is obtained by means of an extremely simple arrangement, which we shall describe more in detail later. The ram is long, has a quick return, and is actuated by a powerful train of heavy gearing made in duplicate, the under surface of the ram being formed with two racks, with which the driving gears engage. The ram head is graduated, swivels on trunnion, is secured by T bolts to the ram, and has depth gauge, with a run of $5\frac{1}{4}$ inches. As stated, the driving gears are double, and so arranged that the cogs of one machine overlap the other. This imparts a smooth and even motion to the ram, and greatly promotes the endurance of the gears.

The machine has two speeds (for cast iron and steel), which admits of instant use without change of belt. Sufficient power is obtained to sustain a heavy cut, and an automatic coarse surfacing feed is provided. An important feature is the

dle is held a pulley, one of which operates the forward stroke of the ram and the other the return. The diameters are different, so as to get a quick speed on the return. Each pulley is mounted so as to revolve freely upon the hollow shaft, being held to the spindle by an arrangement shown in Fig. 5. Fitting a thread in the end of the spindle k is a nut, n, which holds the disk m in position. The hub o of the pulley is free to revolve on the hollow shaft. The hub is formed at its outer end with a thread, upon which fits the cap l, thereby forming an annular bearing about the disk m, so that while the pulley is free to revolve upon the hollow shaft, it is held in place by means of the disk m and the nut n to the spindle k. Fitting within the inner periphery of each pulley P is a friction pulley, p, mounted upon the hollow shaft with which it is rigidly connected. The spiral gear J is mounted about at the center of the driving shaft, and its extended hub is provided with a slot, j, through which passes a key, this key passing through a slot in the hol-

the thrust of the pinion J along the shaft, and the tighter will be the frictional hold between the pulleys p and P.

Fulcrumed at h, Fig. 8, on the side of the machine, is the lever H, the free end of which is formed with a yoke, as shown in the plan. In the free end of the yoke is pivoted a rod, the other end of which is provided with a standard having an arm adapted to engage with the usual tappets placed on top of the machine and carried by the ram. Pivoted a short distance from the fulcrum of the arm H is a rod extending through the case and carrying the friction arm, which is so arranged that any movement it makes in a direction parallel to the axis of its shaft will impart a similar movement to the spiral gear J. This arm, shown detached in Fig. 6, is of case-hardened malleable iron, and is provided with plugs of raw hide upon each side. As the ram moves forward its tappet strikes the upper projecting rod of the lever H and moves the rod entering the case, and therefore the spiral pinion

and its inner shaft or spindle, in a direction to throw out the driving pulley. At the reverse end of the stroke the mechanism takes the opposite course and

the lever H need be moved but a fraction to accomplish the movement of the spiral gear and the throwing out of the friction clutches. It is apparent that the heavier the

ing shaft to the ram and also to the feed mechanism, which latter is driven through the segmental arm B, thus engaging with the rack D, which drives the train B F G

Fig. 2.—Side Elevation of Putnam Shaper.

Fig. 3.—Plan View of Putnam Shaper.

relieves the friction from the pulley at the other end of the driving shaft. This mechanism permits of the working of the ram at an exceptionally short stroke, since

load the more powerful will be the force moving the spiral along the shaft and engaging the driving friction. In the side elevation, Fig. 2, are shown the trains from the driv-

operating the feed. The friction box operating this gearing consumes power only at the instant of action. From the brief description we have given of the

operating parts of this machine it will be seen that it is especially adapted for heavy work, that provision is made for compensating all wear of the frictional surfaces, and that it is so proportioned and designed as to work with the least possible time consumed by loss of stroke. The machine is unusually heavy and compact, and, possessing the admirable features we have mentioned, is rapidly making a place for itself in the long line of well-known tools coming from the Putnam shops. In an early issue we shall describe the rack-cutting attachment, designed to be used in connection with this shaper. This attachment can be placed on the shaper, with whose operation it will not in the least interfere, and at any time it can be used for the cutting of racks of any length. These

valued, as it is understood, at about or over \$1 per pound, is not the "steel strips" which pay 3½ cents per pound when valued at over 10 cents per pound, and 45 per cent. ad valorem when valued at under 4 cents per pound. This provision is evidently not applicable to such highly polished and finished merchandise as the article in question.

DUTY ON SWIVELS.

On an appeal from an assessment of 45 per cent. ad valorem on certain swivels, claimed to be dutiable under the provisions for "chain or chains of all kinds," the Department says: "The appraiser reports that the articles consist of a loop and swivel, having three or four short links of chain attached, and intended to be used, in connection with a leather strap, as a

still others four, strands of steel wire, also heavily covered with manila yarn, some of the latter being coated with tar and some not so coated. The merchandise not being the steel wire of commerce "covered with cotton, silk or other material," and not being the iron or steel wire rope also specified, and also being not otherwise enumerated, is dutiable at the rate of 45 per cent. ad valorem for "manufactures, articles or wares not specially enumerated or provided for * * * composed wholly or in part of * * * steel," &c., and the principle enunciated in the Department's decision, wherein it was held that certain "wire ribbon," which was a woven fabric consisting of fine wires covered with cotton thread and united together by a cotton web, was not the iron or steel wire covered with cotton, silk or

machines are built by the Putnam Machine Company, of Fitchburg, Mass.

Recent Customs Decisions.

The Secretary of the Treasury has announced the following decisions in customs cases under the metal schedule:

STEEL IN STRIPS.

The Treasury Department declines to reverse its decision whereby certain thin polished strips or tapes of steel were held to be dutiable at the rate of 45 per cent. ad valorem, for "steel not specially enumerated or provided for." From the statement, as well as that of the manufacturer, it was clear that the merchandise had, by the process of filing, polishing, &c., become, if not wholly, at least "partially," manufactured articles of steel, so that even if not covered by said provision it would be dutiable at the rate of 45 per cent. ad valorem. At any rate, the said merchandise, which, in many cases, is

patented article for fastening dogs, and that they are not, in his opinion, the 'chain' or 'chains' of commerce. From an examination of the sample submitted, the Department is of opinion that the articles are parts of chains, and that they were properly dutiable as claimed."

BUOY AND GRAPNEL ROPE.

On an assessment of duty at the rate of 45 per cent. ad valorem on certain so-called "steel wire covered with yarn," which the appellant claims to be dutiable at the rate of 6½ cents per pound, for steel wire galvanized, &c., the Department rules: "It appears from the report of the appraiser and an inspection of samples that the merchandise in question is not wire as commercially known and recognized, but that it consists of rope (styled by the appellant grapnel rope and buoy rope) composed of wire and manila yarn, some of the coils being composed of single pieces of galvanized steel wire heavily covered with manila yarn and coated with tar, and others containing three, and

other material as specified in said schedule.

DRAWBACK ON STEEL NAILS.

The Department in an application for drawback on certain steel nails has decided that on the exportation of steel nails manufactured wholly from imported steel slabs a drawback will be allowed equal in amount to the duty paid on the imported material used in the manufacture, less the legal retention of 10 per cent. The quantity of the material so used to be determined by adding to the net weight of the exported nails 7½ per cent. of such net weight.

Lord Stanley, Governor-General of Canada, advises that all Canadian fortifications be supplied with guns similar to those mounted in Halifax. So far from approving of this action, the Imperial Government, according to an Ottawa dispatch, remonstrates in imperative terms against the hostile policy pursued of late by the provincial authorities.

Pressure Regulator.

The safety pressure regulator here shown is especially designed for use in connection with a system for a public service of natural gas. It consists in a valve controlled and opened and closed by the shifting of a body of fluid which is moved by the pressure of the gas. The body of fluid is introduced into chambers, between which it is free to flow through the flexible pipe connecting them. The device is set so that under the average pressure of gas the fluid will be sustained in a state of about equal division between the two chambers; then, if the pressure drops a little in the outlet pipe, the pressure on the fluid will be proportionately relieved and enough fluid will gravitate from the movable chamber into the stationary chamber to sufficiently lighten the former to permit the weight to lift it, and hence the valve-arm, so as to open the valve wider and correct the variation in pressure by letting enough more gas pass the valve to make up. When, on the other hand, the pressure rises slightly above the average pressure, sufficient fluid will be forced from the stationary chamber to the movable chamber to pull the latter, and hence the valve-arm, down by the increase of weight in such chamber, and so close the valve enough to prevent increase of pressure and keep the amount of gas passing

gas-main and turning it on again without the consumer's knowledge. In case there should be a dangerous overpressure of gas, the entire amount of fluid will be forced into the movable chamber, which will then overbalance the weight and pull down the valve-arm so as to entirely close the valve. But as the pressure reduces, the fluid will flow back into the stationary chamber and permit the weight to lift the movable chamber and arm, and thus automatically open the valve. The regulator has therefore the three-fold function of compensating for variations of pressure in the ordinary use of the gas, in shutting off the gas so that it must be turned again personally by the consumer when it is turned off in the main line, and, also, in shutting it off entirely when the pressure is so excessive as to be dangerous or inconvenient. The arrangement of passages and connections is such that no fluid can remain in them, thus giving absolute freedom from frost. Owing to the parts being all of metal, the operation is no more affected by fire than are the pipes or connections. This regulator is being made by Adams Bros. & Co., of Findlay, Ohio.

Exhibitors at Paris.

The efforts of the American Commissioners of the Paris Exposition appear to have led to success, the number of manu-

Ohio; Union Metallic Cartridge Company, New York; Winchester Repeating Arms Company, New Haven, Conn.

Boilers.—E. P. Brown, Flushing, N. Y.; Hopson & Chapin Mfg. Company, New London, Conn.

Drills.—American Diamond Rock Boring Company, New York; Ingersoll Rock Drill Company, New York.

Carpenters' Tools.—Darling, Brown & Sharpe, rules, &c., Providence, R. I.; E. E. Gayland, saws, planes, &c., Bridgeport, Conn.

Engines.—John Henry Blake, marine rotary, New York; Crist & Covert, gas, New York; N. Huntley Edgerton, Philadelphia; J. Willis Morris, New York; Simonds Manufacturing Company, New York; Straight Line Engine Company, Syracuse, N. Y.; George W. Tift Sons & Co., automatic, Buffalo.

Glues.—Le Page & Co., Boston; Mrs. Christine Lugano, Kingston, N. Y.; Russia Cement Company, Gloucester, Mass.

Hardware.—Stanley Works, New Britain, Conn.; L. & J. White, tools and knives, Buffalo, N. Y.

Road Machines.—American Road Machine Company, Kennett Square, Pa.; Brooklyn Railway Supply Company, New York; Gendron Iron Wheel Company, Toledo, Ohio; George N. Pierce & Co., Buffalo.

Railway Supplies.—D. E. Bishop, railroad joint, New York; Henry Bornstein & Co., patent pin hook, Boston; William H. Inloca, model of turntable, Asheville, N. C.; Dr. B. F. Laird, car coupling, Covington, Ky.; New York Car Wheel Works, Buffalo, N. Y.; New York Commercial Company, New York; Peckham Paper Car Wheel Company, New York; H. K. Porter & Co., Pittsburgh; John Stephenson Company, New York; A. Whitney & Sons, car wheels, Philadelphia.

RYDER PRESSURE REGULATOR, MADE BY ADAMS BROS. & CO., OF FINDLAY, OHIO.

into the outlet pipe nearly constant. It will be seen that the fluctuations in pressure in the gas supply at once act through the movable fluid to operate the valve in compensatory action, so that although variations of pressure occur in the gas main, the pressure of gas passing through the outlet pipe will be constant. In case the gas should be entirely shut off in the gas main, all the fluid will then at once gravitate into the stationary chamber, leaving the movable chamber so light that it is overbalanced by the weight and lifted until the valve-arm rotates the valve so as to entirely close it. It will thus be seen that the shutting off of the gas in the gas-main is followed by the automatic closing of the valve. The regulator acts as a visual indicator to signal to the consumer that the gas has been shut off in the main line. Now, although the gas may be turned on in the main line, none will pass into the outlet pipe until the consumer has manually opened the valve by lifting the weighted lever, which he must hold in an elevated position against the weight until the pressure of the gas thus let into the outlet pipe, and hence into the stationary chamber, has forced enough liquid into the movable chamber to balance the weight and keep the valve open. It will be evident from the foregoing that the device constitutes a safeguard against accident due to shutting off the gas in the

facturers to whom space is allotted being very large. The commissioners have assured exhibitors that every possible care will be taken to display to the best advantage whatever may be sent. There will be no expense for freight charges either going to France or returning, but exhibitors are expected to provide packing for their goods, and to attach to the various exhibits cards stating the insurable value of the goods. They must agree also not to offer any of the exhibits for sale during the progress of the exhibition, and not to withdraw any of them during that time. Space has been allotted thus far to the following firms:

Agricultural.—S. L. Allen & Co., seed drills, Philadelphia; Egbert Benson, cultivator, Raritan, N. J.; Columbia Agricultural Works, Columbia, Pa.; Cyclone Pulverizer Company, New York; Enterprise Mfg. Company, feed grinders, Columbiana, Ohio; Genesee Valley Mfg. Company, drill, corn-sheller, &c., Mount Morris, N. Y.; Higginum Mfg. Corporation, Higganum, Conn.; J. Moore's Son, rakes and forks, New York; Thornton N. Motley, wheelbarrows, New York; A. G. Peck & Co., axes, Cohoes, N. Y.; Strickler Brothers & Co., butter coloring, Sterling, Ill.

Ammunition, Cannon, Guns, &c.—Bailey, Farrell & Co., Pittsburgh, Pa.; E. P. Brown, Flushing, N. Y.; Colt's Patent Firearms Mfg. Company, Hartford, Conn.; Hurst Reinforced Cartridge and Arms Company, Washington, D. C.; Pneumatic Dynamic Gun Company, New York; Smith & Wesson, Springfield, Mass.; Standard Target Company, Cleveland

Mill Machinery.—Brown & Sharpe Mfg. Company, Providence, R. I.; Curtis & Curtis, Bridgeport, Conn.; A. Heine, Silver Creek, N. Y.; Higley Sawing and Drilling Machine Company, Boston; E. Horton, Son & Co., Windsor Locks, Conn.; Simeon Howes, Silver Creek, N. Y.; Klauder & Bro., Philadelphia; F. W. Leinbach, Bethlehem, Pa.; V. W. Mason & Co., Providence, R. I.; William Sellers & Co., Philadelphia; D. E. Whiton Machine Company, New London, Conn.

Mowing Machines.—Bradley & Co., Syracuse, N. Y.; Samuel Johnston & Co., Brockport, N. Y.; McCormick Harvesting Company, Chicago; D. M. Osborn & Co., Auburn, N. Y.

Harvesters.—Johnston Harvester Company, Batavia, N. Y.; Pland Mfg. Company, Chicago; Walter A. Wood Company, Hooick Falls, N. Y.; William N. Whitely Company, Springfield, Ohio.

Stoves, Ovens, &c.—McDowell Oven and Furnace Company, Boston; A. Reid, Buffalo.

Machinery Aids.—American Bit-Brace Company, Buffalo; A. Christoffel, boiler tube scraper, Brooklyn; F. S. Fease, lubricating oils, Buffalo.

Machinery of Various Kinds.—Wilson Ayer, rice machines, Camden, N. J.; Burton Fils, emery wheels, Paris; Chambers Brothers, brick-tempering machine, Philadelphia; J. H. Eaton, plaiter for dress trimming, Monroe, Wis.; Energy Manufacturing Company, rope hoists, Philadelphia; J. D. C. Knapp, vaporizers, Minneapolis, Minn.; Michigan Radiator and Iron Mfg. Company, Detroit, Mich.; W. E. Morgan, numerating machines, Chicago; T. W. Norman, rope-laying machine, Boston; John E. Smith, machine for cutting meat, Buffalo; Stiles & Parker, drop hammers, Middletown, Conn.; Teal Hoist Company, patent hoists, Philadelphia.

Machinery Packings.—United States Metallic Packing Company, Philadelphia.

Mechanics' Tools.—Billings Spence Company, Hartford, Conn.; L. S. Starrett, Athol, Mass.

Locks.—Miller Lock Company, Pabita, Pa.; Yale and Towne Mfg. Company, post-office outfit, Stamford, Conn.

Laundry Machines.—Bailey Wringing Machine Company, Woonsocket, R. I.; Charles A. Bentzen, New York; A. M. Dolph Company, New York; Empire Granite Company, New York; Empire Wringing Company, Auburn, N. Y.; Gowans & Stover, Buffalo; D. K. Hickok, Morrisville, Vt.; C. Mears & Son, Bloomsburg, Pa.

Lawn Mowers.—Chadborn & Coldwell Mfg. Company, Newburg, N. Y.; Lloyd Hardware Company, Philadelphia.

Leather Goods and Belting.—American Leather Link Belting Company, New York;

Riveting Machines.

The gradual advance in forging, from the old sledge wielded by brawny arms to the power and steam hammer of to-day, is well known to every manufacturer, but until 25 years ago little advance had been made over riveting by hand; drop and foot presses have been tried, but the force of the blow expanded the rivet the whole length. The inventor of the machine here illustrated then became convinced that the best results could only be attained by a succession of sharp, quick blows given in the least possible time. After considerable experimenting the principles embodied in this machine were adopted, and

stantly. The blow is rendered elastic by the springs in connection with the air-cushions, and its force can be regulated at the will of the operator by more or less pressure applied to the treadle at the right of the machine; the yoke to which the treadle is attached is self-acting, and the moment the pressure is removed the blows cease and the work can be withdrawn. Suitable devices for holding the work firmly can be attached to the adjustable anvil and connected with the treadle at the left of the machine, so as to be operated by foot if desired. The work being held firmly on the anvil directly under the hammer, the hammer always strikes on the rivet, heading it equally, and as it is rotated while the blows are being struck the head conforms to the shape of the peen of the hammer, and any style of head can be formed. Both hands of the operator being free, he is able to handle the work with ease and rapidity.

Fig. 1 represents the form of machine generally used, and is adapted to all ordinary work, but where more room is required between the anvil and the hammer the base of the machine is changed, as shown in Fig. 2, and can be furnished in various heights with a detachable anvil. When made for agricultural wheels or articles of that height it will answer for all classes of work, but is not recommended for continuous use in general riveting, as the peen of the hammer is so high that the operator must work on a platform in order to be on a level with the hammer, which necessitates raising all of his work to the same height. In Fig. 2 no treadle is shown to operate attachments on the anvil, but when required it will be furnished. In riveting the hubs of wheels or larger articles where much horizontal room is required a machine embodying the upper working parts only can be furnished, and this suspended by a framework from the ceiling will allow of riveting on the surface of work of any diameter.

The machines are made by John Adt & Son, New Haven, Conn., in six sizes—viz., $\frac{1}{8}$, $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$ and 1 inch, each machine being capable of working rivets of the diameter given and many sizes smaller.

Household Utensils.—H. M. Dopp & Son, iron kettles, Buffalo; F. A. Frank, cook stove, New York; George A. Macbeth & Co., lamp chimneys, Pittsburgh; Kellogg & McDougall, brooms, Buffalo; Joseph Noyes & Co., clothes fasteners, Binghamton, N. Y.; Henry Nutrizio, coffee pots, New York; W. H. Pike, self-pouring teapot, New York; A. H. Reid, butter worker, Philadelphia; Sidney Shepard & Co., sifter, knife, &c., Buffalo, N. Y.

Hydraulic Rams, Pumps, &c.—W. B. Douglas, Middletown, Conn.; Silver & Deming Mfg. Company, Salem, Ohio; Worthington Pumping Engine Company, New York.

Nails.—Ausable Horse Nail Company, New York.

Secretary Whitney has given the new dynamite gun the stamp of his official approbation, the recorded result of tests made being pronounced satisfactory.

although many changes and improvements have been made, machines that were then manufactured and which have been in continuous use for over 20 years are still doing the work satisfactorily.

The elastic rotary-blow riveting machine, Fig. 1, was originally designed to rivet together articles of hardware, but its use has from time to time been extended to almost every branch of manufacturing where articles are held together by rivets, and it is now widely used in establishments where its utility has become known. The most important feature of the machine is in the combination and working of the cylinder and hammer-rod. The hammer-rod, suspended by springs and confined air within the cylinder, partakes of its reciprocating motion and produces a sharp, quick blow, which with its rotating action enables the machine to perform the work almost in-

The freight agents at Pittsburgh of the various lines having connections with that city have been at work for some time on a new form of freight tariff, which will prove a great advantage to shippers when wanting information in regard to the rate to any point mentioned in the tariff. At present the rate is given with the name of each point of shipment, thus requiring a vast amount of unnecessary repetition. To find the rate it is necessary to refer to the index to find the page in the tariff list. The new form does away with an index entirely. The name of each place to which merchandise is shipped from Pittsburgh is given in alphabetical order. For instance, if the rate on any class of merchandise from that city to Chicago is wanted, by reference to the alphabetical list the name of the road over which the goods will be shipped is given, and also the number of that city, which is 100. All that is then necessary to find the rate is to refer to the table of rates, which is printed on one page. The simplicity of the new form can be seen at a glance by reference to the following illustration, taking Chicago as an example:

Chicago, Ill. | L. S. M. S. | 100
This shows the city, State, railroad over which merchandise can be shipped, and the number for the table of rates. The table of rates is illustrated as follows:

No. 100.	1	2	3	4	5	6
	42½	37½	27½	20	17½	15

The number 100 indicates the city, the top line of figures shows the various classi-

fications of freight, and the lower line of figures shows the rates per 100 pounds on the different classes of freight. This new

tached to the vertical shaft G' , whose lower end is provided with a hand-wheel, G'' . The cross-head H , which moves upon

threads on the lower end of the feed-screw are much finer than those on the body of the screw. Beneath the recess h

NEW YORK.

Fig. 2.

form of freight tariff will be put in operation some time during the early part of next month.

The Keystone Radial Drill.

This drill is intended for a large range of work. It will take in a pulley up to 4 feet in diameter, and will bore small cylinders and similar work. The screw will feed 14 inches, and has adjustable automatic feed. The circular table is 24 inches in diameter, and is bored to receive bushes for boring bars; it can be raised or lowered without being turned around. The square tilting table slips in the slotted side of the bed and can be quickly removed. The drill illustrated has a radius of 48 inches and will drill to the center of an 80-inch circle. The column is 12 inches in diameter and 6 feet high.

Fig. 2 of the drawings is a side view and Fig. 3 a vertical section of the drill-stock; Fig. 4 is a side view and Fig. 5 a sectional view of the tilting table and its support. Through the horizontal slot in the beam passes a shaft carrying a pinion and hand-wheel engaging with a rack so as to move the drill frame. The drill spindle is revolved from the cone pulley by gearing inclosed within the column and at the top of the beam, as shown in the perspective view. The drill frame is formed with laterally-projecting arms, $E E$, connected together by guide-rods. At the center of these arms are openings, in the lower one of which is journaled the hub of the beveled gear D' , while in the upper opening is seated an internal screw-threaded feed-nut, F , with which the feed-screw G engages. To the upper portion of the feed-nut is secured the pinion g , engaging with which is the gear g' at-

Fig. 5.

Fig. 4.

Fig. 3.

the guide-rods, has a central threaded socket, h , with which the lower end of the feed-screw engages. The and communicating with it is a recess i formed with an annular shoulder to engage a groove on the upper end of the spindle

I, which passes freely through the pinion D' to which it is splined. The lower cross-piece of the drill frame has a vertical conical socket, J, within which is seated a long split sleeve J', threaded at its upper end to receive the adjusting nut j. This sleeve forms the lower bearing for the spindle and may be adjusted vertically within its socket by means of the nut to take up wear. By supporting the spindle in this way the weight of the spindle and its parts does not come upon the drill, and drills of the smallest kind may be used without danger of breaking.

At one end of the platform of the drill is a stationary column carrying a vertically movable table which is rigidly at-

New Power Forging Drop Press.

The accompanying illustrations represent a new drop power forging press put upon the market by the E. W. Bliss Company, Brooklyn, N. Y. Fig. 1 shows the general appearance of this press, while Fig. 2 is a cross-section of the lifting device. The same concern are also just putting upon the market a similar press for sheet-metal stamping work, in which the gripping device is the same as in the forging press. As the two machines embody the same general features of construction, a description of one of them will suffice. The tool is a departure from the familiar types, in the direction of simplicity and

cessity of gearing. As no bolts or screw-threads are used in the construction of the lifter, there is nothing to jar loose. The only bolts used on the entire machine are those shown for securing the guides to the bed, and the nuts for these are placed in cored pockets in the bed and bear upon rubber washers. Several sizes of these tools are now in course of construction, the hammers weighing from 100 to 1000 pounds. The size represented in the cut has a 350-pound hammer, with 28-inch lift; complete weight, 4500 pounds.

One of the most remarkable engineering feats appears to have been achieved in China, in the face of extraordinary phys-

Fig. 1.—General View.

Fig. 2.—Sectional View, Showing Lifting Device

FORGING DROP PRESS, BUILT BY THE E. W. BLISS COMPANY, OF BROOKLYN, N. Y.

tached to a column having horizontal grooves with which engages a pinion carried by the outer column. The table can be adjusted vertically and turned horizontally. A second column, Figs. 4 and 5, may be moved toward or from the first and clamped in any desired position. The construction of this column is clearly shown in the drawings. The table can be raised to any height and adjusted to any desired angle.

This drill is built by the Prentiss Tool and Supply Company of 42 Dey street, New York.

Charles Pratt, the wealthy oil manufacturer of Brooklyn, on Friday, 22d inst., formally presented to Adelphi Academy the new wing to be known as the Collegiate Building, which has been erected at a cost of \$160,000. It is fireproof throughout.

small number of parts, and in order to fully test its merits and discover possible defects before offering it for sale, it has been run continuously for about six months in making drop forgings. This test has led to a few minor changes, the final result being embodied in the machine as illustrated. The principal feature is the peculiar shape of the hammer, which is essentially nothing more than a steel billet placed on end and hammered out at the bottom to give proper support to the die. This construction concentrates the blow upon the work, gives very long guides for the hammer, and makes a very strong and durable arrangement. The lifting rolls are carried in housings, as shown, and work directly against the face of the hammer, and the details are so arranged that no adjustments on account of wear are necessary. Each roll is driven by an independent pulley, thus avoiding the ne-

ical difficulties—namely, the successful stretching of a steel wire cable of seven strands across the river Lunann, this feat having been accomplished by the Danish engineer Delinde, assisted only by unskilled native labor. The cable extends between two points, at a distance of nearly 4700 feet apart, the height of the first support being about 450 feet above the present level of the river, and the second about 740 feet. The cable in question is said to be the longest in the world, with a single exception—namely, the cable across the Kistna, measuring some 5070 feet. There are also two cables across the Ganges, of 2900 and 2830 feet respectively.

An El Paso dispatch says a Scotch firm will erect large works in Mexico, probably at the capital, and that other British industries contemplate a similar move. Smelting works especially invite capital.

Drilling Machine and Link Miller and Slotter.

The engravings represent a horizontal and radial drilling machine and a link miller and slotter invented by P. Leeds, master mechanic Louisville and Nashville Railroad, and manufactured by Pedrick & Ayer, of Philadelphia, Pa. The drilling machine is designed to work on or from a

DRILLING MACHINE, MADE BY PEDRICK & AYER, PHILADELPHIA.

drill press. It is mounted on the frame and is driven direct from the drill-press spindle. It is useful in drilling the ends and diagonal parts of frames; it can also be mounted on the work and driven by a sliding shaft and universal joints. Drilling in all directions can be done with the two taper shanks and the horizontal and vertical movements by loosening the nuts shown. The machine does away with the ratchet worked by hand, and it is capable of drilling with as great speed as though drilled direct.

The link miller and slotter will mill out links to any desired radius. It is designed on the principle that the apex of any angle will touch or describe all parts of a circle whose versed line is equal to the perpendicular where the base is formed by the chord of the arc. It can be used on a good strong drill press or as an attachment to the heavy universal milling machine built by the same firm. It consists of a jointed frame having dove-tailed slots running lengthwise to carry a frame that has the link blank secured in it; this frame is actuated by the screw and hand-wheel and describes a circle, according to the angular position of the lower or jointed frame; flanges are cast on the bottom of this frame for the purpose of bolting down on the table or platen. In the center of the lower frame, at the center of the joint, is a bronze bushing that is set exactly under the center of the drill-press spindle; this serves as a lower support for a boring bar and the shank of the milling-tool arbor. In practice it is found more convenient to drill a hole in one end of the link to be slotted large enough for a boring bar to pass through, then by using a double-end cutter the slot is cut out to nearly the finished size; the link is then moved along $\frac{1}{8}$ or $\frac{1}{4}$ inch and is cut through again until the stock is removed; a milling cutter similar to a reamer is then used and the slot is finished to the radius for which the link is set. With this attachment a link 20 inches long is finished in about four hours.

In connection with the fifth annual meeting of the Ohio Gas-Light Association, at Mansfield, Ohio, March 20 and 21, 1889, there will be an exhibition of gas stoves,

engines, burners, electric motors and any and all kinds of apparatus and appliances of interest to gas men and the lighting fraternity. An exhibition of this kind was announced last year for the annual meeting at Sandusky, Ohio, and while it constituted an interesting feature of the meeting, it was only partially successful, on account of the extremely short notice that was given to manufacturers and dealers

who desired to display their goods. The present notification, however, is given sufficiently in advance to allow all who desire to do so ample time in which to prepare their exhibits and have them in position at the opening of the meeting. A large room for this display has been secured close to the place of meeting. Consignments of articles for the exhibition and inquiries for information as to details of

Cleveland Weighing Bureau.

The report of Holland W. Davis, joint weighmaster of the Cleveland Weighing and Inspection Bureau, from June 1, 1888, when the inspection began, to December 31, is given below. The Detroit and Cleveland Steam Navigation figures are from June 1 to October 31 only, the Cleveland and Canton from July 1 to August 21, and the Empire Line from November 1 to December 31. The figures given are in thousands of pounds:

	Ship's wt.	Act'l wt.	Excess.
Pennsylvania.....	49,215	55,000	7,444
L. S. & M. S.....	41,064	47,576	6,511
N. Y., C. & St. L.	24,260	27,283	3,023
N. Y., P. & O.....	8,215	9,253	1,038
C., C., C. & I.....	8,389	9,324	935
Valley.....	3,448	4,135	687
D. & C. Nav. Co.	361	444	83
Cleveland & C an-			
ton.....	210	253	43
Empire Line.....	189	154	14
Total.....	185,335	155,086	19,751

This excess of 9876 tons, discovered and corrected by the bureau, amounts to 13.85 per cent. of the freight inspected. Mr. Davis estimates that 60 per cent. of the excess discovered was fourth, fifth and sixth class freight, with an average rate of 10 cents per 100 pounds, and 40 per cent. first, second and third class matter, with an average rate of 15 cents per 100 pounds. At these estimates the excess tonnage discovered would amount to \$28,702; the estimated gain in changes of classification discovered is \$1306; deducting expenses of the bureau, \$3685; the net gain to the railroads for this period was, therefore, \$21,223. Mr. Davis says that the percentage of excess weights obtained is as great now as when the bureau began business last summer.

R. F. House, of Pomona, Cal., has contracted to sell his seedling oranges at \$1.10 a box. He does not have to pick, pack or haul any of the oranges. The pickers gathered 60 boxes of fruit on the first day

LINK MILLER AND SLOTTOR, MADE BY PEDRICK & AYER, PHILADELPHIA.

the arrangements must be sent to Geo. S. Harris, Superintendent Gas and Electric Light Companies, Mansfield, Ohio.

A committee of the National Board of Steam Navigation, of which President Cheney is chairman, will arrange the marine portion of the centennial celebration of the inauguration of President Washington.

from eight trees in their regular order in the orchard. The total value of the fruit picked that day is \$66. That is at the rate of \$8.25 per tree. There are 100 trees to an acre on the place, and at this rate an acre is worth \$825. The orange orchards of William O'Connor, Dr. Nesbit, James Loney, J. D. Cason and W. H. Woody, in the same locality, will produce the same handsome results.

THE WEEK.

The bill for the admission of four new States, North and South Dakota, Montana and Washington Territory, was signed by President Cleveland on Friday, in honor of Washington's Birthday, so that now 42 stars will represent the national Union. Dakota was organized as a Territory March 2, 1861. It comprises an area of 150,932 square miles. A special census, taken in 1885, showed a population of 415,610, and in 1887 the Governor estimated the population at 568,477. The total assessment of property in 1887 was \$157,084,865. Montana was organized as a Territory May 26, 1864. It comprises an area of 143,776 square miles. Its present estimated population is 175,000. The total taxable value of property in the State in 1886 was \$55,076,871. Washington was organized as a Territory March 2, 1853. It contains 79,994 square miles. By a census taken in 1887 it was shown to contain a population of 143,669.

According to the report of a Massachusetts legislative committee all the grade crossings of railroads in that State must be abolished. There are 2902 intersections of highways and railroads, and to carry out the purposes of the law would necessitate the expenditure of \$48,000,000.

A tugboat fireman was scalded to death in the boiler-room of the J. Jewitt, at Pier No. 18, East River. Becoming wedged in behind the boiler he broke the glass water-gauge and was enveloped by the escaping steam.

The "Young Napoleon of Finance," Henry S. Ives, and Geo. H. Stayner, a business partner, together with E. W. Woodruff, of Newark, N. J., whose exploits in connection with the affairs of the Cincinnati, Hamilton and Dayton Railroad startled the business world a few months ago, are now entangled in the meshes of the law. It is charged that when they failed, August 11, 1887, they owed \$16,000,000. President Dixon, who is now in this city, states that in addition to nearly \$3,000,000 received by them on deposit prior to August 1, being the proceeds of certain mortgage bonds issued for a specific purpose, Ives, Stayner & Co. appropriated to their own use \$624,900 worth of new stock issued for improvement purposes, \$65,000 worth of negotiable bonds, 8840 shares of the stock of the Terre Haute and Indianapolis Railroad, which belonged to the company, and \$10,000,000 of the preferred stock, which was issued in the names of clerks and book-keepers of the firm. On the day when they took \$6,000,000 worth of this stock, the firm, as shown by their books, had a cash balance of less than \$13,000, and at the close of the day's business only \$70,000. Yet on that day their liabilities were \$18,500,000, all payable on demand or at short notice. Ives and Stayner are in Ludlow Street Jail in default of \$50,000 bail.

The American minister to Japan has signed a treaty of commerce, amity and navigation with Japan, a copy of which will be forwarded and laid before the Senate.

The city of Bangor, in Maine, has a water system constructed by the Holly Company, of Lockport, N. Y., which drowns out fires without the need of engines. The water is taken from the Penobscot, $1\frac{1}{4}$ miles above the business center of the city, at which point a big dam was built across the river at an expense of \$250,000. The dam is 900 feet long, from 55 to 85 feet in breadth at the base, and has a sluiceway for rafts and logs 23 feet wide by 817 feet in length. The whole volume of the Penobscot falls

over this great dam, and when the river is at freshest pitch the sight there is grand. At the pumping station they have a 225-horse-power engine, which was used the first year the system was in operation, but ever since then water-power has been used exclusively, the five original wheels, with two recently put in, having a pumping capacity of 10,500,000 gallons daily, whereas only about 2,000,000 gallons are ordinarily needed. There are 25 miles of street mains in Bangor, besides several miles in the opposite town of Brewer, supplying 2700 water-takers and nearly 200 hydrants. To wet down church steeples or inundate the surrounding country it is only necessary to connect with the nearest hydrant.

A second electric street railroad was operated in Boston a few days ago, connecting Bowdoin square with Harvard square, in Cambridge. The roads are about to test the feasibility of the overhead system in crowded streets. Respecting the practicability of underground wires, the National Electrical Association, in session at Chicago, were almost equally divided. Although a committee previously appointed reported that conduits in almost every instance were a failure, Professor Barrett, of Chicago, said the underground system had proved to be an entire success. Mr. Johnson, of Philadelphia, said that the underground system was also in successful operation in the Quaker City.

Twenty carloads of agricultural machinery, valued at \$100,000, arrived in San Francisco last week from Madison, Wis., consigned to a single house. Another train of 20 cars loaded with steel-axle farm wagons will follow.

James C. Flood, of the once famous bonanza firm, Flood & O'Brien, whose estate in California is valued at between \$7,000,000 and \$8,000,000, died in Germany, February 21, of Bright's disease. He was born in New York City in 1826. Going to California in the early days of the mining excitement, he soon became associated with several leading speculators, and by obtaining control of valuable gold deposits on the Comstock lode, the partners ultimately took out \$300,000,000 of ore in the course of six years, each of them at one time taking out about \$750,000 in a single month. Their next step was to organize the Nevada Bank, with a paid-up capital of \$10,000,000. At a later day the bank became involved in the California wheat deal of 1887, in which the loss was about \$11,000,000, and Mr. Flood never recovered from the blow. His magnificent residence in San Francisco, completed in 1886, is said to have cost \$5,000,000, including its accessories. Flood & O'Brien's office in Wall street will be remembered as a resort for the *habitués* of that section, but without the least pretensions to elegance, its entire equipment consisting of little more than a desk and a few chairs.

Manufacturers in Pennsylvania protest against the imposition of the three-mill tax on the capital stock of manufacturing corporations. Among those who are most active in their opposition is H. W. Oliver, of Pittsburgh; Cyrus Elder, of the Cambria Iron Works; Lucinda Furnace Company and Jones & Loughlin, of Pittsburgh.

The Interstate Commerce Railroad Association, as now completed, comprises a membership of 18 roads out of the 22 which were originally deemed necessary to the adoption of the agreement. The principal company holding off is the Chicago, Burlington and Northern. It is stipulated that the agreement shall take effect immediately. Aldace F. Walker, of the Interstate Commission, was offered the chairmanship. The recent meeting of the trunk line presidents, in this city, resulted

in placing upon Commissioner Fink the duty of furnishing the Federal officers with all the evidence that he can secure to convict roads that violate the national law, and it is said that he is determined to act without regard to considerations of policy in a last desperate effort to induce the roads to maintain tariff rates and thereby secure remunerative returns to stockholders and stable rates for shippers.

A seam of coal took fire on the Cincinnati Southern Railroad, near Sunburnt, Tenn., caused by a collision of freight trains in a tunnel at that point. Some of the cars being loaded with oil, the flames communicated to seams of coal and timbers supporting the tunnel, burning fiercely. Walls were erected and the entrances closed up in the hope of smothering the flames. The loss is computed at \$425,000, including the cost of rebuilding.

The ceiling scandal, at Albany, has become notorious. The facts, briefly told, are that the old stone ceiling, which was considered unsafe, was removed and another substituted, but the contractors, taking advantage of the vague terms of the contract, put up a cheap ceiling and put in a bill for a good one. They ask \$270,000, and, as it has been shown by experts that the work cost only \$165,000, a clear profit of \$105,000 is the result. New York has been unfortunate in the building of its Capitol. It has already cost \$18,000,000, when the original estimate was \$4,000,000. The penalties for breach of contract should be rigorously exacted where the offense is proved, before we have a carnival of robbery in which law-makers figure most conspicuously as law-breakers and the machinery of justice become a contemptuous farce. The committee of the Assembly who were charged with the subject made a report, in which they find that the experts were substantially right in their estimate of the profits on the job. The committee place them at about \$85,000.

The specifications for the armored coast defense vessel for which bids are to be opened March 15 have been completed in the Bureau of Construction and Steam Engineering in the Navy Department. The vessel is to be of 4000 tons displacement, 250 feet long, 59 feet beam, and 11 feet $7\frac{1}{4}$ inches deep from the top of the main deck beams to her inner bottom. She is to be armored with steel plates 16 inches in thickness, and is to be built throughout of materials of domestic manufacture. The total weight of her machinery, including boilers, engines and appurtenances, but exclusive of the turret machinery, is to be 431 tons. The engines are to develop and successfully maintain for four consecutive hours 5400 maximum indicated horse-power. For every horse-power over this the contractors are to receive \$100 in addition to the contract price, but if they fail to attain that horse-power they are to forfeit \$100 for each horse-power less than the contract calls for.

Sir Richard Cartwright's resolution before the Dominion Parliament designed to secure from the home government a recognition of the right of Canada to negotiate her own treaties was defeated by a vote of 66 against 94. In advocating the resolution he said: "If Canadian agents responsible to Parliament had visited Washington, various international questions would have been settled long ago. Canadian interests," he continued, "cannot be trusted in English ambassadors' hands."

The Lehigh Valley Railroad Company proposes to furnish Newark, N. J., with an abundant supply of pure water, 27,500,000 gallons daily, for \$4,000,000, and an additional supply of 25,000,000 gallons

daily for \$2,000,000 more, the entire plant and the lands overflowed to be the property of the city.

Edison will occupy 8000 feet of floor space at the Paris Exhibition with models of his inventions. Among other novelties will be a huge dynamo and an enormous lamp with 20,000 incandescent burners.

Two of the largest meat companies in the West, Armour & Co. and a new concern of which J. H. Flagler is president, threaten a lively competition in supplying the Eastern market. The last named is an organization of various cattle companies in New Mexico, Colorado and Mexico, including the famous ranches lately owned by Stephen Dorsey and Robert G. Ingersoll, and is said to have at present 20,000 head of cattle.

The initial meeting of the revived eight-hour movement was held at Cooper Union on Friday evening. Samuel Gompers, president of the Federation of Labor, was the principal speaker. S. E. Shevitch, the so-called socialist editor, said: "All the virgin forests of the world cannot produce enough clubs to club the movement down. There is not lead enough in the mines to make bullets to shoot it down."

England contemplates making a large addition to her naval armament. In France, 11 armored vessels are now in course of construction, five of which will be completed this year and the others in 1890 and 1891. Two steelclad cruisers are also to be completed within the same period. Eighteen cruisers of not less than 1000 tons displacement are on the stocks, and the programme for 1889-91 includes several torpedo cruisers. Furthermore, an expenditure has been authorized for the protection of the harbors of Cherbourg and Brest, and these works have already been begun. In Italy the programme of 1889-91 contemplates a gradual increase in every type or class of ship, from armored battle ships through protected cruisers, of which class this nation owns some splendid specimens, down to speedy torpedo craft and armed seagoing tugs. Russia stands third in importance, so far as relates to its naval strength, among the European powers. In addition to the existing fleet it was proposed to build 19 first-class battle ships, four second-class and ten first-class cruisers. The armorclads are now being turned out at the rate of three or four a year and the cruisers are being finished nearly as fast. Two battle ships are on the stocks and four more cruisers have been ordered in the Baltic.

Real estate sales in New York City indicate a remarkably active demand for this season of the year. Of the total for last week, amounting to \$4,750,000, property to the value of \$3,500,000 was sold at auction. A large store on Chambers street, that rents for \$19,800 per annum, sold for \$256,000 and as a rule the gross income from the prices paid is below 5 per cent.

The socialists who withdrew from the Central Labor Union a week ago met on Sunday and organized the "Central Labor Federation of New York." Ludwig Jablonsky presided and Ernest Bohm and Michael O'Brien were chosen secretaries. It was reported that 50 organizations had joined the federation, and it was decided to apply to the American Federation of Labor for a charter.

The greatness of the United States formed the theme of a thousand orations on Washington's Birthday. Among the most graceful tributes was the address of W. H. H. Murray, a venerable business man of Boston, who said: "When the Almighty fixed the geography of this continent He made this country possible. Egypt gave to the world records that the best scholarship of this day

is striving to decipher. Then Greece gave to the world letters and died. Then He called Rome into being, and she gave jurisprudence. He needed manners for the world and He summoned France, and France taught the world politeness. Then He needed constitutional liberty—liberty for life and property and home—and so England came into being. Then, my friends, I believe the march of events had moved forward to that point in the history of mankind that the hour had struck for human liberty to be born and crowned, and He called this country into existence [applause], and George Washington was the favored agent to assist in carrying out the Almighty's designs."

Muncie, Ind., is indebted to the discovery of natural gas for its existence, and this is true in the same sense that water has done much for navigation. Muncie has now 32 natural gas wells, capable of producing 1,000,000 cubic feet per day, equal in heating power to 5000 tons of coal. Estimating coal at \$2 per ton, the 32 wells will produce \$10,000 worth of the best kind of fuel every 24 hours, or over \$3,000,000 per year. The total number of factories of all kinds now located at Muncie is 52, and the total number of hands employed 2773. The Muncie Nail Works, employing 300 hands, are among the largest.

The Carnegie Free Library, in Braddock, Pa., just completed at a cost of near \$100,000, will be opened in a few days, not only to residents, but to all workmen in the Edgar Thomson Steel Works. The structure is of solid rough-faced stone from Ohio quarries, three stories high and of the Romanesque style of architecture, surrounded by beautiful walks and a roadway. The main entrance is surmounted by a heavy stone arch, above which the stonework is carried up to a Romanesque gable. On each side are the entrances to the store of the Carnegie Co-operative Association. The entrances are in the form of round bay-windows and run up into a tapering roof. In the gable of the center is a bust of Mr. Carnegie, and immediately under it is carved "Carnegie Library." Just under this and extending entirely across the front is a carved stone frieze 5 feet high. The roof is of iron throughout, also the rafters and beams. The beams and girders were all turned out by Carnegie's Homestead Mill and are very heavy structures, the beams all being 12-inch. The building probably contains 1000 tons of iron. The structure is 100 feet square. The side and rear walls are of fire-brick of great thickness. No wood was used except for finishings and floors. The library room is 86 feet long by 30 feet wide, and contains cases for over 5000 volumes.

The result of the extensive Japanese emigration to Hawaii has been to throw most of the Portuguese laborers out of employment, as they demand higher wages than the Japanese. About 2000 Portuguese are making arrangements to remove to the new State of Washington, if they can find suitable lands.

One of the largest gas wells in the country has been struck at Lancaster, Ohio.

Rumor says that it is the intention of the Manhattan Elevated Railroad Company to build a third track between the two tracks existing at present on the Sixth and the Third avenue lines. Express trains, it is said, are to be run to the Battery during the morning, and from the Battery during the rush of traffic in the afternoon. Inquiry resulted in obtaining no definite information.

The hull of the steamer Bristol, burnt at Newport, was bought by C. H. Gregory & Co., of New York, for \$13,450, and will be broken up.

MANUFACTURING.

Iron and Steel.

After being idle one week, the entire plant of the Keystone Iron Works, Limited, at Reading, Pa., resumed operations in full on Monday, the 18th inst.

The Bellaire Nail Works, of Bellaire, Ohio, have had under consideration for some time the subject of building an additional blast furnace, of the same size as their present one, but as yet have not arrived at a final conclusion in the matter.

The works of the Beaver Valley Mfg. Company, at West Bridgewater, Beaver County, Pa., which were totally destroyed by fire in August of last year, have been rebuilt, and have resumed operations. The new building is a frame one, 60 x 160 feet, with a wing 38 x 32. The company manufacture Bessemer steel castings by a new process, by which the metal is melted in a Swedish furnace, said to be the first and only one of the kind in the United States.

On Wednesday, the 20th inst., the Secretary of the Treasury awarded to the Pennsylvania Construction Company, of Pittsburgh, the contract for the iron roof and other parts of the new Government building at Denver, Col. The amount of the contract is \$29,700.

At a meeting of the Crane Iron Company, of Catasauqua, Pa., held on Wednesday, the 12th inst., Mr. Beauvean Borie, of Philadelphia, was elected a director, to fill the vacancy caused by the death of Mr. Fisher Hazard, of Mauch Chunk, Pa.

The trouble between Morehead, Bro. & Co., proprietors of the Vesuvius Iron and Nail Works, at Sharpsburg, Pa., near Pittsburgh, and the Philadelphia Natural Gas Company has been amicably arranged and the plant has resumed operations. The firm employs about 300 men.

No. 1 furnace of the Crane Iron Company, at Catasauqua, Pa., has been blown out for repairs and the workmen are rapidly removing the lining preparatory to the mason work. No 1 is the largest in the plant, and will be given a thorough overhauling.

Keystone Furnace of the Thomas Iron Company, at Chain Dam, Pa., has been blown out for repairs.

The name of the Canonsburg Iron Company, Limited, at Canonsburg, Pa., has been changed to the Canonsburg Iron and Steel Company. Three of the stockholders having refused to sign a paper closing up the affairs of the old concern, a committee of three stockholders has been appointed to ascertain measures for effecting that end. It is hinted that there may be some litigation before this is brought about.

The Duquesne Forge Company have been chartered, to succeed the Miller Forge Company, Limited, at Pittsburgh. The new concern has a capital stock of \$2500, divided into 100 shares of \$25 each. Additional particulars regarding this new firm were given in our issue of the 14th inst.

It is expected that the large new plate mill now in course of erection by the Manner Rolling Mill Company, of Toledo, Ohio, will be ready to commence operations about the middle of March.

From the Cleveland (Ohio) *Trade Review* of the 23d inst., we take the following: "The result of the recent arbitration between the Cleveland Rolling Mill Company and the employees in the rail and blooming mills is stated as follows: The company gave the men to understand that there were orders enough ahead to keep the mill busy for a year,

provided that the work could be turned out at a reduction; but if the men insisted on the old wages the mill would have to be closed for an indefinite period. The men met and decided to accept the decrease, which will probably average 15 per cent. or perhaps a trifle more all around. The decrease was graded from 28 to 5 per cent., as follows: To all men earning \$6 a day and upward, a decrease of 28 per cent.; those earning \$5 or more and less than \$6, a decrease of 20 per cent.; for \$4 and less than \$5, a decrease of 15 per cent.; for \$3 and less than \$4, a decrease of 10 per cent., and for \$2 a decrease of 5 per cent. Laborers who earn about \$1.15 per day were not reduced. This arrangement gave about 300 men employment, less than one-half the force employed when the mill is in full operation. The barb-wire mill, it is reported, will soon be in operation."

Mr. Theo. Morgan, for some years manager of the plant of the Sharon Iron Company at Sharon, Pa., has resigned his position to accept a similar post with the Portage Iron Company, Limited, at Duncansville, Pa. The change goes into effect on March 1 next.

The annual meeting of the stockholders of the Catasauqua Mfg. Company, of Catasauqua, Pa., was held at the office in that place on Wednesday, the 20th inst., and the old board of directors was re-elected, including James W. Fuller, of Catasauqua, who was recently chosen to fill the vacancy caused by the death of Fisher Hazard, of Mauch Chunk, Pa.

All the blast furnaces of the Pennsylvania Steel Company, at Steelton, Pa., with the exception of No. 2, are in blast and doing good work. This company had 3053 names on their pay-roll for January.

The order for the discharge of 150 men from the employ of the Glendon Iron Company, at Easton, Pa., has been modified, and it is now thought that not more than 100 men will be discharged.

The adjourned sale of the Middlesex Rolling Mill, at Middlesex, Pa., and adjacent property, will take place at the United States Marshal's office in Pittsburgh on Friday next, March 1.

At the organization of the board of directors of the Junction Iron Company, of Mingo Junction, Ohio, H. M. Priest was re-elected president and general manager, and George A. Dane, secretary and superintendent.

The Fort Payne Furnace Company, recently organized, propose to build a furnace at Fort Payne, Ala.

Anderson, Du Puy & Co., Pittsburgh, Pa., are much pushed in their department devoted to the manufacture of railroad spiral springs, and are at present completing an order for 300 tons of springs for the 2000 cars which the Pennsylvania road are building, probably one of the largest single contracts for springs given to one manufacturer. They are furnishing springs to railroads and agricultural machine makers in all parts of the country. Their success in this department has led them to consider the desirability of building a separate shop for elliptic springs for use on locomotives and passenger equipments, and they expect in the near future to have this department in good running order, and thus be in shape to handle a general line of all kinds and sizes of springs. They are also increasing their tool steel department, having their present furnaces taxed to their utmost capacity.

Machinery.

The Milton Mfg. Company, of Milton, Pa., are refitting their rolling mill at that place and putting in nut and washer machinery. Heretofore the firm have made

only bar and hoop iron. The company were organized in 1888, and now consist of S. J. Shimer, president; E. S. Shimer, secretary and treasurer, and G. S. Shimer, superintendent.

The Skinner Chuck Company, New Britain, Conn., have increased their capital stock from \$12,000 to \$36,000. The additional capital was called for by an increase in the business, which has been established less than two years.

The Aetna Mfg. Company, Warren, Ohio, recently received an order from Chicago parties for another of their large engines. It is for a 500 horse-power engine, with boilers and fixtures all complete, for the Chicago Steel Rivet Company, of Chicago, Ill. The engine is to drive a train of rolls in their new mills which they are now building at Hartford City, Ind.

The Phoenix Machine Company, of Cleveland, Ohio, manufacturers of steam cranes, have several large contracts on hand. They are building 18 cranes for the Anniston Pipe Company, at Anniston, Ala.; three large cranes for parties in Milwaukee; one for Charleston, S. C.; a large crane for a party at Chattanooga, and one for a Pittsburgh firm. They have orders enough on their books to keep them running over a year.

The Fuel Gas and Electrical Engineering Company, of Pittsburgh, have about decided to build a foundry and machine shop at Wilmerding, on the Pennsylvania Railroad. The Westinghouse Air-Brake Company have purchased a tract of land containing some 31 acres near that place for \$90,000, and there is some talk that all the Westinghouse enterprises will be moved to that place. The new air-brake building at Wilmerding will not be completed until the latter part of the summer.

Rankin & Fritch Foundry and Machine Company, St. Louis, Mo., have lately placed in position in their machine shop a planer to be used in the manufacture of plate glass machinery, which is one of their specialties and in which they have a large trade. The dimensions of the planer are 32 feet long by 8 feet wide, and by resetting can be made 24 feet wide, should the work so require. They are also laying the foundation for a boring mill, which will be one of the largest in that section, the weight amounting to something over 67 tons.

Hooker Colville Steam Pump Company, St. Louis, Mo., report an active demand in their line. Among the orders lately received was one from N. K. Fairbank, St. Louis, for a large size air pump to be used in their land factory.

St. Louis Drip Pan Company, St. Louis, Mo., have completed their works and placed in position the latest improved machinery for the manufacture of drip pans, and inform us they are now in a position to fill orders for any size that may be required.

Arthur O'Malley, whose address is in care of the Peck, Stow & Wilcox Company, of 27 Chambers street, New York, would like to correspond with New York manufacturers of petroleum burning engines.

The contract for furnishing machinery for the Mare Island Navy Yard has been awarded to the S. C. Forsaith Company, of Manchester, N. H., for \$5240.

Hardware.

With reference to an item which appeared in our last issue with regard to the recent fire in their No. 2 mill, the Washburn & Moen Mfg. Company, Worcester, Mass., advise us that only two upper floors were injured; that nearly all the machinery in the building was running again on Wednesday, the 20th inst., and that there has been, and will be, no delay whatever

in the execution of orders. A brick story has been added in place of the Mansard roof which was burned, and the building is now nearly roofed in.

Freeman Wire Company report an active demand for work in their specialty department. They have a force of men engaged in erecting the iron framing round the elevator hatches in the Odd Fellows Building, St. Louis, preparatory to constructing the channel and iron wirework inclosures for the elevators on Ninth street and Olive street sides of the building from second story to eighth story inclusive. They have completed the work of inclosing the elevator in the Hotel Belvedere, St. Louis, with expanded metal panel work, and have now under way several contracts for office railings, to be made of this class of work. The season is not far enough advanced to create much demand for fence work as yet, and the only order of importance under way is an elaborate channel iron and wire railing, made of long diamond wirework, with casting rosette center and cast-iron post in the panels, to inclose a cemetery lot for a wealthy gentleman in Arkansas.

At the annual meeting of the stockholders of the American Tack Company, of Fairhaven, Mass., held on Thursday, the 14th inst., the following officers were re-elected: Directors, O. P. Brightman, Loren Snow, J. A. Beauvais, E. W. Hervey, of New Bedford, and C. D. Hunt, of Fairhaven; clerk and treasurer, J. A. Beauvais.

A. M. Bristol, Rochester, N. Y., manufacturer of registers and ventilators, is making large additions to his plant, which when completed will about double its present capacity. He will also add a number of new sizes to his assortment in time for this season's trade.

The wood shop of the Cortland Door and Window Screen Company, Cortland, N. Y., was destroyed by fire the 18th inst., but their large storehouse, located some distance from the factory and containing goods manufactured by them for the last six months, remains intact and without injury. This will enable them to fill orders now on their books with considerable stock to spare, and as they rebuild at once and on a large scale they expect to fill all orders which may be sent them with their usual promptness. They advise us that their stock on hand consists of about 8000 dozen window screens and 30,000 doors. The new shops will consist of one building 200 x 60 feet, three stories high, and another 150 x 40 feet, one story high. They expect confidently to be in running order on or before April 1.

The Adams Coke-Bottom Mfg. Company, recently organized at Pittsburgh, are erecting a number of experimental ovens at Mansfield. The company, which has been organized with a capital of \$5000, has received its charter. The ovens are constructed with a false bottom that is worked by hydraulic pressure. They claim that it will be an immense saving in labor. At the present time one man is able to draw from three to four ovens per day. Their system will enable one man to draw 25 ovens per day. Another advantage is that the ovens are not dampened when the draw is made. A new bottom can immediately be put in, and four drawings can be made instead of three, as at present.

The Iron Land Company, of Minnesota, with £1,000,000 capital, has been launched in London. The company have purchased 2000 acres of the Vermillion range, which, it is estimated by the promoters, will yield 1,250,000 tons of ore annually at a profit of 2 shillings per ton.

The Iron Age

New York, Thursday, February 28, 1889.

The Presidents' Agreement.

The questions regarding combinations in trade—trusts and the like—and also regarding the necessity or undesirability of legislation specially directed against them are important problems awaiting solution. What has now come up for general discussion was a few years ago confined to railroad matters. The supposed dangers of combinations among carriers led to the passage of the Interstate Commerce act, prohibiting pooling. We are now, however, called to look upon another side of the case—that there is an intimate connection between stable, open rates and public welfare, and that without association of some kind such rates are impossible. Hence it is that the mercantile community have in general supported the presidents' agreement heartily. At the same time, it is conceivable that there might be opposition to any legislation regarding trade combinations, and yet in favor of some restriction upon our railroads. This grows out of the essential physical conditions of a railroad, which forbid that it should ever be a free highway, or that the competition of capital with capital can there be relied upon to work always for the interest of the public at large, as is often claimed to be the case in business affairs. From these considerations it is unlikely that, as a matter of politics, the section forbidding railway pooling will be soon repealed. Our Western States would hardly favor such repeal.

In this view the agreement becomes an important step toward securing the good results of association. Its weakness is also its strength. By relying upon a certain measure of publicity, upon arbitration, upon public approval, rather than upon extreme penalties, the framers showed their wisdom. Too many railroad agreements have gone to pieces because they sought to accomplish too much, because their complete fulfillment demanded a practical surrender of each road's autonomy. It is to the credit of the presidents that they have provided for the non-observance of the tariffs when any company considered such action imperative for its own preservation. To this extent the agreement will be indorsed even by the anti-railroad sentiment of the Granger states. No road is bound to any theory of injustice, only that each one should do openly and for good reasons whatever it thinks best.

Directly in line with this phase of the situation is the statement of Judge Cooley and his associates that the law should be enforced. It is conceded by all that the sections about publicity of tariffs, against secret rate cutting and the like are excellent. Let them be put in practice and violations punished. Let the railroad managers be freed from that false notion that violations of the law of the land should not be pointed out and stopped by

the action of railroad men themselves. If a carrier has information that a competitor is violating his pledge and making underhand concessions, it is the poorest of all retorts to begin doing the same thing. Rather let the injured party bring the offender before the proper tribunal. The time is coming when the merchants in their own interest will demand adjustment of such troubles rather than hope for a further spread of the discrimination, in vain belief that they are its sole beneficiaries.

The railroad situation cannot be cleared up at once, and those investors who look for immediate return to old earnings will be disappointed. Extensions of lines into non-paying territory must continue for a year or two to be a drain upon the parent road. A railroad as well as a merchant may be brought near to bankruptcy through having valuable but unsaleable assets. Then, again, the channels of trade are constantly changing; a roundabout line built at high cost may, like the Missouri, Kansas and Texas, find itself out of the flow. It is a strong point in favor of the presidents' agreement that it does not pretend to regulate or decide everything of this kind, but contents itself with arranging for such a presentation of disputed points as will enable a fair decision from all concerned. It seems unlikely that the refusal of a few roads to join will be able to prevent the ultimate moral success of the plan.

The Nicaragua Canal.

The final passage, in its amended form, of the Nicaragua Canal bill by Congress and its signature by the President may be looked upon as foreshadowing an important era not only in American ocean trade, but also in that of the world at large. When, prior to the adoption of the Panama Canal route, M. de Lesseps and his engineers assembled at Paris, the choice to be made was between Panama on the one hand and either Nicaragua or the Atrato on the other. It was urged at the time by the American engineers that Nicaragua, judging from the surveys previously made by order of the United States Government, seemed by all means the most advisable route. It was urged, and is quite as much asserted now, that good terminal harbors are necessary adjuncts to any project, for vessels *en route* must have spacious roadsteads affording them protection while awaiting transit. As a rule isthmian routes possessing the best termini have the worst internal features; but the reverse seems to be the case with Nicaragua. The most eminent engineers in the world have studied and approved the plans proposed for the restoration of Greytown and Brito harbors. The advantages claimed for a canal at this point are: first, that it is in a favorable geographical position, being in a region of perpetual trade winds—which position, by the by, is also eminently favorable to the United States; second, that the canal can be constructed here at less cost than by any other route; third, that it passes through a country rich in resources and already sufficiently developed and populated to furnish subsistence to the construction force; fourth, that it presents no novel engineering problems, nor any that cannot be solved at a moderate expense; fifth, that it is a fresh-

water canal, and will perform an important function in scouring ships' bottoms and boilers; sixth, that it offers splendid facilities for dockage and repairs on Lake Nicaragua; seventh, that the material needed for the construction of the canal is close at hand; eighth, that all the plant can be conveyed by water communication already established, and by roads for which no royalty will be paid; ninth, that the mean average rainfall is comparatively small, and, tenth, that it possesses a superb inland sea, which drains 10,000 square miles of country, and thus gives a full volume for canal purposes.

Flushed as M. de Lesseps was with the success of the Suez Canal, and by reason of the latter predisposed in favor of a sea-level canal without locks, Panama was given the preference. The experience since made has amply proved that it was a fatal decision. It involved the ruin of the present shareholders' interest, and even in its modified shape of a canal with locks it is too expensive and too risky for any new company to finish, even if nothing were paid for all that has been so far accomplished and for the plant on the spot. In fact, the only thing that M. de Lesseps' company owns which is worth anything is the Panama Railway and the land so far granted by the Colombian Government.

The Nicaragua Canal will extend over a distance from ocean to ocean of 169 miles, of which 56½ miles are on Lake Nicaragua and 84½ miles on the rivers that are to be deepened and widened. The canal proper to be dug will not exceed 28 miles in length. There are to be six locks, three on the Atlantic side and three on the Pacific side, while for over a distance of 152 miles the maximum elevation above the level of the sea will be 111 feet. The present estimate of cost is \$65,000,000. The charter of the company nevertheless fixes the capital stock at \$100,000,000, to be doubled if need be, and the canal may be finished in 1895. Prior to signing the bill President Cleveland gave a hearing at the State Department to the friends and opponents of the measure, in order to determine whether there were any valid legal objections to the approval of the bill. Simon Sterne and John T. McCook, of New York, representing the American Atlantic and Pacific Transit Company, made arguments against the bill. The former contended that it was clearly unconstitutional, contrary to the spirit and traditions of the United States Government, and entirely unnecessary and vicious in that it recognized and encouraged one corporation to the detriment of others equally if not more deserving. Mr. McCook argued that to allow this bill to become a law would be an act of great injustice to Americans and Englishmen holding nearly \$2,000,000 of bonds of the Atlantic and Pacific Transit Company, and would undoubtedly lead to serious complications with Great Britain. Judge C. P. Daly, of New York, replied in behalf of the Nicaragua Maritime Canal Company, contending that the constitutional features of the measure were fully and freely discussed in Congress, and that no unlawful powers of concession were conferred by the bill. Subsequently the Clayton-Bulwer treaty was also gone over, and on February 18 Secretary of State Bayard and Attorney-General Garland made a report favoring the bill.

Since then Commander Taylor, general manager of the company, stated that they would organize and begin work promptly. The first work would be done at Greytown, and as soon as the entrance there was improved to 15 feet, which will probably take about two months, work is to start up all along the line. Last year Chief Engineer Menocal, Engineers H. C. Litchfield and Peary, together with M. Le Baron, made a thorough and careful survey of the entire route, and upon their report the company was formed. As the bill was at first opposed by strong influences in Congress, a preliminary charter was obtained from the Vermont Legislature, but the incorporation by our National Congress is a decided advantage gained, inasmuch as it lends the enterprise a specifically American character.

It may not be out of place to cite what the London *Times* of February 8 remarks on the subject:

It does not follow from the passing of the Nicaragua Canal bill that any vigorous steps will be immediately taken to carry the project into execution. Probably the immediate object is fully served by the passing of the bill. The progress of the Panama Canal is effectually arrested, and something may depend upon the measures that may be taken when that fact has been fairly brought home to the French investors. Negotiations may be attempted with a view of getting the works taken over at the price by an American company, and their success will depend upon the opinion entertained in America as to the feasibility of the route. One thing is certain, that the Panama company will negotiate under serious disadvantages. Every week that passes will depreciate the value of the plant and of the partially executed excavations, while the Americans will have plenty of leisure. When one party is anxious to sell and the other in no great hurry to buy, the price is likely to be moderate. It is quite possible, however, that the Americans may prefer to work the Nicaragua route, in which case the whole of the Panama company's expenditure seems likely to be lost. All that is quite clear at present is that the United States mean to be masters on the traffic route between the two oceans.

It has been asserted in Congress during the debates that if Americans were offered to-day all that has been done on the Isthmus of Panama in the canal enterprise for nothing, provided they would undertake to finish it, it would still be both cheaper and safer to leave Panama severely alone, and confine the undertaking to Nicaragua instead. We candidly confess that we unreservedly concur with this view.

In a letter to the Senate Finance Committee, under date of December 11, 1888, Fred J. Slade, of the New Jersey Steel and Iron Company, states that after an examination of the books of the company he finds that the cost of the most expensive size of beams and channels made at the works is \$35.90, and for the cheapest \$58.34, per ton of 2240 pounds, charging no interest on the plant. At that time the selling price was \$73.92, which usually includes delivery. The company have therefore made on these shapes a profit of from \$8 to \$15 per ton—say an average of \$12. The average yearly product of each mill is less than 9000 tons, making a profit of some \$100,000 per year on an investment of over \$1,000,000. Since the date of Mr. Slade's letter the price has been reduced to \$62.72, so that now the returns on capital are decidedly modest. These figures are worth

pondering over by those who have raised such an outcry against the beam combination, and should put a stop to the wild assertions of those who undertake, with the Hon. W. L. Scott, to figure out that the cost of beams and channels may be readily calculated from alleged cost figures of steel rails.

The Drawback System.

We print elsewhere a letter from one of the leading manufacturers of lead pipe and sheet lead in the country, in which some data are given clearly demonstrating the injustice of the retention of 10 per cent. of the duties on raw materials used to manufacture goods for export. The Treasury, which does not need the money, retains amounts considerably in excess of the cost of collection and supervision. The whole drawback system needs readjustment in accordance with simple principles. If an American manufacturer can secure foreign raw material, convert it into finished product in this country, and sell it in the markets of the world in competition with foreign rivals, he certainly deserves encouragement. He is adding to the amount of work being done here. He pays for wages, rents, fuel and supplies for which there would not be a demand but for his enterprise. His profits, however large or small they may be, remain in this country. He adds to the volume of business done, and aids in securing whatever advantages there may be in educating foreign buyers to look to us for their purchases. As matters stand now all these advantages are deliberately sacrificed. There are few articles in which American manufacturers are so far in advance of their foreign rivals that the economy of improved methods overbalances the additions to cost through extra handling, through higher wages, costlier fuel and supplies, and the necessity of earning on an average a higher rate of interest on his capital. To this would have to be added the cost of supervision by the Government of the entry of foreign material and the export of goods manufactured therefrom. It is conceded that such supervision should be thorough and close. It is only fair that the industry causing the expenditure on the part of the Government should bear the cost thereof. But it is undesirable and unnecessary that the Government should make a large profit on the transaction.

Under the circumstances, with the high retentions, the amount of business done is very small indeed. Nearly all there is of it is confined to the manufacture of packages for American products sold for export. It so happens that the Standard Oil Company is the chief beneficiary of the system, and that fact alone has been enough to create a prejudice against it which demagogues have been eager to foster. It is argued that by saving the amount of money returned by the Government that monopoly is adding to its already exorbitant profits. We are inclined to look at the matter in a different light. Anything which will cheapen the cost to foreign consumers without prejudice to American interests is so much gained in the direction of fostering consumption and extending trade.

Another argument, sectional in its character, is advanced against a more liberal

and a juster drawback system. Let it be assumed that works at tidewater succeed in building up a large foreign trade, based on imported raw material. This will enable them to give full employment to their plants, even in dull times. Other things being equal, they have the advantage, as against their rivals in the interior, of lower general cost, which is the result of full order books. They may even be content to sacrifice a part or the whole of their profits on work for foreign markets in order to compete more effectually with domestic rivals. In other words, a lowering of the retention to figures covering only cost of supervision to the Government would be equivalent to a discrimination against inland manufacturers.

It is possible that this contention may be just in some cases, but we are inclined to believe that the benefits to be derived from a modification of the present law would far outbalance any probable local injury. Incidentally it may be noted that it would silence the cry for free raw materials on the part of those who honestly believe that they can compete in the markets of the world.

The Westward Course of Empire.

The past week has been signalized by an event without precedent in the history of the United States, denoting "the march of empire." Using as an implement a quill plucked from a Dakota eagle, President Cleveland affixed his signature to a bill admitting four States of an enormous superficial area and of unbounded resources into the American Federal Union. The importance of the act cannot easily be exaggerated. Referring to the accretion of new States, the London *Times* says it is inevitable that "the center of national gravity must be substantially altered," and that "the Americans themselves imperfectly comprehend the actual amount of metamorphosis involved," doubtless meaning that the ascendancy acquired by the original 13 States and by other States which from time to time have dropped into the federal galaxy must gradually depart, and other millions of populations beyond the Mississippi River and spreading far out over the Western plains and beyond the mountains must have a controlling voice in the national councils.

Some of the best known Senators express themselves in unequivocal terms. Senator Cullom, of Illinois, says: "The admission of four States into this Union is a great event. It has occurred that two States have been taken in at one time, but it has never before occurred in the history of this country that the Congress of the United States has provided for the admission of four great commonwealths into the Union at once. These Territories are possessed of all the elements that justify their admission into the Union in population, resources, civilization, and all that makes them worthy of Statehood."

Senator Platt, of Connecticut, says: "The admission of four new States at practically the same time is an event the importance of which can scarcely be estimated. Probably a million of people are now permitted to assume the responsibilities and enjoy the privileges of complete self-government; and when we consider the abundant natural resources of the Ter-

ritories thus to become States, it is not too much to expect that within ten years 5,000,000 people will find homes within their borders and employment in every branch of industry and enterprise known to our civilization, limited only by climatic conditions. They are to be States of great development and will add immensely to our national power and opportunity."

Senator Hiscock, of New York: "I hardly know what more to say than that the admission, or rather the enabling act, was just and proper. They too long have been kept out for partisan or party purposes."

Senator Butler, of South Carolina: "My opinion is, each of the States admitted was entitled to become a State because they all have the necessary qualifications for Statehood—population, resources, institutions, and a soil capable of sustaining increasing numbers of people. Beyond this I do not think Congress ought to look in determining the question of admitting States."

Senator Morgan, of Alabama: "These four States were admitted because they possessed every qualification for Statehood. They will be growing, progressive States—not rotten boroughs like Nevada, which is losing its population every year. I think all four of the new States have wonderful resources, and have a good future before them."

Akin to this subject is the passage of a bill in Congress providing for the opening of a new ocean highway between the Atlantic and Pacific oceans, thus making another large stride in the progress of our country, her trade and destiny.

At the Edison Phonograph Works an extremely simple method is in use for keeping track of the work in hand and the work finished. It is possible at a glance to ascertain the number of each piece of work under way, and also the number of completed pieces. At the engine, which is located about at the middle of the shop, is placed a board about 3 feet wide by 7 or 8 feet long. The board is pierced with vertical and horizontal rows of holes arranged, vertically, in sets of five rows. Between certain rows are left blank spaces, upon which the names of the parts of the machine are written. Reports are daily made by messenger to the man in charge of the board of the new parts being worked and of those which have been finished. If five pieces have just been begun he inserts five pegs in the holes in line with the name of that particular piece. When these five pieces have been finished the five pegs are inserted in holes in red. It is evident that a simple inspection of this board at any time will show all the work of the shop on hand, and will also show the number of completed parts ready for assembling. An important advantage of this method arises from the fact that any tendency of one part to overrun the requirements is instantly perceived, and other work is allotted to the machine making that part. Should an order be received requiring quick response, the board would show how many machines were ready for assembling and how many and what parts were needed to meet the requirements.

In the Kingston Daily Whig J. Bawden makes a plea for the development of the water-power of the Mississippi River, along the road of the Kingston and Pembroke Railroad.

Pig Iron Warrants.

MR. HULL REPLIES.

To the Editor:—I have read with interest the criticisms on the warrant company published in your issue of February 14, and will avail myself of your invitation to reply to same. I note with pleasure that the favorable criticisms come from parties who evidently understand the plan and purposes of the warrant company, whereas, most of the unfavorable criticisms contain clauses that show conclusively that the warrant company's plans and objects are largely, or entirely, misunderstood by the writers. From experience I am satisfied that those who now oppose it will be heartily in favor of it as soon as they understand it thoroughly, unless we except the British ironmaster, who is the only natural enemy of the American Warrant Company.

I will not occupy unnecessary space by restating the objections as published in your issue of the 14th, but will simply answer them in the order they are noted in a memorandum before me. The warrant company is not a trust or combination, and has no powers or features that can be objected to by the furnace interest or by the country at large. It was organized for no purpose that is not plainly stated by its organizers. It has no power to coerce any party into business relations with it, or to interfere with any one who may choose to stay out. It simply offers to issue its warrants for the iron put into its yards by any furnace that makes a contract with it, and the best possible guarantee the furnaces can have that the warrant company will be managed for the furnace interests is that they are not bound to do any business with it during the whole term of the contract unless it is so managed and they choose so to do.

Its capital is pledged for one thing only—namely, as a guarantee for the safe custody of the iron put into its hands. The warrant company takes no commercial risk; it does not buy or sell its own warrants; it issues them to the order of the furnaces who store the iron, has no power over them after they are issued, and has no power to control, or attempt to control, the market. It is only on such a basis that this company could hope to issue a warrant that would command the confidence of the banks and moneyed institutions, and influence the millions of money that will flow to the absorption of its warrants. The company does not loan money, as one writer supposes, but it will act as broker to secure loans for furnaces who furnish warrants as collateral, and expects to be able to place these loans promptly, for any amount desired, whenever money is to be had on anything. Enough money has already been voluntarily offered by the banks, trust companies and capitalists to absorb all the iron that can be stored with us for many months, and it is expected that the standing of the warrant issued by this company will be unquestioned, and that it will eventually command money from the moneyed centers at as low rates as any other security, not excepting the Government bond.

In one sense, the warrant company may be designated as a clearing house, by means of which the furnaces may carry or market their surplus product when the consumer does not require it, and through which they may equalize, regulate or correct the various inequalities and abuses that now exist in the iron business. Through the warrant company it is expected to bring about not only uniformity in the weight of a ton and uniformity in classification, but such other improvements and such economy as may from time to time present themselves.

Under the present system of selling iron the producer is at the mercy of the railroads, who refuse to hold themselves responsible for the loss in weight, simply because they have not been required to do so, nor has the question been put in a shape that makes the demand seem reasonable to them. They, however, hold themselves responsible for shortage in grain, which is also determined by weight, simply because the elevator company becomes a medium that can reasonably require it. The warrant company will become such a medium for the iron interest, and the railroad companies will at once recognize that the warrant company cannot reasonably be expected to give a receipt and not require one in return. The furnace company will receive pay for their iron when they part with their warrant, and any claim for shortage made at the point of destination must be proved and made against the railroad company. All iron handled by the warrant company will be weighed on two different scales to insure accuracy, and will be classified under the inspection of expert graders.

The warrant company asks the furnace companies to make their contracts for twenty years, as it is only on the basis of one powerful, substantial and permanent company that the furnaces can hope to realize the full benefit that should be derived from such an organization. If there were two or more warrant companies in this country, they could not possibly command the support and confidence of the banks to the extent that one company would. We have found no one to object to the 20-year clause after they have understood the scope and objects of the company, but, on the other hand, several of the furnaces that have made contracts with us have insisted that we should on no account make contracts for less time, as the furnaces, more than any one else, were interested in insuring one powerful company. If the furnaces bound themselves by the contract to yard a certain amount of iron each year, there would be some reason to object to the 20-year clause, but they are free to handle their own iron across their own yard, and ship direct to consumers, as before, with all or any part of their product, and they will naturally only use the warrant yard to the extent that it is to their interest to do so.

An objection made to the warrant company is that "it will aid the poor furnaces;" that the rich furnaces do not need it, and that it is against their interest, as they claim it will simply keep alive the poor furnaces, whereas, in their judgment, the best results would ensue from their being driven to the wall and broken up, and thus be gotten out of the way. This is a short-sighted objection. The poor furnaces will not be got rid of in this way. There are more poor furnaces to-day than there were 10, 20 or 30 years ago. It is the present system of the iron business that creates these poor furnaces, and new ones will spring into existence to take the place of those that fail just as long as the present system is in effect. It is during a season of unnaturally high prices that furnaces are built in unnatural locations, simply because they can make money, even in such locations, while high prices prevail, and it is this class of furnaces that do the most injury to the iron business. They are the first to get hopelessly in debt; are at all times confident of a speedy reaction, and are responsible for the unnaturally low prices finally reached. Some system that will control the violent fluctuations will stop the building of this class of furnaces in the future. Those that now exist where iron cannot be made profitably at reasonable figures must, of course, succumb permanently, as under the warrant system there will be in the future no unnaturally high prices to revive or duplicate them.

It is claimed by many that even under our present system extremely high prices would never again be seen in this country. This is the same old story; it is repeated over and over again during each period of depression, and what is still more remarkable, is almost universally believed. But nothing is truer than that history repeats itself. We will be in a more dangerous situation on the next revival of business than ever before, as we will not again have a larger producing country than our own to draw from, as the American product of iron and steel now exceeds the product of Great Britain. If it were practicable for the rich companies to combine and raise several millions of dollars to be used to carry the product of poor but well-located furnaces over dull times, it would be a wise move and they might possibly thereby prevent the unnaturally low prices, but such a plan is not practicable. The warrant company, however, under a plan that is practicable, will not only accomplish this result, but will transfer the carriage of iron from the shoulders of the furnaces to the capitalist.

The condition of things now that will prevent the extreme prices is the carriage of large stocks. The carriage of large stocks is not possible if we rely simply upon the furnaces storing and borrowing money upon their product. Such a system is ruinous, whereas, on the other hand, the investing element of the country has shown itself ready and willing to carry almost any amount of securities that are made safe. The producers of oil, grain and many other commodities have taken advantage of this condition of things and use it for their benefit. Why should not the furnaces do likewise? Pig iron warrants, as soon as understood, will be a favorite security for investors, as iron can be carried cheaper than any other commodity, and is attended with less risk.

It is believed that as soon as the sale of iron by warrants becomes general the demand for them from investors will be great, and a warrant will be worth more than iron, as is generally the case in Great Britain. This company does not advocate or pretend to justify speculation, but simply looks at the business situation as it exists, and proposes that the iron trade shall have the advantages of this condition of affairs as well as other branches of business.

The great variety in quality of irons made by different furnaces, the great variety of classification and the great number of grades produced at each furnace are difficulties to be overcome, but are not obstacles to pig iron being put on the metal exchanges, as is claimed by some. There was just as great a variety in the classification of flour and wheat from different mills and different sections, and yet these differences have either been regulated or provided for, and the same may be done with iron. There are numerous instances in this country where irons now known by 40 or 50 different names may be grouped under one head and known by one name, as, for instance, "Lake Superior charcoal," or "Southern coke," just as the word "Glen-garnock" is one name applied to the product of many furnaces abroad.

Iron, like grain, would probably be put on the boards of trade in two separate departments—an option department and a cash department. In the option department, which would probably comprise 99 out of every 100 sales made, the difference on sales would be settled on the difference between price on the date of sale and the date of delivery for the grade which the metal exchange had made its standard to govern such sales; this would probably be No. 2 foundry, just as "No. 2 spring wheat" governs sales on wheat option boards. On this class of sales actual delivery of certificates is rarely made, a settlement simply being made on the difference

in quotations, as above. If deliveries were called for, they would be governed by the rules of the exchange as to what comprised good merchantable brands. In the cash department, however, actual certificates for the different grades pass, and in this department the mill man and foundry man or their agents will buy the actual brand or grade needed for consumption. The warrant will pass, for which payment will be made at the market price of that iron at the place of purchase, less the accrued storage charges and the official published rate of freight from the furnace to that place. In the option department it would not be necessary for the buyer or seller to know anything about quality, brands, grades, freights or location of furnaces. In the cash department, however, these features would probably enter into every sale made, and are fully understood by the parties who would deal in this department.

The introduction of the warrant system is not expected to make any difference in the territory which will consume the different brands of iron. The consumer will either buy direct, as he does now, or if he buys on exchanges will unquestionably buy warrants for the same brands and grades of iron that he is accustomed to use at the present time. The sale of iron on metal exchanges has been a failure heretofore, simply because of the absence of a warrant as a foundation for sales. Sales of grain and oil on boards were only made possible through the creation of certificates representing those commodities.

As to the "overproduction" objection, there is certainly something wrong in a system that makes a stock of three weeks' make "overproduction." This country has never produced in 10 years as much iron as it consumes in 10 years. What the American iron interest has suffered from is under-production and want of a warrant system. The farmer would certainly be considered very improvident if he was satisfied to raise during the growing months of the year only enough grain to satisfy the consumption of those months and relied upon importation to feed the country during the other eight months of the year. And yet this is exactly the principle on which the pig iron interest of this country has been working in the past, and must continue to work until we carry our iron, as well as our grain, by certificate or warrant. During every period of active business in the United States we import several millions of tons of iron and steel, which the British ironmaster has been long-headed enough to inaugurate a warrant system to carry, ready to take advantage of our improvidence. He is thus enabled to keep his furnace running during dull times, as well as during active times. There is no reason why the American ironmaster should not keep his furnace running instead, and pile up this surplus under an American warrant system, thereby supplying our own demand during active times, instead of importing large quantities from abroad, as heretofore, and permitting foreign interests to get the benefit of the high prices prevailing at such times.

Another writer claims that a large stock would be "a constant menace to the market." It is the carriage of iron by borrowers that is the "constant menace to the market." A large carriage by investors will not have this objection, and the danger from it will not exist as soon as it is known that iron can be marketed at any hour on the exchange. The government bond is not a "constant menace" to the market, simply because the demand for it is greater than the supply, and this will be the case with iron warrants.

The increase in the population of the United States is so rapid that our growth from 50,000,000 to 60,000,000 is hardly noticed, and the increase in business is so

much more rapid than the increase in population that it would be impossible, with all the available furnaces in the United States in full blast, for this country to accumulate more iron than she would consume in the first season of activity, or more than the investor will carry in the interim. (In considering this we have simply to remember the fact that when iron was \$60 per ton there were only a little over 60 per cent. of the furnaces on the official list in blast, and this is about the largest percentage that is ever likely to be in blast at one time.)

The wealth of this country has increased so enormously during the past few years that capital not only readily absorbs any security that is safe, but takes up many securities that have very little element of safety about them. There is no known security that is as absolutely safe as pig iron, and after warrants have once become known to the investor an enormous permanent carriage may be confidently relied upon, and the demand from investors will be as reliable as the demand from consumers.

The pig-iron manufacturer now has but one customer; that is the consumer. Under the warrant system the capitalist of the country would become a purchaser, and the facility thus created for placing the surplus would prevent prices ever going as low as they otherwise would. The fact that oil sold at 52 cents per barrel at the wells, on a stock of 500,000 barrels without certificate, and only went to 64 cents on a stock of 36,000,000 barrels with certificates, should be sufficient evidence of this.

Another writer urges as a reason against the success of the American warrant the fact that the Scotch warrant is for 500 tons, two-thirds No. 1 and one-third No. 3, and as mills do not use No. 1 iron and as founders do not use No. 3 iron, warrants would not suit either and users would not buy them. As the American warrant is for 100 tons of one grade only, and is entirely free from any such condition, this objection does not apply; on the contrary, the natural inference of an unprejudiced mind would be that if the British system has been a success under such drawbacks, how much more reason to expect success under the American system, which is entirely free from such objections.

Another party states that pig iron will not stand these charges, implying that the American warrant system adds to the expense of handling iron, whereas the reverse is the case. The warrant charge under the American system is 25 cents per ton. Nor is this 25 cents an expense. At present the producer must wait from 30 to 60 days after he has shipped his iron before he receives payment for the same. This loss of interest, the risk of the responsibility of the buyer during that time, and the possible loss from a claim of under-grade or under-weight on the part of the buyer, all of which, under the warrant system, the seller escapes, will more than save the 25 cents paid for the warrant. The warrant charge, therefore, is not an expense, as under the new system the warrant is paid for on its delivery. As soon as the sales by warrants become customary, the producer will make a clear saving in being able to sell his product at an expense of 5 cents per ton, in place of the present cost of from 35 to 50 cents per ton.

Another party objects to the plan because it would tend to make speculators of producers. This, again, is a mistake. Of course, producers can become speculators if they choose, but the practical result of the introduction of the warrant system is that the bulk of the stock is carried by the capitalist. In Great Britain there is no article that is as generally carried by all classes of investors as warrants. The warrant company was not organized

with special reference to furnishing aid to furnaces in any particular section, as some parties state. It was organized to furnish its facilities to every furnace in the country that chose to avail itself of those facilities. The subscription to the original stock of the company was nearly completed before it was known to any furnaceman, in any section, that such a company was contemplated.

The warrant company is not in any way connected with any other organization. Business men connected with other large organizations were invited to become stockholders, simply because the experience and ability of such men were considered advantageous to the warrant company—in fact, it was recognized that if the warrant company was to be a success it must be backed by men of broad business experience as well as by men controlling vast capital.

As another writer suggests, it is of course true that when warrants are placed on stock or metal exchanges they are liable to be manipulated by the bulls and bears. This being the case, it remains with the iron producers to consider whether such influence shall be used for or against their interests. The opinion of those who have thoroughly considered the matter is that it can do them no harm, but would present opportunities of great benefit to the iron interests. The extreme fluctuations possible to be caused by these influences would be quick and sharp, and confined to probably 20 days more or less; not long enough, during such advance, to encourage the building of furnaces in unnatural locations, nor long enough, during the decline, to compel furnaces selling on it. In fact, the furnaces would simply refrain from selling during the few days of low prices, and during the few days of high prices, if caused by a corner, could reap a rich harvest by simply rushing all their surplus iron into the warrant yard and unloading their warrant on the clique who were forcing the corner. Of course a furnace company having no warrant yard could not avail themselves of this opportunity, and the possibility of such opportunities occurring is a good reason for a furnace having a thoroughly equipped warrant yard at their plant, even though they might, in ordinary times, have no use for it. The furnace interest is the only interest that could create warrants, and, therefore, the interest that would derive most benefit from a corner, or sudden advance in price. The suggestion that bears might squeeze the market and hammer prices down to unnatural figures is not an objection. This is frequently done with stocks, because stocks which have no real value may at times stand at high figures, whereas iron has a positive value, which is known to thousands of mill and foundry men all over the country, who would be quick to take advantage of any unusually low prices that might be caused by manipulation.

Some contend that the warrant company would be of no use to the rich furnaces who do not borrow money. This, however, is not the general impression. In fact, the first two parties to sign contracts with the warrant company were concerns of large wealth who had never been known to borrow a dollar, and who probably have twenty times as much capital outside of their plants as they have in their plants; the majority of those who have signed contracts with the company are among the class who are abundantly able to take care of themselves.

The objections urged by iron commission men indicate that they have an idea that the success of the warrant company might cause them to lose their agencies. There is no foundation for this fear. There is no reason why furnacemen should not continue doing business with their present agents whether the sales are made by war-

rant or by handling the actual iron. The iron commission merchant would be benefited by the warrant system. The entire pig iron commission element of the United States does not now sell in one year as much iron as is produced in one year, whereas when the sale by warrant becomes thoroughly organized there will doubtless be sold in each year by warrants a hundred or a thousand times as much as is produced in each year.

The sales of oil on the New York Board alone are from 100 to 150 times as great as the entire production of the country, and the dealer in certificates nets his \$50,000 per year to-day with much greater ease than he netted his \$5000 when the actual oil was handled. In fact, in the case of pig iron the actual handling of iron must still continue, and the sale by certificates is simply an additional revenue thrown in the way of the dealers and agents, but the additional revenue derived, instead of coming out of the purchaser, comes out of the investor, and at the same time provides the investor with a less expensive commodity to handle than any he has at the present time.

All the objections urged in your issue of February 14 have been answered, directly or indirectly, in the above, except that some parties, although acknowledging that the warrant company would be of benefit to the furnace interest if it were a success, do not believe it possible to make a success of it. The best evidence of what can be done in the future is what has been done in the past. We can judge of the probable success of this plan, not only by what has been done in oil, grain and other commodities in this country, but by what has been done by the warrant system in Great Britain. If in Great Britain, where things are generally cheaper than in this country, between 1,000,000 and 2,000,000 tons can be accumulated on the warrant charge of 50 cents, it is fair to believe that a much larger amount can be accumulated here on a warrant charge of 25 cents.

Under the English system the furnaces must not only do the usual handling of the iron on their own yard, but it must be put on cars, shipped to the warrant company's yard, and there be rehandled by the latter. This extra handling does not add one farthing to the value of the iron, and is entirely avoided under the American system by establishing yards at the furnaces, where the iron can be moved directly from the pig bed and be piled at the warrant company's yard at the same expense that it is now piled in the furnace yards, and when shipped for consumption can be loaded on cars from the warrant company's yard at the same cost that it is now loaded on cars from the furnace yard, the iron being, in the meantime, in the possession and absolutely under the physical and legal control of the warrant company.

The storage of the iron covered by warrant commences from the first of the month following the date of the warrant, which gives the furnaces an average of 15 days to put their warrant on the market before any storage accrues. The investor, or carrier of the warrant, pays the storage, which is the same under the American as the British system, and no other commodity is carried at so small a cost. Although the carriage of iron by furnaces themselves is regarded as unprofitable and unwise, at the same time the carriage of that iron by some means is the great relief sought for, as it will bring about uniformity of price and make the iron business staple and uniformly profitable, if we judge by other interests that have been "liquefied" by the issuing of certificates to represent them.

Whatever doubts there may have been in the minds of the promoters of the warrant company as to its success during its

organization, there is in their minds no doubt of its success at the present time.

GEO. H. HULL,
President American Pig Iron Storage
Warrant Company.
New York, February 20, 1889.

CORRESPONDENCE.

Drawbacks on Exports.

To the Editor: Our attention has been called to the subject of the drawback on exports by your article in *The Iron Age* of February 21, and we beg leave to invite your consideration of the following in this regard. About a year ago we made some investigations, with the aid of the Department of Drawbacks of the New York Custom House, with the object of ascertaining what expense the Government is under by reason of the drawback system, and why it is thought necessary to retain 10 per cent. of the duty paid on the imported raw materials used when exported to foreign countries in the shape of manufactured goods. For the three years ending June 30, 1885, 1886 and 1887 respectively, the average amount of retention of drawback was in round figures \$220,000 at the New York Custom House. Besides this, fees are charged by the Custom House, viz.: Gaugers', inspectors', weighers' and entry fees, which amounted for the same three years to about \$80,000 a year. The total expense to the United States Government in this department for the same three years was not more than \$30,000 a year, so that there was a clear profit to the Government of say \$20,000 a year, without counting the 10 per cent. retention (1 per cent. in the case of sugar). That is to say, our liberal Government charges us \$300,000 a year for doing what costs it only \$60,000. There is another point to which we would call your attention. That is that at present foreign manufacturers can and do bring goods to this port and deposit them in warehouse without paying any duty, and then re-export them over freight lines from this port in competition with our own manufacturers, who are handicapped to the extent of the 10 per cent. of the duty on their raw material retained by our Government, with no ascertainable object whatever. It is difficult to see the reason for this extraordinary legislation. Congress has been asked to remedy this state of affairs by making the amount of the drawback equal to the duty imposed on the raw material again and again, and as there is absolutely no conflicting interest to contend against, it might be supposed that it would be easy to secure the passage of the proper measure. But the experience of the disinterested observer must convince him that the true interests of our people are not of the greatest importance to the "statesmen" who annually convene at Washington.

TATHAM & BROTHERS.

New York, February 25.

The Philadelphia Company, who have almost a monopoly of the natural-gas business at Pittsburgh, recently issued a circular to their patrons advising them to secure meters for the natural gas. After pointing out the many advantages to the consumer, as well as to the company, of burning gas by measurement, a very plain intimation is thrown out that it is probable in the near future the gas will be supplied in no other way. The conditions on which the changes will be made are that former contracts will be canceled as soon as the meters are set ready for use. For the present the charge will be 12½ cents per 1000 cubic feet, with a reduction of 20 per cent. for cash, or 10 after date of contract. For cash customers the rate will thus be 10 cents per 1000 cubic feet. The cost of setting meters and testing new connections will be \$5.

THE MINING ENGINEERS.

NEW YORK MEETING.

On Wednesday morning the members paid a visit to

THE SPIRAL WELD TUBE WORKS,

of which James C. Bayles is president. The plant is on a plot of ground of about 8 acres, with a frontage of 1172 feet on the Delaware, Lackawanna and Western Railroad, and embraces the spiral and cross welding machinery, a Manning boiler 85 feet high, an Ohio Buckeye 150-horsepower engine, a water-gas plant of special design, a machine and pattern shop, and apparatus finishing and testing pipe. The spiral-welding machinery consists of eight machines, making 4, 6, 8 and 10 inch pipe, to which machines are being added to make the range between 12 and 30 inch pipe. There are two cross-welding machines. The usual sizes of skelp are from No. 14 to No. 18 gauge, the machines being able to make pipe at the rate of about a foot per minute. The largest pipe yet made was 44½ feet, the usual maximum being about 30 feet for ordinary practical working. The pipe is tested by hydraulic pressure, one 10-inch No. 14 gauge pipe having resisted a pressure of 850 pounds per square inch.

The members then proceeded to the Edison Laboratory and the phonograph works at Llewellyn, N. J., where these famous establishments were inspected, and a trial run was made of the Edison magnetic ore separator. After an elaborate lunch, of which over 300 visitors partook, a session was held in the library of the Edison Laboratory, the proceedings being opened with a paper on "Magnetic Concentration," of which John Birkenbine and Thomas A. Edison were the joint authors. The growing interest in the United States in the utilization of the leaner magnetic iron ores was dwelt upon, followed by a review of the general principles underlying the construction of the different machines brought before the public recently. *The Iron Age* has placed before its readers illustrated descriptions of two of them, the Edison and the Wenstrom, the latter having been since then modified to some extent. A machine of the new design has just been completed at Bridgeport, Conn., and is to be shipped to Port Henry, N. Y. The third type, that of the belt machine, is represented by the Coakling machine, a description of which was published in *The Iron Age*. Another belt machine is the Norton, which is being developed at Troy. The Buchanan magnetic rolls have been tested over a long period by the Cheevers at the Theall Mine, near Brewsters, N. Y. Messrs. Birkenbine and Edison submitted some data on the results obtained by magnetic separation.

This paper was followed by that of Pedro G. Salom, of Philadelphia, of the Julian Storage Battery Company, on "Electric Storage Batteries."

The Evening Session

had been announced as one especially devoted to iron and steel, and brought the largest and most appreciative audience which the institute has had for a long time. It was opened by the reading of a communication from C. P. Sandberg, of London, England.

ON RAIL SECTIONS.

After reviewing his own work, well known in this country through his own writings and those of others, Mr. Sandberg indorses all that has been said about the evil produced by wide, thin flanges, which have gone to the extreme in America, and trusts that it will meet with a speedy correction on the part of engineers by the designing of sections that can be

made harder—as hard as the old sections in the beginning of steel-rail making—to enable makers to regain the "lost art" which engineers now lament.

With reference to the second cause of inferior rails—namely, want of inspection, he states that everything depends upon the kind of inspection. Sometimes specifications are overdone and impracticable. In general the guarantee is not found to be of much value, practically speaking. Buyers prefer to be convinced of having got their money's worth before they pay for the goods.

While Mr. Sandberg uses the bending-test with sample-ingots, as a preliminary, chiefly to enable the maker to avoid rolling brittle steel into rails, which might break under the falling-test, Mr. Hunt is satisfied with such a preliminary test alone, and does not enforce any falling-test at all. What is more, in his specification the bending tests are repeated two or three times, with a chance of ultimately getting one to stand, and having the rails consequently accepted. Mr. Hunt is not the only one abolishing the falling-test or drop-test. Mr. Sandberg has reduced the so-called "barbarous" tests so as to admit of greater hardness; but he sees no cause to abolish them altogether.

In reference to the cutting off of blooms 12 inches at the top end, Mr. Sandberg says: Fully appreciating the importance of sound ends, I think such a heavy cut must entail great loss upon the maker; and, worse still, that it will not absolutely secure the object in view, inasmuch as hollow sinkings will not always be detected thereby. I would rather aim to obtain in casting a more solid top to the ingot, through the quality of the steel. To promote this I would tolerate more silicon, which makes the steel in casting very quiet, and permits hardly any gases to escape. From thousands of analyses I have found that with 0.10 per cent. of silicon a more solid top is obtained, while no material effect is shown in the testing for physical qualities. I could cite several works on the Continent using regularly as much as ½ per cent. of silicon; their ingots are as if they were planed on the top, and need only the cutting off of a 12-inch crop end of the rail; neither ingots nor blooms being cut at all. In this theory I know that I stand alone, both in Europe and in America, and am, therefore, quite prepared to meet with objections. My difficulty in practice is to obtain the silicon in uniform proportion. While I sometimes get accidentally ½ per cent., at other times I get next to nothing and then I get the hollow top. Regularity in the pig iron, as to its contents of silicon as well as its heat, would rectify these irregularities in the finished article. This would be well worth the makers' attention as a means to insure both economy to themselves and sound rail ends, and satisfaction to the consumer.

The third cause of inferior rails nowadays, as compared with those first rolled, namely, the driving, is perhaps the most important of the three, particularly because there is no help for it. To ask the maker to give more time to both the chemical and the mechanical processes would be regarded as a suggestion to return to the old stage-coach. Nevertheless, the fact is that no sooner is the pig iron in the converter than it is out as a rail. Any one having the least experience in chemical processes must know that time cannot be dispensed with, but is necessary for dissolving, precipitating and mixing, and for the due escape of the gases produced. Why is the Siemens-Martin steel more homogeneous than the Bessemer? Simply because time is given.

Again, in mechanical respects, the old mills, running at slow speed, produced a close grain in the rails, because the pressure was given in the stage of brown heat.

This made the rails physically hard. It explains why different wearing results might be got from the same chemical composition. One rail might be rolled at red heat and the other at brown or nearly black. The thick flanges formerly prevalent permitted such cold-rolling without consequent rejections or waste. Since the thin flanges, like razors, have come into use, makers have been actually bound to spin them out in quick-rolling mills, and the only part that gets cold-rolling is the flange, while the head is always coming out red hot. No close grain or physical hardness can be expected in the big heads—which is just the reverse of what should be the result sought.

However, it is of no use to ask makers to roll slow; at least not until engineers will return to thick flanges of say ⅞ inch, or, rather, ¾ inch; and even then the ambition to turn out a rail a minute and so many tons out of a converter will not be given up. The only remedy hoped for is that, through the adoption of these thick flanges, the rail-steel might with safety be made harder chemically by admitting as much carbon (and silicon to give solidity) as the amount of phosphorus present will permit. It is in this view that Mr. Sandberg closes a paper recently read before the British Institution of Civil Engineers, with a suggestion of thick flanges and the use of steel base-plates, where the preservation of sleepers will necessitate a broader base than the rail-flange can practically give.

The second paper on the same subject was that of Frederic A. Delano, of Chicago, Ill., who is connected with the Chicago, Burlington and Quincy Railroad, from which we quote:

The designing of many rail sections by engineers who are far from being experts in the metallurgy of steel has led to the general acceptance of erroneous principles as the rules for such designs. Until very recently, it has been assumed that the more metal was put in the head to wear away the longer the rail would wear, and it has been the practice in adopting heavier sections to put all the additional weight on top of the rail-head of a very much lighter section. Careful investigation on a number of railroads has shown that of the rails weighing 65 pounds per yard and over the greater part have to be removed after comparatively trifling abrasion, solely because they are no longer fit for a smooth track. This is evidence of error in the principles of the design of the section.

It is generally admitted that, as a rule, rail sections designed since 1879 for rails of 65 pounds and over have not given entire satisfaction. There are several reasons which may account for this: first, a constant increase during this period of wheel-loads on engines and cars, together with generally higher speeds; secondly, new methods in manufacture, cheapening the cost of production and possibly producing an inferior article; thirdly, mechanical conditions in the rail itself due to the shape of the rail section.

1. The first cause is undoubtedly a real one. I think there is evidence that the elastic limit of much of the rail-steel now in use is actually often exceeded by the strains of practice, causing a flow of metal, which is then abraded by the wheel flanges; and the result is a kinking or a battering of the rail, which condemns it for a good track. Granting the existence of this cause, there are two ways of ameliorating the result; one is to increase the bearing surface of wheels on rails; the other, to raise the elastic limit of the metal, which subject I shall take up later on.

2. With regard to the second cause, it is held by many that the enormous production, low cost, and "improvements" induced by competition have involved

inferior quality of product. Many well-informed men are content to rest on the simple assertion that the old John Brown steel gave remarkable satisfaction, because it was made of a good iron and did not contain more than .08 per cent. of phosphorus, any analysis showing more being grossly inaccurate. If they are satisfied that this is the solution of the problem of making a really good rail, why do they not try their .08 per cent. of phosphorus? Low-phosphorus steel can be made to-day with more certainty and at less cost than ever before. The only question is whether the elimination of phosphorus is going to be worth what it costs. The fact that as many Bessemer charges are now blown in one hour as were formerly blown in a day is pointed at as evidence that the same care cannot be given to the operation; but I think men really conversant with the turning out of a large product will maintain that almost absolute regularity in the iron is necessary to keep things running with the clock-work regularity required for such a rate of production. Indeed, large product and general smoothness in mill-operation are, to my mind, an indication of a uniform product, so far as metal in the rail itself is concerned, and seem to me, therefore, not objectionable on that score. With the rapid rolling, however, particularly the rapid blooming or breaking-down of large ingots, I find fault.

3. That mechanical conditions in the rail itself, due to the general design of the rail section, can have any important effect on the service-value of rails has not been generally admitted, so I wish to lay particular stress upon this cause and attract to it the recognition it deserves. Speaking in general terms, that form of rail is, in my opinion, faulty, which has a deep massive head, a wide, thin base and a thin web, connected to the head and the base by small fillets only. The objection to this form and the advantages which might be obtained by different proportions may be concisely enumerated as follows:

a. Such a form necessitates rolling at a higher temperature, and, what is of chief importance, finishing at a higher temperature than permits the securing of a well-forged, compact rail.

b. This type of section probably encourages the use of a higher percentage of manganese to reduce the number of second-quality rails; and this production of second-quality rails, as well as the additional manganese, figure in the cost of the rails to the consumer.

c. Rails with heads out of proportion to the rest of the section require a great deal more of cold-straightening, because it is impossible to know how much bending or cambering such a rail needs in its hot state in order that it shall cool straight. This is certainly a very important consideration.

d. The same sort of disproportion must produce corresponding disproportions in the rate of cooling, causing internal strains, which are only partly dispersed or effaced by the small connecting fillets.

e. A section having these internal strains exaggerates the effect of any impurity which may chance to have segregated in the ingot, while a section not liable to these strains would safely admit of a generally higher carbon steel, as well as a considerable latitude in composition.

f. It is not economical to provide for an abrasion of some $\frac{1}{4}$ of an inch, or even more, from the top of the rail, if it is found that rails have failed long before this amount has been abraded. Instead of providing more height to wear away, we can do better by providing more breadth of bearing-surface, and metal of a higher resistance within the elastic limit.

g. Inasmuch as the funnel-shaped cavity, dispersed blowholes and possible impurities exist in the ingot in the axis of its length, it follows that these defects will

exist (especially in rails made from the upper part of the ingot) on an axial line which passes through the rail-section. It follows that if the rail-section has 50 to 55 per cent. of its metal in the head, the poorest metal is inclosed in the head, where it receives the least amount of forging; whereas, if the amount of metal in the head does not exceed 40 to 45 per cent., this poor metal occurs in the thoroughly-worked web portions.

The foregoing objections seem to be so formidable and convincing that I am glad to see a general tendency among all the later investigators to come to the same conclusions. It seemed to me that rail-sections should be made to certain definite proportions, regardless of the weight per pound. It is often said that the larger sections will admit the use of a higher carbon steel; but this assertion requires the proviso that the heavier section shall be similarly proportioned. One 74-pound section which I have in mind could not be safely made of as high a carbon steel as the 62-pound section from which it has been schemed.

The specifications which I append as a conclusion to these brief remarks may be of interest to some, as being different in several particulars from any other rail specifications. They were drawn up originally 15 months ago, and have not been changed in any important particular since that time.

Proposed Specifications for Steel Rails.

1. The steel used in the rails shall be made by the Bessemer or by the open-hearth process, and shall not contain more than 12-100 of 1 per cent. of phosphorus, as determined by an analysis made from a boring into the center of metal of the rail-section of any rail.

2. The ingots shall be poured with care, and the molds filled at one pouring, without undue spattering of the sides. No sand or water shall be thrown upon the ingots after pouring; but, on the contrary, coke or charcoal dust shall be used. In no case shall rails made from a chilled heat or a bled ingot be accepted as first-quality rails.

3. Cold molds or molds in such a shape as to require more than a hand-sledge to free them from the ingot shall not be used.

4. It is preferable that ingots, when taken from the pit, should be kept erect and so heated; but if this is not the practice of the rolling mill company the ingot shall not be laid on its side until it is certain that the central part has solidified.

5. Blooming rolls of 40 inches from center to center shall not be driven at a speed exceeding 30 revolutions per minute, and larger or smaller rolls shall not be driven at a speed exceeding this in linear velocity. (The linear velocity of an ingot going through the first or 18-inch pass of a pair of 40-inch rolls, driven at a speed of 30 revolutions per minute, would be about 205 feet per minute.)

6. No metal shall be cut from that end of the bloom which corresponds to the "butt" end of the ingot.

7. From that part of the bloom which corresponds to the top of the ingot an amount shall be cut equaling in pounds the area of the mean cross-section of the ingot in inches, or as much more as is necessary to secure a sound pipe, free bloom.

8. The number of the charge shall be stamped distinctly on each rail, and the place and date of manufacture rolled on.

9. The section of rail rolled shall conform to the template, and a variation of more than a scant 1-32 inch over or under the template height shall not be allowed, and the rail must be made close enough to template to fit properly in the splice.

10. The weight of the rails per yard shall be kept as close to the standard weight per yard as can be after complying with the conditions of Clause 9.

11. The rails shall be drilled for the bolts of the splice-bar, or, if necessary, notched in the flange, in accordance with the templates and diagrams furnished by the railroad company.

12. The rails shall be cut at right angles to their length, and be at 60° to 70° F., within $\frac{1}{4}$ inch of the standard length of 30 feet. No shorter length rails shall be accepted by the railroad company, except under special provisions of this contract for such acceptance.

13. Rails shall be perfectly straightened in both surface and line, and without any twists, waves or kinks. Particular attention shall be given to having the rails free from "camber," in which the ends droop, and also free from any flaws, cracks or excessive roughness.

14. The rails shall be finished at such a temperature that it will not be necessary to allow more than 4 inches for contraction on every 30-foot rail sawed immediately after coming from the finishing-pass in the rolls.

15. One rail-end, which must correspond to what has been the ingot top, shall be tested for each heat or charge by a drop-weight of 1 gross ton falling 10 feet on the rail-head, midway between the supports, 3 feet apart. (The bearings are to be of iron or steel, fastened firmly to oak framing constructed of oak timbers bolted together into a solid floor, and this supported on masonry foundations not less than 4 feet deep. The guides are to be smooth, straight and parallel.) Should one rail-end be broken by the above test, two similar rail-ends must succeed in enduring the shock, or else cause the rejection of all rails in that same heat. It is expressly desired that the rail steel shall contain as high a percentage of carbon as the maker is willing to put in and still produce a rail which shall endure this drop-test.

16. The representative of the railroad company shall at all times be allowed, on request, to see the *bona fide* analyses and carbon determinations, as made by the rolling-mill company, of the steel used in making these rails.

W. R. Hunt, of Chicago, followed with a paper on the same subject, prefacing it with a reply to the criticisms raised in Mr. Sandberg's communication. Mr. Hunt, starting from the conviction that high heat during the manufacture of the rail and a good product cannot go together, has reached the conclusion that the sections of the rail must be so designed that they can be made successfully at a lower temperature. The earlier rails, which gave such good results, were all of light sections, and they were almost all rolled at a lower heat. It was long supposed and it is still widely believed that chemically the metal in the older rails was superior to that now used. Mr. Hunt quoted a number of analyses of the famous John Brown rails, which showed an astonishing range of chemical composition, the only element present in relatively uniform quantities being manganese. The facts given prove that it was not the character of the metal itself, but the method of manufacture, rolling at a lower heat and with greater roll pressure. The metal was more thoroughly worked. Mr. Hunt, as the result of his wide experience in the manufacture of rails and his close study of the subject, submitted a series of designs of rail sections, the principal characteristics of which were a relatively shallow head and thicker web and flange. He submitted drawings of these designs, the character of which is indicated by the following distribution of metal in the head, web and flange for rails of different weights:

Distribution of Metal.

	Head.	Web.	Flange.
1.—60 pounds.....	41.67	21.11	37.22
2.—65 pounds.....	41.60	21.40	37.90
3.—70 pounds.....	41.62	20.55	37.83
5.—75 pounds.....	41.72	20.96	37.92
6.—80 pounds.....	41.95	21.21	38.34
7.—80 pounds.....	40.00	21.23	38.78
8.—85 pounds.....	43.43	21.20	38.88

No. 1 was specially designed with the idea of making it so that the rail will require the least amount of cold-straightening. No. 7 is a rail greater in height than usual. No. 8 is what Mr. Hunt would suggest as the future rail. Any of the sections can be rolled on existing mills without unduly heating the steel.

The discussion was opened by P. H. Dudley, who pointed out that the 80-pound section was quite similar to that designed by Mr. Dudley for the New York Central Railroad in 1883, a fact which Mr. Hunt admitted to be correct, and the omission of which was due to oversight. A running discussion took place between Mr. Hunt, John Fritz, of the Bethlehem Iron Company; E. C. Pechin, of Cleveland; Dr. Raymond, H. M. Howe, R. Chauvenet and others, chiefly on the question of the character of the pig iron. The majority of the speakers attempted to obtain a definite specification for the chemical composition of Bessemer pig capable of producing good rails, while Mr. Hunt confined himself to

the general reply that the iron is the better the purer it is, the nearer it comes to pure iron and carbon.

The Thursday morning session opened with the presentation by C. Kirchhoff, Jr., of three communications from members of the institute on the subject of

Oil as a Metallurgical Fuel,

the metallurgists reporting being G. H. Billings, of Boston; E. C. Potter, of the North Chicago Rolling Mill Company, and E. C. Felton, assistant superintendent of the Pennsylvania Steel Company, Steelton, Pa. The first named presented the following data as the result of his experience with

COAL VS. OIL IN PUDDLING.

Starting with everything cold, we used 3518 pounds of oil to get the furnace in condition to charge a heat. After charging we ran until we got out 13,840 pounds of puddled blooms, using 8437 pounds of oil. One gallon of oil weighs 6.328 pounds, and 8437 pounds of oil would equal 1333 gallons of oil, which, at 4½ cents per gallon, would cost \$65 (the expense of making 13,840 pounds of blooms). The expense for making one ton of blooms with oil would be \$10.909. As we make 5.70 tons in 24 hours, the expense for using oil as fuel for one day would be \$62.18.

Assuming that one ton of blooms can be puddled with 1.5 tons of coal, this at \$4.875 per ton, would cost \$7.31, and 5.7 tons, or a day's work, would cost \$41.68. As it costs \$62.18 per day using oil and \$41.68 per day using coal, we show a saving in favor of coal of \$20.50 per day. Having used 3518 pounds of oil to get the furnace hot and to make bottom, this is not included in the above calculation. Usually we only have to light the furnace, but in this instance the furnace had been repaired, and a new bottom had to be made, which required the quantity of oil necessary to make three heats of blooms, or 2109 pounds, which, deducted from the 3518 pounds, leaves 1409 pounds of oil. As this quantity must be expended every week in lighting up, it should be divided by 6 to apportion it to each day: 1409 pounds divided by 6 gives us 234 pounds of oil for each day, which, at 4½ cents per gallon, or .0075 per pound, would cost \$1.75 per day, and as we worked 1.2 days the cost would be \$2.10, which, added to \$62.18 (the cost of using oil for fuel for one day), gives us \$64.28, the actual cost per day for the use of oil for fuel. As it costs \$41.68 using coal as fuel and \$64.28 using oil as fuel, we show a saving in favor of coal of \$22.60 per day, and for 300 days, or one year, we would save \$6780 on this furnace. The customary amount of coal used for puddling iron is ton for ton, which would make the saving one-third greater, or \$9040 per year.

The cost of using oil for one week in a puddling furnace was found to be as follows: Starting with everything cold, we ran the furnace six days. We used 6602 gallons of oil and produced 65,595 pounds of blooms: 6602 gallons of oil at 4½ cents would cost \$321.83. As we have to pay \$24 for extra labor, this makes the total cost \$345.83, or \$11.81 per ton. Assuming that 1 ton of blooms can be puddled with 1.5 tons of coal (which, at \$4.875 per ton, would cost \$7.31), it would cost to puddle 65,595 pounds of blooms \$214.06, so that we show a saving of \$4.50 per ton, or \$131.77 per week, or \$6852.04 per year, by using coal instead of oil for fuel. Besides this, on a puddling furnace using coal we would have a boiler from which we would generate steam by the waste heat in value equal to, say, one-half of that which we can make by the direct use of coal, or 4200 pounds per turn, or for 11 turns, or a week's work, 46,200 pounds of coal, which, at .00217 per pound, would cost \$100.25 per week, which,

added to \$345.83, the cost for oil, gives us \$446.08, from which we subtract \$214.06, the cost of making same quantity of blooms by using coal. We get a saving of \$232.02 per week, or \$12,065.04 per year, by using coal instead of oil.

Coal vs. Oil in Raising Steam.—The following is the record of the first day, starting with everything cold. We used 2910 pounds of oil to evaporate 15,600 pounds of water. One gallon of oil weighs 6.328 pounds, and 2910 pounds of oil would equal 459.86 gallons, which, at 4½ cents, is \$22.42 (for 10 hours). As these boilers run night and day, 24 hours, at \$22.42 per shift, would cost \$52.81, and 300 days, or one year, would cost \$16,143 under one boiler. As we have three boilers, the expense of using oil would be \$48,429 per annum. Assuming 1 pound of coal would, under the same circumstances, evaporate 9 pounds of water, it would take, to evaporate 15,600 pounds of water, 1733.33 pounds of coal; this, at \$4.875 per ton, or .00217 per pound, would cost \$3.76 for 10 hours. For 24 hours, at .376 per hour, it would cost \$9.024, and for 300 days, or one year, it would cost \$2707.20, the expense for one boiler. For three boilers it would cost \$8121.60, thereby showing a saving of \$40,307.40 by using coal instead of oil.

On the second day, the furnace was hot (having run the previous day). The results were: We used 4156 pounds of oil to evaporate 27,600 pounds of water. One gallon of oil weighs 6.328 pounds, and 4.156 pounds of oil equal 656.76 gallons; at 4½ cents cost \$32.01, the amount used for 10 hours. As these boilers are run night and day, 24 hours, at \$3.201 per hour equals \$76.82 per day, or at 300 days per year the cost of using oil under one boiler would be \$23,046. As we have three boilers the expense of using oil would be \$69,138 per annum. Assuming 1 pound of coal would under the same conditions evaporate 9 pounds of water, it would take to evaporate 27,600 pounds, as many as 9 is contained in 27,600 pounds, or 3066.66 pounds of coal, costing \$4.875 per ton or \$.00217 per pound, by 3066.66 equals \$6.65 for 10 hours, or for 24 hours, at \$.665 per hour equals \$15.96 per day, or at 300 days per year the cost of using coal under one boiler would be \$4788; under three boilers the expense of using coal would be \$14,364, which subtracted from \$69,138, the cost of oil, leaves \$54,774. Therefore, we show a saving of \$54,774 per year by using coal instead of oil.

The second paper on the same subject presented was that of E. C. Potter:

CRUDE PETROLEUM AS FUEL FOR RAISING STEAM.

Fuel oil was first substituted for coal at the South Chicago works of the North Chicago Rolling Mill Company, in September, 1888, and was first applied to the battery of boilers in the converting department. This battery consists of 14 tubular boilers, 15 feet in length by 5 feet in diameter. To operate these boilers with coal, the following men were required for 24 hours: 14 stokers, 3 ash-wheelers, 6 men unloading coal, 2 water-tenders, making a total of 25 men. With fuel oil the following men are required to operate the same boilers: 2 water-tenders and 4 men to attend to the burners, making a total of 6 men. This gives a saving of 19 men by the use of fuel oil in place of coal, which at an average price of \$2 per day each would give a saving of \$38 per day. Comparing the consumption of fuel oil with that of coal, we find that for the week ending January 5, 1889, with an ingot output of 6403 tons, 2731 barrels of fuel oil were used, as against a necessary consumption of coal for the same work of 848 tons, showing 3.22 barrels of fuel oil to be equivalent to one ton of Indiana block coal. Figuring oil at 60 cents per barrel

and coal at \$2.15 per ton, we have the cost of oil, \$1.93, as equivalent to coal at \$2.15, making a net saving of 22 cents per ton.

In December, 1888, the rail-mill battery of 26 boilers, of the same dimensions as those in the converting department, was equipped for fuel oil. For the week ending January 5, 1889, with a rail output of 5208 tons, 5987 barrels of oil were consumed, as against a necessary consumption of coal to do the same work of 1805 tons, showing 3.31 barrels of fuel oil to be equivalent to 1 ton of Indiana block coal, which, with the costs named above, would show \$1.98 worth of fuel oil to be equal to \$2.15 worth of coal. The labor required to operate the rail-mill boilers for 24 hours is as follows with coal as fuel: 26 stokers, 4 water-tenders, 6 ash-wheelers, 12 men unloading coal, making a total of 48 men. With oil as fuel the following men operate the same battery for 24 hours: 4 water-tenders, 6 men to attend to the burners, making a total of 10 men, a saving over coal of 38 men in 24 hours, which, at an average price of \$2 per day, would be \$76 per day.

With the brief experience we have had with oil as fuel we find that the efficiency of the boilers is somewhat increased and the repairs materially lessened. The perfect cleanliness of the fuel and the ease and simplicity of supply and regulation, together with the steadiness and uniformity of steam supply, make it, for our business at least, a most desirable substitute for coal.

We have made no evaporation tests of any kind, the only test of its efficiency being the fact of its keeping our works running to their fullest capacity. This we find it will do, which cannot be said to be true of coal with our present boiler capacity.

The third series of data came from E. C. Felton, assistant superintendent, and dealt with the results obtained with

OIL AT THE PENNSYLVANIA STEEL COMPANY.

All oil used vaporized in the Archer producer, an apparatus for mixing oil and superheated steam, and heating the mixture to a high temperature, ½ to ¾ pound pea coal to gallon oil used to generate heat.

First Trial.—Heating hot ingots in two Siemens' heating furnaces in the blooming mill, six 14-inch ingots being a charge. The oil used was partially refined, paraffine and a part of the naphtha being removed. It was first put on in March, 1888. Six weeks' run, including the oil necessary to keep the furnaces hot over Sunday, showed a consumption of oil about 6½ gallons to 1 ton of blooms.

Second Trial.—Melting on 30-ton open-hearth furnaces, the materials being cold scrap and pig and iron ore. The same oil as above was used. The gas was carried 300 feet from the producer to the furnace. One month's run showed the use, including keeping the furnace hot over Sunday, of 48 gallons oil per ton of ingots.

Third Trial.—Six Siemens' heating furnaces in the blooming mill were fired with Lima oil. The gas was put on June 11, 1888, and has been used since constantly. The average for last six months, including Sundays and heating some cold ingots, was about 6 gallons oil per ton of blooms. This amount varies with product of mill. Under the most favorable conditions, hot ingots and all the stock which the furnaces can handle, the consumption of oil is 4½ to 5 gallons per ton of blooms. Cold ingots require about three hours in the furnace.

Fourth Trial.—A 30-ton open-hearth furnace was heated with Lima oil, the producer being near the furnace. Six weeks' run showed a consumption of 54 gallons of oil per ton of ingots, including Sundays and starting the furnace. The best week's record was 46.7 gallons. The loss proves

to be somewhat greater than with coal gas, and some trouble was experienced by the clogging of the checkers with fine particles of oxidized iron.

Fifth Trial.—Melting in a 5-ton open-hearth furnace since October last showed a consumption of 50 to 55 gallons of oil per ton of ingots.

Sixth Trial.—Raising steam under two return flue tubular 100 horse-power boilers. The best 12 hours' work showed 16 pounds of water evaporated by 1 pound of oil; the average was about 12 pounds water per pound oil, the temperature of the feed-water being about 160°. The use of oil is not so economical as pea coal.

Seventh Trial.—Oil is being used in a reverberatory furnace for heating cold blooms. The trial is now in progress and is not far enough advanced to report results.

During the discussion which followed R. W. Hunt, of Chicago, reported that when he was in charge of the Troy works an experiment was made with the Hayden apparatus for burning oil. One of two Swindell furnaces was fitted up with it, while a second furnace, identical in construction and in capacity, remained unaltered. Both were serving an 18-inch mill. The petroleum used cost 4½ cents at that time, while the Westmoreland coal cost \$4 per ton. Records kept over a period of three months, under practically identical conditions, showed that if oil could be had at 3 cents a gallon there would be a saving of 50 cents per ton.

J. M. Sherrerd, of the Troy Steel and Iron Company, referred briefly to the experiments now being made at that plant, conditions having considerably changed. The use of oil has been eminently successful in Troy in connection with its use to fire the boilers of the furnace plant when the gas supply happens to be inadequate. Under these conditions oil possesses the great advantage of responding quickly at a time when a prompt supply of steam is particularly needed. Mr. Sherrerd stated that the entire oil consumption for the blast furnace boilers was 1500 gallons in a month, in which time the furnace produced 5900 tons of pig iron.

Dr. R. W. Raymond called attention to an obstacle to the introduction of oil as a fuel, giving as an instance the experience with it at the works of Cooper & Hewitt, at Trenton, N. J. Oil was introduced in one of the puddling furnaces, the result being that heats could be got out faster. The puddlers were paid a lump sum for boiling, they paying helpers. Although the introduction of oil assured to them increased earnings, they declined to make a reduction in the price representing partially the saving of wages to laborers and helpers, on the ground that it would be depriving the latter of work.

The president, Professor Potter, stated that experiments at a large works in St. Louis had shown that oil at 3 cents, the price then ruling, is equivalent to \$2 coal. But as coal costs \$1.37½, delivered, oil is too dear to use. In some instances where cleanliness and a clear fire are particularly desirable oil is preferred. Thus the St. Louis Shovel Company have adopted it for their forges.

Prof. W. P. Blake, of New Haven, spoke on

THE COPPER DEPOSITS OF COPPER BASIN, 30 miles southwest of Prescott, Ariz. The copper occurs chiefly as malachite and azurite in sandstone belts, which overlie a granite formation. Erosion has removed parts of the sandstone deposit, leaving abrupt banks flanking both sides of the valley. The occurrence is very showy, the entire sandstone belt being a mass of green ore with streaks of blue azurite. The copper contents are not so high, however, as the appearance of the sandstone would seem to justify, since the

malachite and azurite generally are merely thin incrustations of the grains, pebbles and boulders of which the rock is composed. The percentage of copper ranges from 5 per cent. up to 20 per cent., the average being about 10 per cent. In the granite, through which course a number of dikes, are a large number of seams and veinlets, carrying red oxide in the center veneered with malachite. Besides, the granite contains, finely distributed through it, copper pyrites. Professor Blake traced in a very interesting manner the connection between the metalliferous contents of the granite and the ore in the sandstone, showing how strong is the evidence in favor of the theory that the origin of the latter is to be found in the older rock. Professor Blake touched also upon the question of the extraction of the metal from the ore. Its high silica contents, the absence of proper fluxing material and the high cost of fuel have led to the abandonment, at least temporarily, of the plan of smelting in the district, although a furnace is partially completed. Professor Blake suggests extraction by means of dilute sulphuric acid and precipitation electrolytically. The acid he proposes to manufacture from auriferous pyrites, the residues of which, after burning, are to be chlorinated for the extraction of gold.

Following Professor Blake, Henry J. Williams, of Pittsburgh, presented a paper on the "Determination of Silicon in Ferro-Silicons and a Study of Its Reactions with Alkaline Carbonates." During the brief discussion the principal subject became the graphitoid form of silicon, and the presence of 2 to 3 per cent. of silicon in the greater part of the aluminium of commerce.

The afternoon session was devoted exclusively to the report of the council and to the discussion of questions relating to the policy of the institute. The usual banquet took place at the Hotel Brunswick in the evening.

On Friday morning the members inspected the Stevens Institute of Technology, and held a meeting there, the first paper being a brief note from Prof. W. P. Blake on the storage of water in Arizona, dealing principally with the large dam at Walnut Grove, Yavapai County, Arizona. E. G. Spilsbury, of the Trenton Iron Company, Trenton, N. J., described and showed samples of the new locked-wire rope, an English invention which the company have begun to introduce. Oberlin Smith, of the Ferracute Machine Company, Bridgeton, N. J., showed samples of the tin nail made from scrap tin plate, to which we have already referred in the columns of *The Iron Age*. He traced the development by which the special machinery was brought to its present form, making from 80 to 90 nails a minute. F. A. McDowell gave an account of the work of uncovering the roof of the Tilly Foster mine, illustrating it with a very fine series of stereopticon views. Professor Denton, of the Stevens Institute, presented the last paper of the meeting, on the work of air compressors.

At the invitation of Professor Morton, president of the Stevens Institute, the members enjoyed the hospitality of his house, scattering afterward into small parties to visit different points of interest. Saturday was devoted to an excursion by river boat to the works of the Central Forge Company, at Whitestone, L. I., to the torpedo station at Willett's Point, and to Fort Hamilton, where Captain Zalinski explained the operation and fired the famous dynamite gun of which he is the inventor.

The Crane Iron Company, at Catsauqua, Pa., are experimenting with an ore concentrator invented by the superintendent of the company.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., February 26, 1889.

The attitude of Chairman Mills, of the Committee on Ways and Means, on the Cowles Tobacco-Tax Repeal bill, amended, reported from the Committee on Appropriations, practically puts an end to all prospects of revenue reduction by this Congress. Having been voted down by an overwhelming majority on his Senate substitute constitutional proposition he has announced his determination to prevent action on the internal revenue movement by means of filibustering. Speaker Carlisle has agreed to recognize Mr. Randall for the purpose of taking up the bill from his committee, but he says that he will also recognize Chairman Mills on his dilatory motions and will vote against the bill if it comes to a vote. There are fully 70 Democrats who are with Mr. Randall on the measure reported from his committee, and will follow his leadership if the opportunity be offered.

There has been considerable canvassing among the Democratic Representatives in hope of persuading Chairman Mills and his friends to abandon their determination to obstruct revenue legislation and to permit the tobacco-tax repeal to go through. Chairman Mills says that not to oppose the Cowles bill would be to surrender their whole position and abandon the doctrines of the St. Louis platform and the President's Message. He thinks that a contest is necessary in order to keep the party in line with the doctrines of a large majority of its own members. Should the Cowles bill get through the House it will be difficult to put it through the parliamentary routine of the Senate, as all the appropriation bills have not been disposed of.

In the House it is not Mr. Randall's purpose to call up his bill until the appropriation bills are finished. The larger share of the attention of the two Houses of Congress is so much absorbed and diverted by the approaching inauguration of the President-elect that it is difficult to press any measures except such as are indispensably necessary to the administration of the Government.

There has been considerable subsidence of extra session talk since the new States have been admitted. It will remain to be seen whether the reduction of the surplus revenues will be regarded by President Harrison as a sufficient reason for the calling of Congress into extra session.

OBITUARY.

COL. DAVID F. HOUSTON.

Col. David F. Houston, general manager of the Crozer Steel and Iron Company, at Roanoke, Va., and a member of the State Senate of Virginia, while on a visit to his cousin, Robert J. Houston, at Lancaster, Pa., on February 16, slipped and fell on the icy pavement, rupturing a blood vessel, and dying from hemorrhage in a few minutes. The deceased was a member of a prominent family of Eastern Pennsylvania. He achieved an honorable name as a soldier and as an intelligent and enterprising business man.

HENRY MC SHANE.

Henry McShane, senior partner of the house of William McShane & Co., manufacturers of plumbers', steam and gas fitters' supplies, and having headquarters in Baltimore, New York, Boston, Brooklyn and Washington, died suddenly at his residence, Mount Washington, on the 23d inst.

TRADE REPORT.

Philadelphia.

Office of The Iron Age, 220 South Fourth St. |
PHILADELPHIA, Pa., February 28, 1889.

Pig Iron.—The market does not show much buoyancy, but there are some indications of a reaction from the depression of the past two or three months. Holders have fixed their mind on prices which they appear to have determined shall be their minimum, and as consumers are confronted with absolute firmness, the conviction is gaining ground that as prices are not likely to be lower, there is no risk in placing orders at current rates. The tendency, therefore, is to select the best brands, so that in this direction, at all events, an early improvement is not improbable. There is plenty of Iron at from \$17 to \$18 delivered, for No. 1; \$16 @ \$17 for No. 2, and \$15.25 @ \$15.75 for Gray Forge. It is not every consumer that can afford to risk such qualities as may be available at the inside quotation, and by the same rule only standard and tried qualities command the outside figure. However, it is usually considered a good feature when prices can be quoted with confidence, and with the extreme variations limited to 50¢ or \$1 per ton, and this, we believe, may be done to-day, allowing a little more for premium on three or four brands, which are too well known to require specific mention. The feeling, therefore, may be regarded as very steady, and if similar reports come from the West, the trade are inclined to expect some good buying within the next couple of weeks. Things are not at a standstill by any means, but buying has been of that unsatisfactory character that it was impossible to form any definite idea as to its continuance. Orders were sent from time to time, according to immediate requirements, but nothing was taken for more than 30 days ahead. The consequence is that the majority of consumers have little or no Iron in their yards, so that they must buy if they intend to keep their hands employed. Should the outlook improve and prices show a firmer tendency, orders would double up at once. There is not much chance for materially higher figures, of course, but on a dull market buyers get various advantages which are not to be had when the turn is in the other direction. Hence, if buyers once get the idea that the market is on rock bottom, it is not much of a step to increasing activity, and from that to better prices. With so large a production, and with more or less uncertainty in regard to consumption, the disposition still is, in the majority of cases, to operate cautiously, although, as already stated, the conviction is becoming general that the lowest point of depression was passed two or three weeks ago, and the trade is disposed to regard the outlook as more encouraging than for some time past.

Foreign Iron.—There is nothing doing, although asking prices are firm as last week's quotations, viz.: Bessemer, \$19.50 @ \$20, c.i.f., duty paid. Spiegeleisen, \$28.25 @ \$28.50, c.i.f., duty paid, for 20%.

Blooms.—A good demand is reported at quotations as follows: \$28 @ \$28.50 at mill for Nail Slabs; \$29 @ \$30 for Sheet Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for Flange purposes; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 per "Bloom" ton of 2464 lb.

Muck Bars.—The demand is slow and prices irregular and unsettled. Some parties are offering Bars at \$26.50 @ \$27, delivered, while others ask \$27 @ \$27.50,

but in ordinary cases \$27 is considered a full quotation, although a sale was made as high as \$28 a few days ago for a special quality.

Bar Iron.—The demand for Bars is very unsatisfactory; large orders being scarce leaves little beyond a small day-to-day trade, which is barely sufficient to keep the mills employed on single turn. There are no inquiries from large consumers, and for the present prospects are not encouraging, although it is thought that with the incoming month business will probably take a new start. Country mills are said to be doing fairly on local orders, but prices are so low that there is no margin for profit, and in many cases it is thought that actual cost is not realized. Skelp orders are scarce, too, so that manufacturers feel very much discouraged. Prices are irregular, and Bars are quoted all the way from 1.70¢ to 1.85¢, according to circumstances. Skelp is nominal at 1.75¢ for grooved and 1.85¢ @ 1.9¢ for sheared, but no recent transactions are reported.

Plate and Tank Material.—The feeling in this department is very despondent. There is a fair amount of business doing, but Steel is so largely called for and is quoted at such low prices by Western mills that local concerns have scarcely a chance when a large order is involved. It is said that both bridge and ship builders will be heavy buyers some time next month, but with such a scarcity of work it will require a great deal of business before prices show much improvement. Nominal quotations are as follows: 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates, 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢. P. S.—An order for about 6000 tons is to be placed on the market in a day or two, chiefly for Plates and Angles, all Steel.

Structural Iron.—Orders for large lots are still in the future, and what little work is going on is chiefly on old contracts. Those directly engaged in this department say that a heavy demand may be regarded as certain, although it may be some time yet before it comes on the market. Financial arrangements have to be settled before anything can be done, but in the present easy condition of the money market there is not much doubt on this point, although there may be more or less delay in carrying them through. Meanwhile mills are only partly employed, and therefore quote low figures on anything that will tide them over until things improve. Quotations nominally as follows: Bridge Plate, 2¢ @ 2.1¢; Angles, 1.95¢ @ 2.5¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

Sheet Iron.—The demand is as good as can be expected at this season, and as a rule mills are getting a fair amount of work. Specialties are in very good demand, and the general report is rather more favorable than in other departments. Prices are about as follows for the best makes:

Best Refined, Nos. 26, 27 and 28....3 @ 3½¢
Best Refined, Nos. 18 to 25....2½¢ @ 3¢
Common, ¼¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28....4¼¢ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25....3¾¢ @ 4¢
Best Bloom Sheets, Nos. 16 to 21....3½¢ @ 3¾¢
Blue Annealed.....2.6¢ @ 2.8¢
Best Bloom, Galvanized, discount.....62½¢
Common, discount.....67½¢

Steel Rails.—As regards this market there is very little to report. Small lots are being taken at quoted rates, but large orders are scarce. The feeling is hopeful, nevertheless, as manufacturers feel somewhat confident that the demand will ultimately develop into a good deal larger business than that of 1888. The demand for Steel

in other shapes also helps them out considerably, so that, while the immediate demand for Rails is poor, the chances appear to favor improvement. Prices are fairly steady at from \$27.50 to \$28, at mill, according to size of order, time for delivery, &c.

Oil Rails.—Nothing doing in spot lots, which are held at \$24 and upward, or at \$23.50 for shipments. Sales for delivery at interior points are being made at from \$24 to 24.75, with a fair inquiry at inside figure.

Scrap Iron.—There is a little more demand, and prices are steady at about the following quotations: \$20 @ \$20.50 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice \$22; No. 2 do., \$14 @ \$15; Turnings, \$18 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Boring, \$9 @ \$10; Old Fish Plates, \$23 @ \$24; Old Car-Wheels, \$17 @ \$18, Philadelphia.

Wrought-Iron Pipe.—There is not much doing for immediate delivery and prices for such are unsettled, and for desirable orders somewhat easier. The demand for large Pipe promises to be very large during the spring months, but financial arrangements are not far enough advanced to permit of the orders being definitely placed on the market. For the ordinary run of business nominal discounts are about as follows: Butt-Welded Black, 55 %; Lap-Welded Black, 65 %; Butt-Welded Galvanized, 45 %; Lap-Welded Galvanized, 55 %; Boiler Tubes, 62½ %.

Nails.—Business is unusually quiet, and very little interest is manifested in it, beyond each mill retaining its own line of trade. Store lots are quoted \$1.90 @ \$2, and while there are plenty of cheaper Nails in carload lots very few seem to be wanted. The feeling among manufacturers is a little better, and efforts will be made to maintain remunerative prices when the spring trade opens.

Cleveland.

CLEVELAND, February 25, 1889.

Iron Ore.—Inquiries from consumers are now coming in quite freely, and offers are known to have been made for Ore in large quantities. Until, however, the mining companies establish formal quotations no active buying movement is looked for. Neither the mine owners or the furnacemen can explain the delay in opening the market. Prices have been practically determined, and many buyers are of the opinion that the total output of the mines will be taken. These conditions would seem to warrant an immediate beginning of business, but the only activity now discernible is confined to the exchange of letters, in which the amount of Ore likely to be consumed is more frequently discussed than the question of prices. Apprehensions regarding Bessemer Ores have been in some degree removed by continued favorable reports from the Rail manufacturers. Eastern furnacemen have been offered Ore within the past week on favorable terms, and it is quite probable that the first heavy sales will be in that direction. Vesselmen are still quite confident of being able to maintain last season's schedule of lake freights, but everything indicates the contrary. It has been announced during the past week that the \$1.25 charters from Ashland to Cleveland cover 125,000 tons of Ore. The permanent rate from the head of Lake Superior to Cleveland will likely be \$1.40, a rate that not only means fair profits to the mine owners, but permits the vesselmen to earn fair dividends upon their investments. All of the mining companies are waiting for the Republic, Champion, Cleveland and Chapin mines to fix prices, after which business will go forward with a rush. A

half dozen small lots of Ore on the docks have been sold during the week at \$4.20 for non-Bessemer Hematites, and \$4.15 @ \$4.20 for non-Bessemer Menominee. About 27,000 tons of Ore have been shipped to the furnaces since the last report.

Pig Iron.—The market retains the encouraging features noted last week. Evidence is not lacking that Standard Irons, having reached bottom figures, are again advancing both in demand and price. More Iron was probably sold by local dealers last week than for any other seven days since December. Consumption and production are once more becoming equalized, and the outlook is regarded on every side as hopeful. Mill Irons are 25¢ @ 50¢ more per ton than in January, and sellers seem quite determined to make no further unnecessary concessions.

Scrap Iron.—Old American Rails may now be quoted at \$21 @ \$21.50, with a few small sales reported at the latter figure. Stocks are accumulating.

Nails.—The market is quite firm, with indications of better prices within 30 days. Steel Wire Nails at \$2.40 are in fair demand.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, February 25, 1889.

Pig Iron.—There has been very little change in the local market for Pig Iron during the week. There have been but few, if any, developments which have influenced the markets, either for better or for worse. Prices have remained steady, as a rule, but there have been instances where very low rates have been made for a few hundred ton lots, which has contrasted strongly with the confidence indulged in for some makes of Iron. However, the general impression has been that the market has given evidence of improvement, although the volume of business has been only moderate and there is an absence of large trades. The transactions which have been made have been of small amounts and well distributed, the demand showing but little preference for either Forge or Foundry grades. The large sales of Car-Wheel Iron last week have not been repeated during the week under review. Among the larger sales have been 1000 tons No. 1 Southern Foundry at \$15, and 500 tons Virginia Iron equivalent to \$16.75 here. The following are the approximate prices current here at the close for cash, f.o.b.:

Foundry.

Southern Coke, No. 1 (new classification).....	\$15.00 @ \$15.50
Southern Coke, No. 2 (new classification).....	14.50 @ 14.75
Southern Coke, No. 3 (new classification).....	14.00 @ 14.25
Ohio Soft Stone Coal, No. 1.....	15.00 @ 15.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.00
Mahoning and Shenango Valley.....	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.00
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

Forge.

Strong Neutral Coke.....	13.00 @ 13.50
Mottled Neutral Coke.....	12.50 @ 12.75
Gray Forge.....	13.00 @ 13.25

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	21.00 @ 22.00

Manufactured Iron.—The market for both Plate and Bar Iron has been quiet, but the market has remained steady.

Nails.—There has been a moderate demand, which has been readily met at previous prices: 12d @ 40d sell at \$1.90 @ \$1.95 ¢ keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$1.95, and Steel Wire Nails at \$2.60 @ \$2.65 ¢ keg.

Old Material.—The market has been without animation. Old Rails have been offered to a moderate extent at \$22, but

difficult to sell over \$21.50, cash. Old Wheels have met little demand, and ruled easy at \$18 @ \$18.50 ¢ ton, at present delivery.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, February 25, 1889.

Pig Iron.—It appears to be the general opinion among the producers that the worst is over. It is certainly a fact that producers are feeling much better than they were some two or three weeks ago, and are declining offers that are being made now, but which they would have entertained then, and are asking an average of 50¢ to 75¢ more per ton. On Friday last one of our Birmingham stacks sold 1100 tons No. 2 Foundry for \$12.80, cash on cars, and a sale of 500 tons of No. 1 by another furnace, to go to New York, was made at \$13.80, net cash in 30 days. The same furnace was solicited to duplicate the transaction, but declined to do so. A careful inquiry among a number of furnace owners developed about the same condition of feeling. Upon the subject of storage and warrant enterprise there is still a difference of opinion among producers as to its effects upon prices. The fact is that most of them are looking upon it with a feeling of indifference, and there is not the interest being taken in it that its promoters anticipated. The writer has yet to meet any producer who intends putting up a ton of their production and availing themselves of the warrants to raise money; still, if the project should materialize successfully there will probably be occasionally round lots placed and warrants issued for the purpose of raising money, but the project is creating no particular enthusiasm. There is another feeling among the Southern producers which so far has had but little mention, and that is they are averse to prices advancing more than \$1 to \$2 ¢ ton. The points that they make in their arguments are not worth while to mention, but, nevertheless, they exist, and from their standpoint are apparently well taken. There are very few producers in the South but what are enthusiastic as to the future of the Southern Pig Iron business, and as one of the best evidences of their convictions three of the largest and most successful concerns are now making arrangements to add two stacks to each of their plants, while the Eureka, at Oxmoor, has already commenced the erection of two more stacks to their present plant of two furnaces. Under the present conditions of the Pig Iron business, of the prospects of overproduction and present low prices it may seem premature to state that during the next five to seven years there will be not less than 25 additional furnaces erected in the Southern Iron-producing districts, and they will be of the very largest capacity and better equipped, if it be possible, than any yet built. During the past year the improvement of the better class of furnaces has been very great in economy of working as well as quality and quantity of their output, which has been very encouraging to their owners.

St. Louis.

Office of *The Iron Age*, 212 N. Sixth st., ST. LOUIS, February 23, 1889.

Pig Iron.—The market continues in an unsettled condition, and there are no transactions of any interest to report. More inquiry is reported, especially from manufacturing consumers, and indications point to an improving market with the advent of the spring months. Consumption is not large, but orders are coming in regularly, but in a small way, yet in the aggregate sufficient to prevent any large accumulation of stocks. Prices show no

change from last week, and the figures quoted below are generally adhered to, except in isolated cases. Furnaces seem disposed to maintain prices, and shrewd buyers are picking up odd lots whenever the opportunity presents itself. We quote as follows, for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry, \$15.25 @ \$15.75	
Southern Coke, No. 2 Foundry, 15.00 @ 15.25	
Southern Coke, No. 3 Foundry, 14.25 @ 14.75	
Gray Forge.....	13.50 @ 13.75
Ohio Softeners.....	17.50 @ 20.00
Lake Superior Charcoal.....	21.00 @ 21.50

Missouri.

Charcoal Foundry, No. 1.....	16.00 @ 16.50
Charcoal Foundry, No. 2.....	15.00 @ 15.50

Tennessee.

Charcoal Foundry, No. 1.....	17.50 @ 18.50
Charcoal Foundry, No. 2.....	16.75 @ 17.50
Connellsville Coke, f.o.b. East St. Louis, \$4.70; St. Louis, \$4.85.	

Bar Iron.—A small amount of business is being transacted at current rates. Sales are small and prices are steady, although in some cases sales are made that are considered to be pretty close to cost. Lots from store are quoted at 1.85¢ @ 1.90¢, according to quantity and quality.

Barb Wire.—The active demand which has characterized this department for some time past continues to be the feature, and it now looks as if there will be no cessation of work, as inquiries are coming in for some good-sized lots for delivery in the early spring. The open winter has enabled farmers to do considerable fence building, and the stock of Wire in the hands of retailers has been pretty well cleaned up. Prices, however, fail to show any improvement, although it is doubtful if any concessions would be made on the figures quoted herewith, even on the most desirable orders. Carload lots Two and Four Point Painted, \$2.90; carload lots Two and Four Point Galvanized, \$3.50, f.o.b. St. Louis; less than carload lots, 5¢ additional.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave., PITTSBURGH, February 23, 1889.

There has been nothing particularly new developed in the general Iron situation during the past week, with the exception of an increased movement in the raw article, which it is believed will lead to an improved demand for the products.

The failure of the Grand Lake Coal Company, reference to which was made in our last report, demonstrates that Southern coal is to a considerable extent supplanting Pittsburgh coal in some of the leading Southern markets. The failure of the company in question was in part caused by the losing of large Southern contracts, one of which was with the Morgan Steamship Line, at New Orleans. It has demonstrated that for general use, with the exception of gas, coal of Georgia and Alabama is about equal to that of Western Pennsylvania, and the cost of transportation is so much less that the Southern coal has the advantage in Southern markets. The river coal operators here are very much interested in having the National Government buy out the Monongahela Navigation Company and make the Monongahela River free of tolls. Our coal operators say they cannot compete with Southern coal in the South unless relieved of these oppressive tolls, and it is a matter in which the Southern people are very much interested.

Pig Iron.—There has been a considerably increased movement in Mill Irons the past week. Sales of several thousand tons have been made, some of them for future delivery, and the market, as might be expected, has stiffened up considerably. Nearly all the Iron in question reported was upon a basis of \$14.25, cash, for Gray Forge, but some furnaces are now refusing to make additional contracts at that price.

Bessemer Iron is also firmer, with some considerable inquiry. There has been an offer on the market for some days for a lot of 4000 tons at \$16.50, cash, without finding a seller, whereas a few weeks ago there was a large contract made at \$15.25, cash. Mahoning and Shenango furnaces are refusing to sell now in this market, and nearly all the business here for some months past has been done by city furnaces, who, some people think, are making an effort to shut outside furnaces out of this market, and, whether intentional or not, with considerable success this winter. Foundry Irons continue dull. We quote prices as follows:

Neutral Gray Forge.....	\$14.25 @ \$14.50,	cash.
All Ore Mill.....	15.00 @ 15.50,	"
White and Mottled.....	13.50 @ 14.00,	"
No. 1 Foundry.....	16.00 @ 16.50,	"
No. 2 Foundry.....	15.50 @ 16.00,	"
No. 1 Charcoal Foundry.....	22.50 @ 23.00,	"
Cold Blast Charcoal.....	25.00 @ 26.00,	"
Bessemer Iron.....	16.50 @ 16.75,	"

Muck Bar.—There has been little or nothing done the past week, and while there is not much offering the demand is light, and prices remain about as last quoted, \$27, cash. It is expected that there will be an improved demand before long, and, if so, a stronger market will doubtless be the result.

Spiegel.—Demand continues light, while prices remain unchanged. Small sales at \$28 @ \$29 for 20 % Ferro-manganese; 80 %, \$56 @ \$57, cash.

Manufactured Iron.—The market is still far from being what may be termed active, but there is more inquiry, and the indications are that business will improve from now on. Large buyers who have been holding off in order to buy at the lowest notch are now beginning to feel around, having about arrived at the conclusion that the time for placing their orders is near at hand. Prices remain unchanged. Bars at 1.70¢ @ 1.80¢; Plates, 2.1¢ @ 2.20¢; No. 24 Sheet, 2.70¢ @ 2.80¢, all 60 days, 2 % off for cash. Skelp Iron continues very low. Sales of Grooved are reported as low as 1.65¢, and Sheared at 1.90¢.

Wrought-Iron Pipe.—There is a continued fair business for the season, but prices continue unsettled, and, to makers, unsatisfactory. It is said that some of the Eastern mills have sold recently below prices quoted, and if so it is evident that they are hard up for business. Discounts may be fairly quoted as follows: On Black Butt-Welded Pipe, 57½ and 5 %; on Galvanized do., 55 %; on Black Lap-Welded, 67½ and 5 %; on Galvanized do., 57½ %; 2-inch Tubing, 11¢ ½ foot net; ¾-inch Casing, 85¢ ½ foot net; Boiler Tubes, 65 % off regular list.

Old Rails.—There have been no sales reported since our last; there is more inquiry, and sellers are inclined to the belief that as soon as the demand fairly set in there will be a considerably stronger market. The work of lifting has been suspended for several weeks past owing to the hard freezing weather; the visible supply is growing less; stocks in hands of consumers generally are much reduced.

Steel Rails.—Heavy Sections are still quoted at \$28 @ \$28.50, cash, at mill, but there is not much doubt that a desirable order could be placed for considerably less; the prices quoted are no doubt intended for small lots.

Blooms, Billets, &c.—Bessemer Steel Blooms and Billets are still quoted nominally at \$27.50 @ \$28, and Slabs at \$27 @ \$27.50; Domestic Bloom Ends, \$17.50 @ \$18, and Crop Ends, \$18 @ \$18.50.

Railway Track Supplies.—There has been no change in prices for a considerable time. Spikes, 2.10¢, 80 days, f.o.b. at works; Splice Bars, 1.70¢ @ 1.80¢; Track Bolts, 2.75¢ with Square and 2.85¢ with Hexagon Nuts.

Old Material.—Demand continues light and prices are offish. No. 1 Wrought Scrap, \$20 @ \$20.50; Wrought Turnings, \$18 @ \$18.50; Car Axles, \$24.50 @ \$25; Cast Scrap, \$14.50 @ \$15, gross; Cast Borings, \$11 @ \$12; Old Car-Wheels, \$19; Old Steel Rails, \$17.50 for short and \$20 for long lengths.

Detroit.

WILLIAM F. JARVIS & Co., successors to Chas. Himrod & Co., under date of Feb. 25, 1889, report as follows: While the situation remains practically the same as a week ago, there was one sale of 5000 tons of Southern Gray Forge and No. 8 Foundry made in this market during the week at the lowest price that has been made here for several years. The deliveries are to run through 10 months, beginning April. The majority of Southern furnaces refuse to name any such prices, but a few are evidently compelled to realize on their output, and this buyer, being a very desirable customer, was able to obtain the Iron at a very low price. Numerous inquiries for Lake Superior Charcoal are being made, and some buyers claim that a few furnaces are willing to shade quotations, but the best brands are held firm, and makers prefer to lose the orders rather than reduce prices. We quote for the present as follows:

Lake Superior Charcoal, all numbers.....	\$19.50 @ \$20.00
Lake Superior Coke, all ore.....	18.75 @ 19.25
Lake Superior Coke, cinder mixed.....	17.75 @ 18.25
Standard Ohio Black Band.....	18.75 @ 19.25
Southern No. 1.....	17.00 @ 17.50
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	16.50 @ 17.00
Jackson County (Ohio) Silvery.....	18.25 @ 18.75
Old Wheels.....	18.50 @ 19.00

New York.

Office of *The Iron Age*, 66 and 68 Duane street, NEW YORK, February 27, 1889.

American Pig.—A fair amount of business is being transacted, and sellers generally insist that the tone of the market is better. It is a fact, however, that very low offerings continue to be made, notably of No. 2 Foundry. These are not to be confounded with Irons too low in silicon for Foundry purposes, which have been seeking a buyer for some time past. In fact, a lot of 1500 tons of such Iron is now in the market at a low figure. The Thomas Iron Company report having sold 12,000 tons of Gray Forge at \$14.75 at furnace. We continue to quote for standard brands Northern Iron No. 1, \$17.50 @ \$18; No. 2, \$16.25 @ \$17, and Gray Forge, \$15 @ \$16, all at tidewater.

Scotch Pig.—We quote: Coltness, \$20.50 @ \$21; Shotts, \$20 @ \$20.50; Langloan, \$20 @ \$20.25; Summerlee, \$20.25 @ \$20.50 and Dalmellington, \$19.25 @ \$19.50.

Plates.—We quote Iron Tank, 2¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3¼¢ @ 4¢.

Structural Iron.—We quote Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 2¢ @ 2.10¢; Tees, 2.4¢ @ 2.6¢, and Channels and Beams, 2.8¢ on dock for all sizes.

Bar Iron.—We quote: Carload lots on dock, half extras, Common, 1.65¢ @ 1.7¢; Medium, 1.7¢ @ 1.75¢, and Refined, 1.75¢ @ 2¢.

Steel Rails.—We note sales during the week aggregating between 18,000 and 20,000 tons by Eastern mills, chiefly to Eastern roads, about one-half of the quantity being taken by a coal road. Reports of low figures keep cropping up, but on the whole the active Eastern mills are firmer,

and are asking \$27 and upward. On the 1st of April the allotment is to be readjusted, the works which have sold no Rails or only a part of their quota yielding it.

Merchant Steel.—The demoralization in Merchant Steel continues. Spring Steel has sold in small quantities to consumer at 2.20¢, delivered, cut to length, four months flat, and 2¢ has been shaded for delivery in large quantities. Planished Machinery Steel has sold, delivered at Boston, at 1.90¢ for large quantities.

Spiegeleisen.—We note a recent sale at private terms to a mill in the Pittsburgh district of about 1000 tons. We quote \$27.50 @ \$28 for English Spiegeleisen, ex-ship.

Billets.—There is only a very light demand for Foreign Billets and Slabs, a part of the purchases being made for manufacturing Barb Wire and Nails for export. Basic Billets are quoted \$31.50.

Wire Rods.—Negotiations are pending for a fair-sized order. The market is a little off, there being some pressure to sell which tells in the narrow market which there now is for Foreign Rods. The only business of any consequence done lately was the sale of between 2500 and 3000 tons for the Pacific Coast. Domestic Rods are selling at Pittsburgh for \$41.50, so that at the same price at tidewater for Foreign Rods there is not any chance for any business inland.

Old Rails.—During the past few days the market has been very quiet and dull. There had been sales previously, aggregating about 4000 tons, part Southern Rails shipped to this port, and part Rails from store here. We quote \$23 @ \$23.50.

Scrap.—We note a sale of 200 tons of American No. 1 at \$22, on cars at Jersey City.

Rail Fastenings.—We continue to quote Spikes at \$2 @ \$2.10, delivered in large lots. Angle Bars are 1.75¢ @ 1.85¢, delivered. Steel Angles are coming into the market in increased quantities.

Metal Market.

Copper.—At the time of our last week's report spot Chili Bars and Good Merchantable were quoted in the London market £80, gradually declining to £79. 10/ yesterday, and futures of both from £75 to £67, which demonstrates the weak feeling on the other side as regards coming developments in connection with the syndicate. Sales in London aggregate 1000 tons for the week. It appears that a violent attack is just now being made in London by outside operators on everything connected with syndicate matters in the Copper trade, and that these parties are selling boldly the three months' futures at the present low quotation and all the year as low as £58. Here in the meantime absolutely nothing of interest occurred. The few lots obtainable from outside parties of Lake Copper, 16¼¢ to 16½¢, have to be paid for, while casting brands are obtainable at 15¼¢ to 16¢. This morning, London declined with spot Good Merchantable from £79. 10/ to £78. 10/, and futures from £67 to £66. Best Selected remained unaltered during the week at £79. 10/. Our own market closed steady at 17¢ @ 16¼¢, for Lake on the spot. On February 24 it was cabled from Paris that the formation of the Compagnie Auxiliaire des Métaux had finally taken place, that the shares thereof had not been offered on the market, having all been taken by the founders of the company themselves, who held their first meeting on Thursday last, on which occasion it was shown that 25 per cent. of the capital subscribed for of 40,000,000 francs had been paid in. Messrs. Hentsch, Masson and Quiedeville have been appointed managers for six years to come, and

Messrs. Danfert and Secrétan auditors. The Paris correspondent of the *Hamburg Börsenhalle* wrote, under date February 9: The negotiations between the Paris and English members of the Copper syndicate are still proceeding on the following basis: A French company is to be formed with a capital of 40,000,000 francs, which company at the same time is to be authorized first to issue 40,000,000 francs of bonds and furthermore 40,000,000 francs of bonds. This would constitute a capital of together 120,000,000 francs. But this is not enough, inasmuch as the *Société des Métaux* insists emphatically that the syndicate should authorize an additional issue of 100,000,000 francs in so-called warrant bonds. This issue is proposed to be made by the new company at a suitable moment in order to enable the same to carry the Copper monopoly to a safe issue. The total capital to be thus created would consequently finally reach the enormous amount of 220,000,000 francs, which it is true would enable the parties to pay for 110,000 tons of Copper and store them away. The idea of dividing the stock, a thing which heretofore was looked upon as so very important, would be dropped if the above financial plan were to be carried out, but this appears to be a matter pushed into the background by the fact that for a couple of weeks past the syndicate succeeded in selling some large lines of Copper. I am informed that the 40,000,000 francs of capital stock of the new company have been subscribed for, the greater portion of it, among others, by those English firms that took such a lively interest in the matter when it was first broached; it is therefore all the more to be regretted that the form of an English syndicate should not have been adhered to. I may also add that Baron Hirsch has made considerable advances to the *Société des Métaux* on Copper warrants, and that from all appearances the company is now financially stronger than it has been at any time previously. The company's shares are worth 547 francs to-day. The import of American Copper into Liverpool and Swansea from January 1 to February 16 has been 4576 tons Fine, against 3985 during the corresponding period of last year.

Tin.—Tin closed a week ago at £94. 7/8 for spot, winding up yesterday at £95, while futures advanced from £95. 2/8 to £95. 17/8, the sales made summing up 700 tons. In our own market there has been a good deal of irregularity, but more doing, some 50 tons changing hands soon after the first advance in London at 21.30¢ in the open market for spot, and on the Metal Exchange 10 tons March at 21.10¢, and 20 tons April at 21.30¢ @ 21.35¢, followed by sales of 40 tons spot at the Metal Exchange at 21.40¢, 10 tons March at 21.35¢, and 10 tons May at 21.50¢, sales in the open market at the same time summing up 100 tons at 21½¢ @ 21¼¢ on the spot. The exports of tin from the Straits Settlements to the United States last year amounted to 62,310 piculs, against 70,916 in 1887; 82,015 in 1886, 48,989 in 1885, 59,901 in 1884 and 114,284 in 1883. This morning London improved from £95 to £95. 10/ on the spot, and for futures from £95. 12/8 to £96. 5/-. In our own market 10 tons March sold this morning at 21.55¢, and spot closes at 21½¢ @ 21¼¢. **Tin Plates.**—While our own market has continued the reverse of active, leaving last week's quotations unaltered, Liverpool has been stiffening up in sympathy with steel plates, coal, oil, &c., and it now looks as though those parties who have been holding back orders for lower prices were not going to gain their point. We quote, large lines, per box: Siemens-Martin Steel, Charcoal Finish, \$4.75 @ \$5.50; Terns \$4.12½ @ \$4.25; Coke Tins, \$4.22½ @ \$4.30, and Wasters \$4.12½

@ \$4.15. The quotation in Liverpool is unchanged at 13/ for Coke Tin.

Lead.—Sales in the open market have been limited to 200 tons Common Domestic, all told, at 3.70¢ @ 3.75¢, the metal being held with greater firmness; but consumers, sufficiently stocked to meet the light demand for their manufactures, not feeling disposed to subscribe to any further advance. St. Louis has been quiet at 3.55¢, and our closing price to-day on a firm market is 3.70¢. London for the week remained at £12. 10/ for Soft Spanish and £12. 15/ for English Pig.

Spelter.—Has remained featureless, pending a revival in the spring demand, delayed by untoward weather. The Western market remained tolerably firm, while here the quotation for ordinary brands does not vary from 5¢, Silesian being neglected at 5.75¢. In London Silesian improved from £17. 7/ to £17. 10/.

Antimony.—A steady local demand has caused continual firmness in Cookson at 13.25¢, while Hallett has improved to 12¢, both being scarce and well held.

New York Metal Exchange.

The following sales are reported:

TUESDAY, February 26.	
40 tons Tin, spot.....	21.40¢
10 tons Tin, March.....	21.35¢
10 tons Tin, May.....	21.50¢
WEDNESDAY, February 27.	
10 tons Tin, March.....	21.55¢
80 tons Tin, April.....	21.55¢
10 tons Tin, April.....	21.40¢
10 tons Tin, March.....	21.40¢

Coal Market.

The Anthracite Coal trade is stagnant, making necessary a further restriction of production. For the week ending February 23 the total shipments from the mines comprised 505,197 tons, a reduction of 60,000 tons compared with the previous week and 157,000 compared with the corresponding week last year. Since January 1 the aggregate is 4,302,319 tons, against 4,573,682 tons for the same time in 1888. The situation causes much perplexity among the Coal operators, and will be the subject of an early conference with reference to prices and production. An official of one of the large corporations argues that the presidents or general managers of the Coal-producing interests should personally direct in these matters. He says "that some of the sales agents do not seem to consider whether or not the prices at which they offer to sell Coal will enable the managers to pay the interest on the debts of their companies or afford the stockholders any dividends; and, besides, they not being directly responsible to the owners of the Coal properties and railroads, take advantage of their position to cut and slash prices whenever it suits their own fancy, in order to effect sales, irrespective of the question of profits." A letter from Shamokin, Pa., of February 24, speaks of great suffering among the miners. The writer says: "Some idea of the general situation throughout the Schuylkill region may be obtained when it is known that of the 56 collieries operated by the Philadelphia and Reading Coal and Iron Company less than 20 are in operation, and but a few of these are working full time. This means that at least 20,000 of the workers in and about the mines of the Philadelphia and Reading Coal and Iron Company are now and have been for nearly ten weeks in enforced idleness, and as their condition is generally about the same as the condition of the miners and mine-workers here and at Mount Carmel the actual distress throughout the Schuylkill region may be approximated. It is estimated that in all there are not less than 30,000 to 40,000

miners and mine-workers in all the lower or Schuylkill region without work and without money."

At Philadelphia four of the Reading steam colliers are laid up and their crews discharged, trade being virtually at a stand-still, a well-known shipping man remarking that there is now more Coal at Port Richmond than before for 30 years. In the old Lehigh region the Coal and Navigation Company have closed all their collieries. New York sales agents still quote the regular schedule prices. Freight rates are all down, lower than a year ago.

The Government purchased 2000 tons of Coal from C. G. Barber & Co. of this city, at \$3.62½ per ton, for Samoa.

The internal dissensions in the Clearfield Consolidated Coal Company were on Saturday last carried into Court of Common Pleas at Philadelphia, but on Tuesday resulted in the appointment of the Guarantee Trust and Safe Deposit Company as receiver for the company.

The Bituminous Seaboard Association is said to have agreed upon the percentages of production for tidewater shipment. Several contracts have been closed in Boston.

Financial.

Now that a new Administration is about to be inaugurated at Washington, an interesting question arises respecting the future disposition of the Treasury surplus, but it is assumed that bond purchases will continue as in the past. The volume of trade through the country at large is increased, but there is reason to suspect that the improvement is mainly confined to speculative circles. Even with this abatement the indications are generally good and warrant a more confident tone. The movement of merchandise is larger, both by rail and by the ocean carriers. Exports of provisions are particularly heavy. The clearances from all Atlantic ports of provisions last week comprised 11,831,615 lb lard, which is larger by 8,000,000 lb than in the corresponding week of last year, and 6,573,917 lb of bacon, which is greater than last year by 1,500,000 lb. The tramp steamer *Kong Alf* reports having run the Haytian blockade at Gonarves, disposing of flour and potatoes at \$17 ¢ barrel; do. pork, \$30 ¢ barrel. In flour there is more export buying and there are fair orders for wheat for the United Kingdom, which is an agreeable change. Cotton is in more demand by British spinners. Coffee is supposed to be in a stronger position and sugar has a hardening tendency. Dry goods jobbers speak of the spring trade as opening auspiciously, with favorable reports from other centers.

The stock market was affected by contradictory reports from Chicago regarding the probable outcome of the efforts to form an interstate railway association, and it was not until Thursday evening that the news came that the presidents had decided to organize without the aid of the dissenting roads. Friday being a holiday, the news, although favorably received, did not have its full effect on Saturday. The Northern Pacific and the Union Pacific agreed to make an arrangement by which the lines in Oregon and in Washington Territory are to be operated by trustees. It is reasoned that with 18 roads active members, with another road in sympathy with it, and three remaining roads more neutral than inimical, the new association has promise of stability. Moreover, the trunk lines are believed to be well organized. Chairman Cooley is said to have recently expressed the opinion that the time for cautioning, counseling and advising railway men not to break the law had passed, and that prompt measures to exact the penalties provided by the national statute were all that was left to the

men who were authorized and directed by Congress to see that the law was observed and that offenders were punished. The coal shares were depressed by a resolution of the mining companies to suspend operations two days each week, some of them closing their collieries indefinitely.

United States bonds are quoted as follows:

U. S. 4½, 1891, registered.....	107½
U. S. 4½, 1891, coupon.....	109
U. S. 4, 1897, registered.....	128½
U. S. 4, 1897, coupon.....	128¾
U. S. currency 6s.....	120

The weekly bank statement from the clearing house in this city shows an increase in deposits of \$211,000, an expansion in loans of \$951,800, and a decrease in specie and legal tenders combined of \$1,502,700. The banks now hold \$15,740,150 above the 25 per cent. required by law, against \$15,200,425 in 1888, and \$11,393,000 in 1887. The currency movement was light. The low rates for money on call, and the heavy disbursements each month for interests and dividends create a demand for all good securities. On March 1 the Treasury will pay out interest then due on about \$170,000,000 4½ per cents, and the disbursements by railroads and other corporations at this center will reach a large total. In Boston alone they are estimated at nearly \$6,000,000. Quotations are 3½ for 60 to 90 days, 3¼ for four months and 4½ for longer dates. The demand for commercial paper is in excess of the supply. Railroad earnings show an improvement since rates have been maintained west of Chicago. An event in the financial world was the death of millionaire Flood, of California. Stocks which Flood in bonanza days sold for \$900 per share are now freely offered at \$5 and \$8. The two mines that paid \$46,000,000 in dividends are now consolidated. Wm. G. Bates was appointed receiver for the L. M. Bates Company. The old charges of discrimination against the trade of New York by through bills of lading from Western points to European seaports are again being heard. By this means grain can be delivered in Liverpool 2¢ or 3¢ cheaper than it could be if bought in New York and forwarded from here. The Treasury at Washington received on Saturday from the Philadelphia mint 2,000,000 standard silver dollars, the weight of which is 59 tons. The number of silver dollars now in the vault is 86,000,000, which is equivalent to 2887 tons.

Sterling exchange was firm at \$4.89½ for short, slightly below the gold exporting point. In London discount rates are softening, owing to impending gold arrivals from South America and largely increased arrivals from Australia. The total clearings of 42 cities for the week ended February 23 show an increase of 19.9% compared with last year, and 28.5% the previous week. Outside of New York the gain was 9.7%. New York increased 25.2; Boston, 17; Philadelphia, 13.3; Chicago, 5.7; Pittsburg, 8.3; Cincinnati, 9.6; Kansas City, 23.2; Milwaukee, 22.3; Omaha, 4.1; Denver, 26.8; Galveston and Duluth, 100%. St. Louis, San Francisco, Baltimore, New Orleans, St. Paul and Minneapolis all show a slight decrease. The Director of the Mint submitted to Congress his report on the production of gold and silver in the United States during the calendar year 1888. The gold product was 1,644,927 fine ounces of the value of \$33,175,000. This is about the same as in 1887. The silver product was 45,783,632 fine ounces, of the commercial value of about \$43,000,000, and the coin value of \$59,195,000. This is an increase of 4,515,327 fine ounces over the product in 1887. At the highest price of silver during the year the bullion value of the silver dollar was 75.5¢, and at the lowest price, 70.5¢. The director estimates the consumption of gold and silver in the

industries in the United States during the calendar year 1888 to have been: Gold, \$14,600,000; silver, \$3,280,000.

The imports of merchandise at this port during the week were valued at \$8,951,000, of which \$3,365,000 represents dry goods. Since January 1 the total is \$79,114,000, against \$75,902,000 for the same time last year and \$71,000,000 in 1887. The imports of specie were \$187,000 and the exports \$1,357,408. Since January 1 the exports of specie amount to \$5,242,000, as compared with \$4,204,000 for the same time in 1888.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, February 27, 1889.

During the early portion of the week large quantities of Chili Bars and Good Merchant Copper were purchased for syndicate account at £78. 10/. Afterward the syndicate agents raised their bids 17/6, carrying the price up to £79. 7/6. This brought out considerable demand from the "bears" for prompts for covering of short sales, the syndicate brokers then withdrawing. Outside holders have benefited largely by the advance, and are at present holding what few warrants they have left. Purchases for consumption have been small and are still restricted by the uncertain tone of the market. The opinion is entertained that the syndicate does not intend any movement in the direction of cornering the market, but will keep prices on a fair level. Three months' futures are still at a considerable discount and quoted to-day at £68.

After dropping to £93. 10/ the Block-Tin market has reacted sharply, the reported heavy shipments and the small buying for consumption having been offset by substantial support from large operators. Higher prices cabled from the States also assisted in the reaction, and the market still shows an advancing tendency.

Business in Tin Plate has been confined mainly to the purchase of a few special descriptions, mainly Steels, at 13/6. The general situation of the market is practically the same as a week ago. It is stated that the Wallesey Works will be erected at Liverpool.

The demand for Pig Iron of all descriptions has improved still further, and prices are again higher, with the tendency still upward. Scotch Warrants have advanced to 43/, and Makers' Brands are 1/ @ 2/ higher to-day than during the middle of last week. Hematites have also moved up 6d @ 1/ during the week, and Middlesboro' Pig is a good 1/ higher.

Old Material of all descriptions continues in slow demand, and it is believed that lower rates than those generally quoted have been accepted.

There have been no important changes in the market for Steel, as far at least as prices are concerned, and business continues quite brisk. The trade in Manufactured Iron is fairly active and at previous prices.

Cleveland Pig.—Dealings have been on a large scale, and prices show a further advance. No. 1 Middlesboro', G.M.B., 38/6; No. 3 ditto, 36/.

Bessemer Pig.—Sales have been made at 6d rise, and a further 6d advance is asked. The demand continues brisk. West Coast brands, mixed numbers, 46/6 @ 47/, f.o.b. shipping point.

Scotch Pig.—Business continues active, and prices are strong at the advance.

No. 1 Coltness, f.o.b. Glasgow.....	54/
No. 1 Summerlee, " ".....	55/
No. 1 Gartsherrie, " ".....	51/
No. 1 Langloan, " ".....	52/6
No. 1 Carnbroe, " ".....	45/6
No. 1 Shotts, " at Leith.....	54/
No. 1 Glengarnock, " Ardrossan.....	49/
No. 1 Dalmellington, " ".....	45/
No. 1 Eglinton, " ".....	49/6
Steamer freights, Glasgow to New York, 5/;	
Liverpool to New York, 10/.	

Spiegeleisen.—The market remains very firm, and is fairly active. English 20% quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—Although not as active as last week the market is lively, with prices firm. Heavy sections quoted at £4. 5/, and light sections £4. 10/ @ £4. 17/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—A fair business passing, but prices somewhat irregular. We quote £3. 17/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—There continues to be a good trade in these at firm prices. Bessemer, 2½ x 2½ inch, £4. 5/, f.o.b. at N. W. England shipping point.

Steel Slabs.—Somewhat larger sales reported, but at irregular prices. Bessemer, £3. 17/6, f.o.b. at N. W. England shipping point.

Old Rails.—The market remains quiet, with previous prices asked. Tees quoted at £3. 5/ @ £3. 6/, and Double Heads, £3. 8/ @ £3. 10/, c.i.f., New York.

Scrap Iron.—A moderate business doing at unchanged prices. Heavy Wrought quoted at £2. 2/6 @ £2. 7/6, f.o.b.

Crop Ends.—Only moderate sales making and prices unchanged. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

Tin Plate.—The market continues quiet. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/9 @ 16/3
IC Bessemer Steel, Coke finish.....	15/6 @
IC Siemens " ".....	15/9 @
IC Coke, H. V. grade.....	13/ @ 12/3
Charcoal Terne, Dean grade.....	12/6 @ 13/

Manufactured Iron.—Business still of good volume. Prices show slight changes. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars.....	£ s. d. 2 5 0
Common " ".....	5 12 6 @ 5 15 0
Staff. Bl'k Sheet, singles.....	7 12 6 @
Welsh Bars (f.o.b. Wales).....	5 0 0 @ 5 2 6

Copper.—The market showing better tone, but rather quiet. The quoted prices are: Chili Bars, £79. 10/ for spot, and £68 for three months futures. Best Selected, £79 nominal.

Tin.—The demand fairly active and the market firm. Straits quoted at \$95, spot, and £95. 15/ for three months' futures.

Lead.—There has been only a moderate trade. Quoted at £12. 10/ for Soft Spanish.

Spelter.—The market stronger and more active. Quoted at £17. 10/ for ordinary Silesian.

It is reported that Merion Furnace West Conshohocken Pa., has chilled.

Digitized by Google

Hardware.

During the present month a good business has been done and it draws to a close with a general activity which should be in volume generally satisfactory. Most houses, including jobbers, commission merchants and manufacturers, report the month's business as being slightly in excess of last February's, but complaint is often made in regard to the narrow margins of profit, owing to the low prices prevailing on nearly all goods which are not in combination. The past week, however, has not witnessed any reductions in price of any importance, and in some lines the market is characterized by a greater firmness. There is some complaint of sluggishness in collections, but the financial situation is regarded as good, and the outlook for a satisfactory season's trade is favorable.

Cut Nails.

There has been some irregularity in prices, due to pressure to sell on the part of one large mill. We continue to quote \$1.80 to \$1.85 for carload lots on dock, and \$1.90 to \$1.95 for small lots from store, with the market in buyers' favor.

Wire Nails.

The market continues without especial change in feature, the prices which have lately ruled still continuing. Some of the manufacturers are showing less disposition than others to accept ruling prices, but the quotation of \$2.30 on average assortments, carload lots, at mill, is still continued. The usual advances for small lots from store are made.

Barb Wire.

The agreement between the Eastern manufacturers gives regularity to prices ruling in this market, but the transactions are very limited.

Miscellaneous Prices.

At a meeting of the manufacturers of Axles the following revised discounts were adopted, terms four months, 3 per cent. discount for cash in 30 days:

Nos. 7 to 14	55&5 %
Nos. 15 to 18	47½ %
Nos. 19 to 22	70 %

Revised prices are also announced on heavy Axles which are sold at new figures. The condition of the market in this line of goods is referred to as satisfactory and the volume of trade as being good.

The Arms-Bell Company, Youngstown, Ohio, are paying special attention to the manufacture of Cold Punched Nuts, and in particular to Chamfered and Trimmed Nuts suitable for engines and other finished work, as well as to Railroad Track Bolts, of which they make all styles and shapes. The following quotations indicate the principal goods manufactured by them and the prices at which they are offered; terms 60 days, or 2 per cent. discount for cash in ten days:

	Discount.
Carriage Bolts	75&10 %
Machine Bolts	80&30&5 %
Bolt Ends	80 %
Lag Screws	80&5 %
Flaw Bolts	65 %
Tire Bolts	70&10 %
Square Nuts, hot or cold	5 4¢ off list.
Hot Pressed Hexagon Nuts	5.90¢ off list.
Cold Pressed Hexagon Nuts	5.50¢ off list.
Chamfered and Trimmed Nuts	5.20¢ off list.
Washers	5.50¢ off list.

Items.

The change in the last classification, by which Hardware not exceeding 5 cents per pound in value, was placed in third class, as noticed in our last issue, is regarded by the trade with satisfaction as giving a reduced rate on many heavy

goods and as being a step in the right direction, and the large jobbing houses, by whose efforts this change was effected, are entitled to congratulation for the result achieved. As some in the trade are aware, the Simmons Hardware Company, and other jobbers in the West, made a systematic effort to have Hardware placed in third class, and, while they have not succeeded in accomplishing this, the change above referred to is largely due to their efforts.

The trade will learn with regret of the death on Sunday last of W. B. Belknap. Louisville, Ky., founder of the house of W. B. Belknap & Co., of that city.

The exports of Hardware from New York during January comprised 13,028 packages, valued at \$208,615, and of Cutlery 1377 cases, valued at \$24,687. Exports of Machinery in the same month were valued at \$286,624.

Chase, Taylor & Co., Kalamazoo, Mich., issue circulars announcing that they have been granted by D. C. & H. C. Reed & Co., Kalamazoo, Mich., a license to sell their patent Spring Tooth Harrows in all territory west of the States of New York, Pennsylvania, West Virginia and Virginia, under the Reed patent No. 201,946; and also that they have been granted by G. B. Olin & Co., Canandaigua, N. Y., a license to sell them in the New England States, New York, Pennsylvania, New Jersey, Delaware, Maryland, Virginia and West Virginia. They also issue a circular giving description of this Harrow and referring to its advantages.

Canton Saw Company, Canton, Ohio, issue a convenient price-list, 46 pages, describing their Solid and Inserted Tooth Circular Saws, Knight's Patent Sawmill Dogs, Sec-Saw and Merry-go-Round and other goods which they are offering.

Among the special notices on page 48 will be seen one in which Clement M. Biddle & Co., 815 Arch street, Philadelphia, Pa., announce that a Southern jobbing house wishes to engage a salesman acquainted with the coal-mining and furnace-supply business. We understand that for one having the requisite qualifications the opening thus presented is a favorable one.

Enterprise Mfg. Company, Philadelphia, Pa., for whom J. C. McCarty & Co., 97 Chambers street, New York, are agents, are putting on the market a convenient arrangement by which their Mrs. Potts' Sad Irons are furnished in family outfits. For this use they are put up in cases, each case containing a set of Sad Irons, a Polish-iron and a Girl's Iron, either nickel-plated or plain polished. Their circular relating to these goods illustrates the outfit and indicates its utility.

The name of King's Great Western Powder Company, Cincinnati, Ohio, has been changed to The King Powder Company. In announcing this change of title the company refer to its fitness, as it has no need of high-sounding titles to recommend itself or its goods, and much valuable time will be saved in writing the name, while the liability of error in its use will be reduced to a minimum. The new name went into use February 25.

A fire occurred this morning in the factory of G. & H. Barnett, File manufacturers, Philadelphia, but we are glad to be able to state that it affected only one portion of the works, and will not long delay operations, as it is expected that work will be resumed in a few days.

The Le Page Company, Gloucester, Mass, for whom Tower & Lyon are agents, 95 Chambers street, New York, have prepared Wire Stands of neat design for the convenience of dealers exhibiting and selling their Improved Process Glues. They

are intended to be placed on counters or in show windows. The cases are made to contain four different assortments of Glue, and the price of each case is the regular price of the Glue.

Russell & Erwin Mfg. Company, New York, are putting on the market a new patent Window Sash Cord and Clothes Line. It is made of wire woven around a core, and is referred to as combining durability, strength and flexibility. It is claimed that it will not stretch, does not chafe and wear, and will not fuzz, while it also costs no more than common sash lines. It is put up in pieces of 100 feet, 12 pieces in a package, and can also be had in coils or on reels of any length, as may be desired. It is made in only one size, which is referred to as strong enough for the heaviest weights and obviates the necessity of keeping several lines in stock.

To replace an engine which surrendered to the inevitable last Monday, Sargent & Co., of New Haven, will inaugurate on the 4th of March a pair of 850 horsepower Harris-Corliss steam engines, with 42 x 20 inch cylinders, balance wheel weighing 25,000 pounds, 18 feet diameter, and 38-inch face. In order to meet emergencies Sargent & Co.'s steam power has been so arranged that all the four separate and complete systems or groups of the establishment can be connected, and any or all departments can be run from one or more of the engines placed in the various localities, so that now the whole works are running driven by power borrowed from the other six engines on the premises, and the usual production of goods is obtained. We understand that the two new and powerful engines will be christened Harrison and Morton.

The Heavy Hardware Jobbers' National Union met in session at Indianapolis the 20th and 21st insts., but nothing was done which has any special bearing upon the market at the present time. There is a movement on foot to form a similar association of Eastern jobbers. The object of the associations will be to combine their efforts in correcting abuses in the trade.

John Pritzlaff Hardware Company, Milwaukee, Wis., have issued their circular No. 4, February, 1889. It is devoted to seasonable goods, such as Forks, Hoes, Rakes, Scythes, Sheep Shears, Corn Planters, Freezers, Screens, Spring Hinges, Wheelbarrows, Refrigerators, &c. Tin Plate, Sheet and Galvanized Iron, Barb Wire and Tinware are also represented in the circular.

The Atlanta Saw Works, Atlanta, Ga., issue an illustrated catalogue and price list showing the line of Saws which they manufacture. It covers Circular, Mulay, Mill, Crosscut, Gang and other Saws, of which list prices are given, with information useful to sawyers and others interested in the manufacture of lumber. The company make a specialty of very thin Circular Saws, and give particular attention to repairing.

Byram & Co., Detroit, Mich., successors to the Colliau Furnace Company, issue a catalogue describing the Colliau Patent Cupola Furnace, of which a full description is given, with illustrations of the different sizes and patterns, and testimonials from leading founders who have used it.

L. C. Beardsley & Co., Cleveland, Ohio, have issued a neat catalogue describing their manufactures, including Pails, Oil Cans, Harness Oil Cans, Syrup Cans, Gasoline Stove Reservoirs, Street Lanterns, Steel Stove Shovels, the Economic Self-Basting Steam Roaster, Felloe Plates, &c.

Vaughan & Bushnell Mfg. Company, Chicago, Ill., have issued a revised price list of their special wrought goods. It

relates to such articles as Nail Grips and Claws, Grappling Hooks, Eye Bolts, Heavy Hasps, Ice Tongs, Clothes Line Hook, Hitching Rings, Leader Hooks, &c. Their well-known Post Hole Auger is also represented, and it is stated that they have made and sold over 250,000 of them since the date of patent.

E. D. Clapp Wagon Company, Auburn, N. Y., have issued a new catalogue relating to their Wagons and Bob Sleighs, in

ized iron instead of zinc. Emphasis is laid on its excellence as a hard wood and dry air Refrigerator.

Horizontal Freezer Company, Port Byron, Ill., and Philadelphia, Pa., issue circulars relating to their Horizontal Freezers for which they solicit trial offers. They advise us that their large machines are nearly all sold to customers on trial, and that dealers are permitted to sell on the same condition. The Freezer is referred

is furnished with glass doors. This is referred to as a very desirable way to keep Hand Saws, and as being much better than having them in drawers or hanging them up. In the front of the store, occupying the middle of the room, there is a light strong rack arranged in steps, Fig. 320. It is 10 feet long, 3 feet wide at the base, 4½ feet high. There are in it four steps 10 inches wide. A 3-inch strip is nailed under them as a support. On this rack Granite-Ware, samples of Coun-

Fig. 318.—Store of C. V. B. Barse & Co., Olean, N. Y.

which leading patterns are represented, with descriptive matter. They emphasize the excellence of their Steel Axles, and in selling their Steel Axle Wagon give a guarantee that they will replace, free of charge, every broken Steel Axle, no matter what the load may be or the circumstances under which it broke.

E. C. Meacham Arms Company, St. Louis, Mo., have issued their price current No. 400, February 11, 1889. It has 16 pages devoted to Arms, Ammunition, Tents, Roller Skates, Cycles, &c.

Paine, Diehl & Co., Philadelphia, Pa., have issued a volume of 84 pages, entitled, "P., D. & Co., Keystone Cook Book," which contains a number of receipts for dishes in the preparation of

to as giving better satisfaction than ever, as it is more carefully made, and the company expect to largely increase the sale to dealers.

Arrangement of Stores.

The illustrations herewith given, Figs. 318 to 322, relate to the Hardware store of C. V. B. Barse & Co., Olean, N. Y. The store, Fig. 318, is 30x120 feet, inside measurement, the first and second floors and the cellar being devoted to the business. In the rear is a storehouse about 32x90 feet, where Nails, White Lead, Sheet Iron, Bar Iron, &c., are kept, the tin shop occupying a portion of it, as shown in Fig. 319. There is a bank entrance to the store, with a door which slides up out of the way. It will thus be seen that the

ter Scales, Lanterns, Wringers and various other goods are accommodated. We are advised that it is found very convenient and satisfactory in use. It is stained cherry, making an attractive appearance. The method in which Steel Squares are accommodated is shown in Fig. 321. In this rack there are six steps 3 inches wide, the risers being also 3 inches. The top shelf is 6 inches wide, made of ½-inch stuff, and on this a row of Bonney Vises is fastened. The Squares are kept in paper boxes, and as the price of the Square is marked on the box, the desired quality is readily selected. Each shelf holds a dozen Squares. Fig. 322 shows a sample case which permits the effective display of the goods for which it is used. The show board inside the case is covered with black velvet and

Fig. 319.—Plan of Storeroom.

which the Keystone Beaters may be used. A brief description of these Beaters, Nos. 1 and 2, is also given, while attention is likewise paid to their Self-Pouring Tea and Coffee Pots, Potato Masher, Egg Beater, Press and Strainer and other articles of their manufacture.

R. Armiger & Son, Baltimore, Md., have issued their catalogue and price list of Refrigerators for the coming season. It is divided into four sections devoted as follows: *Section 1.*—Alpine, Horizontal and Chest Refrigerators and Grocers' Chest. *Section 2.*—Buffet Refrigerators, including the Victor, Daisy, Beauty, Charm, Regal and Princess. *Section 3.*—Climax Refrigerators; and *Section 4.*—Sterling Refrigerators. The latter is referred to as an entirely new Refrigerator, added this season, made of solid oak in antique finish, and also a poplar handsomely grained in oak color. It is lined with heavy galvan-

firm has excellent quarters for the accommodation of their important business, and their store is regarded as excellently equipped and arranged. On entering the front door, Fig. 318, there is on the left an upright case which is made of walnut, and is 15 feet long, 2 feet deep, and 8½ feet high. The under part has eight paneled doors, while the upper section is furnished with eight glass doors. This case contains Mechanics' Tools, Guns, fancy Tea Pots, &c., the lower part being occupied with surplus stock. Just beyond this there is a case for Saws. This case is 3 feet 4 inches wide, 3 feet 6 inches high, and 34 inches deep. It contains four shelves, on which are strips about 5 inches wide standing on edge, with grooves sawed in about 1½ inches apart. Saws are placed lengthwise in these grooves, each kind being kept on a shelf by itself. The case

is supported in place by small black-walnut posts placed in each corner. In these a small brass rod is inserted, on which are hung a fine line of Dog Collars, the extra stock being kept in the boxes below. Believing that hanging goods in sight helps sales, this enterprising house advise us that they avail themselves of every spare place on the wall to hang something in sight, as, for example, along the stairway and on the wall up the stairs to their second story they have strips to which they hang Chains, Steelyards, Shovels, Scoops, Manure Forks, &c.

Exports.

PER BARK TEOCLE, FEBRUARY 20, 1889, FOR WELLINGTON, NEW ZEALAND.

By Arkell & Douglas.—3 dozen Wringers, 2 packages Plated Ware.
By McLean Bros. & Rigby.—6 Anvils and Vises, 3 dozen Hog Ringers, 3 dozen Hay Forks, 2 dozen Door Bells.

By H. W. Peabody & Co.—100,826 pounds Barb Wire, 2 cases Agricultural Implements, 269 dozen Handles, 2240 pounds Grease, 400 pounds Nails, 58 packages Hardware, 9 cases Stoves, 1 case Pumps, 9 dozen Whetstones, 2 packages Plated Ware, 3 cases Wringers, 2 packages Agricultural Implements, 1 case Wringers, 18 packages Hardware, 1 case Pencils, 21 packages Carriage Ware, 5 packages Lamp Ware, 120 cases Edge Tools.

By R. W. Forbes & Son.—11 dozen Garden Rakes, 1 case Hardware, 7½ dozen Rake Handles, ½ dozen Combined Drills, 29 dozen Axe Handles, 6 cases Hardware, 36 dozen Axe Handles, 5 dozen Bush Hooks, 6 dozen Garden Rakes, 1 case Hardware, 189 dozen Shoe Blacking, 4760 pounds Nails, 20 dozen

Fig. 320.—Rack for Granite-Ware, &c.

Axes, 190 dozen Axe Handles, 20 dozen Axes, 9 dozen Harness, 2½ dozen Clothes Wringers, 20 dozen Shovel Handles, 15 dozen Garden Rakes, 3½ dozen Churns, 20 boxes Carpet Tacks, 7 cases Hardware, 2 dozen Clothes Wringers, 19 cases Hardware, 22 dozen Rake Handles, 50 gross Clothes Pins, 4½ dozen Churns, 120 boxes Clothes Pins, 450 dozen Axe Handles, 25 dozen Axes, 44 packages Hardware, 500 gross Clothes Pins, 5 gross Sewing Machine Oil, 1000 dozen Axe Handles, 8 dozen Churns, 74 pounds Rubber Springs, 12 dozen Spade Handles, 4 packages Lampware, 48 packages Carriage Ware, 60 dozen Axe Handles, 3½ dozen Wringers, 1 case Hardware, 135 pounds Rubber Springs, 6 dozen Spade Handles, 23 packages Hardware, 500 pounds Horse Nails, 1 crate Carriage Ware, 1 box Harness, 14 gross Blacking, 907 pounds Horse Nails, 6544 pounds Horse Nails, 3206 pounds Horse Nails, 9 cases

Fig. 321.—Steel-Square Rack.

Hardware, 4 cases Hardware, 30 dozen Axes 49 dozen Axes, 6 dozen Axes, 10 dozen Axes, 88 dozen Axes, 5 dozen Spades, 8 dozen Scoops, 4 cases Hardware.

By W. H. Crossman & Bro.—½ dozen Padlocks, 11 Whiffletrees, 1500 pounds Nails, 6 nests Pails, 4 dozen Grindstone Fixtures, 12 packages Hardware, 25 Lawn Mowers, ½ dozen Scales, 5 packages Lamp Goods, 18 cases Handles, 4 cases Plow Parts, 1 bundle Carriage-Ware, 8 Dashers, 100 pounds Nails, 2 Drills, 8 rolls Sandpaper, 194 pounds Stone, 1690 pounds Axle Grease, 38 dozen Axes, 20 dozen Rakes, 1 case Hardware, 4 cases Agricultural Implements, 10 dozen Hammers, 18 dozen Hatchets, 28 Churns, 1 crate Tire Benders.

By A. S. Lascelles & Co.—30 cases Slates.

By Singer Mfg. Co.—685 Sewing Machines.

By Russell & Erwin Mfg. Co.—6 cases Hardware.

By Collins Co.—10 dozen Picks.

By Peters & Calhoun Co.—1 case Sadlery.

By New York Belting and Packing Co.—1 case Emery Wheels, 1780 feet Rubber Belting.

By Goulds Mfg. Co.—55 Pumps.

By Plumb, Burdick & Barnard.—6000 Carriage Bolts.

FOR AUCKLAND.

By Manhattan Brass Co.—18 packages Brass Goods.

FOR NAPIER.

By Manhattan Brass Co.—6 packages Lampware.

FOR NELSON.

By McLean Bros. & Rigg.—¼ gross Blacking, ¼ dozen Hay Knives, 1 dozen Leather Dashers, 2 Carpet Sweepers, 1 dozen Clocks, 200 Pot and Kettle Scrapers, 7 packages Carriage-Ware, 12 Stoves, 1200 Clothes Pins, 6 dozen Washboards, 81 dozen Handles, 3 dozen Axes.

By Arkell & Douglas.—396 pounds Axle Grease, 30 Ranges, 3 dozen Hammers, 24 dozen Handles, 4 dozen Axes, 12 dozen Picks, 12 dozen Handles, 1000 Cartridges, 2 dozen Forks, 1 gross Axle Grease, 2 Sprinklers, 6 dozen Mattooks, 8 Mangles, 5 crates Churns, 1 case Hammers, 825 pounds Nails, 1½ dozen Wringers, 7 cases Hardware, 336 pounds Nails, 5 cases Castings, 7 gross Sewing Machine Oil, 2 dozen Wrenches, 1 dozen Glue, 12 dozen Wire Goods, 3000 Hooks, 21 pounds Iron Washers, 1 case Hardware, 20,000 Cartridges, 3 dozen Blacking.

By H. W. Peabody & Co.—1 case Agricultural Implements, 44,800 pounds Barb Wire, 12 dozen Washboards, 75 dozen Brooms, 71

Fig. 322.—Sample Case.

packages Hardware, 12 dozen Sewing Machine Oil, 5 packages Lawn Mowers, 8 cases Firearms, 31 cases Slates.

Business Methods.

With reference to the question referred to by our correspondent in a recent issue as to the best method of keeping account of goods on hand, we have the following letter from a Hardwareman in Illinois:

As regards keeping an account of stock, as per your article in *The Iron Age* of February 14, I desire to say that, with the many small sales made in a retail Hardware store, it would be impracticable, and almost impossible, to keep an accounting so as to take an inventory at the end of the year from the books. Most retailers put the cash from cash sales in the drawer without any account, and at night charge the cash account with the aggregate amount made up of many sales, large and small. Thus we have but one entry on the cash book to keep track of the cash, where it would take a great many entries to keep track of the many small merchandise sales. We think where an accounting is kept of all merchandise going out it would be more trouble to find amount of stock on hand from the books than it would be to take an account of stock. For instance, a customer comes in and buys a package of Tacks, a Fork Handle, 10 cents worth of Copper Rivets, a 10-cent File and a box of Hog Rings; next man wants 5 cents

worth of Sandpaper, a pair of Butts, a Thumb Latch and a Bull Ring. And so it goes all day. It would take as many accountants to keep track of all these small articles as it would clerks to sell them. Where goods are kept in nice, clean shape it is no trouble to take an inventory at the end of the year.

It seems to us to be entirely unnecessary, and altogether too expensive for the retailer who pretends to have any trade, to keep an accounting of stock for the purpose of making out his want list. Our system of keeping up our stock is—first, to keep everything in its place and have a place for everything; then for each clerk, the boss included, to keep a small memorandum book in his pocket, and when any article is sold out, or getting low, to make a note of such. Now, when we get a card from blank's salesman saying he will call on a certain day, we make a list of such goods as we will want to buy of him, from our various memorandums, the day before the salesman is expected, go to the stock and see that we really need them, and give our order when he calls. In this way we know just what we want, no guesswork, do not order duplicates of what we have already in stock, and save time for the salesman, something they all appreciate. We have seen the boss sit down with the salesman and go through the catalogue, skipping things he ought to buy and buying others he did not need, taking up his own time as well as the salesman's, all for not having a want list.

Trade.

Wells & Nelligar Company, Chicago, Ill., have issued a price current under date February 19. It relates to Railroad Milk Can Stock, Steel Goods, Showcases, Clevises, Galvanized Wire, Bird Cages, Baby Carriages, Guns, &c. It is prefaced by the following remarks in regard to business:

HARDWARE.—Our business in 1888 was the largest that we have ever had in 12 months, which we attribute in part to succeeding to the Keith, Benham & Desendorf trade, also to the class of goods for which we are headquarters and the low prices and prompt shipments which we are making. We feel confident that volume of trade will be still larger this year, with firmer and higher prices, as Hardware will certainly be no lower.

NAILS.—The demand is very great for both Wire and Cut Nails, and the recent manufacturers' advance will before long necessitate higher prices in this market.

BARBED WIRE.—Is still being sold at very low rates, and buyers are paying closer attention to quality than heretofore.

The following review of the San Francisco Hardware and Metal trade, for the past year is given by the *San Francisco Journal of Commerce*:

The Hardware and Metal trade was, on the whole, 25 per cent. larger than in 1887—in some cases much larger. The increasing population of the State, and our extraordinary and varying manufactures, are the direct cause of this. Our manufactures of Agricultural Implements, Iron and Steel Wire, &c., are very important, and are daily increasing in extent and value. Our Canned Goods and Salmon industries called for an especially large supply of Tin Plate. There will be a large increase noted in the business of 1889. The volume of the business done was as follows:

Agricultural Implements.....	\$3,000,000
Iron and Steel.....	6,100,000
Hardware.....	8,000,000
Tin Plate.....	1,400,000
Quicksilver.....	1,415,000
Wire and Wire Goods.....	2,000,000
Pig Iron.....	430,000
Nails.....	1,100,000
Various.....	100,000

Total.....\$18,445,000

Agricultural Implements.

Imports in—	Pounds.
1884.....	15,300,890
1885.....	12,681,000
1886.....	11,999,810
1887.....	16,722,320
1888.....	20,790,440

Imports by rail have thus been much larger than in 1887. The business of the year may be reported as good, while the development of the California industry has exceeded expectations. Our home industries are steadily increasing in importance and in suitability to the needs of the State. The heavy rains insure an extra good demand for 1889. The steady settlement of both sections of the State should insure an even larger than ordinary demand. Then, too, our farmers are becoming more careful and more scientific in their methods of cultivation, and are constantly on the lookout for the latest and most improved Agricultural Machinery.

The Quincy Mine.

The pleasant effect upon the balance sheets of the copper mining companies of the cornering operations of the syndicate is well illustrated by the annual report of the Quincy Mining Company. The product of the mine was 7,762,945 pounds of mineral, yielding about 88.10 per cent., or 6,867,809 pounds of refined copper, for which was realized the gross sum of \$1,014,315.38, silver produced adding to the revenue \$4173.04. The running expenses of the mine were \$360,585.39, and the smelting, transportation and all other expenses, \$106,841.84. In addition to this, \$38,438.01 were spent for building and construction, \$67,117.37 for the Quincy and Torch Lake Railroad, and machinery was contracted for to the extent of \$75,000, leaving as a mining profit \$375,510.81. From interest on loans and sale of real estate additional funds were obtained, making the income \$386,250.66. Adding the balance of January 1, 1888, of \$536,509.75, there was available for dividends \$922,766.41. There was actually paid out in profits in 1888 \$360,000, leaving a balance on January 1, 1889, of \$562,766.41, out of which \$200,000 has been since declared in dividends. The company had an original paid-up capital stock of \$200,000, and have during their existence paid on this amount \$4,970,000. The greater part of the product of the mine is obtained from stamping rock, 117,514 tons being crushed, which yielded 3.04 per cent. of mineral. The company decided during the year 1888 to build a new mill, located at Torch Lake, to connect with which the construction of the Quincy and Torch Lake Railroad was begun. It is expected that this road will be in running order early the coming summer. It will be six miles long, with an almost uniform grade of 90 feet to the mile. The preparations for building the new stamp mill at Torch Lake are under way, contracts being let for two steam stamps of the latest design capable of crushing 250 tons of rock per day. A third steam stamp is to be added later. The plant includes an 8,000,000 high duty pump engine, one 14 x 36 inch Corliss engine, six 6 x 16 inch return tubular boilers, and 56 iron jigs. It will be seen, therefore, that this new equipment promises to increase the capacity of the mine by about 50 per cent., so that when it is in full operation the yield annually should be close to 9,000,000 pounds fine. In 1887 the earnings of the company on a product of 5,609,762 pounds of ingot were \$187,728.29. Practically the high prices running during 1888 have doubled the profits of the mine.

In a circular to manufacturers, the Board of Trade of Tiffin, Ohio, offer as inducements for locating there free natural gas and free building sites. During the past eight months the following companies have located there: A. J. Beatty & Sons' glass works, employing 400 men; Tiffin Glass Company, 200 men; Belgian Glass Company, 100 men; Ohio Lantern Company, 75 men; American Pulp and Paper Company, 100 men; Western Crayon Works, 50 men; Glick & McCormack's wagon supply works, 40 men; Brewer Pottery Works, 600 men, and the Sterling Wrench Company, 75 men. Tiffin has first-class railroad facilities, has water works and sewer system, and incandescent and arc light stations.

Harper's Weekly publishes in its last issue an article on the Robert process, accompanied with an illustration of a Bessemer converter of preposterous dimensions. It would be altogether useless to criticize the report in question. Suffice it to say

that the writer claims the following: "The entire plant, including engines and all the necessary machinery for the production of 100 tons a day of any grade of iron or steel, can be built for less than \$10,000, or one-third the cost of the Bessemer plant of the same capacity. The tuyeres of a Bessemer converter must be renewed after 15 blasts. The tuyeres of the new last for 250 blasts. The Bessemer converter must be relined after a very few blasts, the Robert after 1000 blasts." It is fair to assume that the writer knows as much of the Robert process as he does of Bessemer steel manufacture.

The New Submarine Boat.

The bid of the Columbia Iron Works, of Baltimore, for the construction of the submarine torpedo-boat desired by Secretary Whitney is the only one that can be accepted. That of Mr. Baker, of Des Moines, does not contain the necessary guarantees, while the Baltimore company offer them, and this company are now building the gunboat *Petrel* for the Navy Department. The Holland boat, an improvement on which it proposes, is familiar in New York waters, having shown in North River trials, witnessed by thousands of people, its powers of diving and rising at will, and of going a certain distance under water.

The great problem is as to what this practicable distance beneath the surface is. Many boats can go all day, and perhaps all night added, with a mere curved back surmounted by a cupola showing. But what is wanted is the distance a boat can go with nothing showing. In other words, the true problem is a submarine boat that can sink miles distant from the enemy and guide herself under water to that enemy. The storm of heavy projectiles now available from Hotchkiss cannon and rapid-fire guns makes the show of even an armored conning tower perilous. The custom is, in talking of such inventions, to dwell on the enormous size of the dynamite torpedo that can be exploded beneath the hostile hull. That, however, is not the immediate question at all. The first thing is the power of travel and guidance completely under water. With that once accomplished, a torpedo as big as a balloon can be used if the inventor likes. The results of the explosion of gun cotton or dynamite need not be dwelt on; the only question is as to carrying it with certainty to the place where it is to be applied.

The Columbia Iron Works apparently propose a boat that will do this, although the exact specifications of a contract may reveal some shortcoming in the exceedingly difficult task. Submarine boats of various sorts can do many wonderful things. They can remain submerged for six or eight hours, and the crew will come out no worse for the performance. They can sink rapidly, and keep an even keel under water by an ingenious system of balanced rudders. They can drop to a depth sufficient for them to go under any keel. They can disappear under the water and emerge half a mile distant. The inquiry naturally is whether this is not enough, and why there is not an instant rush to build such boats. The reply is that what is needed is combined performances of this sort, each of which can be a little less remarkable than when used separately. A speed of twelve knots on the surface is excellent, but not so valuable as one of six knots under the water. Submerging for eight hours at rest is noticeable, but submerging for one hour is more so, provided during that hour the boat can be kept going. The difficulties of powerful enough storage batteries where electricity is employed, and the intolerable heat generated where steam is used in running under water—this last, of course, re-

quiring stored steam—are well known. A boat that will go under the water, without once showing itself, for a specified distance (which distance need only be such that it could not have been detected by an enemy when it went below the surface) will be a great success, whatever its speed or slowness as a surface boat. It is a matter of minor consequence even in what time it accomplishes this distance wholly beneath the water.

The most interesting foreign submarine boats at the present time are the new ones on which France and Spain have been recently experimenting. According to *Le Temps* the trials of the *Gymnote*, at Toulon, were very satisfactory. She is said to be of about 30 tons displacement, and to steer exceedingly well, maintaining any desired depth without difficulty. She is operated by electricity, and at full power has a speed of from 9 to 10 knots, this presumably being on the surface. The Spanish submarine boat *Peral* has also attracted much attention. She is 72 feet long by nearly 9½ feet broad, and 87 tons displacement. She is fitted with electromotors and is said to attain a speed of 11 knots on the surface, and not much less below. She has recently been launched, but has not been tried. Commander Peral is confident she could remain submerged more than a day before the air would need to be renewed. She is to carry Whitehead torpedoes.

It is admitted that all submarine torpedo-boats yet tried have fallen short of what is desired, and the proposals made by the Columbia Iron Works are upon the whole more promising than any. A guarantee of 9 knots submerged, with a sub-surface endurance for an hour while thus running, is more than could have been hoped for by the most eager advocate of submarine boats. If she can literally fulfill this our Government will have the start of the rest of the world in this important branch of naval warfare.

We have received the annual report of the secretary and treasurer of the Brown & Sharpe Mutual Relief Association, which was organized for the mutual relief of its members in case of sickness or other infirmity unfitting them for daily labor. The membership is divided into two classes: the first consisting of those whose weekly pay is \$8 or over, and the second of those whose pay is less than \$8 per week. Any person in the employ of the Brown & Sharpe Mfg. Co. is eligible for membership. Admission to the first class is 50 cents, and to the second 25 cents. The dues in the first are 5 cents per week, and in the second 2½ cents, collected every four weeks. In January, 1888, the membership was 253, and during the year 147 entered and 93 left the association. There are 267 belonging to the first class and 40 to the second. During the year 29 assessments were made, and 668 day benefits paid, of which 562 were for sickness and 106 for other causes. The treasurer had on hand, at the beginning of the year, \$156, and received during the year \$715. The expenses amounted to \$616 for sickness and \$19 for all other expenses. The balance on hand January 1, 1889, was \$242.

During the week ending February 23 the Scranton Steel Company, at Scranton, Pa., made in 760 heats 4536 ingots, weighing in the aggregate 5025 tons 11 cwt., the best day's work being 892 tons. In the same week the mill turned out 4243 gross tons of rails.

A. E. Hunt, of Pittsburgh, is manufacturing aluminium on a large scale by a process invented by himself. A sample of the metal in a large ingot was shown at the recent meeting of the American Institute of Mining Engineers.

Wright's Patent Self-Lubricating Axle.

This axle is manufactured by the Buffalo Patent Axle and Wheel Company, Buffalo, N. Y. It is shown in the accompanying illustrations, Fig. 1 representing one end of the axle provided with a hub, Fig. 2 showing the operation of the axle with patented parts, and Fig. 3 showing the back part of the axle. In Figs. 2 and 3 the different parts are denoted by the following letters: A, axle; B, axle bear-

also of the steel parts of the axle, is of special quality, no expense having been spared in the material or finish of the goods. They also claim that the axles are especially durable, and that even with the self-lubricating feature and the other advantages possessed they are offered at about the price of the ordinary axle.

George Gunton, the author of "Wealth and Progress," delivered a striking lecture in Union Hall, Boston, a few nights ago, on "The Economic Relation of Labor to

Fig. 1.—One End of a Vehicle Axle Provided With a Hub.

ing; B', fixed collar; C, flanged collar; D, movable flange; E, swivel nut; F, axle box; G, oil chamber; H, nut; I, inside hub band; J, hub; K, outside hub band; L, mortise. The nut H on the front end of the axle has four different uses—namely, it aids in setting the box, serves as an oil chamber, contains absorbent for evenly supplying the oil, and at the same time has the appearance of the ordinary hub, except that it is entirely free from

Capital in Modern Times." In the course of it he pointed out the tendency of an increased diversity of manufacturing interests to bring the capitalist and laborer nearer together. "With the growth of the factory system was inaugurated a new system and a new epoch, upon the threshold of which we now stand. Adam Smith, with his doctrine that profits were the object of labor, and that high profits grow out of low wages, had been the high

Fig. 2.—Showing Operation of Axle With Patented Parts.

oil on the outside. The manufacturers call special attention to the lubrication, and allude to it as practical and successful under the severe tests to which it has been exposed. The ease and rapidity with which the oil is applied is mentioned, and they guarantee that there will be no setting of the wheel if properly oiled four times a year. The point is also made that the axle is strongest where others are weakest, and that they are proof against breakage in ordinary use. Other points made in regard to it are: That the axle-

priest of the old epoch. Time was when a few aristocrats in one country or another consumed all which capital could produce. But, with machinery and all improvements, those few, that small and privileged class, can no longer begin to consume all which capital is eager to produce. The middle and lower classes now stand ready to be the consumers, and whatever raises their standard of living, be it fair wages or short hours, makes of them a tremendous factor in the success of the capitalist. Help the laborer up! Enable him to buy

Fig. 3.—Showing Back Part of Axle.

box is very simply set, and requires no banding of the hub, except those bands furnished free with the axle, nor wedging of the box; that owing to the packing of the box in the rear and the perfectly sealed front sand or grit cannot get in or oil work out, and that as the collar of the axle is provided with washers on both sides the wheel is noiseless; that the box being made of malleable iron, case hardened and smaller, affords greater depth for the spoke without increasing the diameter of the hub; that this self-lubricating axle is adapted to fine carriage work, while it is also suitable for heavy wagons, and that the malleable iron used for the boxes, as

your manufactured goods. Give him civilization, self-respect, fair wages. Do not crush him with too long hours. The result will flow into your own coffers in the end, O capitalist! Kill not the goose that lays the golden eggs. Preserve the laborer's well-being as the most valuable, the absolutely indispensable factor of your own success."

California carriers of fruit and vegetables are practically shut out from the Eastern market by increased freight charges amounting to \$20 per car. The shipments by sail last year approximated 500,000 cases.

Timby's Burglar-Proof Sash-Lock and Ventilator.

Messrs. Jenkins & Timby, of Oswego, N. Y., and 102 Chambers street, New York, are introducing to the trade what they are pleased to call Timby's Burglar-

Timby's Burglar-Proof Sash-Lock and Ventilator.—Fig. 1.—Section of Window Frame, Showing Application of Lock.

Proof Sash-Lock and Ventilator, a general idea of the construction and operation of which may be gathered from an inspection of the accompanying illustrations. Fig. 1 shows a section of the window frame with the lock applied, the cut being semi-transparent for the purpose of showing the interior construction, actuating spring, &c. Fig. 2 shows the device with

Fig. 2.—Section Showing Thumb-Nut Moved Upward, Releasing Upper Sash.

the thumb-nut moved upward in a position to release the upper sash. Fig. 3 is a back view of the lock and operating device, the thumb-nut being moved upward and the bolts thrown back, the same as in Fig. 2. The bolts employed in this device are made from the best malleable iron, the case is of wrought steel, while the face-plate and thumb-nuts are made of

Fig. 3.—Back View of Lock and Operating Device.

brass and bronze metal highly polished and lacquered. The manufacturers state that this lock is very simple in construction and operation, and is readily adapted to any window. One lock is employed to fasten either one or both sash, as may be

desired, securing them in any position, whether the windows are entirely closed or are adjusted for purposes of ventilation. The device is said to automatically secure the sash in place, and the lock is applied in such a manner as to be burglar-proof. It is said that varying thicknesses of sash or inside strips do not interfere at all with its application. It may be used on windows having sash adjusted with or without weights, and does not obstruct the employment of weather-strips or inside blinds. The principal features of construction are covered by letters patent granted to T. F. Timby, under date of March 29, 1887. This lock is made in three sizes, the smallest being designed for ordinary windows, and especially for dumb-waiter doors. The firm are meeting with a very gratifying demand for this novelty, and inquiries are daily received from all parts of the country.

The I X L Poke.

This article is made by A. W. Bishop, Berea, Ohio. The special feature in this poke is the fact that the head, or cross-

The I X L Poke.

piece, is hinged on one side, being attached to the other by a bolt or catch operated by a spring. With this construction it can be brought up near the animal's neck and avoid the difficulties which have been found when it, as in other pokes, is placed too far down, and especially the liability of the animal to get his front feet through and be cast. As will be inferred from the illustration, the head is so constructed that, when pressed upon, the pins, covered in ordinary use, project and pierce the skin of the unruly beast. In order to preclude the possibility of their breaking, it is stated that the best of oak or hickory timber will be used. The effectiveness of this contrivance in preventing mules or horses from pushing or jumping fences, or being injured by barb wire, is alluded to.

The Wentworth Dust Guard Axle.

This axle, the construction of which is represented in the accompanying illustrations, is made by the Wentworth Spring and Axle Company, Gardiner, Me. It is intended to meet the demand for an efficient, easily applied and strong contrivance for keeping dust and grit from the axles of carriages, while it will also prevent the sticking of wheels, the waste of oil or grease used in lubricating and the

Wentworth's Dust Guard Axle.

untidy appearance of the axle stock caused by the escaping oil. As will be seen from the illustrations, the flange of the guard, which is made of malleable iron neatly finished, is made to fit a hub of any size, and is attached to the shoulder of the axle by a right and left hand thread and is turned to its place by a light wrench furnished for the purpose. The box is set as for other axles, the rear band of the hub being made to project $\frac{1}{4}$ inch over the wood. The following points are made in regard to the advantages of this axle: That it is especially strong, being of full size of iron or steel where the strength is needed; that it protects the axle arms from water, dirt or grit; that with ordinary care it will never stick; that no oil is permitted to outwork upon the axle stock and hub; that, as the oil is retained and kept clean, less frequent oiling is required; and that it is simple, strong and especially durable.

Grasse, in the South of France, is the headquarters for the manufacture of perfumes, though Nice and Cannes are close rivals. Grasse and Cannes excel in the culture of the rose, cassie, jasmine and tuberose. Nice is celebrated for its violet and mignonette, while Sicily furnishes most of the orange and citron. In Grasse 22,000 pounds of orange blossoms were received at the factories in a single day, and the value of the flowers consumed at the three points named approximates \$1,000,000 yearly. From 120,000 to 150,000 pounds of pomade are imported each year for use in the processes of manufacture, packing, &c.

Commendation from a high source was bestowed upon American workmen by Lord Brassey, of England, in a paper read by him on the 22d inst. before the United Service Institution. In reference to the building yards of America he said: "No navy has displayed more original genius in construction than that of the United States." The lecturer then proceeded to compare English and French dockyards, stating that in French dockyards the number of workmen is 21,000, and their average earnings £40 a year. The number of workmen in English dockyards is 18,047, and their average earnings exceed £65 a year. With this remarkable difference in

the scale of wages, the cost of building appears to be approximately the same in the two countries.

New Combination Divider No. 85.

This tool is made by L. S. Starrett, Athol, Mass. The cut represents it with its attachments. It has, it will be observed, auxiliary caliper legs which, together with a common pencil, may all be used interchangeably with the arms, forming valuable

combinations. A novel feature in this divider is an auxiliary nut between the arms to lock them firmly against the action of the spring after the fine adjustment is made, thus remedying the weak point in the common wing-divider, the legs of which are only as stiff as the adjusting spring. It will be observed also that the wing is round and is fastened by passing through a stud set in the arm, upon which is a wing-nut with full thread to clamp the wing firmly. This is referred to as more efficient and durable than the common kind with the screw tapped upon the arm only three or four threads deep, which soon wears out. The head and arms are made from malleable iron, the rest of steel. The points are hardened and warranted first

New Combination Divider No. 85.

class. The smallest size is 7 inches long, which by adjustments of points becomes 9 inches, and will describe a 22-inch circle. It will caliper 11 inches outside and 13 inches inside. The second size is 9 inches and by adjustments of points becomes 12 inches, and will describe a 30-inch circle, and caliper 14 inches outside and 16 inches inside. The divider will be sold without caliper legs when so ordered.

CURRENT HARDWARE PRICES.

FEBRUARY 27, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

THE IRON AGE

THURSDAY, MARCH 7, 1889.

Wheeler's Surface Condenser.

The accompanying cuts illustrate the combination of the Wheeler surface condenser with independent system of air and circulating pumps. The condenser is mounted on the latter, thus saving floor space, which is of considerable importance in engine-rooms that are crowded with machinery. In this design the condenser is firmly bolted down on the pumps, the latter serving as a foundation, thereby saving expense of piping between the pumps and the condenser. As shown by the sectional view on the next page, the water pump delivers the circulating water through the nozzle C directly into the lower section of tubes in the condenser.

or similar materials. In fact, there are no ferrules, washers or packings of any kind employed. The tubes are of seamless brass tubing, carefully tinned inside and outside. They are arranged in pairs, the smaller tube inside of the larger. The latter is thickened at one end, on which a deep thread is chased. This end of the tube is screwed into a head of brass, and on the other end of the tube is screwed a cap, as shown. One end of the small tube is also drawn thick and a thread chased on it. This tube is also screwed into a head of brass. The tubes can be easily taken out and thoroughly cleaned, as their form and the manner of fastening permit of this being readily done. The tightly screwed fastenings of the tubes also permit the use of

Signaling from Mining Cages." 41

An efficient arrangement for signaling by means of electricity from cages in motion in shafts is described in a recent issue of *Engineering*. The object is attained by inserting an insulated copper wire in the hoisting rope and by connecting it at the cage end to an ordinary push button. At the drum end of the rope the insulated wire is brought out and connected to an insulated brass ring working upon the drum-shaft, and upon which a strip of copper rubs so as to maintain an electric connection with the signal bell and battery placed in front of the engineman. Those in the cage by touching the push can instantly communicate with the

WHEELER'S SURFACE CONDENSER, COMBINED WITH INDEPENDENT AIR AND CIRCULATING PUMP.

From thence the water flows by the passageway E into the chamber H, passing through the upper group of tubes, and finally discharging at the outlet nozzle D, as shown by the arrows. The exhaust steam, entering at the nozzle A, comes in contact with the scattering plate O, thereby distributing uniformly over the cooling surface of the tubes. The water of condensation gravitates to the bottom of the condenser, and flows directly to the air pump by the annular passage B, the air pump discharging the water and vapors through the outlet nozzle at the side of the cylinder. Both air and circulating pumps are operated by a direct-acting steam cylinder in the usual way.

In our issue of January 7, 1886, we gave a sectional view of this surface condenser, showing more of the details of construction. It may be well to state here, however, that the arrangement is one providing very thoroughly for the expansion and contraction of the tubes, and this without the use of tube packings of wood, paper

circulating water under pressure, which is often the case with stationary engines where the supply is from a head of considerable height. The circulation of water is very perfect, and consequently the smallest amount of cooling water is required. This feature gives a marked saving in the power necessary for the circulating pump. The condensers are made with bodies of both circular and rectangular shape. The larger sizes are usually of the latter design. The patentee and proprietor of these improved condensers is Frederick M. Wheeler, 98 Liberty street, New York.

The last of the large castings for the hull of the United States cruiser San Francisco, now being constructed at the Union Iron Works, was made at the Pacific Rolling Mills recently. The casting is of steel, and is the port strut for the port shaft of the vessel. The charge of metal in the furnace was 26,000 pounds, and the casting will weigh about 16,000 pounds.

engineman at any part of the lift, and signal to him to stop, or raise, or lower the cage. At the Newbattle Collieries, Dalkeith where the signaling apparatus is now working, it has been applied in the pumping shaft, 300 yards deep, and is specially used by the pump men for working at the pumps in different parts of the shaft. By means of the signal, standing in or upon the top of the cage, the men can instantly signal their requirements. Connections are also put upon the frame of each desk of the cage, so that coal work signals can be made by means of the rope at a great saving of time.

"The application appears," says our contemporary, "to be of special value in case of repairs in the shafts, affording as it does absolute safety to the occupants of the cage in making signals, and it would also be of inestimable value in cases of accident arising from explosion or break up in the winding shaft, where the state of the shaft or of the atmosphere is unknown, and where in such cases many

lives have been lost through the occupants of the cage having no means of signaling to the engineman. A case such as this was the well-known and recent case at the De Beers mine, in South Africa, where the cage and its occupants, including Mr. Lindsay, the manager, was lowered into a deadly atmosphere without means of preventing the descent after the cage left the surface."

Early Anthracite Furnaces.

Oliver Williams, of Catasauqua, reviews as follows the early history of the manufacture of anthracite pig iron in Pennsylvania, in a letter to a local newspaper:

In 1828 Neilson, of Scotland, patented the use of hot air in the smelting of iron ore in the blast furnace. The inventor "built better than he knew," as at that time anthracite coal was practically unknown in Scotland, and the use of his

out Dr. Geissenhainer died, and American metallurgy suffered its first great loss.

While these experiments were going on at Silver Creek, John Potts was working on the same lines at Cressonia, Schuylkill County, and with commendable success; but, as in the case of the Valley Furnace, the Potts Furnace was too small and his blast too weak and cold. In 1838 a small furnace at Mauch Chunk was blown in on anthracite coal. It limped along for a few months, and was then blown out. It was again put in blast early in 1839, with an improved hot blast, but after running a short time was abandoned. Mr. F. C. Lathorp, an eminent engineer—still living, I believe, at Trenton, N. J.—was connected with this enterprise, and is fully qualified to write an interesting chapter on the early history of anthracite pig iron.

In 1838 Burch Patterson commenced the erection of the Pioneer Furnace at Pottsville. He engaged Mr. William Lyman, who had been connected with a

These experiments were all being watched by the Lehigh Coal and Navigation Company with intense interest. It is but rarely that so great an amount of brains was ever concentrated in the skulls of a company as was developed in the heads of this company. Two men especially connected with the management—Josiah White and Erskine Hazard, both of Philadelphia—were marvels of foresightedness, indomitable energy and untiring industry. Mr. White was a strict Friend, which must have been a great trial to him sometimes when his plans went awry through the stupidity of his agents.

Philadelphia has erected monuments to many men who have not done one-tenth of what these men did to pour gold into her lap. Mr. White and Mr. Hazard saw that the time had now arrived for them to move in the matter of pig-iron making. Mr. Hazard was sent over to Wales, and there found Mr. Crane's furnace successfully smelting iron ores with anthracite

SECTIONAL ELEVATION OF WHEELER'S SURFACE CONDENSER.

patent was confined to smelting with bituminous coal. In 1836 George Crane, of Wales, obtained a British patent for the use of the hot blast in connection with anthracite coal. Mr. Crane at that time owned an anthracite coal mine at Yniscedwin, South Wales, that was valueless to him. Mr. Crane, in connection with Mr. David Thomas, at once proceeded to change a furnace that had been run on coke, to use anthracite. This furnace was put in blast early in 1837, and it was a complete success from the start. Prior to this Dr. Geissenhainer, a Lutheran clergyman of New York City, a man deeply interested in the sciences and evidently well informed as to Neilson's discovery, and fully appreciating its value as connected with the use of anthracite coal, commenced the erection of a blast furnace on Silver Creek, about seven miles from Pottsville. This was known as the Valley Furnace, and was blown in some time in July, 1836. This furnace continued in blast some ten or twelve weeks, using anthracite coal exclusively. The furnace was small, the pressure of blast about 8 pounds, with a temperature of only some 200° F. Unfortunately, soon after the furnace was blown

rolling mill in Boston, as manager. It was first blown in on the 10th of July, 1839. It continued in blast but a few days, and was shoveled out. Benjamin Parry, who had worked at Yniscedwin with David Thomas, took the position of founder. The furnace was again blown in some time in October, 1839. Mr. Thomas was then in Catasauqua, and Mr. Parry sent for him to come to Pottsville for aid and counsel. Mr. Thomas, accompanied by his son Samuel, then a mere stripling, but now eminent in the trade, drove over to Pottsville and remained there for a week, during which time Pioneer was for the second time blown in. As stated by Mr. Jenks, this furnace then ran successfully, but only for a long enough time to secure the premium of \$5000 (not \$12,000, as stated by Mr. Jenks) offered by Nicholas Biddle to the first person who would make anthracite pig iron continuously for three months. Owing to the poor supply of ores in the vicinity, Pioneer was blown out early in 1840, and remained idle for some time. During the year 1840 several small furnaces were blown in at different points in Eastern Pennsylvania, but none of them proved a commercial success.

coal exclusively, under the management of David Thomas. Mr. Hazard at once contracted with Mr. Thomas to come to this country and erect a furnace. Mr. Thomas arrived here June 5, 1839, and promptly commenced building a furnace at Craneville, now Catasauqua, on the banks of the Lehigh Canal. This furnace, though small, was of far more generous proportions than any of its American predecessors. It was supplied with an improved hot-blast oven capable of heating the air to about 600° F., and with a blowing apparatus giving the pressure of about six pounds to the square inch. Mr. Thomas blew this furnace in July 8, 1840; made his first cast July 4, 1840; continued it in blast—with, of course, the necessary renewals—until 1879, when it was replaced by a furnace of more modern design. This furnace not only made iron, but, equally as important, made money from the word "go." Mr. Thomas followed this up by building the magnificent plants of the Crane and the Thomas Iron Companies, earned for himself the honor of having been the first man in this country to successfully and profitably establish the manufacture of anthracite pig iron, and as such is fairly entitled to

the monument which I trust will be dedicated to his memory on the 4th day of July, 1890.

The Factory Mutual Insurance Companies.

Edward Atkinson, the president of the Associated Factory Mutual Insurance Companies, has published his joint report for the year 1888, 19 companies in New England and Pennsylvania being members of the association. The premiums received in gross in 1888 amounted to \$4,462,059.90, of which \$146,354.99 was returned on policies canceled. The risks, written at the average rate of 0.9081, amounted to \$491,366,988, the net risks carried 12 months being \$475,261,438. The losses incurred were \$848,068.50, a percentage to net premium of 19.65, or 17.84 cents loss per \$100 of risks carried 12 months. The premiums on risks terminated in 1888, on policies issued in 1887, figured up \$4,055,827.78. The dividends returned on the same were \$3,062,306.86, or 75.5 per cent. The average rate of premium charged in 1887 on policies which terminated in 1888 was 89.34 cents per \$100 of risks taken. Deducting the dividend of 75½ per cent., leaves the net cost of insurance, including losses, expenses and taxes, 21.89 cents per \$100. On the 31st of December last the risks outstanding were \$473,928,628.

The practically concurrent action of all the mutual companies and the establishment of systematic and regular inspections of all risks began in 1878. In 1879 the conclusion was reached that the increase of property at risk in almost all mill yards required additional safeguards, which were steadily called for until nearly all risks were protected with suitable apparatus, at the present standard of adequate protection, in or about the year 1883.

Since that date the members have had a right to expect an increase in the percentage of their annual dividends, even though a concession in the rates of premium varying from 5 cents to 25 cents on each \$100 of risks carried has been made in consideration of the additional safeguards called for. Too much clerical work would be required to determine the exact sum of the concessions in the rate of premium. It is computed at not less than \$2,000,000 during the last ten years. Had the old rates been continued, and had this additional sum been paid in to the companies, it would all have been returned in the form of dividends. The average rate of premium placed on deposit with the mutual companies, at the reduction granted during the last five years, has varied but a fraction from 90 cents on each \$100 of risks insured.

The gain in dividends has been as follows:

	Premiums on expired policies.	Dividends.	Per cent.
1884.....	\$3,047,008.61	\$2,047,328.75	67.20
1885.....	3,259,548.82	2,416,419.04	74.12
1886.....	3,455,847.96	2,706,397.50	77.71
1887.....	3,763,203.41	2,667,154.88	70.38
1888.....	4,965,827.78	3,062,306.86	75.50
	\$17,611,416.18	\$12,902,073.88	73.24

The steady progress in preventing loss by fire is most conclusively proved by the regular increase in the rate of dividend.

Per cent.

The dividend of all companies from the respective dates of their organization up to December 31, 1878, the year in which concurrent action and joint inspection were established, had been at the average rate of.....	60.925
In the last five years of this period the increase in risks taken had not been coupled with increased protection, and the average rate of dividend was only.....	59
In the years 1878 to 1883 a steady pressure was exerted for improvement, and from 1884 to 1888, inclusive, the average dividend as above given has been.....	73.26
In the year 1888, taken separately....	75.50

The gain to all members from the concession in rates, with the actual gain in dividends on the reduced rates added thereto, is computed at not less than \$5,000,000 in ten years—1879 to 1888 inclusive—which sum would far more than suffice to cover the estimated cost of all the additional safeguards which have been called for.

STATEMENT No. 4.

Cost of insurance in 19 factory mutual Insurance Companies from the date of their organization, respectively, to December 31, 1888, assuming that all risks should be re-insured on that day, and one-half the premiums received in 1888 applied thereto:

Total amount of risks written.....	\$5,000,580,784.00
Premiums received thereon.....	\$49,347,370.01
Dividends made thereon.....	\$30,633,720.60
Value of assets, \$4,647,308.13. Less deduction for re-insurance.	\$2,157,902.45
	2,490,306.68
The remainder constitutes the cost of insurance.....	\$16,224,343.73

On this basis the cost of insurance has been 28½ cents on each \$100 of risks taken—equal to 32.08 per cent. of the premiums received, but through cancellation from time to time, and by computation for the cancellation of policies which had not terminated December 31, 1888, the amount of risks above written would be somewhat more than had been carried a full term of 12 months. Making allowance for this element of cancellation, the actual cost of insurance for full 12 months on each \$100 of risks taken may be computed at 30 cents per \$100, and the proportion of premium required to meet losses, expenses and taxes may be considered substantially 33½ per cent. of the premium received.

The system of inspection has been more fully perfected during the last year. Additional experts and employees have been required for making special inspections, laying out fire protection, making plans and the like. The cost of this service is assessed in proportion to the amount of risk carried by each company at the end of each year, and, while the increase in the number of risks has called for some additional expense in the aggregate, the proportionate expense to the amount of work done has not been increased, but has of late slightly diminished. According to the experience of the last few years, the cost of general and special inspection, making plans, printing and distributing documents, making special investigations of oil, hose, sprinklers, &c., comes to \$150 per year on each \$1,000,000 of risks insured.

Labor in Connecticut.

The fourth annual report of the Connecticut Bureau of Labor Statistics has been issued. It is an important and interesting work. It opens with the statement of the result of the figures and information taken from the books and pay-rolls of 90 establishments, representing 20 lines of manufacture, in the State. In the fall of 1887 investigation had shown that the real cause of dissatisfaction on the part of the laboring people was that their wages were not just in proportion to the profits received by their employers. On the other hand, employers believed that wages were as high as the condition of business would justify, and that any considerable advance would necessitate the closing of many of the factories and workshops in the State. In many instances, it was asserted, factories were run at a positive loss. As this was the real question, it was decided by the Labor Bureau to enter upon an investigation of wages, cost of living and profits of business in the order named.

The report says there is now far less complaint of unreasoning and unthinking agitation among such employees than before, and a noticeable willingness to adjust questions on reasonable terms. But while there is an abandonment of industrial warfare among the laboring people there is a deep-seated conviction that laborers are losing ground in the industrial turmoil, and that rapidly-changing conditions and methods of production are crowding the workmen into closer and closer lines of activity and reducing the number and range of their occupations and their wages without a corresponding reduction in the cost of living; diminishing the number of small manufacturers and multiplying the number of wage earners as these are crowded out by the large corporations. Just where the trouble lies, or what it is, is not clear to their minds, but in some general way it is summed up that the laborer's share is not in just proportion to his employer's, and that his opportunities to rise are diminished.

When the manufacturers were questioned, the wages of the present time were compared with those of 1860, and in this examination it was found that many of the officials of the concerns now were formerly common laborers in the same employ. In many of these corporations the ranks of laborers are carefully watched for men having the necessary qualifications for advancement; hence the report says it is a mistake for the laboring man, because the conditions of his lot seem hard, to relax his efforts to do his best at all times. The contract system of work in many factories, it is said, gives money to contractors which ought to go to laborers; and it does so because laboring men have not been wise enough to make it for their employers' interest to dispense with the middleman. The plan of weekly payments has gained in favor during the past year. It is very generally favored, but some of the corporations have not yet adopted it; and this is probably the most fruitful source of complaint among the laboring people to-day, as the non-adoption is regarded as a sort of intimidation.

The law limiting the work for women and children to 60 hours per week is generally conscientiously obeyed, but that compelling the attendance of children under 18 years of age at school is enforced with difficulty, unscrupulous parents resorting to various subterfuges to keep their children at work in the mills. Commissioner Hotchkiss, in conclusion, deprecates the blacklisting of employees and the boycotting of employers, and says they are both relics of barbarism, and that their very names should be forgotten. Under the head of manufactures it is shown that the 90 establishments above referred to manufactured in 1887 goods to the value of \$46,618,192.80, at a net profit of \$2,868,191.75. The wages of the 28,256 hands employed amounted to 29.17 per cent. of the cost of goods manufactured, or \$12,470,277.87. The statistics on comparative wages and the cost of food, 1860 to 1887, show that there has been an average advance in the wages of males in the occupations shown since 1860 of 48 per cent. and of females 57 per cent.

A number of Chicago manufacturers were burned out by a fire at 63 and 65 South Canal street, on the 24th inst. The basement was occupied by W. H. Casper & Co., manufacturers of metallic weather strips, and H. S. Holden, manufacturer of gas fixtures. The first floor was used by Goodell & Waters, manufacturers of wood-working machinery. Underwood & Co., manufacturers of baking, were on the third floor. All lost quite heavily, but were fully insured. This building was rebuilt last April after having been partially destroyed by fire.

Great Britain's Coal Supply.

R. Price-Williams, in a paper before the British Statistical Society, follows very closely in his argument concerning the exhaustion of England's coal resources the methods of Prof. Stanley Jevons and of the Royal Commission of 1866. In 1871 the commissioners reported a period of 350 years as the length of time assigned for the working out of the coal supply of the United Kingdom. According to Mr. Price-Williams, this is an over-estimate, and, assuming that the report of the Royal Commission was based on sufficient data, he is certainly justified in the conclusions he has arrived at. That these latter are very startling, it must be confessed. Mr. Price-Williams states that, at the present rate of consumption, all the known sources of supply, with the solitary exception of the Debieghshire and Flintshire coal fields, will be exhausted by the year 1883. The western division of South Wales, with its invaluable steam coals, will be exhausted in 46 years; Warwickshire will cease to produce coal in 53 years; Scotland will in 92 years have to seek its fuel elsewhere, and in two years more even Northumberland and Durham will be denuded of their mineral wealth. Of course Mr. Price-Williams's argument depends upon the maintenance of the present average rate of output, but, even if that rate is reduced, it is obvious that the only result will be a proportionate addition to the number of years which must elapse before the inevitable exhaustion is accomplished. The author of the paper and several of the speakers who followed him very fairly alluded to the great economy of fuel in modern methods for the manufacture of steel, and consequent on the introduction of double and triple expansion engines. These economies, however, cannot materially affect the ever-increasing growth of the coal exports, for which there is no remedy. Any idea of an export duty is quite out of the question, for, as was pointed out, England, with its vast carrying trade, is, and must ever be, so long as that trade exists, the chief benefiter from her coal exports. The only remedy for the evil pointed out is the exercise of judicious economy in the use of that most precious gift which nature has bestowed.

A General Bankruptcy Law.—A movement in favor of a general bankruptcy law has been initiated by the wholesale grocers of St. Louis, and at a convention held in that city last week nearly all the boards of trade and financial organizations in our leading cities were represented by delegates. Col. J. L. Torry, of St. Louis, was made permanent chairman, and George H. Stone, of Chicago, secretary. John H. Goddard, president of the Wholesale Grocers' Association, said, in stating the object of the convention: "A national law that will provide for the honest collection and disbursement of the assets of an insolvent debtor. We want this law so framed that it will accomplish its work quickly and economically. It must be a stringent law, one that will punish the fraudulent debtor, so far, at least, as to make him liable for his debts until they are paid, while at the same time it will not crush the poor but honest debtor, and prevent him from again engaging in business. We believe that all creditors should share fairly and proportionately in the assets of the debtors." Before adjourning, the convention passed resolutions urging upon Congress the adoption of the Lowell bill, passed by the Senate, as the basis of the desired legislation.

The Pennsylvania repair shops at Pittsburgh will be removed to Watts Station, 14 miles distant, and roundhouses to hold 800 engines will be built at the

same point, where 800 men are engaged in changing the bed of Turtle Creek for over a mile, thus reclaiming a large track of waste land for the new location.

The Prentiss Friction Shaper.

By shifting the tappets, or dogs, which are similar to those in general use, the stroke of this machine can be changed without stopping to any length from $\frac{1}{4}$ inch to its full extent. There are two different speeds for cutting hard or soft metals, and the return stroke is 40 per cent. quicker than the cutting stroke. The grip is produced by two leather surfaces brought together in such a way as to

contracted, and its leather lining is pressed either against the inside of the outer pulley *g*, the top of which runs toward the front of the machine, or it is pressed around the outside of the inner pulley, which runs in the opposite direction. Both pulleys are driven from the same countershaft, one with open and the other with crossed belt. The pulleys have long hubs, and are loose on the shaft. One of the arms, *f*, is fastened to the shaft, thus imparting either a forward or backward motion. On the shaft is mounted a pinion, which engages with a large intermediate gear, *h*, loosely fitted on shaft 2. On the arms of this gear is a ring turned on the inner side to receive, under friction, a leather-faced steel spring having

FRICION SHAPER, BUILT BY THE PRENTISS TOOL AND SUPPLY CO. NEW YORK.

cause the grip to tighten in proportion to the resistance of the work. This enables the machine to take an exceptionally heavy cut—in fact, all the driving belt can pull without danger of slipping. The friction consumes no power except when feeding.

In the sectional side elevation we show the construction of the grip. When the hand-lever *a* is moved forward or back, either by hand or by the tappets *b* on the ram *N*, it will, through the connecting-rod *c*, rock the yoke *d* and shift a sleeve which is fitted loosely on the shaft. This sleeve holds a ring provided with two opposite notches engaging spirally-shaped fingers, which are attached to the two arms *f*, *f*. The ends of these arms are fastened to the ends of a steel band, which forms nearly a complete circle, and is lined on both sides with leather. When the hand-lever *a* moves, this band is either expanded or

lugs on each end. An arm fastened to the shaft engages with and is driven by one or the other of these lugs until arrested by one of the stationary stops *k*, thereby producing an intermittent rocking motion to drive the feed mechanism. When striking the stops the spring ring is relieved and the gear is freed to move without friction. The hub of this gear forms a second pinion, which drives the ram by means of the table gear *m*. One end of the shaft of this gear extends beyond its bearings, and is provided with two disks and adjusting nut, and forms the fulcrum of the hand-lever, on which the disks produce just enough friction to keep it and all parts connected with it in the required position to the end of the stroke of the ram, when, by one of the tappets, the position of the lever is reversed, thereby reversing the motion. This shaper is built by George Juenget & Sons, of Croton Falls,

N. Y., of whom the entire output is taken by the Prentiss Tool and Supply Company, of 42 Dey street, New York.

Our New Armor-Clads.

The interest felt in the unarmored cruisers and torpedo craft, now one after another approaching completion, has naturally diverted attention from the more slowly progressing armor-clads. Of these there are no fewer than ten authorized or already under construction, without taking account of the 13 single-turret monitors in ordinary, which could perform some service, if needed, in harbor defense.

The five double-turret iron monitors, the first of which is nearly ready, have side

fensive efficiency, and their light draft will give them an advantage in maneuver in many harbors over deep-draft hostile armorclads.

Indeed, it may be said that the monitor type modernized gives the basis for a nearly perfect harbor-defense vessel. As there is no necessity for those great space allowances for coal and provisions which the sea-going armorclad must have, everything can be made to turn on armor and armament, supplies and fuel being furnished from the shore up to the time of conflict. In the sixth coast-defense armorclad, authority for which was given two years ago, a sum of \$2,000,000 being allowed for its construction, we find the best features of the monitor type introduced. The bids for it will be opened in a few weeks, as the specifications have just been

ized but not yet fully planned. The fourth is the one designed by Congressman Thomas, to which both the Senate and the House have agreed, though with some differences in detail, now the subject of conference. The Maine will carry four 10-inch and six 6-inch guns of the type already spoken of. The difficulty in securing proper steel materials for this vessel has been great, so new to this country is the industry of building large modern ironclads wholly of domestic materials. Even the use of the materials, when properly furnished, is not always skillful, and losses are thereby occasioned. The Texas is much less advanced than the Maine, because incongruities were discovered which have required the modification of her original plans in order to carry out the purposes of the department in her construction. She will carry two 12-inch and six 6-inch guns. The third armored vessel, provided for last year, will have about 7500 tons displacement, and will carry four 12-inch guns. Her engines will give her probably about 17 knots speed, and with 16 inches of solid steel armor on a water-line belt extending clear fore and aft, she will be one of the most valuable fighting ships to be found anywhere. The tenth of our new armor-clad vessels will be the sea-going partly submerged monitor. Its speed and other details cannot be positively described until an agreement is reached on this subject by Congress, but its plans in general have been mainly approved by naval experts.

The Kearsarge Copper Company.

The operations of the Kearsarge Copper Company, one of the new Lake Superior mines, in 1888 show this general result:

Mineral product 946,876 pounds,	
yielding at 86.83 per cent. 829,185	
pounds refined copper, sold for.....	\$137,609.71
Interest receipts.....	1,458.65
Assets January 1, 1888.....	56,479.56

Total.....	\$195,547.92
Expenditure:	
Operating.....	\$72,554.60
Smelting, freight, &c.....	10,579.43
Total.....	\$83,134.03
In-mine plant.....	18,173.79
	\$101,307.82

Assets January 1, 1889.....	\$94,240.10
-----------------------------	-------------

<i>Assets.</i>	
Cash at Boston.....	\$7,303.75
Cash at mine.....	562.68
Supplies at mine.....	1,630.73

250 shares.....	25,000.00
Copper on hand, 560,885 pounds....	43,046.03

Total.....	\$122,082.94
------------	--------------

<i>Liabilities.</i>	
Drafts outstanding.....	\$11,536.68
Accounts payable.....	16,312.16

Total.....	\$27,848.84
------------	-------------

Balance of assets January 1, 1889....	\$94,240.10
---------------------------------------	-------------

The mineral yielded the large average of 86.83 per cent. of ingot copper, which was sold at an average price of 16.6 cents per pound. President Van Brunt says the mine has been producing only since last August. The stopes in the two upper levels have held out remarkably well for copper, and continue to do so, while the lower levels have been somewhat disappointing. Strong hopes, however, are entertained of better results later on. The company have the use of one of the Osceola stamps on very favorable terms for what rock they have to treat, so that for the present, and until the mine is further developed, it does not seem wise to erect stamp mills of their own.

The extensive cordage works at Elizabethport, N. J., are to be enlarged by an additional structure 450 feet long and 60 wide, permitting the employment of 1200 operatives.

SECTIONAL SIDE ELEVATION OF PRENTISS FRICTION SHAPER.

armor not as thick as it should be, except in the case of the Puritan, but their turrets are covered with 11½ inches of steel. They all carry four 10-inch steel breech-loading rifles, firing projectiles that weigh 500 pounds with a powder charge of 250 pounds. This gun will pierce 23 inches of wrought iron at the muzzle and 17½ at the distance of a mile, and at this latter distance the 30 inches of freeboard exposed by the Puritan makes a hard mark to hit, while in the other four the exposed side is only 25 inches. This is the real source of the reliance which may be placed even on the four which have but 7 inches of side armor. As to the Puritan, which has 12 inches of side armor, as a harbor defense vessel she need not fear to attack any opponent. Their guns, which are of the best modern type, can be brought into play at a distance which gives the enemy a most difficult target, with shots likely to glance from the low cylindrical turrets. Double bottoms, water-tight compartments and protective decks aid their de-

completed at the Navy Department. She is to have a length of 250 feet, a breadth of 59, and a depth of a little over 11½, with a displacement of 4000 tons. Her steel armor will be 16 inches thick at the maximum, and her engines are to develop 5400 indicated horse-power. She is to carry a 16-inch breech-loading rifle weighing, exclusive of the carriage, at least 107 tons, and throwing a 2000-pound projectile with a powder charge of 1000 pounds. This will be capable of penetrating at the muzzle more than 36 inches of wrought iron. She will also carry a 12-inch, high-power rifle, having a projectile of 1350 pounds, propelled by a powder charge of 675 pounds, and having a muzzle penetration in wrought iron of 32 inches. A dynamite tube and a powerful secondary battery will complete her armament.

Besides these six harbor-defense vessels we shall have four sea-going armor clads. Two of these, the Maine and the Texas, are building at Brooklyn and Norfolk. A third, larger than either, has been author-

Automatic Four-Slide Wire Forming Machine.

This machine is designed to form wire into a great variety of shapes, such as furniture drop handles, buckle frames, round and oval rings, screw-eye blanks, handles for dripping-pans, belt hooks—in fact, almost any article that can be bent around a form can be made on this machine. The mode of operation is as follows: The wire is drawn through a series of rolls by the feed, which straightens and carries it through a cut-off die and in front of a form which is the shape of the article to be formed. It is then cut off by the action of the four slides and is bent around said form. Then by another motion the article is thrown off the form and drops into a box or other suitable receptacle under the machine. The four slides are operated from the four sides of the machine by means of positive motion cams

and strong, it is easy to adjust and operate, and when once started it will run without close attention until the end of wire is reached. The manufacturers claim it to be the simplest, the cheapest and most unique and durable machine in the market. This machine is built in several sizes. For further information address the E. J. Manville Machine Company, Waterbury, Conn.

The Chinese Wall.

The Chinese Wall is no myth, contrary to recent assertions. Built 1700 years before America was discovered, 1600 miles of it still remain erect. A correspondent who recently rode two days from Peking and mounted its ramparts said:

I could see it climbing the mountains and going down the valleys as far as my eyes could reach. It did not diminish in strength nor size at the various points I visited, and its masonry would have been

mines, of which the builders and architects constructed the mighty Cathedral of Milan.

A gigantic safe-deposit vault weighing 500 tons, and constructed of miter blocks, none of which are less than a foot thick, has been built in Pittsburgh by the National Safe Deposit in Vault Company, and finished at the foundry of the Griffin Car Wheel Company, in Cleveland, Ohio. It is 81 feet long and 17 feet wide, with two doors, each weighing 5½ tons, without lock, knob or dial, which are moved transversely on rollers across the recesses by a system of gear work that is built in the foundation blocks and secured by a locking device that is set in the floor in front of the vault. The doors themselves are secured by a series of steel bolts, operated by a double automatic bolt-throwing device, which is in turn regulated by a chronometer, triple-movement

AUTOMATIC FOUR-SLIDE WIRE FORMING MACHINE, BUILT BY E. J. MANVILLE MACHINE COMPANY, WATERBURY, CONN.

which are keyed to the shafts. These cams are made of cast iron with hardened cast-steel working parts. These hardened parts work against a hardened and ground roll which revolves on a pin, thus reducing the friction to a minimum. The form is fastened rigidly in a casting, in a manner that renders it perfectly solid, but the casting or form holder is made adjustable on the bed of machine, so as to allow for any inaccuracy in the making of the form and to compensate for different shapes which it may be necessary to make. The holding of the form solidly has been proven, by practical experience, to be a great improvement over a movable or traveling form. The machine, as illustrated, has a positive-grip feed, which for small wire is considered preferable, but a roll-feed, however, can be applied, as the nature of the work governs the case. If it is desired to straighten and cut the wires to be formed by some other device, a hopper feed can be applied that will carry the wires one by one to the tools, as practically as if fed by a positive feed. The cut shows the machine back geared, which feature can readily be dispensed with providing the work to be performed does not require it. While it is sufficiently heavy

good work for the American builders of to-day. It is about 25 feet high, and at the top it is so wide that two carriages could drive abreast along it and the hubs of one would not touch those of the other. Its exterior walls are of blue brick of such a size that they look like massive stones, and these are filled in with earth and paved with brick at the top. The grass and the moss have now grown over the top of this great wall. No archers now guard it, and it stands amid the snowy mountains a monument of the almond-eyed men who thus, 2000 years ago, sought to protect their homes and those of their descendants for all time to come. No one can stand upon the ramparts of this structure and not be impressed with the greatness of the Chinese nation. It is a greater monument than the pyramids of Egypt, built by selfish kings for royal tombs, and its purpose was nobler. It is a monument also of the great truth that while man dies his work remains, and that the lives bottled up here 20 centuries ago exist to-day, as does the hand that carved the Venus di Medici, the pen that wrote Shakespeare and the Æneid, and, in a humbler though no less effective way, the muscle that dug out the marble from the

time lock. Altogether there are 400 blocks, composed of a special quality of cold-blast charcoal and Salisbury iron, forming a car-wheel mixture. There is a hard chill of 2 inches on the outer surface of each metal block. This chill is so hard that no steel tool can penetrate it. The side and end walls are composed of separate blocks, each block having a tongue and a corresponding groove upon their adjacent horizontal faces, and a dovetail joint upon the adjacent vertical faces. All the dovetail joints are drawn up with steel keys. Two steel tie rods, 2½ inches in diameter are passed vertically through each course of wall blocks, the lower ends of such rods engaging with wrought-iron square nuts set in the outside course of floor blocks. The roof of the vault is constructed of a series of blocks of the same material and thickness as the wall blocks.

In Sweden hollow steel ingots are being made by casting steel in molds hung on trunnions, allowing the sides to chill to the required thickness and pouring out the steel still liquid in the center. These hollow ingots go to England, where they are drawn out cold to tubing.

Large Grinding Machine.

We illustrate on this page a new grinding machine just produced by the Diamond Machine Company, Providence, R. I., who have a branch at 51 South Canal street, Chicago. It is especially adapted for use in large foundries and machine shops, and is a very heavy and solid machine, which insures steadiness. The aim has been to make the construction through-

or profit upon steel rails until some mode of combination has been adopted by the trade. The hope of forming such a combination has by no means been given up. Negotiations are still proceeding with a view to some reasonable arrangement being come to among the 16 firms who make steel rails, and the directors have recently taken an important step in sending round to the directors and general managers of the various companies and

diagonally with pieces of rubber instead of bristles, as at present used in street sweeping. Under the driver's feet is a water-pipe, from which copious jets of water are thrown, washing away the sand, which is swept into the gutter and washed into the sewers. The machine cleaned two blocks in Fifth avenue, leaving the stone pavement as clean as it would appear on a summer's day. The time occupied was six minutes on each block.

LARGE GRINDING MACHINE, BUILT BY THE DIAMOND MACHINE CO., PROVIDENCE, R. I.

out of equal finish to the best make of engine lathes. It has steel spindle, engine lathe boxes and arms for rests, both front and back. It will run two emery-wheels up to 34 inches in diameter, of any thickness up to 5 inches. It has bear-

members of the firms interested a carefully-considered circular on this subject, in the hope of advancing the object in view and of obtaining for all parties a fair return, but no more than a fair return, for the capital invested in the business. Mean-

The Sweetland Eight-Jaw Chuck.

This chuck is intended principally for use in chucking articles which require an extra strong grip to hold them. An important advantage is also gained from the fact that, as the pressure is distributed over eight points, all danger of the article held springing out of shape is eliminated. The Sweetland is a combination chuck, both independent and universal. Its construction is so plainly shown by the accompanying engravings as to render a description in detail unnecessary. It is made by the Hoggson & Pettis Mfg. Company, of New Haven, Conn.

The Gatling Gun.—The Gatling Gun Company, Limited, of England, which was some time ago formed for acquiring from the Gatling Gun Company of America the patent and manufacturing rights for Europe and the whole Eastern hemisphere, has, says an English contemporary, "purchased the Birmingham works of the defunct National Arms and Ammunition Company. The works and site, which cost the late company about £120,000, were purchased for the present holders for £30,000, and about £15,000 are being spent in adapting them for the manufacture of Gatling guns and ammunition. The machine shops have been re-floored and repainted, and a large number of the machines which are obsolete are being converted on the pattern of those in use in

EIGHT-JAW CHUCK, MADE BY THE HOGGSON & PETTIS MFG. COMPANY, NEW HAVEN, CONN.

ings 9 inches long, the size of spindle in the bearing being $2\frac{1}{4}$ inches, with 2-inch spindle between flanges. The machine stands 32 inches high from floor to center of spindle, and its weight, complete with countershaft, is 1050 pounds.

The International Steel Rail Syndicate is referred to in the following terms by the directors of the Rhymney Iron Company, one of the large English works: "Judging from past experience, it would seem to be impossible to obtain under existing competition a reasonable price for

while the directors are devoting their attention to decreasing the quantity of steel rails manufactured and increasing their output of tin plate, bars, and other special branches, which may from time to time afford a better result, pending the possibility of realizing a profit on steel-rail manufacture."

A new street-sweeping machine is on trial in New York City. The machine is a large circular water tank, running on three wheels, underneath which are placed large rollers or scrapers set

the American factory. It is stated that when the factory is in full work it will find employment for nearly 1000 men and women, and the establishment, when fully organized, will be capable of turning out about 1000 machine guns a year and 3,000,000 cartridges per week. Hitherto the European manufacture of the Gatling gun has been carried on for the American company at the Elswick works. The new works at Birmingham are under the direction of Mr. J. Accles, who is the inventor of several improvements in the gun."

"Blackband" Iron.

Apropos of the fact, recently alluded to in *The Iron Age*, that the Chicago pig iron makers are striving more than ever to control their home market, comes a very "natty" publication from the office of Charles Himrod & Co., of that city, entitled, "A Few Remarks About Blackband Irons." It consists of cardboard leaves tied together with scarlet ribbon, but despite its innocent appearance it throws down the gauntlet to the Ohio makers of soft irons in a very positive, not to say aggressive, manner. First, the statement is made that the soft Ohio irons, known as blackband irons, have been of such excellent quality as to replace almost everywhere the imported irons formerly used for softeners. Next, it is declared that the increasing cost of Ohio blackband ores and the receding price of iron have compelled the Ohio furnacemen to replace their native ores with Lake Superior ores, but they still call their irons "blackband" irons, and they are in fact just as good as they were when native ores were used. This is proved by the experience of one of the most successful foundry iron companies in Ohio, whose product has always sold at the top of the market as a "blackband" iron, while it did not contain enough blackband ore to affect its character. The logical sequence then follows—namely, "there is no good reason why the same ores will not make as good iron in Chicago as they will in the Mahoning or Shenango valleys." The statements following are made to prove that not only are the identical ores available for the use of Chicago iron makers, but that analyses of pig iron made from them show as good results as the Ohio irons or imported Scotch. The following comparative analyses are published:

	Sil. Man.		Carbon.		Phos. Sul.	
			Graph.	Com.		
Coltness.....	3.39	1.77	3.27	0.60	0.44	0.04
Glenarnock.....	2.53	2.13	2.69	0.85	0.54	0.04
Ohio softener.....	3.12	1.41	3.34	0.08	0.48	0.02
* Ohio softener.....	3.00	2.50	0.75
Calumet.....	1.96	0.57	3.28	0.42	0.23	0.03
Chicago Scotch.....	3.33	0.60	3.215	0.288	0.316	0.03

* This is a very celebrated iron, the makers of which do not claim to use any blackband ores.

Messrs. Himrod & Co. point out the importance to foundrymen of the amount of silicon present in pig iron, and state that their Calumet iron is analyzed for silicon and carefully graded according to the proportion it contains, so that purchasers can depend upon securing a uniform iron. The document is well calculated to secure a lodgment in the minds of Northwestern foundrymen of a favorable impression concerning the irons now being made in their immediate vicinity.

Lloyd's Rules for Steel Vessels.—The committee and officials at Lloyd's Registry have again found it advisable to modify their rules in the light of further investigations, and accordingly they have this year issued new rules for steel vessels, and amended rules for iron vessels, which, on the whole, are considered to be more favorable for iron than they have been. Of course anything that lessens the difference between the thicknesses of iron and steel plates, while the prices of the two are so far apart, must tell in favor of iron. Thus iron manufacturers have better hopes regarding their prospects. The new rules, it may be mentioned, fill a quarto volume of 200 pages, there being included a large number of tables for iron and steel and full particulars of dimensions. They assign the limits of safe construction and

details of the strength and reliability of the different metals, their behavior under stress and strain, &c. It may be stated that these new rules provide that for iron of a thickness of a certain number of sixteenths of an inch—the difference being regulated by the size, &c., of the vessel to be built—a steel plate of so many twentieths of an inch may be considered an equivalent—e. g., a first garboard steel strake of $\frac{5}{16}$ inch is equivalent to an iron one of $\frac{1}{4}$ inch.

Buffalo Glass Oil-Cup.

With the increasing use of high-speed machinery, the problem of a thoroughly efficient and reliable means of supplying oil to the bearings becomes constantly more important and difficult. Not only

Four-Hole Eight-Drop Buffalo Glass Oil Cup.

is this demanded, but there must be economy in the use of oil. The oil-cup manufactured by Felthousen & Sherwood, of Buffalo, N. Y., and shown in the accompanying engraving, possesses new features of interest in connection with this question. It is of glass, with metallic base and cap. In the base are openings covered by glass lenses, through which the feed can be seen. The feed can be adjusted to suit requirements and fastened with a lock nut. It can then be started or stopped instantly by means of the lever, shown in the cut, without interfering in any way with the feed adjustment. The lenses on the sight drop can be easily taken out, cleaned and replaced, or new ones substituted if necessary. The cup is filled from the top, and has no loose parts to come off. If at any time it is desirable to flush the cup, it can be done by simply pulling up on the adjusting stem, when a stream of oil can be sent through it, this being accomplished without any change in the regular feed adjustment. These cups are made in four styles—two holes open, two holes protected by lenses, four holes open and four holes protected by lenses

A National Bankrupt Law.

The Committee on Bankrupt Law of the National Stove Association, consisting of W. P. Kellogg, E. W. Peck, A. J. Redway, E. G. Callahan, W. P. Warren, J. L. Smyser and W. H. Whitehead, made the following report, at the Chicago meeting:

Your committee appointed to prepare a resolution expressing the sense of this convention upon the question of a general bankrupt law beg leave to report: That in their judgment a uniform plan for the collection of debts, or more particularly for the collection and distribution of the assets of insolvents, is in its importance to the business community second only to that of a uniform currency. Laws uniform in their operation throughout the United States can only be passed by Congress, and Congress has no power to pass any such law, except under the power conferred by the Constitution to establish uniform laws upon the subject of bankruptcy. We all know the ease and frequency of preferences—by chattel mortgage, bill of sale or confidential indebtedness to relatives or others—that by rendering fraud easy, and escape from its punishment easier, put a premium upon dishonesty, the unsecured or unpreferred creditor having no redress.

It is by no means rare for a wholesale house to bolster the credit of a weak merchant, until others are induced to sell him, and then enforce a demand for payment or security by threat of proceedings for collection. We believe that an equitable bankrupt law is one by which it is impossible for a debtor to be discharged from the legal obligation of his debts without a full disclosure of his condition and a full surrender of his property. If a law provided that any confidential preference or any deception or concealment of property should prevent a discharge in bankruptcy, it would be an incentive to honesty and prove a safeguard both to debtor and creditor. Former bankrupt laws have been passed after periods of depression or of panic, when relief for large numbers seemed to justify a legal discharge from their obligations. What we now need is a measure of permanency, adapted to the current needs of business, that shall take the property of a debtor unable or unwilling to pay, and by a single process, at minimum cost, distribute the proceeds to his creditors.

One chief abuse that a bankrupt law should be framed to prevent is that of preferences. When they are given to creditors, it may be by connivance between debtor and creditor; that in itself amounts to fraud. When given to relatives or friends their effect is usually fraudulent, and they are often so intended from the first. The law should make them impossible, unless given openly and as a matter of record, and with a limit of time that is ample notification to creditors. We do not wish to discuss the question at length in this report, but, believing a general bankrupt law to be a measure that would have a salutary effect upon business, we hope for a free discussion of the question in convention, and would recommend the adoption of the following resolution:

Resolved, That the early enactment of a general bankrupt law, to compel an unreserved showing and surrender of assets, to prevent unjust preferences, and to facilitate just settlement of the estates of insolvent debtors, as a permanent feature of our collection laws, is a much needed measure, and one that would benefit business alike in all sections.

Your committee further recommend that our secretary be instructed to officially communicate this action of our association to boards of trade and business men's associations in other cities and the press.

We also recommend a memorial to Congress from our association urging the passage of such a law, and that as individuals we urge it upon the attention of our respective representatives in Congress.

The Adt Butt Machinery.

The butt milling machine is for milling all kinds of cast butts, and is designed to be attached to an ordinary bench; the gang of mills is mounted on a horizontal steel spindle, and the work is fed up to it on a sliding table provided with a self-closing adjustable chuck; the table is raised and lowered by a rack and gear operated by a weighted lever, and the extent of its upward motion is regulated by a set-screw at the bottom of the slide. In operating the machine the butt is placed in position with one hand, while the other releases the spring catch and starts the lever; at the same time the chuck closes automatically and holds the butt firmly during the milling operation; when this is completed and the lever raised, the chuck opens and the butt is released. One operator can run two machines, and by matching the halves of the butts during the milling process detect any slight variation in the parts. It is claimed that this is the only method by which accurate work can be assured, as if one machine is used for both parts, especially on large lots, the mills may become dull before the first halves are finished, which will cause a variation in size, and by the time the second halves are finished there will be so much difference between the two parts that some of them will not match, and it will then be necessary to mill them over again or fit them by hand. In using a separate machine for each part, not only is much time saved in changing mills, but the butts are matched ready to commence

BUTT MILLING MACHINE, BUILT BY JOHN ADT & SON,

AUTOMATIC BUTT DRILLING MACHINE, BUILT BY JOHN ADT & SON,
NEW HAVEN, CONN.

drilling at once, and thus the two operations can be carried on together without the delay of waiting for the second half to be finished. A full outfit of butt milling and drilling machines should consist proportionately of one of the former to two of the latter.

Formerly the joints of butts were drilled on ordinary hand-lathes, and the only improvement made was in drilling by means of weights or a positive feed; but this method demanded the constant attention of the operator in order to prevent the drills heating or breaking. About 20 years ago the inventor of the machine here illustrated became convinced that both halves of butts could be drilled and matched together at one operation, and thereby avoid the constant watching required by the above method. To accomplish this he devised the plan of feeding by a screw and using a split nut arranged to open instantly whenever the drill became dull or struck a hard spot. This improvement forms one of the most important features of the automatic butt-drilling machine, and 20 years' use has demonstrated its advantages over all other methods. This machine is arranged with drills running in stationary bearings provided with convenient tubes for oiling, and protected from chips and dirt by bell-shaped guards attached to the spindles. The sliding carriage upon which the work is placed is fed toward the drills, and is started by closing a split nut on the feeding screw with a slight motion of a lever. When the proper depth is reached the lever comes in contact with a gauge on the side of the machine, which instantly opens the nut, and the carriage slides back by means of weights to its former position. As one boy can run ten machines, the most economical arrangement is to have them mounted in gangs of five and placed end to end. The cut shows four machines, which is the smallest number that can be recommended in one gang. The amount of work which can be done on these machines is equivalent to 1 inch per minute for each spindle on a medium-sized butt. The above machines are manufactured by John Adt & Son, New Haven, Conn.

Smoke Prevention.

In an address before the St. Louis Commercial Club, Robert Moore, C. E., speaking of smoke prevention in cities, referred to a class of devices in which small openings are made into the furnace above the coal precisely as in the Argand furnace of Wye Williams. But instead of depending upon natural draft to force the air through them, there is in each a small jet of steam, which projects the air into the fire with a high velocity and causes the mixture of hot air and gas to be made more quickly and thoroughly than is practicable by natural draft alone. The result of this, where the number and arrangement of jets is properly made, is a very perfect combustion of gas with an almost entire absence of smoke. Two devices of this kind are now in actual use in St. Louis. One of them may be seen at the power house of the Olive Street Cable Railway, and the other at the store of D. Crawford & Co.

In principle this method of smoke prevention is entirely sound, and the results actually attained are very good. It has also the great merit of being comparatively inexpensive, and of being easily applied to an existing furnace. In these respects it has greatly the advantage over the class of mechanical stokers, which are much more costly, and can, as a rule, be applied to an existing plant only by entire reconstruction to the furnace. It has also the further and very important advantage of admitting a higher rate of combustion than so far seems practicable by the other method, thus giving to the same set of boilers a greater working value.

This reduction of capacity has up to this time been the greatest obstacle of all to the introduction of smoke preventing furnaces. A very careful and very valuable series of tests of the actual working of such furnaces has been made by Professors White, Jones and Potter, of the Washington University, who have thereby done more than any other persons whom I know to convert the ordinary crude guesses upon this subject into exact and scientific knowledge. Their experiments, which have included the Backus, the Hall, the Jarvis, the Williams and the Murphy furnaces, have shown that by their use in such a manner as to be smokeless, the capacity of the steam plant as a whole is from a value of 100 per cent. given by the common smoke producing furnace brought down to 60, a reduction of 40 per cent. In other words, if with the common furnace burning coal without any regard to the amount of smoke produced it requires three boilers to make a given amount of steam, five boilers will be required to make the same amount of steam if a smokeless furnace be used. As steam boiler practice at St. Louis has always been largely governed by that of the river steamboats, on which it is of vital importance to make the needed steam with the smallest boiler possible, and as moreover many steam users are unable as well as unwilling to incur the increased outlay necessary for a smokeless plant, the introduction of these has until recently made little or no progress. Many have put in smoke burning devices, but finding they could not make the steam which their business demanded have taken them out and reverted to the old methods, which do indeed produce smoke, but do at the same time give them the power which they require. And unless some method is found by which this difficulty can be overcome, the prevention of smoke will be seriously embarrassed, as it will in practice be found to be a matter of much difficulty to compel steam users to make the larger investment of money which a smokeless plant will require.

In order to ascertain by an actual working test the performance in this respect of

the device in use at the Olive street power house, which was not included in the series of tests already mentioned, Mr. P. C. Maffit, president of the Missouri Railroad Company, very kindly consented to put the plant for this purpose at the disposal of Mr. C. E. Jones, of the Manual Training School, who volunteered to give the matter the necessary time. Such a test was accordingly made on October 18, extending from 7.30 in the morning until 11 o'clock at night. During this time the boilers were run first at the ordinary rate necessary to do their regular work, burning 23 pounds of coal per square foot of grate surface per hour; second at a rate of 32½ pounds; third at a rate of 27 pounds, the smoke-preventing apparatus being all this time in full operation and the amount of smoke produced being noted by an observer stationed on the roof. Finally the plant was run for three hours with the smoke burner shut off.

While these experiments were not sufficient to determine all the facts in regard to the working of the apparatus, notably the amount of steam required to operate it and its effect, if any, on the boiler, they were enough to show that simply as a preventer of smoke it has much merit. Up to a rate of 27 pounds of coal per square foot of grate surface it was practically smokeless. Beyond this rate of firing there was a good deal of smoke though very much less than with an ordinary furnace. Though in practice it is sometimes desirable, or even necessary, to push a furnace to a rate of 35 or even 40 pounds of coal per square foot of grate surface per hour, it is not common and ought perhaps never to be necessary. So that a furnace which will, as in this case, burn 27 pounds substantially without smoke may be considered as fairly successful.

I am of the belief, however, that the highest success attainable will be reached by a combination of these two general methods—viz., by some form of mechanical stoker which will feed larger coal than those now in use, coupled with means for the admission of air, by a forced draft if necessary, in proper quantity above the coal or at the bridge wall for the combustion of the gases. I do not know of any existing apparatus which quite fills this ideal, but I can see in it nothing impracticable, nothing which we may not reasonably hope to attain. On the whole we are, I think, justified in the belief that with proper efforts the smoke nuisance can even now be greatly mitigated, and in course of time substantially abated. To do this will, no doubt, cost something in money and something in convenience to the coal user. The same thing may be said, however, of nearly every other public nuisance. As a rule their abatement is attended with both trouble and expense and hardly any of the comforts of civilization are given to us for nothing. But even if the sacrifice required in this case were much greater than it is ever likely to be, it is no more than we have a right to ask, or even to require, the citizen to make to the comfort and well being of the community at large. And to help to form a public sentiment which will emphasize and enforce this demand, and without which the most stringent ordinance will be a nullity, is a worthy object both for individual and associated effort.

The Williams Printing Company, of Cherry street, in this city, who print *The Iron Age*, *The Metal Worker and Carpentry and Building*, have lately introduced a simple contrivance which removes thoroughly the source of much annoyance in printing. At times so much electricity is generated in printing that either the sheets cling together tenaciously or they show remarkable eccentricities in their

movements, suddenly shooting off from the delivery table for yards. At times this trouble has reached a point where work had to be stopped entirely. After experimenting unsuccessfully with a number of devices, the dissipator of L. E. Bathrick was tried. It did its work so well that it was applied to all of the eight large presses of the Williams Printing Company. Along the feed-table and under it is a long rod, from which is suspended a fringe of cloth saturated with a dissipating fluid, kept in contact with the delivery cylinder. Attached to it is a copper wire wound several times around the standard of the press. Its end is provided with bar, which is introduced between the delivery table and the sheet zinc covering of the latter. Even in damp weather a number of sparks can be observed in rapid succession when the bar is taken from its place and is made to approach the sheet zinc.

Some Tin-Plate Statistics.

The magnitude of the tin-plate industry is seldom fully realized by those outside of the trade, except when they chance to see some table of statistics. A single sheet of tin makes such a big showing for its weight that we are surprised to find the annual Welsh product running up to such large quantities. We also do not give full weight to the fact that this industry, the product of which goes all over the world, is practically centered in a single country. A similar product, sheet iron, for example, presents no remarkable statistics, for each country supplies its own demand; but when the demand of many countries is supplied from one, as is the case with tin plates, the tables of production necessarily contain large figures. During 1888 the total exports of tin and terne plates from England were 7,825,820 boxes, or 391,291 tons; of this sum 5,852,460 boxes came to the United States, while the next largest importer was Canada with 400,000 boxes. Compared with 1887 the imports to this country increased nearly 500,000 boxes, while the total exports from England increased less than 800,000 boxes. The United States imports of tin plates have shown a remarkably uniform rate of increase for the past 25 years. Beginning with about 600,000 boxes in 1863, the imports rose to 1,000,000 boxes in 1866, to 2,100,000 in 1867, to 3,100,000 in 1879, to 4,300,000 in 1882 and to 5,270,000 in 1888. On January 1, 1888, there were 87 existing works, representing 393 mills, of which 350 were in operation, with an estimated annual productive power of 9,130,000 boxes. On January 1, 1889, the existing works numbered 93, representing 444 mills, of which 403 were in operation, with a productive capacity of 10,075,000 boxes per annum. The prices last year were also favorable as compared with the three preceding years, though the advance was not very noteworthy.

Merchandise in Transit in Bond.

In respect of merchandise transported in bond between the United States and Canada, Acting-Secretary Thompson issued the following: "Hereafter all bonds on entries of merchandise for immediate transportation and exportation under the provisions of Articles 846 and 856 of the General Regulations of 1884 will be taken for a period of one year, instead of the respective periods of 60 days and four months specified in the first-mentioned article. Bonds heretofore given under said articles may be withheld from prosecution under the usual condition as to the consent and responsibility of the sureties for a period of time not exceeding one year from their respective dates.

Combination Friction Drill.

This tool is made for both taper and square shank drills, and is particularly adapted for machinists' use, where the different styles and sizes of drills are employed. The hexagonal top on the sleeve of this drill, to which the wrench is fitted, is an improvement over the hole and pin in making up the feed screw. In this drill, which is made by the F. F. Waters Mfg. Company, of 88 Oliver street, Boston, Mass., the well-known and certain friction clutch principle is employed. This construction results in doing away with almost all lost motion, as the drill can be operated with less than $\frac{1}{4}$ -inch backward thrust

fitters. A pin attached to the spring at each end holds the bit firmly in place. Fig. 3 is similar to Fig. 1, except that the end is round instead of hexagonal. The boiler drill, intended for working in contracted places, is shown in Fig. 5.

The Collins Furnace.

A correspondent of the *Bulletin* of the American Iron and Steel Association gives the following interesting information in regard to the above-named furnace:

The Collins Furnace, the new furnace of the Bellefontaine Furnace Company, at Bellefontaine, Pa., recently completed its

taken from the different banks of the company, and average from 49 to 53 per cent. of iron, 15 to 28 per cent. of silica, 0.08 to 0.16 per cent. of phosphorus, and from a trace to 0.03 or 0.04 per cent. of sulphur. They vary in appearance from a dark colored, often black hematite, with a pitch-like luster, rich in iron, to a lighter, liver-colored, compact hematite, not so rich. The ores are easily smelted in the furnace, and make an excellent quality of pig iron. They contain but few impurities, and it is this fact which made the charcoal irons of Centre County so famous in the past, and which is giving the coke iron now made from these ores a like good reputation. The ore from which the Bellefonte iron is made is taken from the banks which were opened and worked for the old charcoal furnaces. The coke used by the furnace is brought from the Connellsville region. The limestone used is quarried within 1500 feet of the furnace. A sample from the middle bed, the principal stratum worked, gives: Carbonate of lime, 98.322 per cent.; carbonate of magnesia, 1.170 per cent.; carbonate of iron and alumina, 0.320 per cent.; insoluble silicious matter, 0.390 per cent.

It may be interesting to furnacemen, at a time when their attention is being drawn to the South and other new regions, to observe the production and success of a new furnace in what was two years ago a practically undeveloped iron section, although, at the same time, one of the oldest iron-producing sections in the country. The increased power of the modern blowing engine and other improvements in furnace and mining practice have rendered valuable ores that were considered unavailable for the older furnaces, and which were left in the banks and on the screening floors by our old furnacemen.

La Grange Charcoal Pig.

The pig iron made in the charcoal furnaces of West Tennessee had a very high reputation for strength in the palmy days of that iron-making section before the war. Of recent years not so much has been heard of this iron, partly because of the greater development of the iron interests of other sections, and partly because the use of the iron has been mainly confined to a limited territory instead of covering a wide section of the Union, as of old. Attention has been freshly drawn to this matter through the publication by Rogers, Brown & Co., of Cincinnati and Chicago, of the results shown by comparative tests of strength made between the La Grange charcoal iron of West Tennessee and several leading brands of Lake Superior charcoal iron. The tests were made by a prominent manufacturer of agricultural implements, for his own information, and without the knowledge of the makers or their agents until the results were furnished them. Excellent as the Lake Superior irons proved themselves to be, the La Grange surpassed them. A 2-foot 1-inch square bar was broken in each case, the La Grange at 1500 pounds and the average of the Lake Superior irons at about 1200 pounds. This is a remarkable showing, in which the Tennessee iron manufacturers may well take pride.

A Chattanooga telegram says there has been consummated in that city one of the largest and most important real estate transactions in the history of the Central South. The Chattanooga Land, Coal, Iron and Railway Company, owning 25,000 acres of land on the north and west sides of the river opposite the city, embracing valuable coal deposits on Walden's Ridge, large iron ore mines and timber lands, have sold controlling interests to the Boston, New York and Philadelphia syndicate, the consideration exceeding \$1,000,-

SMITH'S PATENT COMBINATION FRICTION DRILL.

of the outer end of the handle. This permits of the use of the drill in places so constructed that a drill having a considerable lost motion could not be employed. All the working parts—the body, cam, friction rolls, and feed-screw, which has a regular turned square thread—are of the best quality steel, drop-forged and tempered. The construction is shown in the lower drawing, Fig. 2. The letter E represents the body of the drill, around which the cam D revolves. The rolls A are held in place by the springs B. The opening C in the cam, into which the rolls and springs are placed, is broached out of this cam to a taper, so that whenever the handle is left the rolls will grip the body. The cam spaces are triplicated and arranged at equal distances apart, as shown. The auger friction bit stock shown in Fig. 4 is particularly adapted for the use of carpenters, machinists and gas-

first year's record, which was in every way satisfactory, 27,127 gross tons of pig iron having been made, an average of 81 gross tons for each day it was in blast. The furnace is 70 feet high, the bosh is 15 feet in diameter, and the crucible is 8 feet; the total capacity of the furnace is 72,000 cubic feet. The blast was put on on Tuesday, January 31, 1888, at 10.25 a. m., a little over nine months from the time work had been commenced on the foundation of the furnace, and the first cast was made on Wednesday, February 1, at 9 a. m. Since that time the only trouble of consequence experienced was caused by the wearing away of the in-wall at the stock-line, which was corrected by relaying the wall at that point with a harder brick.

The ores used are Centre County hematites, taken from the Buffalo Run and Barrens groups. The washed ores are

000, and the erection of an iron railway bridge across the Tennessee, the building of a railroad to the top of Walden's Ridge, and other extensive improvements will be begun immediately. The purchasers are headed by John W. Candler, a member-elect of the Fifty-first Congress from Boston.

The Osceola Company.

The annual report of this Lake Superior copper mine shows that the mining profit was \$142,076, of which \$22,907 was expended upon plant, leaving \$119,169 applicable to dividends. The dividend payments were \$150,000, showing failure to earn the same by \$30,831, instead of \$7924, as previously stated. This deficiency was charged to assets of \$235,516 at the beginning of the year, reducing them to \$204,685 January 1, 1889. The statistics of operations for the year were:

	1888.	1887.
Rock stamped, tons.....	183,036	145,200
Mineral, pounds.....	4,883,543	4,184,438
Refined copper, pounds.....	4,134,320	3,583,723
Copper per ton stamp rock, pounds.....	22.59	24.68
Refined copper per cubic fathom ground broken, pounds.....	35.9	377.15
Per cent. mineral in stamp rock.....	1.32	1.44
Per cent. refined copper in stamp rock.....	1.13	1.23
Cost per ton of rock hoisted.....	\$1.95	\$1.75
Cost per ton of rock stamped.....	2.21	2.05
Refined copper, cost at mine.....	9.78¢.	8.31¢.
Cost of smelting, freight and other expenses.....	1.83¢.	1.57¢.
Total cost per pound in New York.....	11.16¢.	9.88¢.

The chief cause of the high cost of refined copper, according to the report, was the reduced amount of refined copper per ton of rock, only 22.59 pounds against an average of 25 pounds for six years. The yield in December was 27.12 pounds, and the January yield will be as good. There was also necessary dead work done. Assets and liabilities January 1, 1889, were:

Assets.	
Cash in Boston.....	\$24,855
Cash at mine.....	1,383
Supplies.....	29,356
Fuel.....	12,812
Accounts receivable at mine.....	33,658
Accounts receivable in Boston.....	120,527
3000 shares T. & O. Mfg. Company...	15,000
250 shares H. and C. R.R. Company...	25,000
Copper since sold.....	39,549
Total.....	\$301,643

Liabilities.	
Drafts outstanding.....	\$28,435
Accounts payable at mine.....	37,414
Accounts payable in Boston.....	29,921
Dividends uncalled for.....	1,186
Total.....	\$96,950
Surplus assets.....	204,685
Grand total.....	\$301,643

The following statement in the report will be of interest: "It is doubtless well known to our stockholders that this company, as well as nearly all of the other copper producers of the world, have sold their production of copper for about three years to 'La Societe Industrielle et Commerciale des Metaux de Paris,' at 13 cents per pound, and, in addition, such sums as shall be equal to one-half the net profits realized above this price on re-sales thereafter made of said copper. This sale, consummated April 20 last, expires December 31, 1890, and, as a guarantee, a letter of credit in favor of this company was opened by 'Comptoir d'Escompte de Paris,' with J. W. Seligman & Co., of New York, for \$520,000. Thirty days before May 1 next a similar letter of credit is to be furnished, and same is true of the year following. Up to this time this letter of credit has been

reduced to about \$410,000 by deliveries of copper unsold. On re-sales, of course, credits are not drawn against.

Double Center-Drilling and Counter-Sinking Machine.

The large number of turned bolts used in machinery, and the constantly growing demand for more accurate and uniform sizes, led Nicholson & Waterman, of Providence, R. I., to develop as a companion to their special bolt lathes the machine which we herewith illustrate. This tool performs the operation of center-drilling and counter-sinking both ends of bolts or rods at the same time. The nicety of turned work depends very materially upon the accuracy of counter-sinking, and while the opera-

prolongation of a line drawn from the center of the pivot stud through the center of the shafts are placed two hardened taper recess pieces, into which a tempered center is forced by a spring and is carried by the chuck frame and serves to locate the bolt in the center and in line for drilling. The two shafts are driven by one belt passing over an idler and over a drum pulley on the countershaft. The spindles are advanced by a handle in front of the machine, which is connected by crank and rod to a forked lever. The connection between the lever and the rod is adjustable to accommodate the different positions of the head. The chuck frame consists of a lower lug, through which the pivot stud passes, and which is provided at the upper end with a handle, to one side of which is attached a lever for re-

CENTER DRILLING AND COUNTER-SINKING MACHINE.—NICHOLSON & WATERMAN, PROVIDENCE, R. I.

tion of counter-drilling appears insignificant, yet the numerous handlings for drilling both ends become so considerable an item that very frequently they are omitted, and the center punch driven in with a hammer serves to make the seat for the lathe-centers. It was to perform these operations at one handling and accurately that the machine was designed. Contrary to the usual practice, the centering of the head is done from the sides of the head and not from the stock under the head. The end of the bolt is seized about an inch from the end, away from irregularities caused by shearing. In detail the machine consists of a bed upon which are placed two heads, which may be adjusted to any position to suit the length of the work. As they are duplicates, a description of one will cover both. The head carries a pivot stud a little below the level of the top of the bed and upon which the chuck frame swings. Above this, one on each side, are two sliding shafts, which carry respectively a drill and a countersink. At the

moving the centering pin when changing position. In line with the drilled shafts is placed a scroll chuck for one side (that of the end of the bolt) and interchangeable head holders for the head end. A separate holder is provided for each side of the head, and these holders are made tapering, the standard sizes being in the middle and the tapering allowing for variations in sizes. The depth of the countersink is regulated by the end of the countersink holder, which is tempered and brought against the work. For entering work the two chuck holders are brought forward against two lugs, the chuck being thus in line.

In practice, the operation consists in first placing the bolt in the two chucks, pressing the head end firmly into the holder and screwing down the chuck end. Next, grasping with both hands the two chucks and placing in line with drills, and then pressing down on the levers until sufficient depth of drilling is obtained, and advancing the chucks to the line of the countersinks, pressing the levers for

countersinking, and, finally, returning the chucks to the front of the machine for removing bolts.

THE WEEK.

The Nebraska State Farmers' Alliance estimate the amount of farm mortgages in that State as \$150,000,000, which, at 7 per cent., drains the State to the extent of \$10,500,000 per annum, and this is exclusive of corporate and municipal indebtedness. Artisans in consequence find the conditions of life harder, and manufacturers are compelled to narrow the margins of profit. Thus dealers and manufacturers are driven into the formation of trusts, "which seem pernicious and tyrannical."

Henry A. Gould, dealer in dyestuffs, rubber, gutta percha, &c., in Boston, under the firm name of Henry A. Gould & Co., made a voluntary assignment, with liabilities approaching \$1,000,000 and assets at present unknown. Mr. Gould has branch houses in Philadelphia, New York and London, and a purchasing house in Para, Brazil, the latter being the oldest American house in that city. He is said to have an interest in the reorganized National Rubber Company, the Brookhaven Rubber Shoe Company; also two camphor refineries, one of them at Rumney, N. H., and the other at Stamford, Conn., and is said to control the product of a German manufactory of anilines. About seven years ago the failure of the National Rubber Company, in which Mr. Gould was largely involved, seriously crippled his revenues. Other failures in the rubber trade last year brought further losses, which, report says, would have led to failure long ago but for the backing of Ezra Farnsworth.

Paper doors are said to be great improvements over wooden ones. They are formed of two thick paper boards, stamped and molded into panels and glazed together with glue and potash, and then rolled through heavy rollers. After being covered with a water-proof coating and one that is fire-proof, they are painted, varnished and hung in the usual way.

At the present juncture the views of Secretary Windom in regard to the silver dollar suddenly became of special interest. Referring to the Congressional debate of 1878, on the adoption of the Bland dollar, he expressly favored the remonetization of silver, but opposed the coining of a silver dollar that was not equal in value to a gold dollar. He said: "Several of the leading commercial nations have already adopted the gold dollar as the standard of value, and others are rapidly tending in that direction. If we are to compete for the commerce of the world, and to trade on equal terms with these nations, we must adopt a similar measure of values. Whether the instrument by which values shall be measured be gold or silver makes no difference in my judgment, providing the standards are alike. If, as assumed by the Senator's question, that great instrument of trade and commerce known as the dollar has no recognized value, and one thing may be called a dollar as properly as another, why waste 412½ grains? Why not call 206½ grains a dollar and have twice as many of them?" Mr. Windom finally voted for the Bland dollar, hoping for more favorable action when it became evident that the standard silver coin is deficient in intrinsic value.

Beginning on the first Monday in December, 1887, the Fiftyeth Congress continued practically uninterruptedly in session until the 20th of October, 1888, when it adjourned to meet for the second session in December and to continue until March 4, 1889, as required by law. During the

two sessions there have been introduced in the House 12,659 bills, or 1400 more than in the preceding Congress, and 268 joint resolutions, or five more than in the Forty-ninth Congress. Committee reports have been made to the number of 4154. In the Senate 3998 bills and 144 joint resolutions have been introduced, against 3357 bills and 118 resolutions during the Forty-ninth Congress, which broke all previous records in this respect. There were 2706 written reports made, or over 700 in excess of the preceding Congress. Of all these bills and joint resolutions 1791 became laws, of which number 1190 originated in the House and 601 in the Senate. The President also sent veto messages in the case of 99 House and 47 Senate bills, or 14 more vetoes than were made during the previous Congress.

Extensive coal veins underlie the city of Vancouver and crop out on either side.

Pittsburgh had a grand turnout of its skilled laborers on the 22d ult., comprising 10,892 men, nearly all of the Order of American Mechanics, escorted by 55 bands of music. The Catholic societies paraded at the same time and claim to have been as numerous, making 20,000 men in procession during the day.

An iron rooster, recently mounted on a new church steeple, in Brooklyn, was ignominiously taken down by order of the rector, Architect Waller failing to convince him that the "cock was an emblem of St. Peter," and, therefore, of fitting significance.

Estimates about to be submitted to the German Reichstag provide for an outlay of 21,882,570 marks, a large portion of which goes to strengthen the artillery. Of this total 9,390,266 marks will be raised by matricular assessments and 12,298,054 marks by an imperial loan.

Detroit is obtaining subscriptions for an international fair and exposition. Among the names secured are the Michican Stove Company, \$6000; Block Hardware Company, Bela Hubbard and Detroit Stove Works, each \$3000.

The Pennsylvania Railroad Company have purchased 435 feet of water front in Philadelphia at a cost of \$500,000, and rumor says the object is to accommodate a new steamship line.

The recall from Samoa of Herr Knappe, the German Consul, has been promptly followed by the dispatch of Herr Stuebel, formerly Consul General at Copenhagen, to replace him.

The competition of petroleum tank steamers at Philadelphia is making constant inroads upon shipping rates, affecting all classes of vessels. In the coal transportation business there is a similar depression equal to 20 per cent. to San Francisco and South American ports.

A fire-brick trust, capital \$15,000,000, is spoken of in England.

Mines in the Territories are the subject of a report by a Congressional Committee who state that there is invested in mining lands in the Territories by aliens about \$20,508,705, which has paid in dividends about \$4,737,800. The profits may have been greater than this, but certainly the original capital has been returned to the investors. The investment of foreign capital in the mines of the Territories before the passage of the act prohibiting such investments consisted in the purchase of patented claims. The purchasers usually paid a full consideration and frequently exorbitant prices for this property. The money they brought in helped to develop the country. The people of the Territories, the committee says, do not object to the investment of aliens' capital, but

rather invite it, and the committee thinks it would be as well if the law in relation to the matter were repealed.

No less than a dozen industrial and manufacturing companies are applying for the admission of their shares to dealings on the Stock Exchange.

The city of Spokane Falls, Wash. Ter., which has 15,000 inhabitants, was nine years ago the site of Indian wigwams. It is 400 miles east of Puget Sound on the Northern Pacific Railroad.

The assignee of the Pacific Guano Company reports the liabilities to be \$2,487,800; assets, \$422,284. The condition of Glidden & Curtis was stated as follows: Liabilities, \$2,266,836, of which \$424,400 is secured. The assets include items due from the Pacific Guano Company to the amount of \$1,777,757, face value; from the Ohio and Western Coal and Iron Company, cash and coupon account, \$571,421, face value.

A Detroit paper says the unjust action of the Canadian Government, through an "order in council," imposing an export duty of \$3 per 1000 feet on pine sawlogs coming to the United States, is not fully appreciated until the figures relating to the business are exhibited. The export of white pine logs to the United States was less than 5,000,000 feet in 1888, while over 20,000,000 feet of pine logs were imported by the Canadians, unburdened by either export or import duty, from the Lake of the Woods district of Minnesota, sawed into lumber at Rat Portage, and sold to the people of Manitoba. Most of the spruce cut on the upper St. Johns River in Maine is taken to Canada and manufactured into lumber at St. Johns, N. B. During the past ten years logs and masts to the value of over \$100,000,000 have been shipped from the United States to Canada free of duty, while less than \$20,000,000 worth have been exported from Canada to the United States. This shows the injustice of the Canadian export duty.

Accounts from Ogdensburg, N. Y., represent that very extensive smuggling is going on across the St. Lawrence River at various points, and urges that a steam launch should be employed as auxiliary to the revenue cutter, which can only navigate the channel.

The reactionary spirit of the new Emperor of China with reference to modern innovations is manifest in the opposition of the government to the extension of the Tien-tsin Railway. It is reported in a cable message received in London that the recent partial destruction of the Imperial palace is construed by the astrologers as an evil omen, intended as a warning against permitting the approach of the "Western invention" to the Sacred City; and it is said that the further extension of the railway has been prohibited by imperial decree.

The great lumber mills on Puget Sound shut down for eight days, owing to overproduction and a dull market in Southern California.

New York capitalists have subscribed \$17,000,000—\$8,000,000 in cash having been paid on account—for building two railroads through the immense coal fields and hardwood lands of Eastern Kentucky, to connect with the railroad system of Southwest Virginia.

Further information is given out in regard to the Peekskill Bridge Company's affairs, in which the management of the New York and New England Railroad Company are interested. Basing calculations upon the latest reports of the engineers, it is believed that within two years the bridge will be opened for business. The

work on the bridge structure has already begun, and is being carried on slowly on the site selected, preparatory to the construction of the piers. Of the latter there will be only two, one on either bank of the river. This will make the span one of the longest, if not the longest, in the East. Active work is now being done in several iron establishments preparing material for this span.

Congressman F. W. Ahearn, of Bay City, Mich., has purchased an extensive outfit for steel shipbuilding, and the keel for a steamer 280 feet long, to be fitted with the latest improved machinery, has already been laid.

The Pencoyd Iron Company are under contract with the Fifth Avenue Railroad Company, of Brooklyn, to go on with the construction of the road at the rate of 200 feet a day. Judge Barnard's recent decision, President F. Wilhelm says, removes all legal impediments.

Fully \$1,000,000,000 have been disbursed from the United States Treasury in the shape of pension money since the year 1861, and the new appropriation bill calls for \$84,000,000 more.

The Montezuma special Pullman vestibule train will shorten the time between the capital cities of the two Republics to a little more than 100 hours for a journey of nearly 3000 miles.

The Venezuelan Government has contracted for a large number of Italian laborers at the rate of \$23.08 per head, to be employed in the cultivation of ramie as a substitute for hemp, so extensively grown in Central America.

Cleveland, Ohio, builders are seriously considering the expediency of establishing a trade school in that city.

The great hall to be erected on the site of Madison Square Garden in this city will cost, with the site and equipment, \$2,400,000.

The disputed boundary between Alaska and Canada is described, in a report to the Government at Ottawa, as passing through the best gold bearing districts in the country, in the Yukon district.

The President of Honduras calls for more liberal appropriations in aid of bridge-building, wagon roads and steamship subsidies.

Artie B. Cleveland, president of the Cleveland Seed Company, in this city, is said to be a defaulter to the amount of \$150,000. Losses in Wall street are said to have caused the difficulty.

The report of Sir Julian Pauncefote's appointment as British Minister to the United States is confirmed.

William Beacham, president of the Julian Electric Company, in New York, which is running cars on the Fourth and Madison avenues, testified before a committee of the Massachusetts Legislature that it required six or seven hours to charge a battery; that the batteries in a car weigh 8400 pounds; that they contain sufficient electricity to last six hours; and that it costs 2 cents per car per mile to run cars in New York.

Preparations for opening the Paris Exposition are rapidly maturing. Commissioner-General Franklin and Assistant Commissioner-General Tuck will sail for France in April, and the final shipment of American exhibits will be made on the 9th and 16th inst.

Work at the Staten Island terminals, on wharves and piers, is advancing rapidly, and the three railroads interested in their completion are expected to cross the Kill von Kull bridge within three months.

MANUFACTURING.

Iron and Steel.

Marshall Furnace reports exceedingly satisfactory results since blowing in last month. The average make, prior to the remodeling of the plant by Frank C. Roberts, was 252 tons per week, whereas the present run of two successive weeks is 377 and 385 tons. The superintendent, Major Hiestand, states that he can easily make 400 tons per week. The furnace is the same size as formerly. The fuel consumption has also been reduced by over 500 pounds per ton of iron.

Dalzell & Fox, proprietors of the West Reading Boiler Works, at Reading, Pa., have received a contract to furnish the Ellis & Lessig Steel and Iron Company, Limited, of Pottstown Pa., with 12 steam boilers of 100 horse-power each and 12 stacks for the same.

Carnegie, Phipps & Co., Limited, of Pittsburgh, are shipping to the shipyards of Cramp & Sons, at Philadelphia, some of the largest armor plate ever made in this country. They have just turned out of their Homestead mill two plates which weighed in the aggregate nearly 19,000 pounds. They were 124 inches long by 90 inches in width and 3 inches thick. They weighed 120 pounds to the square foot, and their weight was 9300 pounds each. The plates have been sent to Philadelphia and will be put on one of the new Government cruisers.

The Standard Axle Company, of Wheeling W. Va., recently elected the following officers: John H. Hobbs, president; L. W. Phinney, secretary; A. D. Howe, manager, and Charles L. Hobbs, assistant manager.

At a recent meeting of the board of directors of the Bellaire Nail Works, of Bellaire, Ohio, the question of erecting an additional blast furnace was discussed, and it was decided not to take any action in the matter at present. It is understood that the present unfavorable condition of the iron market was the cause of this decision.

The directors of the Pennsylvania Steel Company met at the office of the company in Philadelphia on Tuesday, February 12, and elected the following officers: President, Luther S. Bent; vice-president and treasurer, Eben F. Barker; secretary, Edmund N. Smith; general manager, F. W. Wood; superintendent, E. C. Felton; assistant superintendent, H. H. Campbell. All of the gentlemen named have long been connected with the company. The changes that have been made in the official staff are all in the line of direct promotion.

Nos. 1 and 2 furnaces, of the Pennsylvania Steel Company, at Steelton, Pa., are idle, while Nos. 3 and 4 are in blast and making a good record.

Chess, Cook & Co., of Pittsburgh, have issued an execution against Graff, Bennett & Co., on an old judgment for \$14,727.75, of which \$7032.40 has been paid, leaving still due \$7695.35.

The Solid Steel Company, Alliance, Ohio, are fitting up separate works for turning out steel castings by the Mitis process. The building is completed and fully fitted for operation. One or two trial heats have already been made.

A press dispatch from Zanesville, Ohio, under date of the 1st inst., reads as follows: "Iron and steel men in this vicinity are much interested in a furnace for the use of fuel gas which has been reconstructed from a Siemens furnace by John H. McGrath, the melter at the steel plant of the Ohio Iron Company, of this city. The furnace was remodeled by cutting

down the chambers containing the checker work used to heat the air and gas before entering the furnace to about one-half the size of the old, and placing the ports from the chambers to the furnace side by side. No estimate as to the saving of coal can be given, as the gas is supplied from the same source as the steel-smelting furnace, but it is said that the consumption of coal is less than in a furnace in the same works built under the Smith patents. By the use of the Smith furnace 9 bushels of slack do the work of 13 bushels of lump coal, and the output is increased from 13 or 14 to 17 or 18 tons per 24 hours. The saving is reckoned at 40 cents on the ton." Of course we do not vouch for the correctness of the above, but give it for what it is worth.

At Pittsburgh, Thursday of last week, J. H. Bailey, assignee of Graff, Bennett & Co., entered suit against the Paulding Iron Company, Limited, for \$79,104.66. The suit is for use of James W. Friend, James M. Bailey and James Pickands, to whom the account was assigned.

At Pittsburgh on Friday, the 1st inst., Deputy United States Marshal Chambers sold at auction the property of C. M. Raymond in West Middlesex, Pa. The property consisted of ground, a rolling mill, chain works, brickyard, kiln, &c. The sale was on judgments on a mortgage held by L. G. Reed, E. A. Wheeler, First National Bank of Sharon and the Sharon National Bank. The concern was formerly known as the Wheeler Iron Company. The property was purchased by R. G. Browne, a broker, for \$8625.

The employees of the blast furnaces in the Mahoning Valley, Ohio, have accepted the reduction of 10 per cent. in wages, mention of which was made in our issue of the 21st ult. It is understood that the reduction will be restored as soon as the condition of the iron market warrants it.

The Chicago Forge and Bolt Company have taken a large contract for the construction of packets for the new ore docks to be built at Two Harbors, Minn., by the Duluth and Iron Range Railroad Company. Extensive preparations are being made by this company for next season's ore business.

The Allegheny Bessemer Steel Company, near Pittsburgh, were to roll their first steel rail on the 4th inst.

We were erroneously advised when we reported recently that P. J. McArdle, of Albany, N. Y., the purchaser of the Jagger property, desired to sell a part of it at a sacrifice. Mr. McArdle informs us that there are about 15 acres of land, with a blast furnace of about 25,000 tons annually. The dockage cost from \$100,000 to \$200,000 to build, and two railroads, the West Shore and the Delaware and Hudson Canal Company, run their cars into the yard. Two hoisting elevators on the dock make it possible to load and unload boats, cars running right to the dock. While on the Hudson River, close to the city of Albany, the property is in the town of Bethlehem, which avoids the city taxes.

Union Furnace, charcoal, of the Union Iron Company, Michigan, made 972 tons in February, with a fuel consumption of 1640 pounds or 82 bushels of charcoal per gross ton of pig iron, the furnace being equipped with cast-iron stoves.

A Chicago dispatch announces that F. T. Wheeler and Lucius S. Fisher, stockholders of the Pullman Iron and Steel Company, filed a bill in the Superior Court Monday asking for the appointment of a receiver for that concern. The company was formed in 1883 with a capital stock of \$500,000, of which \$250,000 was held in equal shares by Frank B. Felt and James P. Perkins,

who turned over to the company patents for making railroad spikes. The rest of the stock, they allege, was taken by George M. Pullman through his private secretary, John M. Smith, and by John W. Doane and others. A rolling mill was erected at Pullman by the company, the complainants allege, but the plant has not been a success. The company is now in debt to the amount of \$300,000, of which \$180,000 is owing to Pullman's Palace Car Company, which kept the iron and steel company running when it was in an insolvent condition. The assets of the company are about \$280,000, consisting mainly of the rolling mill plant.

A company has been organized at Detroit, Mich., to erect works for the manufacture of steel under the process controlled by J. W. Bookwalter. It will be known as the Michigan Steel Company. Press dispatches announce that the works are expected to be completed within three months, and that their output is to reach 150 tons per day.

Works are being built at Joliet, Ill., by the Parsons Railroad Crossing Protector, Switch and Frog Company. They will obtain their materials from the Joliet Steel Company, and expect to employ several hundred hands when in full operation. A switch is to be manufactured which automatically sets danger signals.

Machinery.

The Aetna Machine Company, of Warren, Ohio, recently received an order for two of M. V. Smith's gas furnaces and valves for the Beaver Falls Mills, of Carnegie, Phipps & Co., Limited, also an order for one of Smith's large gas furnaces and valves for the Chicago Horseshoe Company, of Chicago, Ill.

The Columbia Injector Company, Cleveland, Ohio, report an increased demand for their patent injectors. Among their recent sales is one No. 50, which, under 80 pounds of steam pressure, will throw 4000 gallons per hour, sold to the Wheeler Furnace Company, of Sharon, Pa., for their works at Middlesex, Pa., to furnish water for a boiler of 800 horse-power capacity.

Hooker-Colville Steam Pump Works, St. Louis, Mo., report a large increase in their February business over the same month of last year. They have just shipped to a concern in St. Paul, Minn., one of their largest size Hooker feed-water and purifier pumps.

Alfred Box & Co., of 812, 814 and 816 Green street, Philadelphia, have removed to their new works, at Front, Poplar and Canal streets, Philadelphia, where they have increased facilities to carry on their business. They report among their recent orders one of their extra large radial drills to the Union Bridge Company, which makes 22 drills supplied to this company within the last three years. Also an order for six radial drills for the Hilton Bridge Company, of Albany, N. Y., besides large orders from Europe and other places for their double screw hoist.

Morris, Tasker & Co., Philadelphia, Pa., are building a holder of 1,000,000 feet capacity for Philadelphia. They are also about to build for the city of Detroit a 750,000 double-lift holder.

Rohr Bros. & Co., of Harrisonburg, Va., wish the names of the manufacturers of the best ice machines.

During the past year the Buffalo Forge Company, of Buffalo, N. Y., have largely increased their line, adding many new sizes and designs, and greatly improving the construction and workmanship on the goods. All parts of the machines are made interchangeable, and, by the employment of special tools, templates,

presses, dies, &c., the machines have been improved and the cost of manufacture reduced.

J. H. Kase, of Danville, Pa., would like information about the material for making rope binders, cords, &c., and the necessary machinery for doing the work.

The Glamorgan Company, of Lynchburg, Va., ask for the address of manufacturers of compressed paper for making paper pulleys.

The successful bidders on contracts for cabling the West Side street railways of Chicago have just been announced. The Pennsylvania Iron Works, of Reading, Pa., will construct the Madison street power station; Fraser & Chalmers, of Chicago, will build the Milwaukee avenue power station; Robert Wetherill & Co., of Chester, Pa., will furnish the power to operate the loop running through the Washington street tunnel and the south division; Wright, Meysenburg & Co. will construct the cable road on Milwaukee avenue, and the Bullock Mfg. Company will supply the vault machinery. Wright, Meysenburg & Co. will sublet a contract for castings for the Milwaukee avenue road, and bids are now being received from foundrymen. About 4000 tons of yokes and other castings will be required.

F. R. Phillips, 407 Walnut street, Philadelphia, states that the demand for and sales of Post's zero metal for February are more than double any previous month. Mr. Phillips refers to its particular merits, such as durability in wear, coolness of journals under heavy pressure and high speed.

Hardware.

The Findlay Wire Nail Company, of Findlay, Ohio, have been reorganized. Mr. Putnam, of the Putnam Wire Nail Company, is president, and Fred. M. Strong, of Wheeling, W. Va., secretary. The litigation against A. L. Wetherald and his associates, who built the works, is supposed to have been amicably arranged in the reorganization.

A. E. Bronson, of Cleveland, Ohio, well known to the stove and hardware trade, has recently organized a company called the Bronson Supply Company, of which he is the general manager. The purpose of the company is to manufacture and control the sale of different specialties which will be sold largely to the hardware, stove and house-furnishing goods dealers. The address of the company is corner of Lake and Coe streets, Cleveland, Ohio.

Curtis & Curtis, Bridgeport, Conn., have shipped three pipe machines to be used in piping the Paris Exposition. They will also be exhibited there in the American department.

Standard Tool Company, Cleveland, Ohio, are this week moving into their new factory, but will endeavor to fill all orders as promptly as usual. They have greatly enlarged their works, and with their increased facilities will carry a very large stock of the goods they manufacture.

Vulcan Iron Company, Richmond, Va., have nearly completed their arrangements for the manufacture of heel bolts and grass rods, which are used largely in the cotton States. This is the last addition to their line of manufactures, and they expect to have a stock of these goods on hand by the 15th or 20th of the month.

The Syracuse Forging and Gun Company have found it necessary to remove their factory to more commodious buildings at Batavia, N. Y., where they have now nearly 20,000 feet of floor space, which they state is occupied by the best of modern machinery, thus offering facilities for manufacture which they did not enjoy in their former quarters. They re-

fer to Batavia, which is 35 miles east of Buffalo, as offering excellent shipping advantages, so that with their increased facilities they are in a position to give the best attention to orders. The manufacture of the new Baker gun will be under the personal supervision of W. H. Baker, and the output will probably exceed 6000 guns for the coming year.

With reference to the strike in the works of the Enterprise Mfg. Company, Philadelphia, Pa., we have the following advice from the president of the company:

As you are aware, we have a good foundry and have tried to use our men right, and this place is noted for paying high wages to its molders. They were earning a few years ago as high as \$32 and \$33 a week, but the organization to which they belong adopted a rule that they should not earn over \$4.10 a day. Then it was reduced to \$4, and then to \$3.90, where it remains at present; that is, a man must not earn over that amount, their argument being that he is apt to be cut down. Now, to commence our trouble: Some time ago we put two apprentices on, and the molders claimed that this was more than their organization permitted, their rule being one apprentice for every eight molders. I gave them to understand that I did not and would not recognize this, and claimed the right to put on as many as I thought was wise and proper. This was about two months ago. Since that time the molders have been working, as they call it, under protest. Last year we made a lawn mower, and the price for molding the driving-wheel we put at 4½ cents. This year we made another machine and put the price for molding the wheel at 4 cents, there being less work to mold the same and less iron to carry. The Grievance Committee took the matter in hand, and said it was too low and they would not permit it to be made. On this pattern a man can earn \$4 a day and not work extra hard. I gave the committee to understand that we did not intend to be dictated to, but did intend to run our own business, and that we did not recognize their right to interfere in the matter, adding that if the man who had that pattern did not desire to make it for that price he could quit, and they could quit one and all. The consequence was they left, and 11 apprentices followed in their footprints.

Notwithstanding the strike, the company have been running a heat every day, and have 12 hands at work molding, and expect to be able to turn out a fair amount of goods. They are determined not to yield, as they intend to conduct their business without such outside interference.

Miscellaneous.

It is reported by the *Waterbury American* that the sale of the extensive works of Brown & Bros. to Mr. Clowes, of the firm of Randolph & Clowes, has been consummated by the trustees of that property. Mr. Clowes admitted the fact, but was somewhat reticent as to the use he intended to make of it beyond providing facilities for his increasing trade. It is probable that the business will be extended to specialties in metals other than brass and copper, and that operations in steel and iron are contemplated; experiments have been conducted quietly for some time past, and success is no longer a matter of doubt. The old plant was built for a brass and copper rolling mill, and rumor has it that it may possibly be used for rolling copper again, as the price the present combination exacts for the special shapes in which Randolph & Clowes have to buy their copper for seamless house boilers is so great as seriously to hamper competition with makers who buy sheets as ordinarily rolled.

We have received a very attractive little book, treating of the iridium anti-friction metal made by Merchant & Co., of Philadelphia.

The new pumps for the Cleveland water works were tested last week and gave satisfaction. Their lifting capacity is 16,000,000 gallons per day. The engines are the largest ever built by the Knowles Company, and cost the city \$79,000.

The Iron Age

New York, Thursday, March 7, 1889.

Commercial Relations With Canada.

During the past week action has been taken both at Washington and Ottawa intended to promote harmonious relations between the two Governments. At the same time the fact comes out incidentally that whatever views may be entertained by Sir Richard Cartwright, the Liberal leader in Canada, or by parties in the United States who may reciprocate the feeling in favor of commercial union, the Government of the Dominion as now constituted under Sir John Macdonald, the present Premier, will hold in scorn any measure, wherever originating, that contemplates a weakening of the ties that bind her to the British Empire. This appears in the defeat of a motion in the Ottawa Parliament, on February 26, which substantially embodied Mr. Cartwright's plea that Canada be permitted to negotiate her own treaties. The fact becomes still more obvious in the manifestation of feeling in response to the adoption of Mr. Hitt's resolution in the United States House of Representatives on the 1st inst.

The resolution provides that whenever it shall be certified to the President that the Government of Canada has declared a decree to establish commercial union with the United States, having a uniform revenue system, like internal tax to be collected and like import duties to be imposed on articles brought into either country from other nations, with no duties upon trade between the United States and Canada, he shall appoint three commissioners to meet those who may be designed to represent the Government of Canada to prepare a plan for the assimilation of the import duties and internal revenue taxes of the two countries, and an equitable division of receipts in a commercial union. The commissioners shall report to the President, who shall lay the report before Congress. The effect of the enactment of the resolution is to declare merely the disposition of this country to enter into a commercial union with Canada as soon as that country makes any advances. The scheme thus outlined becomes at once "a bone of contention" between the two parties represented in the Dominion Parliament, with no definite prospects for the future as concerns either one or the other. Sir Charles Tupper, since his return from England, emphatically denies the report of the intended retirement of Sir John Macdonald. Mr. Foster, the Minister of Finance, announces that the Government has decided to make no change in the existing customs tariff.

The annual reports of the different Lake Superior copper companies, which are coming in one by one, show pretty clearly what a particularly "good thing" to them has been the work of the French syndicate. Profits have been exceedingly hand-

some in spite of the fact that nearly every one of the mines has expended unusual amounts in improving equipment, bettering means of communication or enlarging capacity. The miners have taken care of themselves pretty well in their dealings with the French speculators, and probably their managers congratulate themselves on the brilliant results obtained. The future, however, will bring the day of fearful reckoning in the form of 8 and 9 cent copper, with dividends passed and a crop of assessments.

Placing the Wires Underground.

The ninth convention of the National Electric Light Association, held at Chicago, beginning February 19, was the most valuable yet held, as was evidenced by the character of the attendance, the standard of the papers presented and the lively interest manifested in many of the subjects treated. The most absorbing topic, and one in which the layman has a direct interest equal to that of the expert, was presented by the report of the committee on underground conduits and conductors. This committee was appointed at the previous convention "to examine into and report upon the systems of underground conduits, with underground conductors and conduits now in operation, and the number of wires actually in use in these conduits." The committee sent a circular letter to all the local electric light companies asking if they had ever placed underground any electric light conductors carrying currents at a potential of 1000 volts or over, and, if so, to state the results, giving the length of conductor, the voltage, the current in amperes, the make and style of dynamo, the kind of conductor, single or grouped in cables, size of conductor, thickness of insulation, maker of cable, whether cable was laid directly on the ground or in conduits, style of conduit, time of experiments and operation of cables, and, "if the cables failed to work satisfactorily, to which of the following causes do you attribute the difficulty: Defective insulation, defects in the joints, or defects in making connections from cables to lamps."

Of the 120 answers received by the committee only seven had had actual experience in placing and running underground electric wires, and of this number six were of the opinion that at the present time it was not practicable, either from an electrical, mechanical or commercial standpoint, to place the wires underground. This opinion was forced upon them principally because of the defective insulation of the wires, and next on account of defects in the conduits. The one favorable report was from a writer who had had his wires in conduits for about five years. The mains were carried through the streets in a composite system of conduits, and connections were made from the system to the cellars through iron pipes, and the wires were then conveyed through the cellars, connection being made from the cellars to the houses. The cellars run completely around the block, and permitted of access to them for the purpose of repairing or making connections to the wires. The report states that he considers the question of the distribution of power and light an exceedingly simple one in his city,

which is probably the only one that is so fortunately situated.

Of the remaining number of those who answered the circular 104 state that, basing their opinions upon tests they have made and seen and such information as they have been able to obtain both in this country and abroad, "it has not been practical to place the wires containing high tension electric arc-light currents underground." They consider that the question of obtaining a satisfactory conduit has not been solved, and that there is no "insulation for the wires that will not deteriorate within a few years and become perfectly useless as an insulator when subjected to the action of steam, water and gas." The difficulty of making connections for buildings and lamps, and the absence of an adequate system of subsidiary conduits, is considered as a bar to successful operation. A method of drawing in the cables, without injuring the insulation, is also needed.

The commercial side of the question is of vast importance, as the first cost is about eight times that of an overhead system, and as the repairs due to deterioration of insulation, and defects caused by mechanical and electrical imperfections, are very much heavier than in the aerial system. This would result in a necessary advance in the price of electric light as now furnished, in order to meet the increased expenses.

The circular was also sent to the electric underground wire companies, and in most of the responses received it was stated that, as they had very little or no experience with wires for that purpose, they were unable to give information. They had no doubt but that, having the demand, the conductor could be brought to meet the requirements.

The discussion of this report was long and entertaining, and, in a great measure, contradicted the conclusions drawn from the answers received. It was shown in several large cities underground electric conductors carrying currents at a potential of 1000 volts and over were in successful operation, both from an electrical and commercial standpoint. The trouble resulting from inferior insulation was not nearly so great as stated, this being shown by the fact that cables are now in service which were laid two or three years ago. The statement was also refuted by the manufacturers of cables, who offer to guarantee, by bond, the life of their insulation for three or four years. The mechanical drawbacks, although not as completely obliterated as desirable, are still so far under control as to present no insurmountable obstacle to the operation of the system; nor do they affect the commercial side by unduly increasing the repair account.

As the discussion of the report elicited more data regarding the actual condition of underground projects than were given in the report itself, and, as the opinions were from those who were in intimate relations with stations using underground conductors, and therefore had the requisite practical experience to render their opinions of value, the conclusion is drawn from the session, taken as a whole, that the placing of electric conductors underground is electrically, mechanically and commercially possible.

Russian and American Wheat Competition.

In consequence of the short wheat crop last year in the United States and the wild speculation in this staple in Chicago and New York it gave the pretext for Russia has been able to furnish England, out of an ample yield, amounts fully compensatory for the lessened receipts of wheat and flour from here. The total export of wheat from the United States last year did not exceed 49,581,915 bushels, as compared with 95,128,641 in 1887, while our flour export was restricted to 10,714,780 barrels, as against 12,181,810 in 1887.

The import of wheat and flour into England from all sources during the past three years has been as follows:

	Wheat, cwt.	Flour, cwt.	Equal to bushels.
1886.....	57,324,384	18,912,773	145,477,645
1887.....	55,784,686	18,066,545	145,403,576
1888.....	47,404,344	14,739,232	122,177,780

Russia, Roumania and Russian Poland exported to England the following amounts of wheat in bushels:

	Russia.	Rou- mania.	Russian Poland.	Totals.
1886....	8,925,378	541,796	2,460,365	9,927,679
1887....	10,800,176	1,062,659	2,896,578	14,759,413
1888....	39,888,414	2,648,948	6,004,322	48,541,684

From the foregoing figures it appears that the increase in the export from Eastern Europe to England between 1886 and 1888 amounted to 38,704,005 bushels. On the other hand, the United States and Canada furnished England the following amounts:

	United States.— Flour. Wheat.	Canada.— Wheat. Equal to
	Cwt. Cwt.	Cwt. bushels.
1886.....	11,478,182 29,621,728	3,080,864 77,936,181
1887.....	14,572,443 30,504,526	5,864,784 93,234,598
1888.....	12,597,086 14,547,185	1,039,080 57,899,650

On comparing the total shipments of wheat and flour in 1888 with the total in 1887 it will be found that there has been a decrease of 40,444,989 bushels. In other words, while this falling off in the supply from America occurred there was, as shown above, an increase of 38,704,005 bushels between 1886 and 1888 from Eastern Europe. This turning of the tables, of course, could not have taken place if the Eastern European crop had not been so abundant of late years and the quantity marketed so desirable. It shows the vigorous competition which our wheat and flour will have to encounter whenever there happens to be even a trifling shortage on this side. In consequence of the exaggerated bull speculation in Chicago and New York our exports are stopped for months.

Our export of flour to countries south of us has also severely suffered from a similar cause, especially shipments to Brazil, which have to compete with Hungarian shipped by steamers direct from Fiume and Trieste to Rio de Janeiro. During the first eleven months of last year the Hungarian flour shipments reached 1,533,583 barrels, the bulk of which went to Brazil, a country which received from the United States in 1887 748,937 barrels. Of course the abundance of the Austro-Hungarian wheat crop and comparatively low prices facilitated a large flour export to countries south of us from Hungary, whose magnificent steam flour mills turn out a quality of flour by no means inferior to our crack brands from Baltimore, St. Louis and Richmond, and which will keep in a tropical climate just as sweet as American. All this has occurred in a year when British India and Australia did not ship

to England any extraordinary amounts of wheat, as the following figures prove:

	British India, Australia.		
	Cwt.	Cwt.	Equal to cwt.
1886.....	11,028,665	738,699	21,965,746
1887.....	9,967,107	1,347,151	20,343,281
1888.....	8,423,155	2,315,700	20,045,863

The Indian railroad system is extending rapidly, there being in running order on March 31, 1888, 14,383 miles. During an abundant wheat crop year an extra stimulus may be given to exportation thence, now that the great wheat belt of British India is being tapped at more points than was formerly the case. It is to be hoped that a more copious wheat yield, combined with more moderate prices, may enable us to regain the superior foothold with our wheat and flour we partially lost in Europe and South America in 1888.

German Silver and Brass Scrap.

A matter which has received little attention from the metal trade at large is the question of the re-importation of German silver and brass scrap. It was brought before the Senate Finance Committee during the close of last year in a number of hearings to representatives of such firms as the Coe Brass Mfg. Company, of Torrington, Plume & Atwood Mfg. Company, Waterbury Brass Company, Benedict & Burnham Mfg. Company, Holmes, Booth & Haydens, Ansonia Brass and Copper Company, Osborne & Cheeseman Company, and the Seymour Mfg. Company, all of them located in the famous Naugatuck Valley. H. H. H. Wooster, of the last named concern, and Charles F. Brooker, of the first corporation, presented a petition in behalf of their associates and explained their views at length.

During the past few years American manufacturers of brass and German silver have been doing an increasing business with foreign countries, supplying makers there with sheet-metal for the manufacture of German silver tableware, show-case frames, and for cartridges. Their customers cut up the sheets in question, and according to the articles made therefrom from 80 to 60 per cent. of the metal so exported becomes scrap. Now, it is a custom, naturally growing out of the character of the business of the two parties to the transaction, that the rolling mill sells to the manufacturer with the understanding that it will take back, at a given price, the scrap produced in the process of cutting up. A seller who cannot undertake to go into such an arrangement is at a disadvantage, because the buyer prefers not to be troubled with the marketing of the scrap.

Now, our tariff imposes upon all German silver scrap a duty of 25 per cent. ad valorem, and upon brass scrap 1½ cents a pound. In the cost of German silver, according to the testimony of Mr. Wooster, this amounts to a minimum of 3 cents per pound on German silver scrap returned from Canada from a fork and spoon manufacturer, as much as 60 per cent. of the original metal returning. In other words, by reason of the duty on scrap returned, the American rolling mill is handicapped to the extent of 1.8 cent per pound on the original metal. But the matter goes even further still. When the American manufacturer uses foreign nickel—which he must do to a considerable extent, because

the American mine does not supply the demand—he is barred from obtaining a drawback on the nickel contents of the alloy. When the scrap returns to him he again pays a duty on the same article. In that case the aggregate duty on the metal that goes out again is figured at 4.08 cents by Mr. Wooster.

What the manufacturers of the Naugatuck Valley have pleaded for particularly, and what they seem justly entitled to, is that at least scrap from their own metal be allowed to enter free of duty, providing its identity can be satisfactorily established. They argue with much force that no American interest can suffer from such a system, but that its establishment will lift burdens imposed upon a foreign trade which can only benefit the country. The only serious objection raised by members of the Senate Committee—an objection which would naturally occur when the matter is presented—is that imports of scrap might be used to evade the payment of duty on constituents of the alloy. It was suggested that alleged scrap might be made to contain 50 per cent. of nickel, and the idea was even brought forward that the metal might be profitably separated from the alloy. In the case of nickel-copper-zinc alloys, this may at once be dismissed as impracticable. A high-grade alloy might, however, be used to make the ordinary grade by the simple addition of the necessary quantities of the baser metals. The Naugatuck Valley manufacturers framed the suggested paragraph in the free list, in the following manner, in order to meet the objection raised:

German silver scrap, containing not to exceed 25 per cent. nickel, made from German silver, the product of the United States, returned after having been exported, without having been advanced in value or improved in condition; but proof of the identity of such scrap shall be made under general regulations to be prescribed by the Secretary of the Treasury.

The manufacturers approached with more hesitation the question of dealing with a drawback, formulating the clause as follows:

There shall be allowed on all articles manufactured in part or materials imported, on which duties have been paid when exported, a drawback equal in amount to the duty once paid on such materials, and no more, to be ascertained under such rules and regulations as shall be prescribed by the Secretary of the Treasury. Ten per cent. on the amount of all drawbacks so allowed shall, however, be retained for the use of the United States by the collectors paying such drawbacks, respectively.

The evidence in regard to this suggestion is accompanied simply with this sentence: "It opens the door very wide, and so we have not much to say in favor of that clause." It would certainly be a somewhat difficult matter to extend the drawback system to single constituents of alloys used for manufacturing, but there seems to be a simple way out of the trouble, so far as the Naugatuck Valley manufacturers are concerned. Let them import all the copper, nickel and spelter used in making their German silver. This is being done with solder and there is no reason why it should not be done in the case of other alloys.

The pressure of work at the Government foundry at Washington is such that the construction of the main shafts for the new cruisers, Concord and Bennington, has been assigned to the Midvale Steel Com-

pany, and that firm are also turning out the steel forging for 12 new ordnance rifles of mark III, 6-inch pattern. The shafts are made of hammered steel and comprise 14 separate pieces. These pieces are sent in an unfinished condition to the West Point foundry, where they are turned down to the proper dimensions and bored out. The work will be finally completed about May 1, and the shafts will then be shipped direct from West Point to the Chester shipyard. The forgings for the rifles will be sent from the Midvale works to the Government foundry at Washington to be tempered, and from there half of them will go the West Point foundry and the rest to the South Boston Iron Works, at Boston, where the guns are to be constructed.

The Paris Universal Exposition.

GENERAL VIEW OF BUILDINGS.

The double-page plate which accompanies this week's issue of *The Iron Age* conveys a fair idea of the magnitude of the buildings. The view taken embraces the two series of structures on either side of the center line of the grounds, occupied at one end by the famous Eiffel tower and on the other end by the great machinery hall, the center line of which is placed at right angles to it. Neither of these structures is shown in our engraving, which, therefore, gives an idea of only two of the smaller buildings in course of construction.

PLANS OF THE BUILDINGS.

We are indebted to the *Génie Civil*, published in Paris, for the accompanying general plan of the buildings of the Universal Exposition, which is to be opened in a few months. The necessary reduction has made it impossible to enter in our drawing all the lettering. A reference to the following list, with accompanying numbers, will enable our readers to locate the principal buildings, countries and exhibitors. Beginning at the upper left-hand corner we have:

1. Panorama of the Transatlantic Steamship Company.
2. Agricultural Exposition.
3. International Petroleum Company.
4. Elevators: Thomas Powell and De Quilliac and Mounier.
5. Le Duc de Felico.
6. History of Habitation.
7. Champ de Mars Station.
8. Finland.
9. Norwegian Cottage.
10. Gas Company.
11. Swedish Cottage.
12. Printing and Office of Exhibition.
13. Aquarelles.
14. Pastels.
15. Monaco.
16. Foundations of Eiffel Tower.
17. Suez and Panama Canals.
18. Argentine Republic.
19. Mexico.
20. Customs.
21. Children's Hall.
22. Venezuela.
23. Bolivia.
24. Brazil.

Returning to the buildings along the Avenue de Labourdonnais we have:

25. Electric Station.
26. Forges du Nord.
27. Dillemont Company.
28. English Colonies.
29. Great Britain.
30. Belgium.
31. Société de Mariemont (collieries).
32. Denmark.
33. Holland.
34. The City of Paris.
35. Belgian Headquarters.
36. The Solvay Company (soda).
37. Cape Colony—The Kimberly Diamond Mines.
38. Fonderies et Forges de l'Homme (iron and steel).
39. Anciens Etablissements Cail (bridge builders, machinery and structural work).
40. Forges de St. Dennis (iron and steel).
41. Union Céramique Chauffournière Montchavise.

Near the Eiffel Tower are located also the following:

46. Folies Parisiennes (theatre).
47. Humfryes.
48. Restaurant.
49. State Manufactures.
50. Telephone Company.

On the other side of the tower there are, near the Avenue de Suffren:

51. Chili.
52. Nicaragua.
53. The Lota Company (Chili copper).
54. Salvador.
55. Valard & Cellard.
56. Uruguay.
57. San Domingo.
58. Uruguay.
59. Guatemala.
60. Liberal Arts.
61. Hayti.
62. India.

The following are in the Hall of Liberal Arts:

64. Restaurant.
65. Geography.
66. Cosmography.
67. Ministry of the Interior.
68. Foreign Countries.
69. Italy.
70. Switzerland.
71. United States.
72. Spain.
73. Portugal.
74. Roumania.
75. Norway.
76. Greece.
77. Life-Saving at Sea.
78. Servia.
79. Japan.
80. Siam.
81. China.
82. Roumania Restaurant.
83. Russian House.
84. Morocco.
85. Egyptian Bazar.
86. Egypt.
87. Persia.

Turning to that part of the principal hall for various groups which lies near the Avenue de Labourdonnais, we have the following countries:

89. Hungary.
90. Austria.
91. Jewelry.
92. Laces, &c.
93. Clothing.
94. Hats and Bonnets.
95. Silks.
96. Coaches.
97. Bleaching and Dyeing.
98. Camp Materials.
99. Chemical Products.
100. Forestry, Hunting and Fishing.

On the other side in the same building there are:

103. Silver Ware.
104. Ceramics.
105. Furniture.
106. Mosaics.
107. Russia.
108. Glassware.
109. Tapestry and Decorations.
110. Carpets.
111. Clocks and Watches.
112. Leather Goods.
113. Perfumery.
114. Stationery.
115. Art Castings.
116. Mining.
117. Bronzes.
118. Stoves and Heaters.

Between this hall and Machinery Hall are the following buildings.

118. Restaurant.
119. The Gramme Company (Electric).
120. Station of the Syndicate.
121. Lecounteux & Garnier.

At the end of the Avenue de Suffren we find, back of Machinery Hall:

122. Station.
123. Police.
124. Sulac and Fontaine boilers.
125. Megg, Echeverria, Boran lights.
126. Fives Lille and Pamtin boilers.
127. Bakers' ovens.
128. Belleville boilers.
129. Works of Ducommun.
130. Naeyer boilers.
131. Roser boilers.
132. Joyd & Pillé boilers.
133. Bakers' ovens.
134. Babcock & Wilcox boilers.
135. Restaurant.

Returning to the Hall of Liberal Arts we have:

136. Instruments of Precision.
137. Medicine and Surgery.
138. Holland.
139. Belgium.
140. Switzerland.

The position of the different countries in Machinery Hall is fixed only in a few cases. The United States have a relatively large space near one corner of the hall.

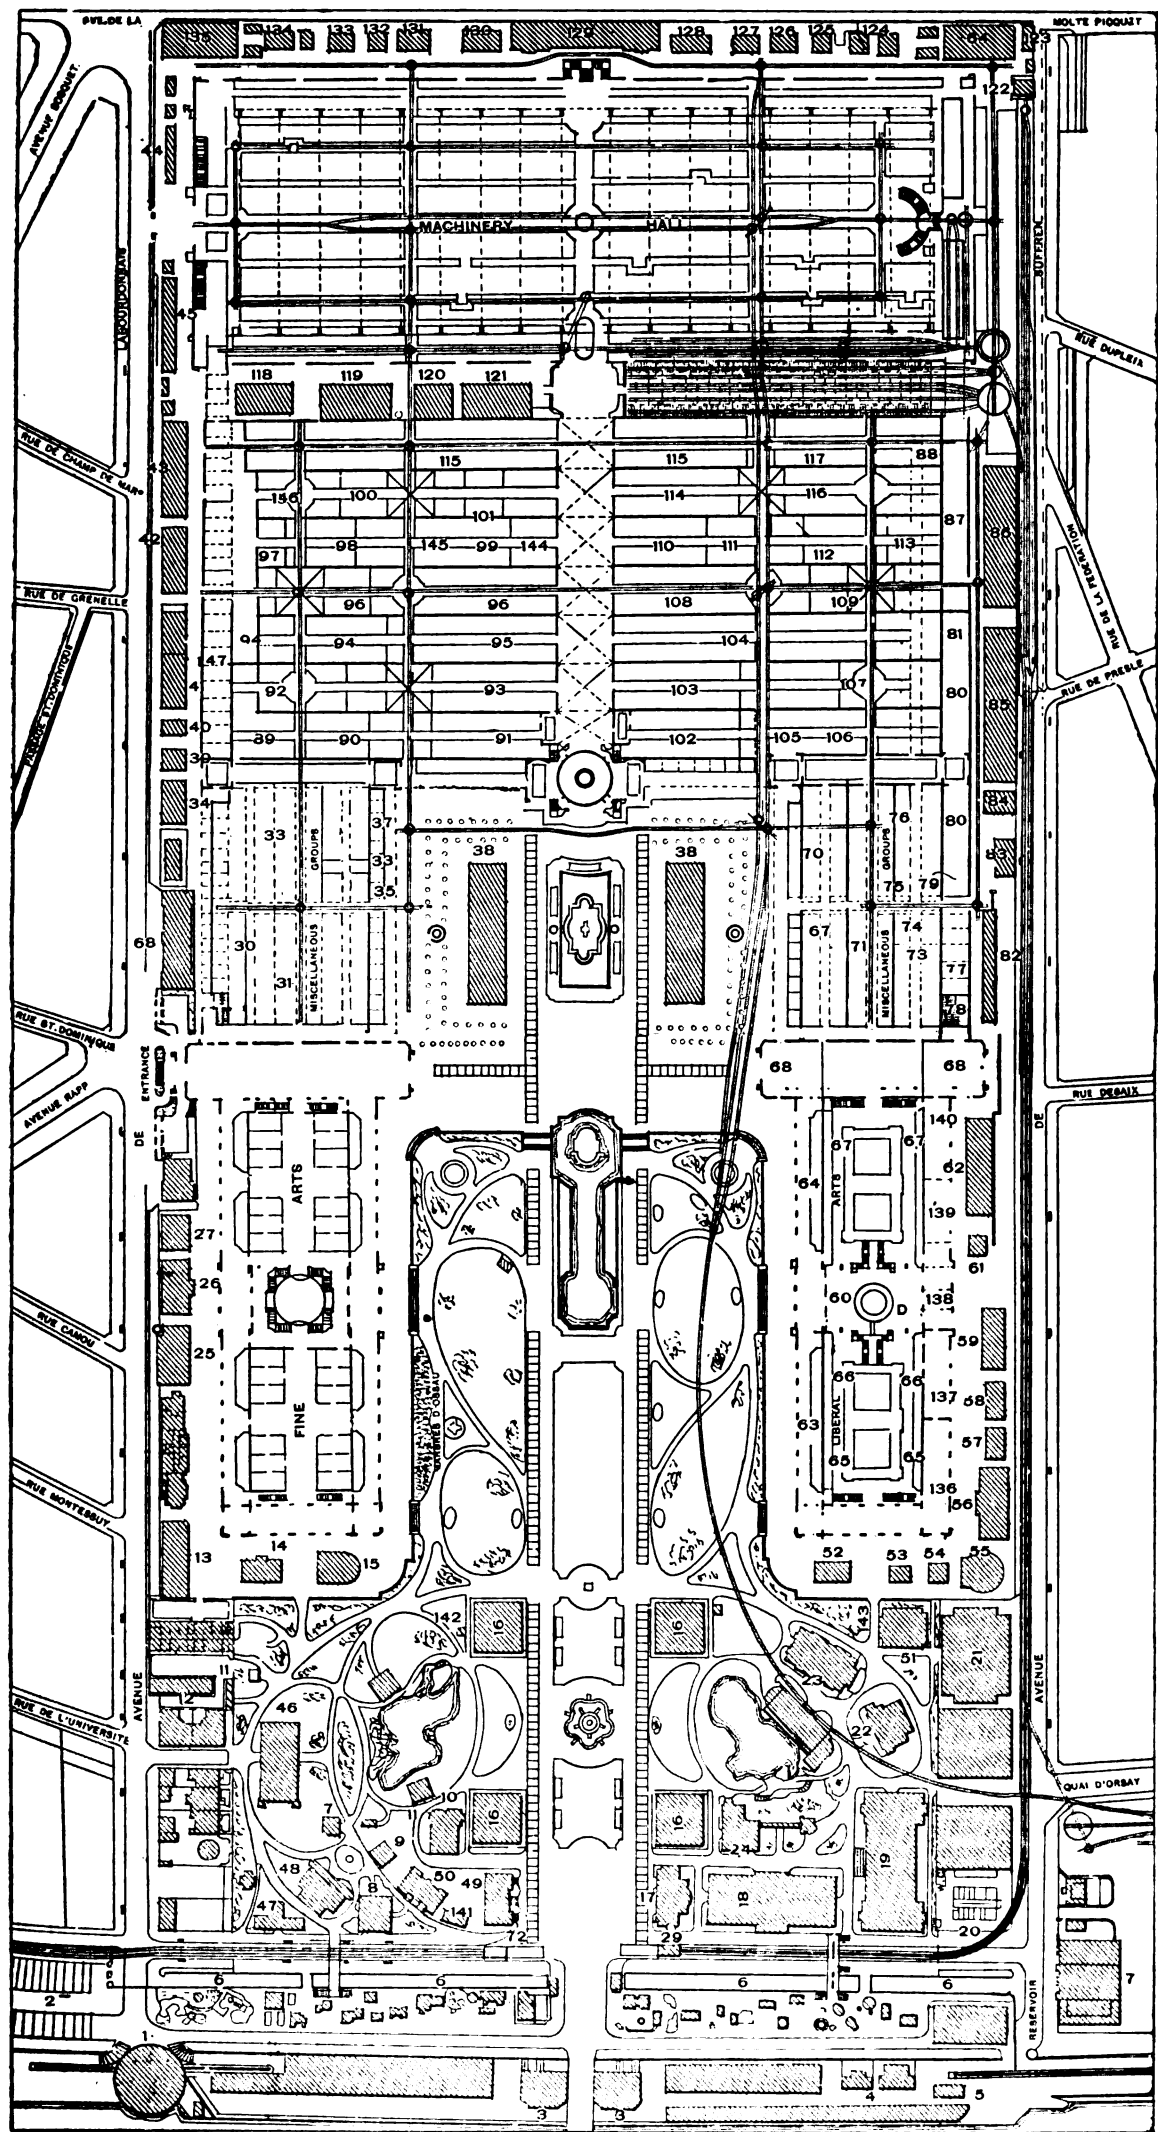

Among the corporations which have recently been authorized by the Secretary of State of Illinois, are the following: Rogers Siberian Iron and Tin Plate Company, Chicago; capital, \$200,000; to manufacture sheet iron and tin plates; William Rogers, W. E. Dustin, S. W. Adams and C. S. Radding. The Coleman White Lead Company, at Chicago; capital, \$200,000; for manufacturing; incorporators, G. D. Coleman, R. R. Bemiss and W. L. Dustin. Novelty Lock Company, Chicago; capital, \$200,000; to manufacture locks and light hardware; incorporators, W. A. Gardner, P. Hale and W. Rice. Walcott Mfg Company, Chicago; capital, \$100,000; to manufacture heat-traps and hardware; incorporators, A. Walcott, F. W. Childs and M. R. Diail. The Patton Motor Mfg Company, at Chicago; capital \$250,000; to manufacture and sell motors; incorporators, W. H. Dyrenforth, Charles E. Gaylord and J. W. Dyrenforth. The Energy Mfg Company, at Chicago; capital, \$10,000; for the manufacture of hardware and other patented articles; incorporators, William H. Fry, Daniel A. Ray and Charles O. Tillman.

The official report of the recent trial of the gunboat Yorktown, submitted to Secretary Whitney last week, shows that the vessel meets all the principal requirements of the contract, and that on the trial she developed 400 more horse-power than is called for by the contract, thereby entitling the contractors to a bonus of \$40,000, or at the rate of \$1000 for each horse-power in excess. It is probable that the vessel will be formally accepted by Secretary Whitney. None of the other vessels of the new navy, the construction of which was begun during Secretary Whitney's administration, is yet completed. Therefore, in case of its acceptance, the Yorktown will be more closely identified with the past administration than any of her sister ships.

At a meeting of the Youngstown (Ohio) committee of freight agents, held at Cleveland, Ohio, on the 27th ult., the following pig iron rates from the Mahoning Valley, Ohio, and the Shenango Valley, Pa., were made: Boston, \$4.20; New York, \$3.20; Albany, \$2.70; Rochester, \$1.95; Utica, \$2.60. The rates on limestone from the above named places were also equalized.

The sample ingot of aluminium exhibited at the meeting of the American Institute of Mining Engineers recently was not made by A. E. Hunt, of Pittsburgh, as stated, but was manufactured by the Magnesium and Aluminium Fabrik, of Bremen, Germany. Mr. Hunt informs us that the works with which he is connected are ready to furnish aluminium in any reasonable quantity, up to a ton, for immediate delivery. He disclaims, however, that he is the inventor of the process.

The contract for docks and trestles of the Central Dock and Terminal Company in Buffalo, has been awarded to W. F. Wentz, of Moreland, N. Y. The work will cost about \$800,000, and is for the handling of the Reading and other shipments of coal. Work will begin as soon as the weather permits, and is to be finished in one year.

PLAN OF THE PARIS EXPOSITION.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St. {
PHILADELPHIA, Pa., March 5, 1889. }

Pig Iron.—The market maintains a firm tone, although it cannot be said to have gained much within the past couple of weeks. There is a good demand, however, and the outlook indicates continued steadiness if not actual improvement. Good brands are readily placed at, say, \$15.50 for Gray Forge; \$16 @ \$16.50 for No. 2, and \$17.50 @ \$18 for No. 1, tide-water deliveries, or their equivalent. Occasional sales are reported at less money, but they are exceptional, and not fair representative transactions. A few specially favorite Irons command a premium on the highest quotations named, but they, too, are a little outside of the general market. As to the supply it is not by any means excessive. There are a good many sellers, it is true, and moderately large orders could be placed at quoted rates, although sellers are on the watch for an improvement, and have some degree of confidence that such an event is not improbable. Of course, no one looks for much change, but 25¢ to 50¢ per ton of an advance would be an important item in times like these. Hence, if the South and the West continue to report favorably, local furnaces would soon feel warranted in asking an advance, and perhaps with some degree of success. This feeling of itself proves that the market has turned. It is no longer a question of concessions from quoted rates, but rather as to how large an order should be taken, or whether an advance should be asked. This is undoubtedly the case to-day as regards the good brands, although it may take some little time yet to settle the matter satisfactorily. This market appears to be in a position to easily keep in line with the South and West, but it cannot improve unless they initiate a similar movement. It may be said, therefore, that the market is a waiting one, steady to firm at quoted rates, with a tendency toward improvement under anything like favorable developments.

Foreign Iron.—There is nothing doing at present, although asking rates are as before, viz., Bessemer, \$19.50 to \$20, c.i.f., duty paid. Spiegeleisen, \$28.25 @ \$28.50, c.i.f., duty paid, for 20 %.

Blooms.—A very considerable business has been done in Steel Slabs, Billets, &c., and in most cases at about the rates quoted for some time past. Sales include several thousand tons Nail Slabs at from \$29 to \$29.50, delivered at consumer's works, Sheet Iron Billets at \$30 @ \$31, delivered, and higher qualities for Boiler Plate, &c., all the way from \$34 to \$40, according to specification. Ordinary quotations are about as follows: \$28 @ \$28.50 at mill, for Nail Slabs; \$29 @ \$30 for Sheet Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for Flange purposes; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 per "Bloom" ton of 2464 lb.

Muck Bars.—The market continues in a very unsettled condition, with all sorts of prices, and probably all sorts of Bars. Good, reliable qualities are offered at \$27 @ \$27.50, delivered, although as low as \$25.50 @ \$26, at mill, would be accepted for some qualities.

Bar Iron.—There is no improvement whatever. Large orders are not offered at present, either for Bars or Skelp, so that mills are either running on old contracts or on such small orders as can be picked up from day to day. Most of the mills are running single turn, and at the moment there is nothing in sight to encour-

age much hope of early improvement. Prices are necessarily very much unsettled, and while the best brands of Refined Bars are quoted at 1.80¢ @ 1.85¢, there is no scarcity of what the makers call "first-class Iron" at 1.70¢ @ 1.75¢. Skelp Iron is quoted at 1.75¢ for Grooved and 1.85 @ 1.90¢ for Sheared, but there is nothing of importance doing at present. The trade have been surprised to-day by a notice from the Reading Iron Works calling a meeting of creditors for Thursday. It is presumed that the assets will cover all liabilities, and that with an extension of time dollar for dollar will be paid, although, of course, it is all guesswork until after the meeting as above mentioned.

Plate and Tank Material.—In a general way the market is dull and without any definite prospect of immediate improvement. Some large orders for Steel Plates have been taken, but they are likely to be placed in the Western part of the State, so that local mills are not getting much advantage from that order (the new St. Louis Bridge). Still there is a great deal of local work going on, so that there ought to be a continuously heavy demand for Plates during the next three or four months. Large consumers, such as Ship, Bridge, Locomotive and Boiler works, are all busy, so that there should be a corresponding demand for materials. Meanwhile competition is sharp and prices irregular, although ordinarily quoted as follows: 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates, 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3¼¢; Fire-Box, 3¼¢ @ 4¼¢.

Structural Material.—The general demand is slow and unsatisfactory, and large orders when placed on the market seem to be taken by mills at a distance. The material for the St. Louis Bridge (about 6000 tons of Steel) was placed a few days ago, but prices are said to have been extremely low, and only a portion of the order will be filled in this vicinity. Nominal quotations are about as follows: Bridge Plate, 2¢ @ 2.1¢; Angles, 1.95¢ @ 2.05¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

Sheet Iron.—The demand for Light Sheet and specialties is good, considering the season. J. Wood & Bro.'s Heavy Sheet mill closed down last week, this department being very dull. Alan Wood Company are running both mills, having a fair line of orders for all of their departments. Prices as follows:

Best Refined, Nos. 26, 27 and 28....	3 @ 3¼¢
Best Refined, Nos. 18 to 25.....	2 @ 3 ¢
Common, ¼¢ less than the above.	
Best Bloom Sheets, Nos. 26 to 28....	4 @ 4¼¢
Best Bloom Sheets, Nos. 22 to 25....	3 @ 4 ¢
Best Bloom Sheets, Nos. 16 to 21....	3 @ 3¼¢
Blue Annealed.....	2½ @ 2½¢
Best Bloom, Galvanized, discount.....	65 %
Common, discount.....	67½ %

Steel Rails.—The market is not active by any means, but there is a feeling of confidence that promises better things in the near future. A good many small lots are being taken, and with upward of 600,000 tons already sold for this year's delivery, the outlook is decidedly more favorable than it was last year at this time. Prices are steady at \$27.50 @ \$28, at mill, with sales in accordance therewith.

Steel Crop Ends.—There is a good demand, but prices are a little too high to permit of business being done. English Basic Crops, \$22.50, with buyers at \$22, c.i.f., duty paid.

Old Rails.—There is very little doing in spot lots, holders being unwilling to meet the figures now attainable. Lots in store are held at \$24 and upward, and shipments at \$23.50, but sales are chiefly

in small lots delivered along the line of roads at from \$24 to \$24.25, according to circumstances.

Scrap Iron.—In good demand at from \$20.50 to \$21 for cargo lots, with sellers at about the following quotations: \$20.50 @ \$21 for cargo lots; \$21 @ \$21.50 for car-load lots, delivered, or for choice \$22; No. 2 do., \$14 @ \$15; Turnings, \$18 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$23 @ \$24; Old Car-Wheels, \$17 @ \$18, Philadelphia.

Wrought-Iron Pipe.—Business is very dull, and, while discounts are nominally unchanged, they are liable to be sharply cut on offers for large lots. Nominal discounts are as follows: Butt-Welded Black, 55 %; Lap-Welded Black, 65 %; Butt-Welded Galvanized, 45 %; Lap-Welded Galvanized, 55 %; Boiler Tubes, 62½ %.

Nails.—Dull, weak and irregular. Prices hard to quote, although store prices for best makes remain at from \$1.90 to \$2, with the usual rebate on car-load lots.

The partnership between Mr. Wm. R. Hart and Mr. George T. Barns, under the firm name of Wm. R. Hart & Co., terminated on March 1. Mr. Hart will continue business on his own account at the former address under the same title as before, while Mr. Barns will have his office at 312 Walnut street, and do business under the firm name of George T. Barns & Co.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave. {
PITTSBURGH, March 5, 1889. }

Prices continue unsettled and unsatisfactory, but with an improved demand better prices will follow. There has been a largely increased business in Pig Iron during the past week, a considerable portion of which was at an advance of 25¢ per ton. Very large shipments of glassware have been made recently by river, and Gray's Iron Line will get out a couple of tows this week, chiefly of Rails; one of these will go through to New Orleans. One of the Gray boats can take a cargo of 4000 tons. The outlook for our manufacturers is generally favorable, and in some lines there is now a fairly good business. The river Coal trade continues in a most unsatisfactory condition, and the outlook for an improvement soon is not very encouraging. Southern Coal is becoming a formidable competitor to Pittsburgh Coal in Southern markets. At New Orleans, the largest distributing point in the South, the prices scarcely cover lay-down cost from Pittsburgh. Some 6,000,000 or 7,000,000 bushels will be started down the river within the next day or two, a considerable proportion of which goes through to New Orleans.

Pig Iron.—The demand continues to increase; consumers who would not a week ago buy a ton beyond their immediate necessities are now anxious to anticipate future wants, as some have done, and that, too, at an advance of 25¢ on the prices of a week ago, when there were plenty of sellers and scarcely any buyers, whereas it is now the other way, the tables having been turned, as the former outnumber the latter. There is no boom, nor is such a thing desired, but there is a largely increased volume of legitimate business and a very much stronger market. A number of sales of Mill Iron were reported at an advance of 25¢, and Bessemer is also stiff at an advance of from 25¢ to 50¢ per ton. We now quote as follows:

Gray Forge Neutral.....	\$14.25 @ \$14.50, cash
All Ore Mill.....	15.50 @ 16.00, "
White and Mottled.....	13.50 @ 14.00, "
No. 1 Foundry.....	16.00 @ 16.50, "

No. 2 Foundry.....	15.25 @ 15.50.	"
No. 2 Charcoal Foundry....	21.50 @ 22.50.	"
No. 1 Charcoal Foundry....	22.50 @ 24.00.	"
Cold Blast Charcoal.....	25.00 @ 27.00.	"
Bessemer Iron.....	16.50 @ 16.75.	"

Muck Bar.—There is some inquiry for future delivery at about \$27 @ \$27.25, cash, but while it can be bought for immediate delivery at the prices quoted, sellers are not disposed to contract ahead, indicating that they look for a better market in the near future and intend to keep themselves in position to take advantage of the same. A large buyer who has been on the market for some days past reports having found but few sellers who were willing to contract ahead.

Spiegel.—Spiegel is quoted at \$28.50 @ \$29 for 20 %. Ferro-manganese is firmer, with an increasing demand; is quoted at \$56.50 @ \$57 for 80 %.

Manufactured Iron.—There is an increasing demand, but trade is far from being active; however, now that the raw article has stiffened, we may look for orders to come forward more freely, as the high demand has been caused by a disposition on the part of buyers to hold back until there was some assurance that hard pan had been reached. Moreover, from the fact that both jobbers and large consumers have been holding off as stated, it is evident that, as a rule, they are low in stock, which will have to be replenished. Prices for first quality Iron quoted at 1.70¢ @ 1.75¢ for Bars, 2.10 @ 2.20¢ for Plates, 2.70¢ @ 2.80¢ for No. 24 Sheet. Skelp Iron, 1.60¢ @ 1.65¢ for Grooved, and 1.90¢ @ 1.95¢ for Sheared—all 60 days, 2 % off for cash.

Nails.—There is no improvement in the Nail trade. In this market the trade is very dull for this season of the year, and there does not appear to be much prospect of an early change for the better. Pittsburgh manufacturers refuse to sell below Pittsburgh card rates—\$1.90, 60 days, 2 % off for cash—but buyers can do better elsewhere.

Wrought-Iron Pipe.—There is more inquiry, and it is expected that there will be a considerably increased volume of business as soon as the fine weather opens up, so that outdoor work can be prosecuted with some degree of satisfaction. The market, however, continues in an unsettled and unsatisfactory condition. We quote discounts for large lines: Black Butt-Welded Pipe, 57½ and 5 %; Galvanized do., 55 %; Black Lap-Welded, 67½ and 5 %; Galvanized do., 57½ %; 2-inch Tubing, 11¢ ¾ foot net; ¾-inch Casing, 85¢ ¾ foot; Boiler Tubes, 65 % off regular list.

Old Rails.—There is more inquiry reported, but no recent sales, in the absence of which we quote nominally at \$23 @ \$23.50, cash. It is expected that the mills in the Shenango and Mahoning valleys will be on the market before long, and, if so, a largely increased volume of business may be looked for. Sellers here have hopes of better prices as soon as the busy season opens up. Old Steel Rails in the absence of sales may be quoted at \$17.50 @ \$18 for short and \$19.50 @ \$20 for long lengths.

Steel Rails.—Heavy Sections are still quoted at \$28 @ \$28.50, cash, at mill, for small lots, but large lots, it is said, have been booked here as low as \$26. The rail mill of the Allegheny Bessemer Company is about ready to start up on rails; it has been making Ingots for some weeks past. This company have several large contracts, booked some time ago.

Billets, &c.—Bessemer Steel Blooms and Billets remain about as last quoted, \$27.50 @ \$28, with a light demand. Domestic Bloom Ends nominal at \$17.50 @ 18, and Rail Crops at \$18 @ 18.50.

Railway Track Supplies.—There is no change to note in prices. Spikes, 2.10¢, 30 days; Splice Bars, 1.70¢ @ 1.80¢; Track Bolts, 2.75¢ with Square and 2.85¢ with Hexagon Nuts.

Merchant Steel.—Trade fair; prices unchanged. Best brands Tool Steel, 8½¢ ½ lb; Crucible Spring, 4½¢; Crucible Machinery, 5¢; Open Hearth do., 2½¢.

Old Material.—The demand continues rather light, while prices remain unchanged. No. 1 Wrought Scrap, \$20 @ \$20.50, net ton; Wrought Turnings, \$18 @ \$18.50; Car Axles, \$24.50 @ \$25; Cast Scrap, \$14.50 @ \$15, gross; Cast Borings, \$11 @ \$12; Old Car-Wheels, \$19.

Cleveland.

CLEVELAND, March 4, 1889.

Iron Ore.—The furnacemen are making liberal inquiries for new Ore, but prices remain unfixed. A large consumer writing during the week for 15,000 tons of Chapin Ore, May delivery, received an offer of the lot at \$5.15 ¾ ton. At the office of the Chapin Mining Company it is intimated that opening prices will be fixed at \$5.10 @ \$5.20. About 3000 tons of this Ore on the dock was sold during the past week at \$5.25 ¾ ton, for immediate delivery. At the headquarters of the Republic and Champion companies \$5.85 @ \$6 are talked of for opening figures. There is every prospect of heavy sales of Gogebic Bessemer early in the season, at prices varying from \$5.10 to \$5.25. The improvement in the Pig Iron situation has materially strengthened the Ore market, and negotiations are known to be pending for several round lots of new Ore at prices from 20¢ to 50¢ in advance of last season's opening prices, and not far from 25¢ below the prices prevailing at the close of navigation, 1888. The formality of fixing prices for high grade Bessemer Ores is likely to be delayed until the upward movement in the Bessemer Pig Iron market has reached its limit. If prices for the latter commodity continue to improve, the first sales of No. 1 Specular and Magnetic Bessemer Ores will likely be made at \$6 ¾ ton. The situation is, therefore, at present one of active inquiry on the part of buyers and of a high degree of confidence among the mine owners and agents. The vessel men have proven by careful calculations that the average price paid for bringing Ore from Ashland to lower lake ports last season was \$1.46 ¾ ton. Estimating from this basis, they are claiming \$1.45, and possibly \$1.50 as the probable season rate from the head of Lake Superior, with a probable rate of \$1.85 from Marquette and \$1.20 from Escanaba. Permanent carrying rates are, however, likely to be fixed about 10¢ ¾ ton less than is now claimed by the vessel owners. There is practically no unsold Ore on the docks, while about 20,000 tons, already sold, have been sent to the furnaces. An interior furnaceman consented during the week to accept 5000 tons of new Ore, delivered in May, in place of the same quantity purchased last season and now lying on the docks. The old Ore, a non-Bessemer grade, was promptly disposed of at \$4.10 ¾ ton, which amount seems likely to be fixed upon as an average quotation for non-Bessemer Ores for the coming season.

Pig Iron.—Bessemer Irons have sold during the week at \$1 advance over December and January prices. The market is firmer in every particular and better prices are readily obtained for all grades of Iron. There has been a liberal increase in sales, and the aggregate amount of Iron disposed of last week was largely in excess of the record for any single week since December. A local dealer who sold 500 tons of Mill Iron at \$14.50 during the

recent depression promptly declined an offer for a similar amount on Saturday. Buyers seem ready to anticipate their requirements for the next three months and are buying accordingly.

Old Rails.—The market is dull, with scattering sales of Old Americans reported at \$21 @ \$21.25.

Birmingham.

Office of *The Iron Age*,
Twenty-first street and Second avenue,
BIRMINGHAM, March 4, 1889.

There is no notable change in the Iron market here. There has not been much selling lately. Furnaces are now piling up stock in the belief and confident expectation of better prices. Nothing of consequence has been sold for the last two weeks in the district. No. 2 Foundry may be quoted at \$12.25 at the furnace. Operations have gone on smoothly since the last report. There has been no break in a steady increase of the output of new material mined or manufactured in the district. The financial situation continues hopeful. There has been a considerable disposition among capitalists operating hereabouts to get hold of choice parcels of mineral property, and much money has recently changed hands in this respect. While recognizing the great resources in Coal, Iron Ore and Limestone which this district possesses, the builders of furnaces until only recently have been somewhat cramped for raw material. Many of them have gone ahead and built furnaces without being assuredly provided with Ore, fuel or fluxing material. The furnaces about Birmingham, however, are just now well up to living business methods, and there is no doubt they are on a solid, healthful basis, which is bound to be productive of general good results. Foundries and machine shops still keep busy. Disposition of rolling mill products is slow, with nothing distinctly promising, although there is a sympathetic hope with Pig-Iron makers of better prices. Much is looked for in the near future from careful experiments with Alabama Ores for Steel-making, and those who have most concerned themselves in the development appear sanguine.

St. Louis.

OFFICE OF *The Iron Age*, 212 N. Sixth st.,
ST. LOUIS, March 4, 1889.

Pig Iron.—There is some slight improvement noticeable in the general tone of the market. During the past week a number of sales of Gray Forge were made, from 500 to 1500 tons, at about prices as quoted herewith, and in some cases a trifle more was paid. Furnaces seem determined to maintain prices, and are refusing to sell at the low figures that have been prevailing for some time. They have confidence in the market and are disposed to look for higher prices when the orders already booked are filled, and are refusing orders for delivery during the year, even at slightly advanced figures. Prices can therefore be quoted steady to firm at about as follows for cash, f. o. b. St. Louis:

Southern Coke, No. 1 Foundry,	\$15.25 @ \$15.75
Southern Coke, No. 2 Foundry,	15.00 @ 15.25
Southern Coke, No. 3 Foundry,	14.25 @ 14.75
Gray Forge.....	13.50 @ 13.75
Ohio Softeners.....	17.50 @ 20.00
Lake Superior Charcoal.....	21.00 @ 21.50

Charcoal Foundry, No. 1.....	16.00 @ 16.50
Charcoal Foundry, No. 2.....	15.00 @ 15.50

Charcoal Foundry, No. 1.....	17.50 @ 18.50
Charcoal Foundry, No. 2.....	16.75 @ 17.50
Connellsville Coke, f.o.b. East St. Louis,	\$4.70; St. Louis, \$4.85.

Bar Iron.—There is no change in this department except the lowering of store

price from \$1.80 to \$1.85, which went into effect on the 1st inst. Business continues in the same channel as last reported, and sales are generally for small lots for quick delivery at from \$1.75 to \$1.85, according to quality, &c.

Barb Wire.—There is nothing of interest to report in this connection. Business keeps up fairly well, and some of the mills are well filled with orders. Others, however, show no disposition to "drum up" trade, and are filling what orders they receive, but looking for nothing outside, as they claim they are now selling at cost and prefer to wait until the market shows some signs of strength before taking orders for spring delivery. It is difficult to give a correct quotation, as each manufacturer makes his own price, in some cases higher, in others lower, than those quoted below: For carload lots Two and Four Point Painted, \$2.90; carload lots Two and Four Point Galvanized, \$3.50, f.o.b. St. Louis; less than carload lots, 5¢ additional.

A. P. De Camp & Co., Laclede Building, St. Louis, Mo., are exclusive agents in that district for Midland Missouri Charcoal Iron, also for Natural Lake Superior Charcoal, and Dexter and Struthers' brands of Ohio Scotch and Blackband Irons.

Chicago.

Office of *The Iron Age*, 85 and 97 Washington street, CHICAGO, March 4, 1889.

Pig Iron.—A considerable quantity of Iron was sold in this market during the past week, but the volume of business was by no means as large as that of a fortnight since. Other deals are pending, and it looks as though much more Iron would be absorbed by consumers before the absolute dullness sets in, which is being freely predicted as a result of the very great activity in February. Ohio and Southern Irons have been purchased most freely of late, as consumers had pretty generally covered their requirements for Strong Irons. Prices still rule very low, as notwithstanding the withdrawal of numerous sellers from the market, and the advance of 25¢ @ 50¢ per ton by others, a remnant is left willing to sell at the old figures. No. 2 Soft Southern has been placed at \$14.25, cash, and it is reported that No. 1 Foundry is not held with equal firmness by all parties. No. 3 Strong Foundry is quoted at full prices by Northern furnace companies, the demand for this grade having been unusually heavy in consequence of the change in progress in foundry practice. The demand for Lake Superior Charcoal is ordinarily very light at this time, but quite a number of buyers are figuring, and it is thought that the requirements of the Agricultural Implement manufacturers will bring them into the market earlier than usual, as they are running their works now to their full capacity. Prices are not so firm as they have been, owing to an accumulation of Nos. 1 and 2 at numerous furnaces, and concessions are being made on desirable orders. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Coke, No. 1, \$16 @ \$16.50; No. 2, \$15 @ \$15.50; No. 3, \$14.50; Chicago Scotch, No. 1, \$17.50; Lake Superior Charcoal, Nos. 1 and 2, \$19.50; Nos. 3 to 6, \$20; American Scotch (Blackband), No. 1, \$18 @ \$19; Jackson County Silvery, No. 1, \$18; other Ohio Soft Irons, No. 1, \$17.25 @ \$17.50; Southern Coke, No. 1 Foundry, \$16 @ \$16.50; No. 2 Foundry and No. 1 Soft, \$15.50 @ \$16; No. 3 Foundry, \$15 @ \$15.50; Gray Forge and No. 2 Soft, \$14.25 @ \$14.75.

Bar Iron.—No improvement is to be noted either in demand or price. Mill lots of Good Common Iron are still quoted at

1.62½¢ @ 1.65¢, half extras, f.o.b., Chicago, but consumers insist that they are being offered better figures by salesmen for mills of good reputation. Store prices range from 1.80¢ to 2¢, according to quantity and quality.

Structural Iron.—So far this year manufacturers and dealers are doing most of their trading in prospects. There is a pleasing outlook, but very little immediate business. In view of the expected trade stocks are being replenished and "deals" fixed up. We quote as follows for mill lots, f.o.b. Chicago: Beams and Channels, 2.90¢; Angles, 2.10¢ @ 2.15¢; Tees, 2.55¢; Universal and Sheared Plates, 2.15¢ @ 2.20¢. Small lots from stock sell as follows: Beams and Channels, 3.40¢; Angles, 2.35¢; Tees, 2.75¢.

Plates, Tubes, &c.—The business transacted during the past week was fairly satisfactory. While not many mill lots were sold, one order was taken which covered some 200 tons of Plates. The quantity of business in sight promises a very active trade for the spring months in this line. Boiler Tubes are still quoted at old figures, and dealers are advising their customers to purchase a supply while they can be had so cheaply. Store quotations on small lots are as follows: Sheet Iron, Nos. 10 to 14, 2.50¢ @ 2.60¢; Sheet Steel, 2.75¢; Shell Iron, 3¢; Shell Steel, 3.12½¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 62½¢ @ 65¢ off.

Sheet Iron.—The demand is very light, and No. 27 Common Black now sells at 3.10¢ @ 3.20¢ in a jobbing way. The manufacturers of Galvanized Iron have made an advance of 2½¢ on deliveries to May 1, but jobbers still quote small lots of Juniata at 65¢ off and Charcoal at 65¢ and 2½¢ off.

Merchant Steel.—The demand is limited at present. The consumers of Spring Steel seem to be well supplied, and other heavy purchasers do not expect to be in the market any earlier than usual this year. Quotations are as follows, according to quantity: Soft Steel, 2.10¢ @ 2.30¢; Tool Steel, 7.75¢ @ 8¢; Specials, 13¢ @ 25¢; Crucible Spring, 3.75¢; Open-Hearth Spring, 2.20¢ @ 2.50¢; Open-Hearth Machinery, 2.30¢ @ 2.50¢; Tire, 2.20¢ @ 2.50¢; Sheet, 7¢ @ 10¢.

Steel Rails.—Manufacturers report a continued dull market, with no immediate prospect of a resumption of activity. They have not changed their quotations of \$30 @ \$30.50, according to quantity.

Old Iron Rails.—Buyers from other sections have appeared in this market and have stiffened prices, although it is understood that the purchases made only covered a couple of thousand tons. For these they paid \$21, Chicago, but it is doubtful if more could be had at that figure just now, as holders are disposed to wait for higher prices.

Scrap Irons.—There is very little demand for any grade of Scrap, and small dealers are selling their stock at \$1 @ \$2 below regular quotations whenever they get an accumulation. Some inquiries are made for Mill Scrap at prices considerably below what holders are asking. Dealers quote for Mixed Country Scrap \$14. Quotations to consumers are as follows, per ton of 2000 lb: No. 1 Railroad Shop, \$20; Fish Plates, \$21; Mixed Track, \$18 @ \$19; No. 1 Mill, \$14 @ \$16; Pipes and Tubes, \$13 @ \$14; No. 2 Mill, \$9.50; Axles, \$25; Horseshoes, \$18 @ \$19; Machinery Cast, \$13.50 @ \$14; Stove Plate, \$11; Cast Borings, \$8.50; Wrought Turnings, \$11 @ \$12; Axle Turnings, \$13.50; Mixed Steel, \$11; Coil and Leaf Steel, \$15; Tires, \$15.

General Hardware.—The demand for Shelf Hardware has been better the past week, appearing to fluctuate with the weather, which has been more spring-like. February was comparatively dull, but it is not expected that March will follow suit, as in many sections a great deal of outdoor work will be prosecuted which will call for a heavy consumption of Hardware. House-Furnishing Goods are in fair demand, as well as Tools, Steel Goods and Staples generally. A new Screw list has been issued, which differs from the old one in naming lower prices and a less discount, but which, however, is understood to make an average advance over the former net prices of about 7½%. In Hardware generally the tendency seems to be upward, while in staple goods it is precisely the reverse. The jobbers of Heavy Hardware complain of decided dullness in their branch of trade, which should at this time be experiencing a fair degree of activity.

Nails.—Steel Nails are still selling at \$2 @ \$2.05 in small lots, and \$1.95 for carloads. The manufacturers are the only ones in the Nail trade maintaining a firm front. They are being undersold by the jobbers, who have long time contracts for stock at low figures, enabling them to control this market effectually. Nevertheless, it is expected that at the next meeting of the Nail Association a further advance of 5¢ in the factory price will be declared. Wire Nails are now being sold at \$2.40 for small lots and \$2.35 for carloads. The manufacturers are not quite so demoralized as they were, but they have as yet effected no understanding with one another, although something of the kind is regarded as very probable.

Barb Wire.—This branch of trade is in about the same condition as the Nail trade. Jobbers are selling small lots of Painted at \$2.65 @ \$2.80, and carloads at 5¢ @ 10¢ per 100 lb less. Galvanized maintains its advance of 60¢ per 100 lb on Painted. At present there seems to be no prospect of an advance.

Pig Lead.—Dealers report a very quiet week, consumers buying only to cover their immediate wants, and their views of the future being colored to some extent by the large stocks still held. At the beginning of the week \$3.60 was asked, but with sales of less than 200 tons prices weakened to \$3.55 and to \$3.50.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, March 4, 1889.

Pig Iron.—The local market has been somewhat irregular during the week, but has given further evidence of improvement. Yet the recovery is so gradual that it fails to impart general confidence. There has been more inquiry, and, in exceptional instances, a few transactions of moment have been made. An advance of 25¢ @ 50¢ per ton has been realized on the prices current during the period of the recent depression, but there are still instances of sales almost, if not quite, as low as those current a few weeks ago. Furnaces, especially in the South, are well sold ahead on Foundry grades, and are refusing to make further large contracts for future delivery, except at an advance, which buyers are not yet ready to pay. Shipments from furnaces during the week have been large, in some instances unprecedented, but production is active and buyers point to the fact that there was a large increase in stocks in January, with the probability of a further increase, although smaller in February, the present month has not progressed far enough to indicate its tendency, and there are views both for and against an increase in stocks. Southern advices lead

to a belief of a reduction rather than otherwise, while it is claimed Northern stocks will show an increase. Among the sales made during the week is reported one lot of mixed Forge grades of 11,000 tons; Gray Forge selling at \$13; Close Bright at \$13.25; Open Bright at \$14.50; Silvery at \$13 @ \$13.25 and Mottled at \$12.50. There were also reported sales of Gray Forge at \$12.75; 1500 tons do. at \$13.25 and 1000 tons do. at \$13.50; 500 tons No. 1 Southern Foundry at \$15, all cash. Car-Wheel Iron has been quiet. Mottled Iron has sold as low as \$12, spot. The following are the approximate prices current here at the close for cash, f.o.b.:

Foundry.

Southern Coke, No. 1 (new classification)	\$15.00 @ \$15.50
Southern Coke, No. 2 (new classification)	14.50 @ 14.75
Southern Coke, No. 3 (new classification)	14.00 @ 14.25
Ohio Soft Stone Coal, No. 1	15.00 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 15.00
Mahoning and Shenango Valley	15.50 @ 17.00
Hanging Rock Charcoal, No. 1	21.00 @ 22.00
Hanging Rock Charcoal, No. 2	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2	17.00 @ 18.00

Forge.

Strong Neutral Coke	13.00 @ 13.50
Mottled Neutral Coke	12.00 @ 12.50
Gray Forge	13.00 @ 13.25

Car-Wheel and Malleable Irons.

Southern Car-Wheel	20.00 @ 25.00
Hanging Rock, Cold Blast	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable	21.00 @ 22.00

Manufactured Iron.—The market has remained quiet, but steady, for all kinds.

Nails.—The market has remained moderately active, and a firmer tone has prevailed, with Steel Nails especially firm and in better demand. 12d @ 40d sell at \$1.95 @ \$2 per keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$2, and Steel Wire Nails at \$2.55 @ \$2.60 per keg.

Old Material.—There has been a moderate demand and a steady market for Old Wheels, which sell at \$18 @ \$18.50. Old Rails have ruled easier, with moderate sales at \$21.50, cash.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, March 4, 1889.

Pig Iron.—There is a better feeling all along the line as to the condition of this market. Prices at which sales were made a few weeks ago are not entertained now, but an advance of 25¢ @ 75¢ per ton is being asked, with many sales at this advance, and there is still a disposition manifested to still advance the prices under the influences of the many inquiries that are being made. The movements of good brands of both Foundry and Forge are by no means sluggish, and there is scarcely a furnace in the Southern districts that has any accumulation of this kind of stock on their yards. The policy of many of the stacks has been heretofore to sell large blocks for future deliveries. Such sales, of course, keep the yards well cleaned up, but those of the furnaces that have not entered into such transactions made sales not in such large lots, but more frequent in number, and, as a general thing, they are realizing a rather better price. While there have been some sales at low figures, yet it must be borne in mind that there is a considerable difference in the quality of Iron that is being turned out by the Southern stacks, and No. 1 Foundry of one furnace is steadily bringing at least \$1 per ton more than the No. 1 of another. An Iron that has always had a good reputation among consumers cannot be had now at less than \$13.75 @ \$14, at the yard, and these figures can be taken as a basis of the present condition of the market.

Miscellaneous.—There appears to be no falling off in the disposition of moneyed

men to make investments in Southern enterprises. Within the past year there has been 23 large sawmills put up on the line of the Georgia Southern Railroad, a new road recently built from Macon south. There are now in course of erection on the same line of road about 25 more, all of which will be completed during the present year. Much of this, of course, is not being done with local capital, but there seems just now to be a greater disposition than ever for a few Eastern and Northern men to combine, throwing into a pool several hundred thousand dollars, and settle on one of the many Southern points that are yet available and force such places into importance by the use of money and the many advantages that nature has placed at their disposal. The effect of these transactions is already being felt through the entire South, and there are those who predict that the time is near at hand when the whole South will take upon herself a much greater boom than any that has occurred in the past.

Louisville.

LOUISVILLE, KY., March 4, 1889.

Pig Iron.—The market has been quiet during the past week, with not much Iron offering. Buyers elsewhere are paying about 50¢ a ton over the lowest prices at which Iron, so far, has been offered. It is thought that a slight reaction has taken place, and furnaces can look forward to a somewhat stronger market. We quote as follows:

Southern Coke, No. 1 Foundry, new classification	\$14.75 @ \$15.25
Southern Coke, No. 2 Foundry, new classification	14.25 @ 14.75
Southern Coke, No. 3 Foundry, new classification	13.75 @ 14.25
Gray Forge	13.25 @ 13.75
White and Mottled, different grades	12.75 @ 13.25
Silver Gray, different grades	13.00 @ 13.50
Hanging Rock Charcoal, No. 1 Foundry	18.25 @ 18.75
" " No. 1 Mill	14.75 @ 15.25
Southern Car-Wheel, standard brands	21.75 @ 22.75
Southern Car-Wheel, other brands	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry	19.50 @ 21.00
Hanging Rock, Cold Blast	20.75 @ 23.75

New York.

Office of *The Iron Age*, 65 and 68 Duane street, NEW YORK, March 6, 1889.

American Pig.—The consensus of opinion is that, while there is no notable increase in buying, the market shows a slightly better tone. The improvement is largely negative—that is to say, there is not as much pressure to sell by weak holders, and bargains are not so liberally hawked about. Reports from consumers are still conflicting. Until many of them see enough ahead in the way of work, they are not likely to become liberal buyers. We continue to quote for standard brands Northern Iron No. 1, \$17.75 @ \$18; No. 2, \$16.50 @ \$17, and Gray Forge, \$15 @ \$16, all at tidewater.

Scotch Pig.—In spite of higher prices abroad, the market has not moved here to any appreciable extent. We quote: Coltness, \$20.50 @ \$21; Shotts, \$20 @ \$20.50; Langloan, \$20 @ \$20.25; Summerlee, \$20.25 @ \$20.50 and Dalmellington, \$19.25 @ \$19.50.

Structural Iron.—We quote Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 1.9¢ @ 2.10¢; Tees, 2.4¢ @ 2.6¢, and Channels and Beams, 2.8¢ on dock for all sizes. Sales of Beams are reported at 2.7¢ at Boston. The Brooklyn elevated extension work was taken by an Eastern Pennsylvania mill.

Plates.—We quote Iron Tank, 2¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.85¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3½¢ @ 4¢.

Bar Iron.—We quote: Carload lots on dock, half extras, Common, 1.65¢ @ 1.7¢; Medium, 1.7¢ @ 1.75¢, and Refined, 1.75¢ @ 2¢.

Steel Rails.—No sales of any consequence are reported this week. There are a number of inquiries in the market, one of the Eastern Steel companies estimating that the business in sight aggregates 75,000 tons at least. In the West the situation remains unsatisfactory. Outside of a lot of 8000 to 10,000 tons for delivery at Duluth or St. Paul, for a new road in the Rocky Mountains, there is no business of any consequence pending. As indicating how little the roads in the territory tributary to the Western mills are buying, we may note that a transcontinental road asking for bids on about 2000 tons, delivery Omaha. Under ordinary conditions, such a road would require many times the amount. The Board of Control holds a meeting to-day at Philadelphia to arrange for an increase in the allotment. We quote \$27 @ \$27.50 nominally. There is a large order in the market for 80-pound Rails.

Nail Slabs.—Some purchases have been made at \$28 at mill, and the tone is steadier.

Wire Rods.—No business is reported. We quote nominally \$41.50 @ \$42 for Foreign.

Old Rails.—The market is very dull. Stocks are low. We quote nominally \$23 @ \$23.50 for Tees.

Galvanized Sheets.—At a meeting in Philadelphia the discount has been advanced to 65 % and 5 % for large lines.

A. T. Shoemaker, Duncan Building, 11 Pine street, has been appointed representative of the North Chicago Rolling Mill Company, the Juliet Steel Company, and the Union Steel Company, for the sale of Steel Rails, &c.

Metal Market.

Copper.—When we reported last week spot Chili Bars, Good Merchantable, were still quoted in London, £78. Since then quite a drop has occurred to £69 yesterday, while futures at the same time gave way from £66 to £60, sales aggregating 500 tons. The panic into which London has been thrown arises from the impression that the syndicate has got into severe financial straits. The monthly statement of visible supply of Copper in England and France showed an increase of 9000 tons, while the deliveries were confined to 1400 tons. These statistics were well calculated to aggravate the situation and precipitate a decline, causing the bears in London to offer futures at £59 for the balance of the year. Here the market was so thoroughly demoralized that for a couple of days nothing was done, until yesterday, when 25,000 lb March were sold at 15½¢. Casting brands have sold at 15¢ here, 15.80¢ at Chicago and below 15¢ at Philadelphia, where a local fight is going on between three refiners. The sudden death of M. Denfert-Rochereau, of the Comptoir d'Escompte, at Paris yesterday, caused a panic in Copper shares on the Exchange there. The following is the dispatch as received by the Associated Press, dated yesterday: "Wild fluctuations marked Metal shares from noon until the close. Société des Métaux shares fell to 188, and when the panic abated they closed at 192. Rio Tinto touched 382 and closed at 397. Comptoir d'Escompte ranged between 800 and 860, the final quotation being 810. Stocks beyond the sphere of copper speculation remained unshaken. Rentes were irregular, but 3 % closed only 10¢ lower for the day. To-

tomorrow, it is understood, will be big with fate for the Copper syndicate, the negotiations for an arrangement with all the mines, including American, finally succeeding or failing. Société de Métaux shares were quoted on Saturday at 280 francs. It is reported that the Chamber of Deputies will discuss the question of the workings of the French syndicate which has secured control of the Copper market." The latest special spot quotation from London is £84. 10/, with no quotation for futures. Our market is paralyzed and altogether nominal, pending further developments in Europe and here. It stopped buying last Thursday, and there was a very sharp decline, not only in its own shares and in those of the mining companies, but also in the leading Paris bank, which is identified with the speculation. In Boston there was a similar fall in shares, so that on Monday the impression was widespread that the end was near. The latest advices, however, show that Boston has recovered somewhat, and that the feeling in Paris, too, is stronger, Société shares rallying to 240 francs. This is probably due to the very important meeting held in this city yesterday between a representative of the Rothschild's, the agents of the syndicate and the American mining companies, including the Anaconda, Calumet and Hecla, Tamarack, Boston, Montana, Atlantic, Central, Quincy and the Arizona companies. It is reported that the meeting was very harmonious, and that all present agreed to a restriction of output, subject to confirmation by the respective boards of directors. The exact percentage is not known as yet. It is variously reported at 15 and 25 %. For the present the price has been left untouched, but it seems certain that there must be some readjustment. The initiative in this latest move appears to have, therefore, been taken by the American companies. The foreign, notably the Spanish, mines must follow, and that very quickly. The mines have as great an interest in the fate of the syndicate as those connected with it, and there are very powerful financiers who cannot afford to let it fail, without having exhausted every means at their disposal. A reduction in the price here is, however, almost as imperative as a reduction of the output. The Spanish export figures for last year are now published, showing that there were shipped 825,045 tons of Pyrites, against 766,801 in 1887, and 671,897 in 1886; and of precipitate 29,105 tons, against 29,890 and 27,003.

Tin—Has been comparatively little affected by the tumble in Copper, declining from £95. 10/ a week ago to £95 for spot and futures from £96. 5/ to £95. 15/ in the London market, sales running up 900 tons. Considering that the monthly statistics exhibited an increase in the visible supply in Europe and America of 1700 tons, it must be confessed that the Metal has, under the circumstances, stood its ground remarkably well. The market here at first ranged between 21.45¢ and 21.75¢ on the spot, 21.40¢ and 21.65¢ March, and 21.40¢ @ 21.50¢ for April, leading at the close to sales of 30 tons spot from 21.60¢ to 21.50¢, closing at 21.55¢ yesterday, while 20 tons March were sold from 21.45¢ down to 21.35¢. During February, as per cable from Gillilan, Wood & Co. to Mr. Chas. Nordhaus, New York, there were shipped from the Straits Settlements to the United States 800 tons, against 250 last year, and to England, 2750, against 2500; total shipment, since January 1 to America, summing up 1850 tons, as compared with 650 same time last year, and 3950, against 6000 to England. Spot Tin declined in London this morning from £95 to £94. 17/6,

futures remaining unaltered. **Tin Plates** have been dull and featureless in this city during the week, while continuing to be well held in England. Futures are held higher in this market, but consumers do not feel disposed to take hold of them as long as a general cloud overhangs the Metal market. We quote at the close, large lines, per box: Siemens-Martin Steel, Charcoal Finish, \$4.75 @ \$5.50; Ternes \$4.12 @ \$4.25; Coke Tins, \$4.22½ @ \$4.30, and Wasters \$4.12½ @ \$4.15. The quotation in Liverpool is 13/ for Coke Tin. As per Board of Trade returns the January export from England amounted to 37,678 tons, against 26,197 in 1888 and 20,310 in 1887; out of these amounts the United States received 28,471, 21,372 and 14,485, respectively, the price of Coke Tins averaging in January 13/ against 14/7 in 1888, and 13/ in 1887.

Lead—Has been devoid of features and quite inactive in our market, some 400 tons being taken in lots at 8.65¢ @ 8.75¢, the closing figure being 8.70¢. At the West, the quotation remains 8.45¢. London has kept steady at £12. 17/6 for Soft Spanish, while English Pig has improved to £13. 2/6 Spain exported last year 129,160 tons of Pig Lead, against 130,797 in 1887, and 114,471 tons in 1886.

Spelter—The domestic article has been more freely offered and cannot be quoted now over 4½¢, while Silesian remains little sought after at 5½¢. Spanish exportation of Calamine amounted last year to 26,098 tons, as compared with 22,841 in 1887, and 26,624 in 1886. London remains steady at £17. 10/.

Antimony—The demand has continued on a moderate scale and at well-sustained figures, being 18½¢ for Cookson, and 12¢ for Hallett.

New York Metal Exchange.

The following sales are reported:

FRIDAY, March 1.	
10 tons Tin, April	21.40¢
MONDAY, March 4.	
10 tons Tin, spot	21.60¢
10 tons Tin, March	21.45¢
TUESDAY, March 5.	
10 tons Tin, spot	21.40¢
50 tons Lead, March	3.72½¢
10 tons Tin, spot	21.50¢
10 tons Tin, March	21.35¢
25,000 pounds Lake Copper, March	15.75¢
WEDNESDAY, March 6.	
20 tons Tin, March	21.30¢

Coal Market.

The Anthracite Coal trade is dull and despondent, the advent of March bringing with it a promise of milder weather, while as yet the winter's accumulations are a standing menace to firmness in prices. At Port Richmond alone there is in stock no less than 220,000 tons. The Coal managers are conferring in reference to opening prices for the new year, and an announcement from the sales agents touching this point will be looked for not later than the 15th inst. Production for the week ending March 2 has fallen to 477,553 tons, a decrease of 27,600 tons compared with the previous week, and 229,000 tons compared with the same week in 1888. Since January 1 the total is 4,793,510 tons, a decrease of 887,338 tons compared with last year. Selling prices by individuals average about 50¢ per ton below the regular schedule, and in other directions sales are reported at a concession. Quotations are: Hard White Ash, Lump, \$4.50; Broken, \$4.15; Egg, \$4.40; Stove, \$4.65; Chestnut, \$4.55; Free-Burning, f.o.b., Broken, \$3.95; Egg, \$4.30; Stove and Chestnut, \$4.65; Pea, \$2.75.

Bituminous Coal prices are irregular on a narrow margin of profit, and the market is dull. Rates to lake ports are unchanged.

Harbor and Eastern freights are on the lowest basis. George E. Barnett has associated himself with the old house of Percy Heilner & Son, No. 1 Broadway, for the handling in this market of the White Ash and Red Ash Coals of the Philadelphia and Reading Coal and Iron Company, direct from the mines. The argument in the case of Cox & Bros. & Co. vs. the Lehigh Valley Railroad Company, before the Interstate Commission, has been postponed until March 14.

The annual report of the Lehigh and Wilkesbarre Coal Company shows that the receipts for Coal last year were \$9,563,866, and the net earnings \$1,986,521. The total Coal tonnage was 2,694,932 tons.

The Poughkeepsie Bridge Company and the railroad lines that connect are considering the plan of introducing the Dodge storage system at some point east of the bridge, where stocks can be accumulated during the summer and fall for winter distribution throughout New England. Cumberland shipments for the week were 56,600 tons; Clearfield, 61,500; Rochester, 36,888; Beech Creek, 24,880.

Financial.

Events transpiring at Washington as yet have no perceptible effect either in the Wall street markets or in business circles generally. The absence in the President's Inaugural Message of any allusion to Treasury management or questions of finance or currency would indicate on his part no sense of disquietude or anxiety with reference to the future, and it remains to be seen that the selection of Secretary Windom to represent the Treasury was not the wisest that could have been made. The President approved the Interstate Commerce act, which was finally passed substantially as prepared by the Senate Committee on Interstate Commerce. One change made is the requiring of three days' notice of any proposed reduction in the published rates of a railroad. Special provision is made to prevent and punish "underbidding" or discrimination. The provisions of the act in regard to the publication of rates are made to apply to joint through rates. Other amendments are intended to complete the power conferred upon the Commissioners, with the special purpose of enforcing the penalties imposed for violation of the law. The proposed amendments relative to the jurisdiction of State's courts and transportation of oil in barrels or tanks were rejected. In reference to the "agreement among gentlemen," Judge Cooley has been furnished with evidence against certain of the weaker roads manipulating freight rates out of Chicago, and said when he left for New York last week he thought the prosecution of some roads was certain. The outcome of the matter will be watched with interest, since hitherto aggressive action has too often provoked retaliation.

The Stock Exchange markets, pending a change of Administration at Washington, were devoid of feature, transactions being confined almost wholly to professional traders. The feeling prevailed in regard to the future that much depended on the success of the endeavors to secure the services of Interstate Commissioner Walker as chairman of the Interstate Railway Association. The market was unaffected by President Harrison's inaugural. The tone of the market was generally strong. On Tuesday the tone was generally strong to near the close, when it became irregular and lower. Manhattan was unfavorably influenced by the declaration of a 1½ % scrip dividend, convertible into new 4 % bonds. The report of the failure of the Reading Iron Company caused something of a flutter. It was understood that a reorganization would fol-

low, the creditors funding their indebtedness, but no statement has been made.

Government bonds are quoted as follows:

U. S. 4½, 1891, registered.....	107½
U. S. 4½, 1891, coupon.....	107½
U. S. 4, 1907, registered.....	127½
U. S. 4, 1907, coupon.....	128½
U. S. currency 6s.....	120

The general business situation is not altogether satisfactory, although the spring demands for various classes of merchandise are assuming larger proportions, and a fair distributive movement is in progress. With dry-goods jobbers prices on all desirable goods are steady, and a better feeling is noted, but accounts respecting trade at interior points are not uniformly good. Wholesale grocers report prices firm, with coffee and sugar tending upward. On the Produce Exchange spot wheat is depressed and spot corn very slow. Cotton is steady on a moderate demand. Provisions are higher all around, with good buying by English houses. Exports from Atlantic ports of bacon and pork are larger than for the corresponding week last year. The total east-bound tonnage from Chicago last week was 65,345 tons, against 68,651 the week before, and 58,129 for the same week last year.

The total clearings of 40 cities last week show an increase of 16%, compared with the same week last year. For the month of February there was a gain of 11.4%, compared with the same month in 1888. New York gained 17.2%; Boston, 8.3%; Philadelphia, 16.8%; Chicago, 7.9%; New Orleans, 19.9%; Kansas City, 25.1%.

The weekly statement of the associated banks was unfavorable, showing a loss of \$3,469,600 in surplus reserve, which is now \$12,270,550, against \$12,744,700 one year ago and \$9,088,000 at the corresponding date in 1887. Loans were increased \$4,045,000; specie decreased \$3,756,400, showing the effect of Treasury absorptions and shipments to other points, the requirements for Boston being unusual; deposits increased \$204,400. Money was in better demand, attended with firmer sales. Lenders were disposed to await official announcements serving to disclose the future policy of the Government respecting bond purchases. The supply of commercial paper is better, but not equal to the demand. Endorsed bills receivable are quoted at 4%, 60 @ 90 days; longer dates 4½ @ 5%. Mercantile houses are expected to put out their usual lines of paper as the season advances. Banks are discounting little, except for customers. The market for sterling is very dull, there being practically no bills, grain, provision, cotton or security offering.

The official statement of foreign commerce for January, issued by the Bureau of Statistics, discloses the fact that during the first month of the new year merchandise exports and imports each exceeded in value those of the same month of 1888 by \$10,000,000. The volume of January imports is unprecedented, being \$18,000,000 above the average of the five years preceding. The volume of January exports was greater than for any year since 1885, and \$5,000,000 above the average for the five years preceding. The value of exports for the month was \$73,470,000, and of imports \$68,348,000. For the seven months of the fiscal year exports have aggregated \$454,204,000, compared with \$447,961,000 for the same period of last year. Imports have amounted to \$420,932,000, compared with \$409,851,000 for the same seven months of the preceding fiscal year.

The new Union Square Bank in this city opened for business on Monday with \$200,000 deposits. The United States Savings Bank of the City of New York, organized to do business in the Nineteenth Ward, has been incorporated. Ex-

Secretary Fairchild becomes the head of the newly-organized New York Security and Trust Company. Announcement is made that enough subscriptions have been offered to absorb four times the capital stock. The public debt statement for February shows an apparent increase in the debt of \$6,443,344. This is owing to unusually heavy expenditures for pensions and premiums. The receipts for the fiscal year thus far are about \$1,000,000 more than for the same period last year, while the expenditures are \$39,000,000 more. The surplus is \$48,096,158—a decrease of nearly \$17,000,000.

Exports for the week are \$6,754,600, and include 581,000 bushels of corn, 137,000 bushels of wheat, and 28,000 bales of cotton. Since January 1 the excess is \$7,500,000, compared with last year.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, March 6, 1889.

The Copper market has continued unsettled and depressed. The syndicate agents have refused to purchase Merchant Bars for prompt delivery and it is stated that they have abstained from buying forwards since January. The further statement is made that they have refused this week to take cash warrants. On Monday prices fell £8, owing to the decline in the shares of the Société des Métaux, and by this decline, it is believed, the credit companies connected with Société suffered most. At this center the outlook is considered more serious than ever before, the immense stock held by the syndicate, which was at high prices, it is said, causing fresh outlay of money and necessitating further borrowing. According to statistics published this week, the consumption in 1888 was 7½% less than in the preceding year.

Copper Furnace material has depreciated, in partial sympathy with the decline in the prices of Bars. Among late sales is noted 400 tons American Matte at 14/3 3/4 unit, and subsequently 60 tons ditto at 14/, f.o.b. Liverpool.

LATER.—No definite information can be obtained as to the result of the negotiations of the syndicate on new contracts. Opinions are variable, but there is an impression at the close of business that the syndicate will save itself. Their agents are again purchasing. The final transactions were at £64. 10/ for prompts.

The demand for Block Tin for consumption is improving. This fact and

higher quotations from New York, together with reports of a larger business there, causes speculators to operate more freely. The market has also been benefited by advices of probable smaller shipments from the Straits. Prices have suffered a temporary reduction, but the market is again stronger. The Billiton sales realized equal to £97. 10/ in Holland.

Prospects for the formation of the Steel Rail syndicate continue favorable. It is stated that the proposal submitted very recently is well received by all the makers. A committee has been appointed to draw up the plan of the scheme in full on the basis presented. It is believed that the makers in the Cumberland district arranged to have orders for Rails booked by Bolckow, Vaughan at late rates. Prices for rails are hardening and quoted one-third higher. Some advance is also quoted on Blooms and Slabs.

The Tin-Plate trade is somewhat disturbed by labor disputes. The Worcester works (eight mills) have closed, and the Upper Forest works (twelve mills) are likely to follow. There is plenty of inquiry at the present time, but little business, as makers are refusing orders at the prices offered.

The Pig Iron market continues to harden under the influence of increasing home consumption. Speculation is comparatively small. There is some talk of blowing in more furnaces in Scotland. Most brands of makers' Iron are again 6d to 1/ higher this week. Middlesboro' Pig has been sold at 9d rise, and Hematites are a good 6d up, with liberal purchases at the advance. Old Rails and Scrap Iron are without improvement.

Scotch Pig.—There continues to be a large business and prices are strong:

No. 1 Coltness, f.o.b. Glasgow.....	54/6
No. 1 Summerlee, " ".....	54/
No. 1 Gartsherrie, " ".....	51/
No. 1 Langloan, " ".....	58/
No. 1 Cambro, " ".....	45/6
No. 1 Shotts, " ".....	51/
No. 1 Glengarnock, " at Leith.....	50/
No. 1 Dalmellington, " Ardrossan.....	45/6
No. 1 Eglinton, " ".....	44/
Steamer freights, Glasgow to New York, 5/;	
Liverpool to New York, 10/.	

Cleveland Pig.—Trade has been large again, and the market is strong at the advance. No. 1 Middlesboro', G.M.B., 89/; No. 8 ditto, 86/9.

Bessemer Pig.—Demand continues large and prices still show advancing tendency. West Coast brands, mixed numbers, 47/ @ 47/6, f.o.b. shipping point.

Spiegeleisen.—The market remains firm and fairly active. English 20% quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—Higher prices generally asked and the demand good. Heavy sections quoted at £4. 6/3, and light sections £4. 12/6 @ £4. 17/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—Only a moderate trade, but prices firmer. We quote £3. 18/9 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—The market firm with demand fair. Bessemer, 2½ x 2½ inch, £4. 5/, f.o.b. at N. W. England shipping point.

Steel Slabs.—There is more demand for these and the market is firmer. Bessemer, £3. 18/9, f.o.b. at N. W. England shipping point.

Old Rails.—No improvement in the demand. Prices nominal. Tees quoted

at £3. 5/ @ £3. 6/, and Double Heads, £3. 8/ @ £3. 10/, c.i.f., New York.

Scrap Iron.—Demand continues slow. Heavy Wrought quoted at £2. 2/6 @ £2. 7/6, f.o.b.

Crop Ends.—A moderate business at barely steady prices. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate.—There is a very good demand and sellers are firm. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....15/9 @ 16/3
IC Bessemer Steel, Coke finish.....13/8 @
IC Siemens.....13/9 @
IC Coke, B. V. grade.....13/ @ 13/3
Charcoal Terne, Dean grade.....12/6 @ 13/

Manufactured Iron.—Trade is of good volume and prices are very steady. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars.....	£ s. d.	£ s. d.
Common.....	5 12 6	5 15 0
Staff. Bl'k Sheet, singles.....	7 12 6	7 12 6
Welsh Bars (f.o.b. Wales).....	5 0 0	5 2 6

Copper.—Market irregular and unsettled. The quoted prices at the close are: Chili Bars, £64. 10/ for spot; for three months futures, no market. Best Selected, £71 nominal.

Tin.—The market fairly active but somewhat irregular. Straits quoted at £95, spot, and £95. 10/ for three months' futures.

Lead.—The trade rather slow, but prices firmer. Quoted at £12. 17/6 for Soft Spanish.

Spelter.—A moderate business passing at steady prices. Quoted at £17. 12/6 for ordinary Silesian.

CHILI.

VALPARAISO, January 4, 1889.—**Copper.**—Dealings have been restricted by the fact that the mines are under contract all the way to the middle of February, and that consequently they may hold back; hence only 5050 quintals were sold at \$26.40 @ \$27 per quintal, as to brand. The price of \$26.25 equals £73. 19/2 per ton, with 30/ freight to Liverpool. **Coal.**—There being considerable difficulty just now in landing Coal at the Nitrate ports, it is not easy to place the latest cargoes arrived; thus New Castle does not bring over 37/6 per ton, on the spot, while afloat it cannot be had for less than 42/6 @ 45/. **Freights.**—Rates are weak, there now being 60,000 tons of ships' room seeking freight. For Nitrate to England 28/9 @ 30/ have been paid; for the Continent 33/9 @ 35/, and for Guano respectively 34/ and 36/3. **Exchange.**—Drafts on London, 90 days' sight, are bringing 28 1/2 d.—Weber & Co.

EAST INDIES.

SINGAPORE, January 21, 1889.—**Tin.**—Has been in brisk request and well sustained, some 365 tons selling at \$36.87 1/2 @ \$37.25 per picul, and there are buyers still at \$37. **Gum Damar.**—A sale has been effected of 20 piculs Palembang at \$19.50 per picul. **Gum Copal.**—Some 60 piculs have changed hands at \$7.55 @ \$11.05, and for a couple of boxes Gum Benjamin from Penang \$38 per picul has been paid. **India-Rubber.**—Borneo is scarce and wanted, ordinary qualities fetching as much as \$38 @ \$39 per picul. **Gutta-Percha.**—Is offered sparingly, so that good quality sells with the greatest ease at \$125 @ \$135 and medium at \$80 @ \$125. **Exchange.**—Bank drafts, four months' sight, 3/1 1/2.—Gillilan, Wood & Co.

MANILA, February 25, 1889.—**Hemp.**—There are buyers at \$16.75 per picul, against \$8.58 a year ago, equaling per ton, cost and freight, \$56. 12/6, as compared with £20. 12/6 in 1883. The clearances for the United States since last cable amount to 7000 bales, against none last year, and since January 1 to 60,000, against

19,000. There remain loading for the United States 41,000 bales, against 22,000; cleared for England since January 1, 44,000, against 38,000; loading for England, 11,000, against 18,000; cleared for all other ports, 6000, against 7000. Receipts at all ports since last cable, 17,000, against 7000; since January 1, 105,000, against 82,000 bales in 1888 and 68,000 in 1887. **Freight.**—\$7.50, against \$5. **Exchange.** 6 months' sight, 3/8, against 3/8 1/2.—Kerr & Co., per cable direct, to Mr. Charles Nordhaus, New York.

BELGIUM.

BRUSSELS, February 23, 1889.—**Iron.**—The Belgian market remains firm, there being a good demand for Finished and several large dealings have taken place among others. The Thy-le-Château Company, among others, made a sale of 17,000 tons Merchant Iron on the spot, and simultaneously received orders for 15,000 tons Beams. In the Castings line export orders are secure, but domestic ones are flocking in all the more actively. Steel is very firm. Cockerill is just executing an order for Havana for Steel Rails, at 111 francs, f.o.b. Our Government stands in need of 15,000 tons Goliath Steel Rails. Following has been the foreign Iron and Steel movement in Belgium in 1888 and 1887:

—Moniteur des Intérêts Matériels.

WEST INDIES.

PORT OF SPAIN, TRINIDAD, February 1, 1889.—**Asphaltum.**—A moderate business has been done during the fortnight at \$14.04 for Bolled per ton, f.o.b., including export duty, and \$6.84 for crude. January shipments have amounted to 1462 tons, as against 3631 in 1888, and 1175 in 1887. **Exchange.**—Drafts on London, 90 days' sight, may be quoted \$4.74 @ \$4.80.—E. F. Masson

SPAIN.

BILBAO, February 9, 1889.—**Iron Ore.**—Our market has been tolerably active, sales being restricted to a few single cargoes for immediate shipment. Meanwhile quotations have remained firm at 8/ @ 8/3 for Campanil and 7/ @ 7/3 for Rubios. The stock of Campanil is so much reduced that some mining companies have refused considering higher figures than those quoted. Meanwhile there is a glut of steamers, 140,000 tons ships' room waiting to take their turn in loading Ore. The weather has been so rainy that it has been impossible to take cargo regularly. Total shipments since January 1 amount to 416,836 tons, as compared with 446,642 same time last year. **Pig Iron.**—The export has been trifling, but there are now ready to take cargo four steamers and one sailing vessel for abroad and three steamers for the Peninsula.

P. S.—February 16.—There has been more doing, Rubios selling down to 7/, yet the actual amount shipped during the week has been restricted to 65,000 tons, in spite of the many steamers ready to load. In consequence of the frequent rain, nothing was done in the way of loading for several days. From January 1 to date there have now been shipped altogether 481,818 tons, against 504,410 last year. **Pig Iron.**—There were exported during the week 5492 tons, and shipped coastwise 1490. **Jet.**—Jet mining has been going on steadily for several years past in the provinces of Santander and Oviedo, the bulk of the product being sent to England; but for the moment competition between the various Spanish mines has caused the Oviedo production to temporarily shut down, the Santander Jet being offered at a

notable reduction, and the superior quality of the Oviedo not being fully appreciated. Washed Oviedo Jet in blocks has been selling hitherto within the range of 3s and 240 rials, according to quality and size of blocks, per quintal of 50 kg., the Spanish rial equalling 50 American. The Oviedo Jet can be worked to better advantage than the Santander, being harder, and therefore not splitting into chips as easily.

Export from Spain During the Past Three Years.

Status of the Blast Furnaces.

Reports from the blast furnaces received to date are not complete enough to enable us to present the final figures. We may state, however, that there has been no change whatever in New York, New Jersey or in the Upper Susquehanna Valley. In the Schuylkill Valley there has been a falling off in the capacity through the blowing out of Edge Hill and of Merion, nearly compensated, however, by the blowing in, on the 12th ult., of the Norristown. Phoenix blew in a second furnace on the 9th ult., but, on the other hand, one of the Pioneer furnaces stopped during February. In the Lehigh Valley the Allentown Rolling Mill Company blew in one furnace in February, and one of the Coplay stacks is at work. Against this there is to be noted that one Crane is out and that Keystone, one of the stacks of the Thomas Iron Company, has gone out for repairs, and will not be blown in before spring. Durham stopped toward the end of February, but is expected to be at work again in a few days. Reviewing the situation generally, among the anthracite furnaces there has been a slight falling off.

Reports thus far received from the coke furnaces indicate a slight decline in the output. In the Shenango, Juniata and Conemaugh and Youghiogheny valleys there has been no change whatever. In Maryland, Catocin was to start on the 4th. In Virginia and West Virginia no changes are reported thus far, and the same is true of Illinois and Indiana. In Ohio Emma has stopped, and Glasgow, in the Hocking Valley, is idle. In the Mahoning Valley Thomas blew in on the 27th ult., after a stoppage of 39 days, the furnace starting nicely on a heavy burden. In the South the only change reported thus far is the blowing out of Bibb Furnace. In Kentucky the second Ashland resumed late in the month. On the whole the indications point to a slight decline in the make.

The Atchison Car Spring Company, of Chicago, are having a serious time with the residents in their vicinity. Fish oil is used in the works to temper the springs, and it is claimed by the neighbors that the fumes arising from the burning oil are unbearably nauseating. Complaint is also made of the shaking of houses by the trip hammers used in forging the steel. The company have been beaten in the suits entered against them in the lower courts, having been fined some months since for maintaining a nuisance in the fish-oil tempering vats, and on the 2d inst. they were again mulcted. A more agreeable tempering liquid than fish oil can probably be found, but it is difficult to see how the work of forging springs can be prosecuted without noise or concussions.

Hardware.

Trade continues in fair volume and without special feature. Prices are remarkably steady, and with the exception of the advance in the price of Screws, as noted below, nothing of special importance has occurred. The trade throughout the country are buying carefully, but stocks on hand are generally low, and it is anticipated that before long there will be more marked activity. The manufacturers generally are pursuing a conservative course, avoiding undue accumulation of stock, and in some lines there is more or less difficulty in obtaining prompt shipments.

Barb Wire.

The market is characterized by more activity and prices remain without material change. In the territory covered by the agreement of the Eastern makers prices are regularly maintained, while for lots outside some slight concessions are made in special cases.

With reference to the statement in regard to the Barb Wire litigation in our issue, 24th ult., to the effect that suits against infringers of the Glidden patent were being pushed with energy, we have the following from the St. Louis Wire Mill Company, St. Louis, Mo.:

This statement is without the slightest shadow of foundation as far as facts are concerned. It is probably a well-known fact that our two companies, the Braddock Wire Company, Rankin, Pa., and St. Louis Wire Mill Company, St. Louis, Mo., are manufacturing more unlicensed Barb Wire than all others put together. Notwithstanding this fact the Washburn & Moen Mfg. Company withdrew their motion for preliminary injunction against Braddock Wire Company, pending in the United States Court at Pittsburgh, on July 1, 1888, at their own cost, not daring to go to trial on the merits of the case, although we, through our attorneys, answered ready at that time. Since then they have not made a move in court against either of our companies, notwithstanding the fact that we submitted a proposition, which you published in your valuable columns under date of July 23, 1888, offering to stipulate and go to trial on very short notice. Not later than last week we, through our attorney, John R. Bennett, 237 Broadway, New York, made the following offer to attorneys of Washburn & Moen Mfg. Company and I. L. Ellwood & Co., of Chicago, Ill.: To stipulate and prepare for a test case to be tried on short notice before His Honor, Judge Brewer, of the Eighth District, and any other United States Circuit Judge before whom any Barbed Wire patent may now be pending. This would include Judge McKennon of the Pennsylvania District, Judge Jackson of the Ohio District, or Judge Gresham, of the Illinois District. Each one of these districts, however, represents several States. This proposition, through their attorneys, the Washburn & Moen Mfg. Company refused to accept, although Judge Brewer is the only Judge who ever sustained the original Glidden patent, which is the only patent the Washburn & Moen Mfg. Company claim to be of any value, and which in its latest adjudication was declared invalid by His Honor, Judge Shiras, of the United States Court of the Eastern District of Iowa, in Dubuque, on January 5, 1888, since which time no decision has been obtained by the Washburn & Moen Mfg. Company sustaining any of their Barbed Wire patents anywhere in the known world.

Screws.

Under date March 1 the associated manufacturers of Wood Screws issue a revised list, which is given on another page, and announce the following discounts:

Flat Head Iron.....	50 %
Round Head Iron.....	40 %
Flat Head Brass.....	45 %
Round Head Brass.....	35 %
Flat Head Bronze Metal.....	45 %
Round Head Bronze Metal.....	35 %
Flat Head Iron Screws, Blued, are 5 per cent. advance on the net prices of the regular goods.	

A comparison of the prices thus announced with those which have heretofore prevailed shows that an advance of about

10 per cent. is made in the price of Iron Screws, and an advance of from 20 to 25 per cent. in the price of Brass Screws. The list, it will be observed, is thoroughly revised, and is regarded by the manufacturers as satisfactorily graded for the different sizes of Screw. The combination existing between the Screw companies enables them to make this advance and maintain firmly the new prices. This action would probably have been taken some time ago had it not been for the presence in the market of large stocks of Screws purchased at the old figures, some of which still remain to give more or less irregularity to current prices. But the stocks thus held are pretty well broken, and it is expected that prices will be well maintained.

The American Screw Company, Providence, R. I., have issued the following discount sheet, March 1, 1889, which besides giving the prices of the regular Wood Screws referred to above, gives, it will be observed, quotations on a large variety of special Screws of which they are manufacturers:

Iron, Bright, Flat Head.....	50 %
Iron, Bright, Round Head.....	40 %
Iron, Blued, Flat Head.....	50 %
Add 5 per cent. to net amount of invoice.	
Iron, Blued, Round Head.....	40 %
Iron, Felce, Flat Head.....	45 %

Phosphor Bronze, Round Head.....	20 %

Miscellaneous Prices.

The address of Gaston, Weston & Ladd, whose Silver Compound, Prestoline, Prestoline Polish and other polishing compounds were referred to in our issue of the 21st ult., is 46 Beekman street, New York. The discounts on these goods from the price list then published are as follows:

Prestoline.....	20 & 10 %
Prestoline Paste.....	33 1/2 %
Gaston's Silver Compound.....	33 1/2 %

The following are the list prices of C. A. Maynard's Handled Planters' and Field Hoes, of which a description is given on page 379, and which are put on the market by Robert Murray, sole agent, 24 Duane street, New York. The list is subject to a discount of 65 per cent.

Planters' Hoes.

	6 in.	7 in.	8 in.	8 1/2 in.
Polished Blades, per doz.....	\$10	\$10.50	\$11	\$11.50
Unpolished Blades, per doz.....	9.50	9.50	10	10.50

Field Hoes.

Polished Blades, per doz.....	\$8
-------------------------------	-----

William H. Jacobus, 90 Chambers street, New York, has been appointed agent for the sale of the Prindle Improved Door Hanger. It is listed at \$6 and is subject to a discount of 40 per cent.

Items.

The Wyeth Hardware and Mfg. Company, of St. Joseph, Mo., have been put to serious inconvenience by the fire which destroyed the printing establishment of the Geo. W. Crane Publishing Company, at Topeka, Kan., on the morning of the 22d of February. The entire edition (3000 copies) of their new catalogue, almost ready for delivery, was utterly consumed, together with the woodcuts and electrotypes, many of which had been specially engraved for them, which were being used in the last part of the book. An immense amount of work had been put on this catalogue by the officers of the company, who had intended to make it a publication which would be appreciated by the Hardware trade generally and become a valuable book of reference, so that its loss is seriously felt. As to future plans, nothing can be formulated until matters are somewhat settled at Topeka.

The trade will observe on page 88 the advertisement in which Peabody & Parks, Troy, N. Y., illustrate the Farmer's Favorite Potato Bug Exterminator, manufactured by them under Eddy's patent. Its utility for applying Paris green, phosphates, &c., to plants is referred to.

D. W. Bosley & Co., Chicago, Ill., issue a six-page leaflet, in which they illustrate their Window Cleaners, Floor Scrubbers, and Bar and Counter Cleaners.

The Hardware business of H. M. Gay & Bro., Milwaukee, Wis., has been discontinued, and Henry M. Gay has made an engagement with Horton, Gilmore, McWilliams & Co., Chicago, Ill., and will travel for them over a portion of the route which for the past 14 years he has been covering for the Biddle Hardware Company, Philadelphia. He will thus visit the larger towns in Wisconsin and Minnesota. Geo. S. Gay engages in the Hardware business at Jacksonville, Ill., in partnership with George Hayden, the style of the firm being George Hayden Hardware Company.

It will be seen that in their advertisement on page 87 the New Departure Bell Company, for whom John H. Graham & Co. are agents, 118 Chambers street, New York, illustrate the New Departure Door Bell and point out its advantages.

Canastota Knife Company, Canastota, N. Y., are sending out a new illustrated catalogue and price list of their line of Pocket Knives. It is obvious that in the preparation of it much care has been taken to make it as attractive and serviceable as possible. An interesting variety of patterns is exhibited, the engraving of the handles representing satisfactorily the different materials of which they are made. It is certainly one of the most complete and satisfactory Pocket Knife catalogues offered to the trade, and illustrates the enterprise and progress of the company.

Hoen & Von Kapff, Baltimore, Md., have prepared a small pamphlet which simply calls attention to some of their leading lines and the parties for whom they are agents, without giving illustrations or descriptive matter. There are such headings as Guns, Ammunition, Gun Material, Reloading Tools, &c., under which leading articles in these departments are designated, and the names of manufacturers whom they represent are given with the principal goods manufact-

ured by them. The pamphlet seems well designed for the purpose for which it is intended.

The G. S. Foos Company, Springfield, Ohio, send out in convenient form samples of printed matter which they prepare for the use of their customers, illustrating and describing the various manufactures of the company. A number of leaflets are thus offered to the trade, showing the different kinds of goods, and calling attention to them in a popular way, so as to aid the merchant in selling them. The trade will appreciate the advantage of such literature.

The Collins-Gibbons Mfg. Company, St. Louis, Mo., issue a small pamphlet devoted to a description of their Spiral Wire Straightener and the Little Giant Wire Cutter. Illustrations of these articles are given and their utility is pointed out.

Springfield Glue and Emery Wheel Company, Springfield, Mass., manufacturers of Sapphire Garnet Paper, Emery and Corundum Wheels, and Emery Wheel Machinery, issue a circular calling attention to the advantages of Garnet Paper and alluding to the extensive mines of Garnet which they own. Their Sapphire Garnet Paper is especially referred to.

It will be seen from the announcement on page 63 that an established commission house on the Pacific Coast is desirous of representing one or two more lines of Hardware or Lumbermen's Supplies, for which they desire sole agencies for that market. We understand that they have represented satisfactorily some Eastern manufacturers for some time.

The Cincinnati Stamping Company, Cincinnati, Ohio, issue a circular describing their Water Coolers, of which different patterns are illustrated.

Early last Sunday morning the Hardware establishment of W. H. Hartley & Sons, Quaker City, Ohio, was destroyed by fire. The dwelling of Wm. H. Hartley, adjoining, was also destroyed, as well as other buildings. In addition to the destruction of the building and stock, the loss of books and papers is a serious one. The destruction caused by the fire is estimated to amount to about \$25,000, with an insurance of \$1000.

American Blower and Forge Company, Lancaster, Pa., issue a catalogue illustrating their different Forges and Blowers, Upright Hand Drill and New American Tire Bender. They call special attention to the Automatic Bell Traction Motion Blower, and point out the advantages possessed by it.

The Chalfant Mfg. Company, Atglen, Pa., illustrate in their catalogue the variety of goods in the Hardware line, with house-furnishing articles, Iron Toys and Floral and Garden Tools, which they manufacture. Sad Irons, a variety of Toilet and other special Irons, such as Druggists', Hatters', &c., Brackets, Soap Dishes, Dumb Bells, Foot Scrapers, Harness and other Hooks, Drawer Pulls, Chest Handles, &c., are thus represented.

The large Cabinet Hardware house of Gibson, Parish & Co., occupying the building at Nos. 78 and 80 Randolph street, Chicago, was totally destroyed by fire on the night of the 1st inst. The stock was worth about \$140,000. Of this between \$75,000 and \$80,000 was in Silk Plushes and Upholstery Goods, and the balance was composed of general Cabinet Hardware. The insurance amounted to about \$135,000, distributed among numerous companies, with policies ranging from \$2500 to \$5000. It will be seen, therefore, that the firm will be able to resume business without any difficulty as

soon as they can find a suitable location. They have established a temporary office at 84 Washington street, second story. It is probable that when they resume they may confine their attention exclusively to Cabinet Hardware. The firm consists of W. D. Gibson, Charles P. Parish and G. H. Luasky, who have been associated together for about eight years. They had occupied the building just burned for some six years.

The following personal items from Chicago are of interest: A. C. Bartlett, of Hibbard, Spencer, Bartlett & Co., has gone to Europe with his family, to be absent for several months. J. McGregor Adams, of the Adams & Westlake Company, is confined to his house with a sprained ankle, which has proved to be a very serious injury. Addison Kelley, of Kelley, Maus & Co., has gone to the Bermuda Islands for a vacation of a month or two. A. C. Mason, of the Mason & Davis Company, has taken a trip to California, combining business with pleasure. James H. Shields, of the Shields & Brown Company, is visiting New York in the interest of the firm. R. C. Hannah, of the North Chicago Rolling Mill Company, is now voyaging in the West Indies.

A copartnership is announced, under date January 23, between D. P. Hyatt, recently of the firm of Bacon, Flote & Co.; J. H. Matthews and A. P. Gahr, under the firm name of Hyatt, Matthews & Gahr, agents. Their offices are at 45 and 46 Mitchell Building, 99 West Fourth street, Cincinnati, Ohio. Their business is the sale of Iron and Steel manufactures, also Pig Iron, Iron Ores, Coke and Rails.

A fire at Lostant, Ill., which occurred on the 28th ult., destroyed a number of business houses, including the Hardware stores of Thomas Drew and Peter Martensen, who carried a stock of \$6000 to \$10,000 each, on which the press dispatches state there was no insurance.

Matthews & Willard Company, Waterbury, Conn., have announced, under date February 16, that, owing to temporary financial embarrassment, C. N. Wayland has been appointed receiver of the company. The object of this action was to keep the business alive in all its branches. They give assurance that orders will be filled with promptness and accuracy, and that the quality of the goods will be kept at a high standard and every effort made to introduce attractive novelties.

We are advised that C. O. Greene, of the late firm of Sheldon & Greene, who for the past four years has represented the Smith & Anthony Stove Company in the West, will for the present represent the Weir Stove Company in New York and surrounding States.

The Syracuse Fibre Ware Company, for whom W. A. Comstock is the Chicago manager, have secured a contract for furnishing the public school buildings of Chicago with water-pails to be used in case of fire. The contract calls for about 3000 pails. It was secured in the face of severe competition from the manufacturers of pails of all descriptions. The demand for ware of this character is growing rapidly, and while it is but natural that the approach of spring should quicken sales, yet the dealers see a larger growth than would reasonably arise from this cause, and they are looking forward to a heavy year's business.

Hughes & Otis, of Fond du Lac, Wis., have bought the stock of their chief competitor, the C. H. Benton Hardware Company, and now have the largest establishment in their line in that part of the State. They are pushing their business with vigor, as this absorption of a rival house well indicates.

The Holmes & Edwards Silver Company, Bridgeport, Conn., call special attention in their advertisement on page 78 to their Mexican Silver Spoons, Forks, &c. The point is made especially in regard to these goods that they resist the atmospheric influence better than any other metal goods in the market, while their other qualities make them very desirable. As there is no plate to wear off, any silver powder, chalk or electroline can be used to clean them, and it is said that in constant use they become even whiter and more beautiful.

The corporate name of the Strong-Hackett Hardware Company, Minneapolis, Minn., has been changed to the C. W. Hackett Hardware Company. Its officers are: C. W. Hackett, president; H. B. Gates, treasurer; and T. G. Walther, secretary.

E. C. Meacham Arms Company, St. Louis, Mo., issue in new and attractive style a catalogue of Athletic Goods, to which is prefixed a discount sheet for use of dealers and clubs only. The catalogue represents a variety of articles and machines for gymnastic exercise, including Chest Machines, Expanders and Developers, machines for different uses, such as exercising the leg, ankles, wrists, fingers, &c., Traveling Parallels, Rowing Machines, Horizontal Bars, Traveling Bars, Vaulting, Jumping and Climbing Apparatus, Boxing Gloves, Dumb Bells, Ten Pins, Garments for the gymnasium, &c. It will thus be seen that the catalogue is unusually interesting as relating to contrivances which are not often brought to the attention of the trade.

S. L. Allen & Co., Philadelphia, Pa., advise us that in addition to their distributing depots in Warren, Ohio, Detroit, Mich., Milwaukee, Wis., and St. Louis, Mo., they have established another distributing depot at Louisville, Ky., for the benefit of their trade in the Southwest, and they will hereafter be glad to make quotations on their goods at any of these points. Inquiries should be addressed to Philadelphia, as they make quotations and render all invoices from there.

The American Buckle and Cartridge Company, West Haven, Conn., for whom Alford & Berkeley Company, 77 Chambers street, New York, are agents, have recently bought the plant, tools, &c., of the American Gun Implement Company, and are busy placing the machines, &c., in their factory, so that in a short time they will be ready to make Brass Shells, Loading Tools, &c. They expect to continue manufacturing the Fowler brand of Brass Shells, and intend to furnish an article of superior quality. We are also advised that there is no foundation for the rumor which has prevailed more or less widely to the effect that they have been negotiating with the Ammunition Association for the sale of their plant.

The National Self-Heating Sad Iron Company, St. Louis, Mo., have removed from 109 North Sixth street to 1106 Pine street. In their new location they have considerable more working space, and are thus enabled to better handle the increasing trade which often taxed the capacity of their old quarters. Their showrooms are much larger and they have excellent shipping facilities in the rear. They report a steady increase in their trade, and have no reason to complain for want of orders.

The Kelly Barb Wire Company, of Chicago, are distributing a "Book of Valuable Information" among their customers, which comprises some 86 pages of miscellany on a multitude of interesting subjects. An accompanying circular calls attention to the Kelly Yielding Barb, which is the specialty of this company. While the fencing which they make is

REVISED SCREW LIST.

Iron Wood Screws.

March 1, 1889.

classed as Barb Wire, it is nevertheless a distinct type, the action of the barb constituting merely a prick and not a tear. The company claim that as a consequence of their barb yielding under pressure it can not seriously injure stock.

D. C. Baldwin, Lockport, Ill., has sold the greater part of his stock to O'Connell & Sloan, and rented to them his main store, where they will carry on the business. Mr. Baldwin has been in the Hardware trade 36 years.

The Taft Company, manufacturers of Wood Ornaments at Hartford, Conn., whose factory was destroyed by fire a few months since, have secured new quarters with greatly increased facilities, and are prepared to fill orders promptly.

A circular letter issued by the Cincinnati Corrugating Company refers to their Sheet-Metal Lath in the following terms: By improvements which we have made in the machinery and processes of manufacture of this Lath, we are now enabled to furnish it in the forms most approved by

the architectural profession and builders generally, and also at a price which will compare very favorably with the Wire Cloth or any other improved Lath now on market. Hence, as can be readily seen, there is a great advantage in the corrugated Metallic Lath as we now make it, on account of its great rigidity; the fact that it can be adapted to any kind of furring; to special curved surfaces, and between large spans where it would evidently be impossible to use the Wire Cloth. Another great advantage consists in the fact that it requires no stretching in putting on, which makes it very difficult to make a good job, unless by an expert in the business and very careful work. That is to say, it would be almost impossible with our Lath to slight work, as in the case of many other kinds.

Trade.

From Dudley Bros. & Lipscomb, Nashville, Tenn., we have the following review of the market:

Trade for 1889 has been better than for years past and continues good, though we think the open winter we have had has caused many of

the trade to buy their spring goods early, and this may affect sales later in the season. Prices have been maintained fairly well, though all our jobbers are selling at very close margins. The country generally is in good condition, and we do not hear much complaint in regard to collections. Steel Nails are worth \$2.10; Burden's Horseshoes, \$4.25; Galvanized Barbed Wire, 3 1/4 to 3 1/2 cents; Merchant Bar Iron, 1.85 to 2 cents. Macey & Co. have removed to the house recently occupied by J. H. Fall & Co. The latter parties have fitted up in another building on the same street one of the handsomest retail Hardware stores to be found anywhere. Our banks report an unusual surplus of money on hand. On the whole, we are hopeful for a prosperous year's business.

A recent issue of the Pittsburgh Dispatch, in an interview with a leading Hardware merchant of that city, gives the following expression of his views in regard to the situation and outlook:

The Hardware trade has undergone great changes in recent years, and the whole tendency has been toward lower prices, and as a consequence closer margins of profit. There are good and sufficient reasons for this downward drift of prices which has brought so many of our goods down to scarcely a living profit for manufacturers. In nearly every line business has been overdone. The prosperity of

PER SHIP WANDERING JEW, FEBRUARY 20, 1889, FOR MELBOURNE, AUSTRALIA.

By Healy & Earl.—5 cases Sawmills, 4 cases Grain Mills, 48 dozen Axes.	
By J. W. Horton & Son.—264 dozen Axe and Pick Handles.	
By Holmes, Booth & Haydens.—16 packages Lamp Goods.	
By Reed & Barton.—484 pounds Plated-Ware.	
By Lalanc & Grosjean Mfg. Company.—695 pounds Household Utensils.	
By Rogers Locomotive and Machine Works.—16,422 pounds Locomotive Machinery.	
By G. P. Patterson.—2766 pounds Cordage, 589 pounds Cordage.	
By Simpson, Hall, Miller & Co.—11 cases Plated-Ware.	
By Collins Company.—100 dozen Edge Tools.	
By Parker & Whipple Company.—105 pounds Clocks, 105 Clocks.	
By W. K. Freeman.—800 dozen Axe Handles, 100 cases Axe Grease.	
By Welsh & Lea.—10 cases Iron Bolts, 1 case Carpet Sweepers.	
By Waterbury Clock Company.—58 cases Clocks, 3 cases Clocks.	
By Ansonia Clock Company.—91 boxes Clocks, 40 boxes Clocks.	
By Yale & Towne Mfg. Company.—856 pounds Locks.	
By Edward Miller & Co.—40 packages Lamp Goods, 33 packages Lamp Goods.	
By New Haven Clock Company.—288 Clocks.	
By Hand Drill Company.—4 boxes Drilling Machine.	
By W. & B. Douglas.—5 boxes, 2 casks Pumps.	
By Meriden Britannia Company.—9 packages Plated-Ware, 20 packages Plated-Ware, 3 boxes Plated-Ware, 3 boxes Plated-Ware.	
By Russell & Erwin Mfg. Company.—11 cases Hardware, 42 packages Hardware.	
By Winchester Repeating Arms Company.—2 cases Guns, 1 case Tools, 22,000 Cartridges.	
By Manhattan Brass Company.—20 cases Lampware, 42 barrels Lampware, 2 cases Brass Goods.	
By H. W. Johns Mfg. Company.—1014 pounds Asbestos Packing, 198 gallons Varnish, 100 gallons Liquid Dryer, 560 pounds Asbestos Packing.	
By Strong & Trowbridge.—5 crates Stoves, 4 cases Whetstones, 6 packages Grindstones and Parts, 1 case Lead Pencils, 1 case Forks.	
By Woodhouse & Stortz.—20 dozen Edge Tools, 1085 pounds Hardware, 202 pounds Electro-Plated Ware.	
By F. B. Wheeler & Co.—27,000 pounds School Slates, 6 sets Harness, 8 1/2 dozen Hardware, 6 dozen Axes, 8 cases Hardware.	
By Isley, Doubleday & Co.—1 case Hardware, 224 pounds Glue, 4 1-6 gross Glue.	
By Maillet & Queveau.—3 cases Hardware, 600 cases School Slates.	
By Arkell & Douglas.—77 cases Handles, 120 dozen Handles, 2 cases Spokes, 3 casks Pumps, 1 case Wrenches, 2 dozen Forks, 3 cases Castings, 23 dozen Locks, 8 packages Hardware, 2 barrels Castings, 69 cases Slates, 5 1/4 dozen	

Velocipedes, 200 boxes Clothes Pins, 36 dozen Towel Rollers, 7 boxes Shade Rollers, 28 dozen Lampware, 2 boxes Hoes, 2 boxes Tools, 1 dozen Clamps, 1 box Harness, 4 dozen Hammocks, 13 boxes Axes, 27 boxes Hardware, 3000 pounds Nails, 12 dozen Hoes, 48 dozen Lamp Goods, 1 box Handles, 1 case Drills, 2 cases Cages, 1/2 dozen Scales, 5 cases Hardware, 358 pounds Cord, 27 dozen Saws, 26 dozen Staples, 600 pounds Nails, 7 dozen Locks, 2 cases Tools, 500 feet Hose, 8826 pounds Bolts, 12 cases Handles, 6 nests Tubs, 6 nests Pails, 5 boxes Tools, 2 cases Hardware, 3 cases Axes, 6 dozen Saws, 7 packages Hardware, 3 dozen Tacks, 12 dozen Wire Goods, 1 case Wire Cord, 1/2 gross Axle Grease, 2 cases Hardware, 3 cases Wrenches, 2 cases Wire Goods, 3 cases Tinware, 6 dozen Oil Stoves, 2 cases Tools, 14 Ranges and 1 box Parts, 100 boxes Clothes Pins, 12 dozen Hoes, 270 pounds Tools, 3 dozen Braces, 12 1/2 dozen Braces, 4 dozen Axes, 111 pounds Wagon Springs, 1 case Bolt Cutters, 16 dozen Stump Joints, 18 gross Hardware, 1/2 gross Shoe Blacking, 7 boxes Tools, 2 crates Mail Boxes, 1 case Chalk, 14 Oil Stoves, 6 dozen Bench Screws, 1 case Bolts, 3 dozen Axes, 6 dozen Hoes, 2 dozen Choppers, 2 cases Bolts, 3 cases Carriage-Ware, 5 cases Hubs, 1 case Whiffletree, 3 Pumps, 2 dozen Sinks, 1/2 dozen Lawn Mowers, 18 boxes Tools, 4 packages Hardware, 10 cases Axes, 4 cases Tools, 100 dozen Bolts, 1 dozen Grindstones, 1 crate Carriage-Ware, 2 cases Springs, 1 case Bolts, 3 cases Carriage-Ware, 1 case Drills, 1 case Bolts, 1 case Tools, 90 dozen Whips.	
By W. H. Crossman & Bro.—125,000 Blasting Caps, 50 dozen Axes, 1 box Stove Parts, 12 dozen Traps, 34 dozen Whisk Brooms, 14 cases Hardware, 310 Clocks, 3 gross Lead Pencils, 27 dozen Wrenches, 12 dozen Hammers, 2 dozen Meat Choppers, 32 cases Nails, 39 dozen Traps, 24 dozen Thermometers, 16 dozen Stencils, 6 dozen Oil-Ra, 18 dozen Curry Combs, 1 case Tools, 1 1/2 dozen Mallets, 1/2 dozen Emery Grinders, 16 dozen Hardware, 1 dozen Meat Choppers, 6 dozen Sives, 10 dozen Reflectors, 1/2 dozen Wringers, 26 cases Hardware, 24 dozen spools Wire, 5 dozen Wooden Faucets, 28 Churns, 1 barrel Lamp Goods, 6 dozen Mattocks, 3800 pounds Nails, 5 gross Shade Rollers, 10,000 Paper Shells, 12,000 Loaded Shot Shells, 123 dozen Axes, 16 dozen Axes, 2 gross Whips, 15 dozen Padlocks, 66 dozen Axes, 12 dozen Hoes, 374 dozen Handles, 228 pounds Tacks, 2 dozen Axes, 2 packages Blocks, 2 cases Tools, 48 pairs Skates, 4 dozen Axes, 1 box Hardware, 32 packages Pumps and Parts, 7 Clocks, 1 box Hardware, 1 case Hardware, 5 1/2 dozen Iron Wagons, 3 cases Hardware, 2 1/4 gross Glue, 1 box Hardware.	
By R. W. Forbes & Son.—3500 pounds Nails, 1 dozen Tubs, 21 dozen Forks, 12 dozen Brush Holders, 5 dozen Hinges, 1 dozen Saws, 1 case Stamped-Ware, 4 gross Rollers, 2 packages Lampware, 3 1/2 dozen Rakes, 3 dozen Lemon Squeezers, 12 packages Hardware, 11 boxes Wringers, 1 case Hardware, 2 packages Hardware, 2 boxes Hardware, 19 packages Hardware, 4 dozen Glue, 181 sets Axes, 3593 pounds Carriage Bolts, 49 packages Hardware, 36 dozen Forks, 4 packages Lawn Mowers, 6 packages Plated-Ware, 11 cases Wringers.	
By R. W. Cameron & Co.—7 cases Saws, 6 cases Axes, 15 cases Axes, 54 cases Axes, 1 box Hardware, 4 packages Drill Machinery, 15 Axes, 2 cases Malleables, 10 cases Spokes, 1 case Pick Handles, 33 Bundles Rough Handles, 1 crate Tills, 6 cases Hardware, 2 barrels Chimneys, 3 cases Spring Rollers, 3 cases Whip Handles, 6 cases Velocipedes, 120,000 Slates, 1 box Hardware, 15 boxes Bolts.	
By A. Field & Co.—15 gross Hinges, 3 gross Hooks, 3 1/2 dozen Locks, 650 pounds Nails, 2 dozen Wringers, 3 dozen Hammers, 18 dozen Axle Grease, 2 gross Varnish, 3 dozen Brushes, 1 1/2 gross Axle Grease, 2 dozen Tools, 3 dozen Harness-Ware, 7 dozen Axes, 34,000 Bolts, 13 dozen Hardware, 18 dozen Axle Grease, 1 gross Varnish, 1 1/2 gross Harness Dressing, 11 1/2 gross Hardware, 12 dozen Whips, 2 gross Harness Dress, 5 dozen Harness Parts, 6 dozen Brushes, 60 pounds Rivets, 122 dozen Harness-Ware, 2 dozen Harness-Ware, 13 1/2 dozen Harness-Ware, 8 dozen Harness-Ware, 3 cases Axle Grease.	
By McLean Bros. & Rigg.—16 Dies, 4 dozen Miter Boxes, 18 dozen Plumbs and Levels, 1 1/2 dozen Chain Wrenches, 21 dozen Coffee Mills, 1 dozen Sad Irons, 8 dozen Meat Choppers, 11 cases Gate Latches, &c., 3 dozen Lamp Reflectors, 180 dozen Burners, 2 1/2 dozen Boring Machines, 82 dozen Locks, 12 dozen Saw Sets, 18 dozen Lamp Goods, 9 dozen Guns, 14,000 Cartridges, 24 Churns, 27 dozen Brackets, 300 dozen Locks, 6 dozen Molasses Gates, 44,000 Bolts, 11 packages Lampware, 1 case Sewing Machine Parts, 110 dozen Hay Forks, 24 dozen Gate Latches, 150 dozen Brackets, 1 dozen Miter Boxes, 39 dozen Wrenches, 10 Stoves and Parts, 76 dozen Saws, 1/2 dozen Guns, 1/2 dozen Wheel-	

barrows, 1 dozen Wringers, 10 dozen Axes, 1 dozen Knives, 60 sets Axes, 1 dozen Spirit Levels.

By Morris, Strouse & Co.—1½ dozen Wringers, 12 dozen Mop Sticks, 68 dozen Edge Tools, 14 gross Kitchen Tools, 36 dozen Iron Tacks, 92 dozen Axes, 30 dozen Hardware, 6 dozen Grindstones and Fixtures, 46 dozen Mouse Traps, 3 gross Tools, 6 gross Shade Rollers, 108 dozen Tools, 1 dozen Money Drawers, 70 dozen Tools, 3 gross Brooms.

By Coombs, Crosby & Eddy.—2400 pounds Nails, 2 Printing Presses, 1 case House-Furnishing Goods, 92 dozen Handles, 2 dozen Wringers, 5 dozen Rakes, 1386 pounds Screws, 6 dozen House-Furnishing Goods.

By H. W. Peabody & Co.—44,803 pounds Barb Wire, 5 packages Hammocks, 2000 pounds Nails.

PER SCHOONER SEVERN, MARCH 2, 1889, FOR EAST LONDON.

By Carey, Yale & Lambert.—1200 feet Sash Cord, 1850 pounds Sash Weights.

By W. H. Crossman & Bro.—62 cases Flow Parts.

By Arkell & Douglas.—40 dozen Axes, 6 cases Agricultural Implements, 1 case Shares, 15 cases Plows, 1 case Slate Pencils, 125 kegs Nails, 230 cases Agricultural Implements, 40 dozen Axes, 39 cases Agricultural Implements, 198 cases Agricultural Implements, 1 barrel Sash Cord, 30 dozen Handles, 50 dozen Axes, 7700 pounds Sash Weights, 20 Pumps, 8 cases Scales, 26 cases Plows, 1½ dozen Clocks, 64 cases Plows, 4 cases Sewing Machines, 60 dozen Picks, 5 Carriages, 26 dozen Picks, 5 Carriages, 4 cases Axes, 6 cases Spokes, 12 dozen Picks, 1 case Hay Forks, 1 case Slate Pencils, 1 case Carriage-Ware, 1 bale Sash Cord, 760 pounds Sash Weights, 3 Carriages, 1 Carriage, 15 cases Plows, 10 kegs Nails, 20,000 pounds Wire, 760 pounds Sash Weights, 1 Carriage, ½ dozen Hardware, 1 dozen Churns, 1½ dozen Saws, 6 dozen Brooms, 1 case Hardware, 3 dozen Tools, 1 case Cages, 2 dozen Wheels, 3 cases Varnish, 100 pounds Oil Stones, 1 case Planes, 6 packages Mills, ½ dozen Mangles, 1 dozen Wringers, ½ dozen Washers, ½ dozen Churns, 37 packages Rims, &c.

By W. H. Crossman & Bro.—4 dozen Axes, 300 dozen Handles, 48 dozen Handles, ½ dozen Braces.

No Trusts for Kansas.—The Kansas Senate has passed the bill to prevent trusts, combinations and pools, and it becomes a law. It provides that all arrangements, contracts, agreements, trusts or combinations between persons or corporations, made with a view or which tend to prevent full and free competition in the importation or transportation of articles imported into that State, or in the product, manufacture and sale of domestic raw materials, or for the use of money, or to fix attorney's fees, and all arrangements, trusts or combinations between persons or corporations designed or which tend to advance the cost to the consumer of any such articles, or which tend to advance or control the rate of interest for the loan or use of money to the borrower, are declared to be against the public policy, unlawful and void. The bill provides a penalty of imprisonment and a fine not to exceed \$1000 for violation.

The trial of the compound locomotive Pennsylvania was made a few days since in the Altoona yards. This engine was built after designs by F. W. Webb, mechanical engineer of the London and Northwestern Railroad, at the works of Beyer, Peacock & Co., Manchester, England, and was assembled at the Altoona shops. In this engine the inventor endeavored not only to secure the economical advantages of the compound principle, but also to obtain the adhesion of four drivers without using parallel rods. Although the test was satisfactory, there are some improvements needed before the Pennsylvania company will order more engines to be built after the same pattern.

Contracts aggregating \$600,000 have been let for the construction of the Ohio connecting railway bridge across the Ohio River at Brunot's Island, a few miles below Pittsburgh. The successful bidders

are Pittsburgh firms, and they have orders to commence work at once. The building of the bridge will be under the supervision of Chief Engineer M. J. Becker, of the Pittsburgh, Cincinnati and St. Louis Railway. It is expected to be finished in about a year. The bridge proper will be a mile long, approached by an iron viaduct 700 feet in length.

The Reading Failure.

The suspension of the Reading Iron Works, one of the largest concerns of the kind in Pennsylvania, has been announced. The works are located in Reading, and are owned by a stock company. The company have issued \$250,000 first mortgage and \$150,000 second mortgage bonds. In addition to this, there is \$500,000 of preferred stock and \$500,000 of common. The floating debt is said to be heavy. About 2500 men are employed in the works at Reading. There are three rolling mills, a steam forge, a large machine shop and foundry, a rail works, and one of the largest pipe mills in the country.

The works were originally owned by Seytert, McManus & Co. The firm failed some years ago, and the creditors then organized and decided to continue the business under the title of the Reading Iron Works. John Penn Brock was elected president and Edward W. Coit general manager. Mr. Brock died about eight years ago, and was succeeded by Mr. Coit, who has since been the executive head of the company. Shortly after the organization of the company there was some trouble caused by business depression, and an extension was asked for and granted. A portion of the indebtedness was paid in cash and a portion in preferred stock. The company continued to do business after the settlement was made, and, under Mr. Coit's management, enjoyed a period of prosperity; but dullness in the trade and shrinkage in prices finally overwhelmed it. A meeting of the creditors will be held in Philadelphia on Thursday.

Later dispatches announce that the rolling mills at Naomi and Gibraltar, near Reading, the greater portion of whose products were received by the Reading Iron Works, closed down for want of orders, and the Keystone Rolling Mill, at Reading, whose entire product is taken by the Reading Iron Works, also shut down.

Orders have been issued by the Reading Railroad Company stopping the shipment to the Reading Iron Works of coal, lime, ore, iron, &c, from the mines, furnaces and kilns controlled by the railway company. The works were running as usual on Wednesday.

An Important Ruling in Commercial Law.

The opinion handed down on the 5th inst. by the United States Supreme Court in the case of the Liverpool and Great Western Steamship Company is one of special interest to the world. The question involved was whether a steamship company can limit its liability for its own negligence. The decision of the court is that it cannot. In this case the company had stipulated in its bills of lading that it should not be liable for the negligence, default or error in judgment of the navigators of the vessel. The vessel was stranded on the coast of Wales. On the trial in the lower court it was found that the stranding was due to negligence on the part of the vessel's officers. The company then claimed that even in that case it was exempt from liability by the express stipulation in its bills of lading. The Supreme Court holds that the stipulation was not valid in law, for the reason that

no steamship company nor any other common carrier has any right or power make such a condition. The court says:

No public carrier is permitted by law to stipulate for an exemption from the consequences of negligence. The fundamental principle upon which the law of common carriers was established was to secure the utmost care and diligence in the performance of their duties. A carrier who stipulates not to be bound to the exercise of care and diligence seeks to put off the essential duties of his employment. Nor can those duties be waived in respect of the servants of the common carrier, especially where the latter is incapable of acting except through others. To admit such a proposition as that the law merely demanded abstract carefulness and diligence in proprietors and stockholders who take no active part in the business would be subversive of the very object of the law.

The court further holds that English law cannot make such a stipulation valid in case of a contract made in this country, for in such case our own law governs. "The fact that the vessel went ashore on the coast of Great Britain is quite immaterial." This decision will have a revolutionary effect on both ocean and land bills of lading. It will make a dead letter of the clause exempting the company from liability for its own negligence.

The Brunot's Island Bridge.—Contracts have been let for the erection of the Ohio connecting railway bridge across the Ohio River, at Brunot's Island, a few miles below Pittsburgh. The contracts amount to \$600,000, and have all been awarded to Pittsburgh parties. The Keystone Bridge Company have the contract for the ironwork. The work will be under the supervision of Chief Engineer M. J. Becker, Pittsburgh, Cincinnati and St. Louis Railway. The bridge will consist of two deck spans, each 121 feet long, over the Chartiers turnpike; eleven deck spans, each 171 feet long over Brunot's Island; two channel spans, one 416 and the other 425 feet long; one span over the Pittsburgh and Western road of 137 feet; two spans over the Fort Wayne yards 150 feet in length each, and one iron viaduct 700 feet long, paralleling and gradually sloping to the grade of the Fort Wayne road. The object in erecting this bridge is to permit the transferring of freight by the Pittsburgh, Cincinnati and St. Louis and the Pittsburgh, Fort Wayne and Chicago Railway lines without having to haul the freight to Pittsburgh, and making the transfer in that city, as is the case at present.

A committee representing 5000 working engineers, members of the five principal stationary engineers' associations in this city and Brooklyn, called on Mayor Grant and filed a protest against the practice, lately begun, of persons contracting to run the boilers and steam apparatus in factories and office buildings and employing incompetent men. They declare that the steam-heating apparatus in many of the public schools is in inefficient hands, and that generally the public is exposed to the danger of being blown up in offices and factories, and even in the streets, whose sidewalks cover many mismanaged boilers. They ask that the law requiring that all boilers be tested and all engineers be licensed after a thorough examination be rigidly enforced.

We understand that two of the rail mills, the Lackawanna Coal and Iron Company and the Edgar Thomson Steel Works, are preparing to add another converter to their plant.

Howard Burden has recently become president of the Hudson River Iron and Ore Company, at Burden, N. Y. We understand that the question of putting up a modern furnace is under consideration by this company.

The Empire Window Screen.

This article is manufactured by C. J. Sherriff & Co., Morristown, N. Y., for whom C. F. Guyon & Co., 99 Reade street, New York, are agents. A general view of the screen is given in the accompanying illustration, Fig. 1, and a view of the fly-escape is given in Fig. 2. These window screens are made of maple or birch finished in the natural color, and are referred to as strongly as well as neatly constructed. The corners are double-mortised and glued, and not simply wire-nailed, as others. The manufacturers call special attention to the fact that the wire screen is tightened perfectly smooth by having inlaid wood strips nailed into the frames through the

Fig. 1.—The Empire Window Screen.

entire length. The screen is made with an automatic spring adjustment by which the side pieces are pressed outward, making them fit snugly in the window. The screens are also made with metallic slides, the advantage of which, as not effected by dampness, is alluded to. It will be observed that the sides or extensions are paneled, thus admitting more light and air than when made solid. Fig. 2, which represents the fly-escape, shows the outside of the screen as it is placed in the window. It will be seen that above the wire cloth are small openings made by the curves in the upper part of the outside piece of the frame, permitting the flies going up on the wire cloth to pass under

Fig. 2.—Fly-Escape.

the inner upper piece of the frame, and out through the aperture thus afforded. The point is made that they will thus make their escape from the room, while at the same time there is no likelihood of their entering through these openings.

Stanley's Patent Roofing Bracket.

Our readers will be interested in the illustration we give of a new device for supporting stagings on a roof. Two brackets are represented in position for use, and another one is shown detached. The material used in constructing the bracket is spring steel, and the parts are riveted together at a point near the base. The two beveled ends can be inserted under two layers of shingles, already laid, and any pressure from above will then fasten both sets of prongs firmly on the roof. Steel spurs which project from the upper bearing surface of the bracket will secure the staging boards in place. It is claimed that one dozen per minute can be put in position or released, and that no nail-holes are left in the roof, a further

advantage being that the brackets are always ready for use, and afterward can be dropped from a roof to the ground without fear of breaking. The manufacture of these goods by the Stanley Rule and Level Company, of New Britain, Conn., has recently been undertaken, and they

Stanley's Patent Roofing Bracket.

report a good demand for the brackets, as also favorable testimonials from carpenters and painters who have already used them.

The Brock Patent Chain Pipe Wrenches.

J. H. Williams & Co., 9 to 15 Richards street, Brooklyn, N. Y., manufacturers of the Brock patent chain pipe wrenches and of other drop-forged specialties, have recently purchased a testing machine from the well-known house of Tinius Olsen & Co., Philadelphia, for the especial purpose of testing the material used in their chain wrenches, as well as the wrenches themselves after assembling. The capacity of this machine is 30,000 pounds, and its owners inform us that not only will all the

blanks and machine handles. Their already extensive line of engineers' wrenches has been enlarged until it now contains all sizes from $\frac{1}{4}$ inch to $2\frac{1}{2}$ inches, the most recent additions being wrenches for 2-inch and $2\frac{1}{2}$ -inch bolts. They carry a large stock of all their products, having constantly on hand 50,000 wrenches of 90 different kinds and 75 different sizes of thumb-screw blanks.

C. A. Maynard's Handled Planters' and Field Hoes.

Robert Murray, 24 Duane street, New York, sole agent for these goods, is now offering them to the trade. It will be observed from the illustrations given that these hoes are so constructed that the head can be

Fig. 1.—A New Hoe.

Brock chain wrenches hereafter made be carefully tested with this apparatus, but that all the material intended for these goods will be subjected to careful trial in the same manner, and its tensile and transverse strength accurately gauged before it is allowed to be made up into the tools. The latest improvement in the Brock chain wrenches, which are manufactured solely by the above firm, is the patent steel safety link now applied to all the sizes. This invention for attaching the chain to the wrench is covered by United States letters patent No. 377,795, granted February 14, 1888, and is re-

readily detached from the handle, thus greatly facilitating the shipping, reducing freight and making the goods more convenient to store. Fig. 1 shows the hoe complete and ready for use, and Fig. 2 the separate parts of which it is made. It will be seen that the blade is a sheet of steel which is attached to the handle by means of a large-headed bolt which passes through it and enters the ferruled end of the handle, in which it is securely fastened by the keys. The utility of this construction is obvious, and the excellence of the material and workmanship is also referred to by the manufacturers. The

Fig. 2.—Parts of Maynard's Handled Hoes.

garded as a most valuable improvement. The object of this addition is to render it impossible for the chain to break away from the jaws, and the great defect existing in other chain wrenches is thereby avoided. The addition of the safety link does not affect the reversibility of the tool, and all sizes are interchangeable as hereto-

planters' hoes are made with polished or unpolished blades, and the field hoes with polished blades.

The reduction works completed at Deadwood, Dak., two months ago at a cost of \$90,000, were destroyed by fire 1st inst.

Bell's Eave-Trough Hanger.

Messrs. John W. Bell & Co., of Mercer, Pa., are directing the attention of the trade to what is known as Bell's eave-trough hanger, made of a single piece of galvanized wire. The statement is made that this hanger will not corrode, nor cause the trough to rust. It can be fast-

to it two uprights of the same material. Secured to these uprights is an adjustable picket-rest with movable gauge. The iron knife bar, or lever, which is provided with a wooden handle, is attached at its lower extremity to the base by means of a hinged joint, which serves as a fulcrum. The manufacturers state that the knife-holder is adjustable upon the knife-bar, and causes the

size has a range of from $\frac{1}{4}$ to 2 inches, and weighs complete 12 pounds. The strength of this pipe-vise, as well as the low price at which it is sold, are also alluded to.

Reading Hardware Company.

From a late issue of the Reading (Pa.) *Times* we take the following description of the new works of the Reading Hardware Company, located in that city, and which are fast approaching completion:

The finishing touches are now being given to the new buildings of the Reading Hardware Company by the carpenters, and by the middle of April the remembrance that the destruction of the old works was the most serious conflagration in the history of Reading will be drowned in the hum of new and improved machinery, and the noise of 700 busy workmen.

The Bell Eave-Trough Hanger as Put Up for Shipment.

ened to the trough while it is on the ground, the operation consisting simply of closing down the hook with a pair of 8-inch gas pliers. When the trough is elevated to its place the hangers may be bent and adjusted to the pitch of the roof in order to give the trough the proper fall. This hanger is claimed to form a complete brace and support to the trough, and to hold it not alone in its proper position but in shape as well. It is easily and quickly adjusted, and is meeting with a great deal

knife to stand at right angles to the bar. The knife is attached to the lever by screws, clearly shown in the cut. When operating the machine, it is only necessary to place a picket on the rest, as indicated in the engraving, push the lever forward, and the work is done. The lever is thrown back into its original position by a spring suitably placed. The makers state that, when desired, they furnish with the machine a miter attachment designed for cutting or pointing ends of shingles. When

Hand Picket Pointer, Made by I. S. Spencer's Sons.

of favor. The hangers are put up in packages of two dozen each, the engraving presented herewith showing the appearance of a bundle of hangers ready for shipment. The firm state that their sales last year were double those of any other season, and the prospects for 1889 are promising.

Hand Picket Pointer.

Messrs. I. S. Spencer's Sons, of Guilford, Conn., are introducing to the building trades a device for shaping the tops of pickets, a general view of the machine being afforded by means of the accompanying illustration. It is known as a hand picket pointer, and is provided with a base made of hard wood, having firmly fastened

this attachment is used, it is fastened to the picket-rest in the place of the gauge.

A New Pipe-Vise.

Curtis & Curtis, manufacturers of the Forbes patent die-stock and pipe cutting and threading machinery, Bridgeport, Conn., are putting on the market the pipe-vise which is illustrated herewith. It is described as made of the best malleable iron and steel. The lightness of the contrivance is referred to by the manufacturers as making it very convenient for carrying in the tool-chest or pocket. The smaller size, which is represented in the cut, weighs complete $2\frac{1}{2}$ pounds, and has a range of from $\frac{1}{4}$ to $\frac{1}{2}$ inch inclusive. The larger

A New Pipe Vise.

Bins and boxes are now being put in the storehouse, which is that portion on Sixth street and extending back almost to and connected with the factory buildings by an iron bridge, for the storage of the various kinds of manufactured articles. The whole arrangement is being made in accordance with the most modern plans adopted by similar establishments, with original modifications and improvements by the proprietors of the works. In the warehouse five floors are utilized, and by the use of two Stokes & Parrish elevators the goods are quickly handled from one floor to another. The elevators are run by a pressure valve with steam from the factory boilers. In the cellar, which has one of the best cement floors, the heavy goods are principally kept. On the first floor is the office and shipping department. When completed the office will be inclosed by a railing and glass partitions, and will be light and roomy, much to the pleasure and satisfaction of the score of bookkeepers. It is supplied with finely finished ash and walnut desks, and two stenographers are kept busy receiving the dictation of many letters daily. The second floor is where the fine bronze plated metal and brass ware is stored. On the fourth the packing is done, and on the fifth the paper boxes are stored. Over 100,000 of these were in the building when it was burned down. The company will hereafter manufacture their own boxes.

The warehouse and factory are connected by a covered iron bridge made by Coffrode & Saylor, of Pottstown, and as the goods are finished in the factory they are at once sent across the bridge to the proper wareroom. The factory and japan house, which is the department where the danger from fire usually exists, has been so constructed in the new building as to make a conflagration through it only a possibility. It is of the safest and best design, with the fire on the ground floor and the ovens on the second. The factory is also supplied with an immense vault, extending from the first to the fourth floors, in which fine tools, dies, &c., are to be stored. The company suffered a heavy loss from the destruction of fine tools at the time of the fire. The floors are all of double thickness, and all the doors and windows are covered with a casing of tin as an additional precaution against fire. An important precaution was also taken in the boiler-house by the building of a belt well, which would prevent a fire in the main shaft from spreading. The new buildings will be completed probably by the 1st of April, and when all departments are in full operation again between 700 and 800 hands will be employed.

The new French cable to Hayti, San Domingo and cities in Venezuela is now open for service.

CURRENT HARDWARE PRICES.

MARCH 6, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

THE IRON AGE

THURSDAY, MARCH 14, 1889.

Tuyere Slagging-Valve.*

BY EDGAR S. COOK, POTTSTOWN, PA.

For several years past, dating particularly from the days of serious "ore-dirt" complications at the Warwick Furnace, I

the crucible, or when, from dropping or jumping of stock, the molten slag is forcibly driven into the belly and leg pipes. Various methods were proposed, but objections of one kind or another always presented themselves, and the subject was postponed to a more convenient season.

jacket at one side of the bottom of the water-blocks were found to be of no value whatever. The swinging or hinged cap on the elbow of the belly-pipe, while convenient to permit the removal of slag after the belly-pipe was partially or wholly filled, could not be adapted to discharge

THREE-INCH TUYERE SLAGGING-VALVE, IN USE AT THE WARWICK FURNACE, POTTSTOWN, PA.

have been desirous of providing some safe, quick and easy method of relieving the tuyeres of slag, when the cinder and iron notches are chilled through loss of heat in

* Read at the Buffalo meeting of the American Institute of Mining Engineers.

In the summer of 1887, while running on anthracite alone, I found the various expedients in use to be so utterly valueless that the importance of a practical tuyere slagging-valve impressed me more forcibly than ever. The holes left in the cast-iron

the slag before solidifying, except at great risk to the men and loss of time just when the constant running of the engine and the keeping of blast on the furnace was of the utmost importance. By removing keys from the caps and holding them in place

with props, the slag could be discharged through the tuyeres and belly-pipes, with the engine running, by knocking the props away at a given signal. This method is extremely hazardous to life and limb, and I have always hesitated to make use of it. When the furnace is in such a condition as to require the adoption of some method of the kind, the stoppage of the engine, cooling the blast and the contents of the crucible, always aggravates the trouble. When the caps are blown open and the slag is discharged by removal of the props it is necessary to stop the engine to replace them. An hour or more will elapse before this can be done, as the slag must be partly removed before the tuyeres can be approached by ordinary mortals, and the caps handled and fastened in place again. Any movement of the stock is liable to burn the workman as he stands securing the cap in front or at one side of the open belly-pipe.

The cooling of crucible contents and the lowering of the heat of the stoves, while thus standing, adds to the difficulty of restoring the furnace to a normal condition and renders necessary a resort to this method a second, third or fourth time, and even oftener, the conditions growing more unfavorable each hour, and thus frequently causes the loss of the furnace which could have been prevented from chilling, while the work was made safe to all engaged, if there had been a quick, easy method of removing the slag through the tuyeres and belly-pipes, without loss of time or heat. We attempted in 1887 to use the method just described, but our belly-pipes filled solid with slag before we could get props in place, the change in the furnace coming unexpectedly and quickly. Several hours were required to clean the pipes. Fortunately, the trouble was only temporary. On starting up again the slag cleared the tuyeres and ran from an enlarged cinder notch without further serious trouble.

This experience brought into existence the tuyere slagging-valve now in use at the Warwick Furnace, and found to be valuable in more ways than one. Our chief engineer suggested that a valve placed in the cap or bottom of the belly-pipe, connected with the piston of a cylinder of larger diameter than the valve and operated with a three-way cock placed in a pipe connecting the cylinder with the main blast-pipe, would afford a safe and sure way of flushing through any belly-pipe without stopping the engine at all. The three-way cock he proposed so to locate at a convenient position that the slag discharged would not interfere with the man operating it. The idea seemed feasible, and orders were given to have one constructed and put into position. The trial of the first valve completed was so satisfactory that we arranged to put similar valves on all our tuyeres, improving the mechanical construction and convenience of the device as we progressed. The accompanying drawings will explain the construction. Figs. 1, 2, 3 and 4 represent the ordinary 3-inch valve.

In these figures, C is the leg-pipe; D, the elbow; E, the belly-pipe; F, the circular casting, keyed to elbow by keys T. This casting carries the valve-seat, held in position by keys Q, and is of the same diameter, external and internal, D, as the elbow. G is the swinging cap of the elbow, held in position by keys S. H is the valve-cylinder, with K opening for connecting pipe running to the circular blast-pipe and a small opening, L, at bottom for the escape to the atmosphere of any air leaking past the piston. M is the usual eye-hole, arranged with a stop-cock to permit the easy cleaning of the glass. N is the guide for the rack-extension, O, of the piston-rod; U, the sector with extended arm, carrying the valve V, and fitted to work easily with rack O. In practice, we found that when

the valve V was thrown open by pressure of air in the belly-pipe (the pressure in valve-cylinder being cut off) owing to its own weight and that of piston and piston-rod, V would partially close again, not enough to interfere with the flow of slag through the opening, but just enough for the slag to strike it and in time cut it. In

the valve V wide open and hold it in the position shown. In pipe J is placed a stop-cock, R, to regulate the amount of air to be admitted to the lower side of the piston. A brass plug, X, is screwed into top of the tee, to facilitate the cleaning of the pipe should it become filled with plumbago or gas-dirt. The

THREE-INCH TUYERE SLAGGING-VALVE.

SIX-INCH TUYERE SLAGGING-VALVE

order to hold the open valve in the position shown in Fig. 4, a 4-inch pipe-connection, J, was made from the top of the circular casting, F, to the lower part of the valve-cylinder H. The opening in the cylinder is immediately opposite the piston when the valve is closed. When the valve V is opened and the piston of the cylinder raises, air passes through pipe J to the lower side of the piston and assists to throw

tuyere slagging-valve is easily applied to any of the usual forms of belly-pipes. The connection between it and the main blast-pipe can be made by any one accustomed to put up gas or steam pipe. One main pipe, 1 1/2 inches in diameter, is connected with the main blast or bustle pipe, and from this 4-inch branches are run to the several tuyeres, one to each tuyere-arch. A 1 1/2-inch three-way cock is

placed in the $1\frac{1}{4}$ -inch pipe and $\frac{3}{4}$ -inch three-way cocks in each of the branches, located as may be found most convenient. The $\frac{3}{4}$ -inch pipe of each tuyere-arch is connected by means of a brass union with the top of the valve-cylinder. To keep the valve closed, the furnace being in operation, the plug of the $1\frac{1}{4}$ -inch three-way cock is so turned that the opening to the atmosphere is closed and the passage from main blast-pipe to branches and cylinders is opened. The $\frac{3}{4}$ -inch cocks are turned

valve the plug of the $\frac{3}{4}$ -inch three-way cock is turned in the opposite direction, closing the passage to the atmosphere and opening communication with the blast-pipe, the pressure from which, acting on the piston of the cylinder, overcomes the resistance of the air in the belly-pipe and closes the valve. By operating the $1\frac{1}{4}$ -inch three-way cock, all of the valves in use, one or six, can be opened instantaneously; or each valve can be used separately by operating the corresponding $\frac{3}{4}$ -

for a moment, thus avoiding all loss of time and all the dangers attending the further cooling off of crucible and blast. The management of a furnace is thus, to some extent, simplified, and one of the most serious annoyances attending the operation of an anthracite furnace is removed—viz., the difficulty of keeping the tuyeres open.

Flushing can be done through the tuyere slugging-valves with the same facility as through the cinder-notch. occasionally

PLAN AND SIDE ELEVATION OF SIX-INCH TUYERE SLUGGING-VALVE.

the same way. The pressure of blast in the belly-pipe is the same as in the valve-cylinder. The area of the piston being larger than the area of the valve in the belly-pipe, the latter is kept tightly closed, never leaking. If it is desired to open a valve, the plug of a $\frac{3}{4}$ -inch three-way cock is turned, cutting off the supply of air from the blast-pipe and opening its passage to the atmosphere. The pressure of blast in the belly-pipe acting upon the valve forces it open, driving up the piston of the valve-cylinder, upon which there is now no pressure. The air filling the cylinders escapes to the atmosphere through the side opening of the cock. To close the

inch three-way cocks. Slag driven into the belly-pipes by the jumping of the stock when the working of the furnace is temporarily deranged can be quickly and easily discharged through one or more of the slugging-valves, without loss of time or any inconvenience whatever. When the crucible is badly chilled the iron and cinder notches are closed and the slag melted by each tuyere is prevented from distributing itself over the area of the crucible, and confined to the immediate vicinity of the tuyere melting it. This slag can be discharged through the tuyere slugging-valves with no risk to the men and without stopping the engine

happens, even in a furnace working well, that a pocket forms under or around a certain tuyere, so that when the engine is stopped this tuyere is sure to fill with slag. When this condition is known to exist, it is only necessary to throw the blast off the furnace, open the valve of the tuyere, put blast on again, blowing slag out, and then stop the engine.

In addition to the uses mentioned, we have found that the tuyere slugging-valves supersede the "pricking" of the tuyeres, and answer the purpose far better. A pricking-rod is now used only when a large hard lump obstructs the nose of a tuyere, which rarely happens. In order

to keep the valves in good working order, it was our custom to open them regularly once or twice per turn. In so doing, we noticed that the tuyeres kept cleaner and brighter than heretofore. Indeed, we never had such uniformly bright and clean tuyeres, under all conditions of working, as we have had since using these valves—some nine months or more. Besides, we never before made so much iron in the same time. A clean, bright tuyere will certainly melt more material per hour than one furred with dirt. The frequent opening of the slagging-valves removes the dirt deposited in the belly-pipes from the gas and the infusible dirt that collects around the nose of each tuyere.

We have found a 3-inch valve the most convenient in size, although we have one 6 inches in diameter. This is shown in Figs. 5, 6 and 7, from which it will be seen that in this form the valve V replaces the ordinary swinging cap, and carries the eye-hole M and the pricker-hole W, the latter being closed by means of a full-way valve, instead of lever and ball. This valve is located on the front tuyere, directly over the iron-notch, and is made to replace the ordinary cap, the eye-sight and pricking-rod holes being in the valve. It can be easily opened to change nozzles. It is safer to operate a valve of this size independently of the others. Its cylinder is connected to the blast-pipe by a separate 1-inch pipe.

We consider that the 6-inch valve would be of more value than the 3-inch one, chiefly in extreme instances of the chilling of the crucible and a large accumulation of dry ore-dirt in the furnace. As now constructed, the 3-inch tuyere slagging-valve can be placed in position in about five minutes, everything being got ready before the stoppage of the furnace after a cast. A circular casting, about 11 inches long, of the same internal and external diameter as the elbow casting of the belly-pipe, is keyed to the elbow in place of the cap, the cap being transferred to the opposite end of the valve-casting. In other words, the ordinary elbow is lengthened by a separate casting 11 inches long. The air-cylinder is permanently attached to this circular casting, carrying the sector and the rack-extension of the piston-rod operating the valve, the valve itself being on the lower side of the casting. The seat of the valve is made detachable, so that it can be renewed should it become worn or cut by the action of the slag.

Recently we allowed considerable slag to accumulate in the furnace. By simply operating the three-way cock of the 6-inch slagging-valve, we flushed through the belly-pipe and valve without any injury either to the pipe or valve. A very slight shell of chilled slag remained in the pipe. The valve was closed easily and tightly by reversing the cock.

On another occasion, shortly before the regular time for flushing, the engine suddenly stopped, in spite of the efforts of the engineer to keep it moving. A joint in the steam-pipe had been remade earlier in the day, and we suppose a chip of wood had somehow got into the pipe and caught on the seat of one of the valves of the engine, thus causing its sudden stoppage. The furnace being full of slag, all the belly-pipes, as the engine stopped without warning, filled immediately. The 6-inch slagging-valve opened automatically from the pressure of the slag in the pipe, draining itself and also the adjoining pipe, the only one on which we had not placed a slagging-valve. The 8-inch valves were opened as quickly as possible by the keeper, by means of a small bar, no air-pressure being in the pipes. From each the slag flowed without difficulty. The delay in opening the 3-inch valves caused a more or less heavy shell to form in the

pipes, in contrast with the 6-inch valve, which opened of itself and left but a light shell in its belly-pipe. In half an hour's time all the pipes were perfectly cleaned and we started up again. But for the slagging-valves the pipes would all have been completely filled with slag, which would have solidified before it would have been possible to remove it by means of the ordinary swinging caps, thus entailing a stoppage of four or five hours. Such a long stoppage, coming unexpectedly, might, under some conditions, cause much trouble and additional expense. We think the valves have already repaid us to their original cost.

We are now making blow-off valves for our boilers, constructed on the same principle, with slight modifications to suit the different conditions. Instead of air, steam direct from the boilers is used to operate the valves. Provision is made to guard

length over all is 430 feet, beam 45 feet and depth of hold 30 feet 6 inches. Although her net tonnage is 3046 and gross tonnage 4649, she will carry 8000 tons of cargo. By a system of water ballast, after her cargo is discharged, she can take in 1000 tons in her tanks in a very short time and go to sea.

Heavy Plowshare Grinder.

This machine is especially adapted for grinding and polishing plows and other castings that are so heavy that it is necessary to handle them on a truck. It is made with a very heavy square base with sufficient spread to stand firmly on the floor and prevent vibration when being used. The arbor is made long, giving a good clearance to handle work. It has four bearings, so as to run steady without

HEAVY PLOWSHARE GRINDER.

against the accumulation of water in the cylinder condensed from the steam and to avoid the possibility of the freezing of any of the parts in extreme cold weather. Letters patent have recently been obtained for the tuyere slagging-valve device.

The new White Star freight steamships Runic and Cufic, recently put on the line between New York and Liverpool, were built strictly for the transportation of merchandise, and are navigated with such economy of fuel and low costs in other respects that they naturally come in sharp competition with rival lines. The Runic has a straight stem, iron hull, iron decks and four iron masts, with yards on the foremast. The other three masts are fitted with four stout booms apiece, fitted into goosenecks, so that when "peaked up" they can be used as derricks for loading or discharging cargo. Her engines are of the triple-expansion type, and will drive her from 12 to 13 knots an hour in fairly smooth water. She is expected to make the trip in less than 10 days. The Runic's

vibration. The weight, without wheels, is 1600 pounds; height from floor to center of spindle, 4½ inches; height of base, 30 inches; length of two outside bearings, 8 inches, and are self-oiling; length of two inside bearings, 6 inches, located each side of pulleys—these are not shown in cut; diameter of spindle in bearings, 2½ inches; diameter of spindle where wheel goes on, 2 inches; distance between wheels, 60 inches; distance spindle extends beyond frame, leaving clear space, 21 inches; entire length of spindle, 71 inches; spindle pulley, 8 x 6 inches; carries two wheels any size up to 60 inches diameter; floor space of base, 34 x 34 inches; driving pulley on countershaft, 20 x 6 inches. This grinder is made by the Springfield Glue and Emery Wheel Company, of Springfield, Mass.

The Namaqua Copper Company, whose mines are at the Cape of Good Hope, have declared an interim dividend of 2/ per share, being at the rate of 20 per cent. per annum.

JOHN ERICSSON.

34

A New Alligator Shear.

The accompanying illustration shows a new and recently designed alligator shear which has just been put on the market by Thomas Carlin's Sons, founders and machinists, of Allegheny City, Pa. The main features in the construction of this shear are as follows: The bed is very wide

shear are steel, and their journal bearings are extra long. These shears are designed to cut $\frac{3}{4}$ -inch agricultural steel.

Gas Engine and Pump Combined.

The combination of the Otto gas engine and pump herewith illustrated is intended to avoid the difficulties frequently

order to furnish a varying quantity of water as required by hydraulic elevators. In this case the slide of the by-pass valve is acted on by a float in one of the elevator tanks, or by a piston and weight, which act when pressure in the accumulator reaches its limit.

The makers of these pumps, Schleicher, Schumm & Co., of Philadelphia, guarantee

ALLIGATOR SHEAR, BUILT BY THOMAS CARLIN'S SONS, ALLEGHENY CITY, PA.

on the base, and has lugs for securing it to the foundation, a 2-inch bolt through the bed under the pin adding considerable stiffness to it. The hubs of the housen are reinforced by wrought-iron links. The knives are set well back under the lever and bed to prevent spalling off, due

met with in bringing power to pumps by means of belting or countershafts when pumps are preferably run at slow speed and with the highest efficiency. This pump is also intended to take the place of rotary or high-speed reciprocating pumps, chosen in order to save room. All danger

that they will pump more water and at less cost, with the size of engine attached to them, than other pumps when driven by the same size of engine. This enables the makers to use smaller sizes of engines to do the work for which their larger sizes have heretofore been selected in connection with

GAS ENGINE AND PUMP COMBINED, BUILT BY SCHLEICHER, SCHUMM & CO., OF PHILADELPHIA.

to the crushing strain at these points. The lever is long and is heavily ribbed for the vertical and side strains to which it is subjected, and for convenience in handling an eye has been put in it. The quick-return cam is chilled on its face, and has a steel plate dovetailed into lever for it to work against, which is cushioned, and has also a safety yoke around the cam. The gearing is heavy, is 7 to 1, and is driven by 80-inch and 8-inch tight and loose pulleys. All the shafts connected with the

of water-hammering is avoided by reason of their slow speed, and as the gears used in them are accurately cut all noise is reduced to a minimum. By means of a by-pass valve the engine can be relieved of all work. When this valve is open the water in the pump cylinder merely circulates from behind one end of the pump piston to the other, and thus admits of starting the engine without load. The by-pass is also used for stopping or starting the delivery of water in an automatic manner in

less efficient and generally high-speed pumps.

About \$1,000,000 will be expended by the Pennsylvania Railroad Company in elevating the surface railroad tracks in Jersey City.

Fargo disputes with Bismarck in North Dakota in the struggle now taking place for recognition as the permanent capital of the new State.

Sturtevant Steam Hot-Blast Apparatus.

The house of B. F. Sturtevant, Boston, Mass., has just brought out a new design of a steam hot-blast apparatus, which is now well known. This design, first placed upon the market a quarter of a century ago, has been gradually improved and rapidly introduced until now about 5500 are employed for various purposes. It combines a fan and a heater, and is usually constructed with an engine directly connected to the fan shaft, as shown in Fig. 1. The shell and wheel are of steel plate, and the shaft of steel, while all stays and braces are of angle. The engine may be directly connected to

through the horizontal pipes, and down into the space connecting with the drips. By this time it has condensed, and leaves the heater in the form of water of condensation. The sides of these heads are planed, and the joints made by copper gaskets, so that when drawn together by the through bolts there is no possibility of leakage. In connection with the sections is bolted on at one end of the group a header for steam inlet and a drip, B. Both of these are large and allow the use of exhaust steam without creating back pressure upon the engine. The pipes C D are, respectively, exhaust-steam inlet and drip communicating with the outermost section, which has no head and is entirely independent of the remainder of the group.

ordinary manufactory the distribution takes place through galvanized-iron piping, either in the form of upright mains extending to the various floors and having one or more outlets near the ceiling on each floor, or in other cases horizontal mains extend the entire length of the building just under the ceiling on each floor and the air is discharged through outlet in these. In schools, churches, &c., the air is generally conveyed through flues built into the interior walls, the volume and rate of discharge being governed by the register through which the air escapes. The object is always to discharge the air either at or toward the cold outer wall; but in this, experience is necessary in order to enable one to lay out

Fig. 1.

STURTEVANT STEAM HOT-BLAST APPARATUS FOR HEATING AND VENTILATING.

the fan shaft, or it may be independent and arranged to drive the fan by belt and pulley. The advantage of a special engine for the sole purpose of driving the fan is evident. The fan may then be run at any time and speed, independent of any other source of power. Radical changes have been made in the heater, which forms a very important factor in the combination. As now constructed, the heater proper consists of a series of hollow sectional bases, shown clearly in Figs. 2 and 3. Their sides are corrugated so as to fit closely together and allow of no alternate expansion and contraction of the air passing between the pipes. At one end of each section is a circular head, Fig. 2, divided horizontally by a diaphragm, so that the upper portion is in communication with the steam inlet and the lower with the drip. Steam admitted at the left through the steam inlet passes up the series of pipes,

It is designed to utilize the exhaust from the fan engine. The head end of each section rests upon the wrought-iron foundation of the heater, while the opposite ends are supported by cast-iron balls, so as to allow for expansion. After continued use of wrought-iron pipe the maker of this apparatus adopted steel pipe as better adapted for use in his heaters, and has it made especially for him of standard weight per foot. The heater is incased in a fire-proof steel-plate jacket, communicating with the inlet to the fan, so that air is drawn by the fan equally across all parts of the heater, and, as the pipes in the sections are set staggering, the air is compelled to take a tortuous course and is brought into intimate contact with every foot of pipe. In operation for heating and ventilating, the outlet of the fan is constructed with a system of ducts or pipes leading to the various parts of the building. In the case of an

a perfect working system. This, the blower system, is positive in its action; the air being forced into the building must of necessity thoroughly circulate through it. As the source of supply of the air introduced is under control, there can be no opportunity for the presence of injurious impurities. Changes in the weather produce no injurious effect upon the system, since the pressure produced by the fan is far in excess of that due to changes in the atmosphere. The large amount of air passing through the heater causes a rapid condensation of steam, and each square foot condenses from three to five times as much steam as would be condensed by the same area in an ordinary coil radiator. In other words, it is claimed that only one-third to one-fifth of the pipe is required to do the same amount of heating. All the pipe is combined in a single heater, and all valves are within easy reach, placing the entire control of the apparatus in the hands of a

single individual. In addition, it is claimed that a more rapid change in the temperature of the building is possible with this system than with any other, either direct or indirect. This method is now in use in some of the largest manufactories in the country.

Industries of Lansing, Mich.

A Western daily publishes the following interesting information relative to the manufacturing interests of Lansing, Mich., which have been developed almost wholly within the past four years: Among the prominent manufactories of Lansing, foremost mention must be made of the Lansing Iron and Engine Works, which were established in January, 1885. The company succeeded the copartnership of Jarvis, Barnes & Co., and since their incorporation with a capital of \$100,000,

the facilities. This factory was only established three years since. A business is being done of \$200,000 a year. James J. Baird is president; Orlando F. Barnes, vice-president, and Frank E. Briggs, secretary and treasurer.

The Lansing Wagon Company, with a capital of \$100,000, turn out over 3000 wagons a year, and are reputed to manufacture as fine a wagon as any in the country. Farm, lumber and freight wagons are made and the works are taxed to their utmost capacity. The Capital Wagon Company also boast of many new and important inventions, and claim for their manufactured goods by comparison a high position and an undoubted superiority. Anderson & Bush's manufactory has a capacity of 3000 road carts a year. The business was established last July. Orders for their goods come chiefly from the East, but their trade reaches Kansas and Nebraska. They manufactured goods last

that kegs of 200 pounds average 15 more spikes. This spike is rolled complete at a single heat through Fowler's patent spike rolls, forming the head without bending or upsetting the metal or breaking its fiber. This is accomplished by rolling down the shank of the spike from a bar of peculiar shape and larger in cross sections than the head of the spike itself. The method of manufacture, the machinery employed and the spike itself are covered by six distinct patents.

Edison Exhibit at Paris.

The Edison exhibit at the Paris Exposition will, according to the *New York Tribune*, occupy nearly one-third of the entire space allowed the United States. The display of phonographs will include the original instrument now in the South Kensington Museum, London, together with those showing the latest improvements. The telegraph department will contain models of all the machines Mr. Edison has worked out. In the telephone division there will be a chronological arrangement of all the devices from the original "Blake transmitter" down to the latest loud-speaking telephone. In electric lighting there will be a complete three-wire municipal system extending over all the exhibit. The principal feature of the exhibit will be an enormous model of an incandescent lamp, 40 feet high, the globe being composed of no less than 20,000 incandescent lamp bulbs, and the carbon filament within being indicated by a loop of red-colored incandescent lamps. The effect when the light is flashed into these thousands of bulbs will be wonderfully brilliant. Around the base of this novel lamp will be a series of panels illustrative of the various stages of the manufacture of in-

Fig. 2.—Heater for Sturtevant Hot-Blast Apparatus.

Fig. 3.—Detail of Heater.

the expansion of the industry has been so marked that its volume of business reaches \$350,000 a year. The character of the engines manufactured by the company is shown by their increasing business, and they have in connection one of the largest boiler shops in the State. They also manufacture compressed air-cylinder derricks for handling heavy machinery and mill, railroad and mine supplies.

Next in importance may be mentioned the Lansing Wheel Company. Michigan can boast of only one carriage-wheel manufactory, and that is operated by the Lansing Wheel Company. In this factory 30,000 sets of wheels are made in a year, and employment is given to a large number of men. The making of carriage-wheels to-day is very different to what it was in the days of old. The rapidity with which all the work is done is remarkable. It takes the spoke driver about 15 minutes to place the spokes in a set of wheels, the machine working on the wheel is done in half that time, the rimmer does his work on a set in 10 minutes, and the set is finished in 40 minutes. The works are so constructed that they can turn out 150 sets a day, and it is the intention to increase

year to the amount of \$75,000, and are now about to build and increase their facilities.

The blast furnace men propose at the next convention of the Amalgamated Association of Iron and Steel Workers to make an effort to be admitted by that organization, if possible. The furnace-workers are now paid by the day, but they believe that in the major part of their work they should be paid by the ton, as their work requires fully as much skill as to puddle iron. Should they be admitted, fully 9000 additional members will be gained by the Amalgamated Association.

The Fowler Rolling Mill Company, 185 Dearborn street, Chicago, are putting a railroad spike of improved shape on the market. The spike has a sharp chisel point, and its shaft is trapezoidal in cross section. This form, it is claimed, presents greater resistance to the thrust of the rail than other spikes, while the sharp point tears the fiber of the tie less. Its weight is less than that of the standard spike, as there is no waste metal in its formation, so

candescant lamps, and on either side will be the French and American flags worked out in colored incandescent globes. One will be inscribed "Paris," and the other "Edison." Among other novelties will be a huge dynamo capable of running 2000 lamps, one of the largest dynamos that has ever been constructed. An interesting feature will be a series of charts, 100 in number, showing the growth and development of all Mr. Edison's inventions from the first crude idea, through all the successive stages, to the complete and perfected instrument. There will be a number of frames showing the filaments in their natural condition, and after being carbonized, with samples, arranged in chronological order, of all the substances that have been experimented with in this direction.

An interesting map of the first electric central station and district in New York will also be exhibited, with a tabular statement showing the growth of the business from a net loss of \$4457 in 1883 to a net profit of \$116,235 in 1888, and this despite the reduction of gas to \$1.25 per 1000 feet, while the equivalent cost of electric light is \$2.25.

The Pierce Air-Valve.

Both the accompanying cuts are full size, Fig. 1 showing the valve provided with dip attachment, Fig. 2 being without the dip. The valve is both automatic and positive. With this combination the positive valve can be opened to heat up the radiation at once, without waiting for the air to be forced out through the automatic. To increase the durability and prevent corrosion all metal parts of the valve are nickel-plated both inside and out. The expansion and contraction of the hard rubber body, responding quickly to heat

\$62,500, the proceeds of the sale of which were to form the working capital of the company. The complainants' interest consists of the purchase of \$5000 each of this stock, and 1625 shares of the stock in all were sold, realizing about \$100,000. George M. Pullman purchased all of Mr. Doane's stock—about 1000 shares—although the stock has never been transferred to him on the books. Extensive works were erected at Pullman for the manufacture of spikes, and a rolling mill was also built at Mr. Pullman's suggestion, it is claimed, increasing the cost of the plant about \$20,000. The

company has been to furnish iron and iron-work for the Pullman Palace Car Company and for their especial benefit, the latter company dictating prices below that of the market. The liabilities of the Pullman Iron and Steel Company are stated to amount to \$302,256.07, while the total assets are \$279,618.19, the greater portion of which are in the plant, which cost \$190,046.54. Of the indebtedness \$180,000 is to the Pullman Palace Car Company. The railway spike patent is claimed to be worthless and to have been practically abandoned. The court is asked, therefore, to order the property sold by the receiver, to direct an accounting to be taken, and that the proceeds may be divided pro rata among the stockholders according to their interest.

The filing of this bill will hardly affect the credit of the company, as long as it is understood that the Pullman Palace Car Company are interested in keeping the works in operation, but the experience of these outside stockholders is very instructive to others who are inclined to invest in auxiliary corporations operating in connection with large consumers of their products.

Upright Power Hammer.

Appreciating the fact that the hammer as previously made was not quite strong enough in some parts, the Belden Machine Company, of New Haven, Conn., have remodeled and made an entirely new set of patterns. The gearing has been simplified, the ways strengthened, and the body in-

Fig. 1.

Fig. 2.

THE PIERCE AIR-VALVE.

and cold, render the automatic part reliable, while the positive is available whenever required. This valve is made by the Pierce, Butler & Pierce Mfg. Company, of Syracuse, N. Y.

The Pullman Iron and Steel Company.

Some interesting information has been given to the public relative to the Pullman Iron and Steel Company, operating a rolling mill at Pullman, near Chicago. This information comes through the filing of a bill on the 4th inst., by Francis T. Wheeler and Lucius G. Fisher, asking for the appointment of a receiver for the company. The complainants own \$5000 of stock each in the company. They say that October 8, 1883, Frank B. Felt and James P. Perkins were owners of one-half a patent on railway spikes, the other half being owned by George M. Pullman and John W. Doane, Mr. Pullman's interest, however, being in the name of James H. Smith, his private secretary. A corporation was formed with a capital of \$500,000. The four stockholders contributed equal amounts out of their stock aggregating

works were completed in the spring of 1884, and have been run, the complainants say, ever since, at a loss to the company. The spike manufacture was almost entirely abandoned as a failure, and the principal business of the company has been the manufacture of bar iron. The works and machinery were found to have cost more than the working capital, which was about \$116,000, and in July, 1884, the company mortgaged their property to secure an issue of \$100,000 of bonds. Of this issue \$25,000 worth of bonds were sold at par. The company still losing money, they borrowed at various times from the Pullman Loan and Savings Bank, of which George M. Pullman is president and controlling officer, sums of money aggregating \$56,000, for which the bank holds the \$75,000 of unsold bonds as security.

The Pullman Palace Car Company, according to the bill, in 1885 extended credit to the Pullman Iron and Steel Company by which the latter were enabled to purchase materials and continue in operation up to the present time. The complainants charge, however, that through the control of Mr. Pullman as principal stockholder almost the entire business of the iron and steel

Upright Power Hammer.

creased in every place where there was a possibility of its being weak. The manufacturers now claim that this hammer can be run at a higher rate of speed and with less jar or liability of breaking, as there are no valves, rods or cylinders, than any other. As every part is plain and simple, the repairs are trifling. It is further claimed that it requires less power and occupies but little space. The dies are never on the work when the hammer is still. The anvil block is made separate, and if broken can be replaced at a small cost. Stock varying from $\frac{1}{4}$ inch to 3 inches can be worked without trouble. The changes made in this hammer were made only after a use extending over several years in the works of the manufacturers.

The Frisbie Valve and Union.

The cylinder valve here illustrated is so designed as to do away with the necessity of disconnecting the valve from the pipe in case the seat becomes worn. This is accomplished by making the disk independent of the stem, but held in position by a cast shoulder. The face of the disk is concave and filled with packing, which is prevented from spreading by the metal walls on the disk. The advantages claimed are that in case of wear the disk may be re-

active when industry is paralyzed; the ordinary payments in legitimate business or in settlements with labor. Obviously these classifications comprise elements too uncertain and intangible to serve as a basis for definite conclusions. Returns of skilled labor employed, prepared at regular intervals, as in England, are of some value as an index of the business situation, and in the United States we have at command, in the statistics of the Labor Bureau, if promptly published, a source of information that should be availed of to

so, after removing a few times, it is unfit for further use and has to be renewed. At the same time this is generally the leaky part of the boiler, and is a continual eye-sore to a skilled mechanic.

With the common use of steel in boiler-making many changes have been made possible and one of the most decided improvements is the form of man-hole opening called Eclipse man-head, which is illustrated herewith. This opening is flanged by a machine especially made for the purpose, the same as if it

THE FRISBIE VALVE.

THE FRISBIE UNION.

moved by unscrewing the nut of the valve, when the concave part can be refilled and placed in position in a short time.

THE FRISBIE UNION.

In the union illustrated the gasket A is held between two metal rings, B B, the space between which is filled with any suitable packing, which is held firmly in position by the rings. These gaskets are furnished the trade in all sizes and filled with asbestos, babbitt or rubber by the

fullest extent. Reports of this character reflecting the condition of a wide range of industries would become invaluable.

The Eclipse Man-Head.

For the purpose of securing entrance to tubular or flue boilers it is the custom to cut a hole in the shell or head large enough to admit a man's body. This

were a flue-hole. The uneven surface is planed level. The man-head plate has a recess or channel, in which molten lead is run, forming a gasket, and prevents it spreading or thinning out under pressure. The bolts and crabs are the same as in the old form. Therefore it will be seen that the flanged and planed opening presents a perfectly level, hard surface against the perfectly level, soft surface of the lead, so there is no chance of a leak and no unequal strain on the boiler, gasket or plate.

Where a boiler was weakest in the old form it is now the strongest, without an increase in weight. Briefly, the advantages gained are strength, improved appearance of the boiler, freedom from leaks, economy in the use of gaskets and ease of entrance to the boiler. It has now been in practical use for over a year in many sections of the country with unqualified success.

The Eclipse man-head and the machines for making it are patented by R. Munroe, of Pittsburgh, a practical boiler-maker of 50 years' practice. Consumers or boiler-makers can obtain this improvement and all information regarding the same by addressing Mr. Munroe, as above, or Joseph T. Ryerson & Son, at Chicago, the sole licensees for Chicago and the West.

THE ECLIPSE MAN-HEAD.

makers of both the union and valve, the Barnett Brass Company, of Mansfield, Ohio.

An improved business barometer is one of the wants of the times. Bank clearings, railroad earnings and even reports of tonnage by the main lines of transportation are all misleading as indications of the volume of current business. Bank exchanges are deceptive, because they report indiscriminately in one aggregate three kinds of transactions, viz., payments on purchases made at any previous time, but especially the settlements on maturing commercial paper, of various dates; purely speculative operations, which are often

hole is oval, and around it is riveted a wrought or cast iron ring of the same internal diameter as the opening. In service this opening is closed from the inside by a cast-iron plate called "man-head plate," which is held in place by bolts and crabs. To secure a steam-tight joint a gasket of rubber, asbestos, lead or other yielding substance is placed between the boiler-head or shell and the man-head plate. In practice it has been found difficult to secure a perfectly flat or even surface, so that it has been necessary to draw the man-head plate tight against the boiler that the gasket might be forced into all the uneven surfaces. This gasket, therefore, is often forced out of shape;

In the French Chamber of Deputies M. Villain moved an order of the day appealing to the Government to safeguard the interests of the shareholders of the Panama Canal. M. Rouvier, Minister of Finance, disclaimed any responsibility on the part of the Government. He said the Government had no means of interfering, although it approved of every effort made by capitalists and companies to prevent the collapse of the undertaking. Prime Minister Tirard, replying to M. de Cassagnac, said the Government would do its utmost for the success of the canal, but he could say no more. The chamber, then, by a vote of 344 to 185, adopted a Government order of the day in regard to the canal. The Court of Appeals decided that the Panama Canal Company is a civil association, thus reversing the decision of the Tribunal of Commerce that the company was a commercial society.

THE WEEK.

It is remarked that the Interstate Commerce law, which provides for the regulation of railway traffic between the States by federal law, has come to stay, and becomes ingrafted upon the established policy of the United States. Congress has shown no disposition to recede from the high ground originally taken, and President Harrison in his inaugural address affords no encouragement to corporations that may have hoped to evade or practically nullify the laws holding them to due accountability and restraint.

The latest Havana advices report a probable decrease this year in the Cuban sugar crop equal to 40 per cent., equivalent to about 200,000 tons compared with the previous crop.

The scheme for a bridge to Long Island, crossing the East River at Blackwell's Island, has encountered an adverse decision in the Supreme Court, Judge Van Brunt having refused an application for the appointment of commissioners to acquire land. He upheld the argument of Assistant Corporation Counsel Twombly, in opposing the application, that the act of 1885 gave authority to a private company to lay railway tracks over the bridge in violation of the provision of the Constitution of the State.

Plans for the improvement of wharf facilities on the North River front were brought to the attention of the New York Chamber of Commerce at its last meeting by President Post, of the Department of Docks. As a large expenditure of money is involved, the approval of the chamber was desired. Some years ago the present engineer in chief of the department suggested a change in the original "new plan" so that the North River front, between Eleventh and Twenty-third streets, might be utilized, and the commercial possibilities of the North River increased some 25 per cent. The change contemplates the extension of West street, with a width of 250 feet in a straight line from West Tenth to West Twenty-third street. Excepting the blocks upon which the West Washington Market is erected and the excavation of the land to the west of the street, the property for this improvement should be purchased by the city. This improvement gave 25 per cent. more wharf room and seemed to be the only way by which the city could be rapidly prepared for its increasing commerce. If it were adopted 19 large piers, 2 half piers, and 2 small piers could be built which would yield to the city a revenue of \$800,000 a year. Its total cost would be about \$8,861,000. Deducting the yearly taxes now received by the city on the property to be purchased, amounting to \$63,000, the net income to the city would be \$737,000, or over 8½ per cent. on the investment, without taking into consideration the increased amount of business which would accrue to the benefit of the city. The subject was referred to the Committee on Harbor and Shipping.

Canadian trade is reported to be suffering for want of a foreign market. All the industries are affected. Trade with Australia is without profit, the costs of transportation being too large. The most promising markets are South America and the West Indies.

Sidney Dillon and other capitalists in New York and Pennsylvania are about to lay pipes in Philadelphia for steam-heating purposes, a location for the central plant having been already purchased.

A falling off in the tide of immigration is noticed at Castle Garden. The arrivals during the last six months number 107,680, a decrease of 21,500 compared with the same months last year. A better class of

immigrants are coming than formerly, as foreign governments have learned that we will not receive ex-convicts and paupers.

The present debt of Canada, as shown by the Minister of Finance, is \$236,000,000, an increase of 120 per cent. in 14 years; but the customs tariff now in force is expected to yield a surplus. While trade with the United States largely increased last year, that with Great Britain shows a marked decline.

An official report of the results of the horse-car strike in this city as affecting the men engaged in it shows that not less than 2783 men lost their positions, entailing severe hardship. Master Workman Magee, who acted a prominent part, affirms that it is the purpose of the railroad managers to drive out of the business all who were identified with the Knights of Labor; that on some roads none of the old men are restored.

The January exports from San Francisco were the largest for the same month in the history of the city, with a single exception. The total valuation was \$3,791,674, of which \$2,611,354 were to Europe and \$1,180,326 to Pacific ports. Among the latter the Hawaiian Islands lead with \$296,000. China, Mexico, Australia and Central America are next, in the order named. Mexico is doing better than before for a long time, while Australia is falling off.

The leading cities and towns of the new State of Washington are Tacoma, Seattle, Spokane Falls, Ellensburg, North Yakima, Port Townsend and Whatcom, all entering upon a prosperous career. The *West Coast Trade*, a weekly paper just started in Tacoma, holds that "Tacoma possesses by right of situation unusual advantages as a jobbing center. Located at the head of ocean navigation, in the midst of as rich and fertile a country as the sun shines upon, it is evident that kind nature intended the 'City of Destiny' to become a supply point, not only for Washington Territory, but eastern Oregon, Idaho and Alaska. There are other corroborative arguments to this claim. Tacoma is the terminus of the great trans-continental railroad in the United States; the terminus of the Japan and China trade; the terminus of the steamship lines to Alaska, and terminus of various lines of boats plying the waters of the sound. Last fall the East was startled by the fact that the surplus wheat of the great inland empire could be shipped through the port of Tacoma and sold in Liverpool in competition with wheat grown on the Atlantic. Our hops command the highest market price in Liverpool. The Nicaragua Canal will be completed some time, and then Tacoma will be 8000 miles nearer New York and 6000 miles nearer Liverpool than she is to-day, and her position as a jobbing point will be second to none in the country."

A. J. Drexel has determined to establish "The Drexel Industrial College for Women," at Wayne, Delaware County, Pa. The entire expense of the institution, including endowment, will reach, it is said, \$1,500,000.

Our seacoast defenses for the better protection of harbors are the subject of earnest inquiry by the Army Board on Ordnance and Fortifications, and the board is now convened at the War Department to further consider the plans of designing engineers. In accordance with the act of Congress, the Watervliet Arsenal, at Troy, N. Y., is now being rapidly converted into an army ordnance gun foundry, at which place the heavy guns for the seacoast defense will be put together. The forgings for this large caliber of ordnance have been contracted for. Reports have been received from Lieut. W. Crozier, of the Ordnance Corps, who was sent abroad about

three months ago especially instructed to make a specialty of gun carriages, and from Lieut. F. E. Hobbs, whose efforts were to be confined to the latest improved method of producing steel. A large order for munitions of war was received at the Allegheny Arsenal on Saturday.

All traffic on the Columbia River and Puget Sound, so far as the Oregon Navigation and Railway Company are concerned, has been wholly suspended, officers and men refusing to work at the proposed 10 per cent. reduction.

The endurance of the steam-engine is well illustrated in the case of the White Star steamship *Germanic*, which has made 280 trips across the Atlantic and steamed nearly 1,000,000 miles. On a recent trip she arrived at Queenstown in 7 days 9 hours and 27 minutes from Sandy Hook, or five hours less than her best previous voyage.

It is again reported that the Oceanic steamship line from San Francisco to Australia will withdraw from service at the end of October, as the North German Lloyd Company, heavily subsidized, are arranging to secure it. Some years ago Wm. H. Webb, of this city, maintained a line to Australia for a considerable length of time, but was compelled to abandon the enterprise for lack of substantial encouragement.

Secretary Tracy has appointed Frank A. Dennette mechanical superintendent of the gun foundry in Washington city. This position has remained vacant for some time, owing to the inability of the Navy Department to procure a competent man for the place. Mr. Dennette has been in the employ of the Bethlehem Steel Works for some time and lately with the South Boston Iron Works.

Justice Cullen, of the Brooklyn Supreme Court, decides, in the case of Mr. Higgins, soap manufacturer, that the certificate of inspection from the insurance company does not exempt owners of boilers from inspection by the constituted authorities.

Legislative delegates from nearly all the cattle-growing States are holding a convention in St. Louis to defeat the alleged beef and pork combination.

By the will of J. V. Williamson, admitted to probate on Monday, another \$1,000,000 is given to the charitable institutions of Philadelphia, including nearly all the old well-established hospitals and homes and some libraries, educational institutions and miscellaneous charities. Noticeable among the gifts of special importance are \$25,000 to the Apprentices' Library and \$20,000 each to the Academy of Natural Sciences and the Academy of the Fine Arts. The crowning act of Mr. Williamson's philanthropic life was the gift of \$2,500,000 for the founding of the Williamson Free School of Mechanical Trades, which is to be built as soon as a location is decided upon. The affairs of the project are now in the hands of a board of trustees selected by Mr. Williamson. The estate of Mr. Williamson will amount to between \$8,000,000 and \$9,000,000, exclusive of the fund for the mechanical school.

Prospects for the completion of the Hudson River Tunnel to connect the railroads terminating in New Jersey with this city have suddenly become brighter. Colonel Haskin, the indefatigable projector, ceased operations only when funds became exhausted. Quite recently an effort to raise money was attempted in London. The *London Financial News* says that the applications for the issue of \$1,500,000 first mortgage 6 per cent. bonds of the Hudson Tunnel Railway Company have exceeded \$2,500,000.

MANUFACTURING.

Iron and Steel.

A press dispatch from Pottsville, Pa., under date of the 5th inst., says: "The employees of the Fishbach rolling mill of the Pottsville Iron and Steel Company, which has been idle for several weeks on account of a reduction of wages, held a meeting in this city to-day to consider a compromise proposition offered by the company. A reduction of 10 per cent. for the tonnage-men was agreed to, with the understanding that as soon as an improvement in the market warrants it the men shall have the benefit of the advance. On the day-men it was agreed that there should be a partial reduction confined to those receiving the higher rate of wages. The agreement has been ratified by both sides, and the mill will start up in all departments tomorrow morning, the entire force of some 800 employees resuming work."

The new Soho Furnace of the Moorhead-McCleane Company, at Pittsburgh, produced 5550 gross tons of pig iron last month.

Mr. S. R. Smythe, secretary of Swindell Construction Company, Lewis Block, Pittsburgh, Pa., engineers and contractors of regenerative gas furnaces, &c.; informs us that his company have changed the name of their firm to the Swindell & Smythe Company, as there are several construction companies, in the same and other businesses, which conflict somewhat with theirs. They will continue to carry on the same business. All the members connected with the Swindell Construction Company will still continue to hold the same interest in the newly-named firm as before.

No. 1 furnace of the Isabella Furnace Company, at Etna, Pa., for the week ending February 16, produced 1812 gross tons of pig iron, and for the following week produced 1810 gross tons. For the month of February just closed both stacks produced 11,974 gross tons. This is certainly an enviable record.

The Scottdale Iron and Steel Company, Limited, of Scottdale, Pa., will soon commence the erection of an additional sheet mill.

Carnegie, Phipps, & Co., Limited, of Pittsburgh, operating the Beaver Falls Mills, at Beaver Falls, Pa., are making some extensive improvements and additions to the plant. An order for 50 wire-nail machines has recently been placed with the National Machinery Company, of Tiffin, Ohio, which will be placed in the works at an early date.

A dispatch from Findlay, Ohio, under date of the 8th inst., reads as follows: "The Findlay Iron and Steel Company to-day passed into the hands of a receiver, owing to financial complications contracted before the removal of the plant from Cincinnati. The liabilities are said to be \$30,000. C. H. Emerson was made receiver."

The Stewart Iron Company, Limited, of Sharon, Pa., are operating Nos. 1 and 2 blast furnaces and 13 puddling furnaces to their full capacity.

The nail factory of the Kelly Nail and Iron Company, at Ironton, Ohio, which has been idle for some weeks, has resumed operations in full again.

It is expected that the present week the entire new plant of the Allegheny Bessemer Steel Company, at Duquesne, Pa., will be in operation. The blooming mill has been in operation for several weeks, and a large supply of blooms being secured, it has been decided to start up the rail department. It is understood

that the company have booked some large orders for rails, sufficient to run the plant full time for some months to come. H. P. Smith, the secretary of the company, who has been in the South since November last, for the benefit of his health, is reported greatly improved and will probably return to Pittsburgh some time during the early part of April next.

During the month of February just closed the blast furnace of the Bellaire Nail Works, at Bellaire, Ohio, produced 4559 gross tons of Bessemer pig iron, or an average of about 163 tons per day.

For the month of February the blast furnace of the Belmont Nail Company, at Wheeling, W. Va., produced 3200 gross tons of Bessemer pig iron.

The nail factory of the Junction Iron Company, at Mingo Junction, Ohio, closed down on Saturday, the 2d inst., for an indefinite period.

A despatch from Youngstown, Ohio, under date of the 7th inst., says: "James Friend and Adrien Hoffstot, of Pittsburgh, with Lloyd Booth and Ralph J. Wick, of this city, have purchased the rolling mill of the Wheeler Iron Company at West Middlesex, which has been idle for the past two years. The price paid was \$8625. The plant cost \$135,000, and most of the machinery is in excellent condition. The purchasers have not decided whether they will operate the plant or dispose of it to other interests."

A boiler in the forging department of the Cleveland Rolling Mills, at Cleveland, Ohio, exploded on Monday morning.

A dispatch from Atlanta, Ga., announces that the Cartersville Furnace Company, the Etowah Company and the Daisy Coal Company now constitute one corporation, under the name of the Etowah Land and Mining Company, with a capital stock of \$1,750,000, with the privilege of increasing it to \$5,000,000. The work will proceed through trustees until the charter is granted. The work on the furnace has been suspended pending negotiations, and the general plan will now be greatly enlarged, and as soon as the new plans have been fully agreed upon the work will be rapidly pushed to completion.

Machinery.

McGill, Manchester & Co., Limited, founders and machinists, of Pittsburgh, recently shipped to the Allegheny Bessemer Steel Company, at Duquesne, Pa., a hot bed consisting of tables and hot and cold pull-ups, weighing about 180,000 pounds. This firm are now building eight hydraulic cranes for the new steel works, at Latrobe, Pa.

Lodge, Davis & Co., of Cincinnati, are now installed in their new quarters at Lake and Canal streets, Chicago, where they have established a branch for the exhibition and sale of their lathes, planers, shapers, milling machines, &c. They make a specialty of engine lathes, with taper attachment, hollow spindle, compound rest, automatic stop to carriage and other attachments, all without extra charge. A feature of their stock is their upright drill press, with patent automatic stop to the down feed, patent quick return, &c. All tools are sold f.o.b. Chicago.

At the works of Schleicher, Schumm & Co., of Philadelphia, manufacturers of the Otto gas engines, we recently saw a twin engine which had furnished power for the entire shop for more than eight years, and which during that time had never refused service, and had cost less than \$10 yearly for repairs. A 50 horse-power gas engine of improved design will soon be placed on the market. Recent sales include two 50 horse-power engines to the Raleigh Gas

Light Company, and one of 50 horsepower to the Derby Gas Company, of Birmingham, Conn., and the Atlantic City Gas and Water Company.

The Stillwell & Bierce Mfg. Company, of Dayton, Ohio, have just engaged in the manufacture and sale of mining machinery and appliances, and for this purpose have associated with them Mr. W. H. Bowers, a mining engineer and metallurgist. The company will make leading specialties of his patented inventions.

Pedrick & Ayer, of Philadelphia, builders of machine tools, have completed plans for a new brick building having a frontage of 40 feet and a depth of 160 feet and two stories high. Upon the first floor will be placed the heavy machinery employed in the manufacture of their large universal milling machines. The iron posts of this story will be provided with powerful cranes, and overhead will be lines of track arranged so as to conveniently handle the work. The engine and boiler room, in the basement at one end of the building, will be covered with brick arching on iron beams. Above this will be the forge-room and a large steam hammer built on a special foundation. On the second floor will be the offices, drafting-rooms, pattern-shop, &c. Each department will be well lighted by an excellent arrangement of skylights.

The firm of Goodell & Waters, of Philadelphia, have in press a large and fully illustrated catalogue showing the improvements they have made in their wood-working machinery. This book—judging by the last issue, will be far in advance of the usual catalogue style—will contain illustrations of all their most important machines, together with clear descriptions of their merits.

Hardware.

The new barbed-wire department of the Cleveland Rolling Mill Company, at Cleveland, Ohio, has commenced operations with a fair amount of orders on hand.

On Wednesday, the 6th inst., notices were posted in the plant of the Wheeling Hinge Company, at Wheeling, W. Va., notifying the employees of a 10 per cent. reduction. The men refused to accept it and the works closed down. The company will attempt to operate the works with new hands, and expect to have no trouble to secure a full complement of men.

S. L. Bignall Hardware Company, 283 Lake street, Chicago, Ill., are giving their attention principally to sad irons, sinks, soil-pipe and fittings, but manufacture also pitcher spout pumps, sinks, blacksmiths' tuyere irons, tire drills, barn-door hangers, jack screws, &c.

Last week the Enterprise Mfg. Company reported 12 hands in the foundry; to-day they are running 21 and have others engaged, and expect in a very short time to report that they have all the molders they need. The former employees are trying their best to prevent new men from working, and to some extent have succeeded, but the company say that no matter how long it takes or what the cost may be they intend to have an independent shop, and not be dictated to by any more grievance committees.

The striking employees of the Ames Shovel Works, in North Easton, Mass., have been notified to vacate the corporation tenements by March 21. None of the men will return unless all are taken back, and Mr. Ames says some of them he will not reinstate. The strike is likely to affect other departments.—*Philadelphia Ledger*.

The Copper Situation.

The newspapers have devoted an unusual amount of attention lately to the metal trade, and have generally been hostile to the syndicate. This has probably been due to the fact that information and comment had come chiefly from disappointed metal brokers, and that the greater number of writers have been able to refer to past predictions with a triumphant "I told you so." From the point of view of the French speculators the situation is certainly very serious. It has become a question not of ultimate success, but of saving as much as possible from the wreck. There is every evidence that heroic efforts are being made to avert a complete panic, which would hurt far greater interests than those which appear on the surface.

Dealing first with the course of events on this side, we may state that in October last the syndicate made overtures to the American companies to extend the existing contracts for 12 years, making, with the two years of the existing unexpired contracts, 14 years. This extension was sought by the speculators, as it would seem, chiefly for the purpose of enabling them to induce English financiers to enter into the proposed metal bank. The American companies were not in a hurry to bind themselves for so long a period. Negotiations dragged, the scheme taking the form finally of a bank in which the American companies were to be represented by four directors, the full board deciding from time to time upon prices and upon the amount of the production. In the meantime English capitalists hung back, and the load became unmanageable for the syndicate and its backer, the Comptoir d'Escompte. The severest blow to the latter was the withdrawal by the Russian Government of its deposit of 25,000,000 francs, followed by the suicide of the leading director and a run on the bank. Simultaneously the American companies, to relieve the situation, agreed at a meeting, at which the leading producers were gathered for the first time, to reduce production 20 per cent., the understanding being that all the mines with which the syndicate had contracts in other parts of the world would do the same.

Events in Paris followed one another in rapid succession. To avert a panic the Bank of France and a number of leading French bankers came to the aid of the Comptoir d'Escompte, advancing it very heavy sums, which enabled it to withstand a run. It is now understood that the Mathesons, a large concern, closely allied with the Rio Tinto Mining Company, the leading Spanish producer, have taken over a large amount of the copper originally held by the Société des Métaux and the Comptoir d'Escompte.

So far as the mining companies in this country are concerned, the situation is the following. Every one of them received

letters of credit on bankers like the Seligman, Belmont & Co., Kidder, Peabody & Co., Brown Brothers, Ladenburg, Thalmann & Co., Müller, Schall & Co. and others for sums equivalent to the purchase price for the output of the guaranteed figure. While in the majority of cases these credits were only for one year's product, others were for the output for the whole period of three years. The mining companies delivered the copper to the agents of the syndicate, but drew against their credits only to the extent of those amounts of copper which were not sold to consumers in this country. The result has been that—at least with the majority of the Lake companies—only a small part of the sums secured to them by credits were drawn. The credits for the first year's product expire during the next few months, and it is probable that considerable balances will remain to the good of the bankers. They in turn appear to have principally worked with the Comptoir d'Escompte, although other French banking institutions are involved. Demands made by the mining companies upon the American bankers during the past few days have been promptly met. To the American mining companies the only uncomfortable feature about the situation is the certainty that the exceptional profits of 1888 are not likely to return for many a year. So far as the immediate future of the metal is concerned, it is pretty clear that the stock of the speculators is tied up in the hands of bankers who have loaned on it enough money to make it probable that the metal will not be sacrificed by throwing it over for what it will fetch.

The majority of large consumers in this country have made contracts up to June for Lake copper at 16½ cents. A few declined to enter into them, but the majority took at least a part of their needed supplies. Outside of the holdings of the syndicate and the bankers affiliated with it, very little, if any, Lake copper is available in this market, and not much can be returned from abroad in the original packages duty free. Unless some reasonable arrangement can be made their position is very unsatisfactory. The trade, the buyers in large or small quantities of copper goods, will certainly buy little or nothing now when lower prices for the raw material are established and still lower figures may be reached in the near future.

Failures in the Iron Trade.

It is a misfortune of the iron trade that undue importance is attached by the public generally to the failures occurring in it. A large dry goods firm may fail, or a great wool house may succumb to the force of adverse circumstances, and beyond the attention given to it as a matter of news no special notice of it will be taken. Hasty generalizations as to the condition of associated interests will not be made by newspaper writers, but the particular occurrence will be permitted to stand on its own basis. But if an iron concern of any considerable importance yields to financial pressure the opinion at once prevails that the entire trade is affected by "dry rot" or some other distemper, and sensational reports and interviews are worked up by the enterprising conductors of the daily press. It appears to make no differ-

ence in such cases if special circumstances in no way connected with the legitimate manufacture and sale of iron have precipitated the catastrophe. It would seem that the outside world firmly believes that the manufacture of iron is either so very profitable that errors of judgment will not seriously affect balance sheets, or so universally unremunerative that the failure of one establishment is but the precursor of widespread ruin. When the latter view is taken and a general alarm is sounded, it is remarkable that more failures do not occur through the impairment of confidence which must follow.

The iron trade of this country is not in a condition of demoralization or impending collapse, even if the recent failures would seem to convey that impression. Those who are immediately affected by these failures have good reason for taking a despondent view of the situation, but the great mass of the people who are not thus brought into positive contact with the resulting pecuniary loss or are not thrown out of employment should not permit their sympathy to control their judgment. At a time of widespread financial derangement, as in the years following the war, there was reason for grave apprehension when failures occurred. Every failure of any magnitude in such a period precipitated a train of evils involving whole communities in distress. Timidity and excessive caution controlled the money lenders, and, as nobody could foresee how sound financial order was to be brought out of the chaos of conflicting views among statesmen and students of political economy, it was no wonder that confidence almost ceased to exist and that credit became merely a tradition. It required years to correct the troubles which existed, manufacturers being obliged to accumulate fresh capital, which was a very slow process. At length upon that foundation was erected a new edifice of faith in the successful prosecution of ordinary business ventures, which exists to-day, and will continue to exist if it is not undermined by the foolish work of those who are now proclaiming general demoralization.

Possibly the recollection of those distressful times is the underlying influence causing apprehension now, particularly among those who regard the iron business as an unfailing barometer showing the condition of general trade. If they will reflect for a few moments they will remember that in 1884 and 1885 the country passed through a period of liquidation following an era of excessive railroad building and speculation. Prices dropped then to unprecedented rates, and a number of manufacturing establishments were forced to the wall. Yet there was no general demoralization, and confidence was not seriously impaired. In some parts of the country heavy investments were made during that very time in new manufacturing enterprises. The finances of the country were not deranged, and capitalists shrewdly argued that we were merely taking breath after severe exertion, which would be followed in due time by another forward movement. This came in 1886 and 1887, and those who had prepared for it reaped their justly earned profits. The country is again resting, and although prices have receded to rates still lower than those of 1884 and 1885, this is not an

unmixed evil and by no means does it portend universal bankruptcy in the iron trade.

It would be marvelous indeed if a condition of business would ever be realized in which failures would not occur until some calamity overwhelmed the entire trade. Such a peculiar state of affairs is not to be expected as long as business ventures are made with insufficient capital or at points possessing inferior resources, or by persons lacking some of the essential elements of successful management. A combination of unfortunate circumstances, such as the sudden curtailment of the demand, diminished prices and bad debts, may precipitate a failure independently of the causes just enumerated, but they will considerably hasten a failure if they are additional and cumulative. As the iron trade is now suffering from a reduced demand and low prices, there may be other establishments whose financial soundness and business management will be severely tested, and in some cases with disastrous results, but no considerable proportion of their number will be forced to the wall. The public should not accept the complaints of manufacturers about their unprofitable and unsatisfactory business as evidence of the unsound condition of the entire trade. Many establishments are even now fairly profitable, many others are making both ends meet with tolerable precision, and most of the remainder will be able to worry through this dull period without serious consequences to their financial backers.

Amendments to the Interstate Law.

One of the last official acts of President Cleveland was the signing of the bill amending the Interstate Commerce act. These amendments do not in any way change the principles underlying the original bill. They are intended rather to punish violations with more severity. It is provided that joint rates shall be published and otherwise considered the same as through rates. Such in effect they are, but some technical doubts about them have been raised which are now dismissed. Taken in connection with the recent decision of the commission, which practically calls every shipment a through one when a through bill of lading is issued, whether the through rate is prorated or merely a combination of locals, it is clear that every possible help is to be given toward extending the power of manufacturers and merchants to reach every city and hamlet by a through rate. This, indeed, is the basis of much of our modern trade, and the extension of the system as far as possible is in the line of progress. Then, reductions of rates must be preceded by three days' notice. Additional precautions are taken to secure to the commission the powers of the courts necessary to carrying out its work and its decrees.

The most important section of the amended law is the one relating to frauds, or what has become known as underbilling. That part of it which refers to shippers of freight we quote in full:

Any person and any officer or agent of any corporation or company who shall deliver property for transportation to any common carrier, subject to the provisions of this act, or for whom as consignor or consignee any such carrier shall transport property, who shall

knowingly and willfully, by false billing, false classification, false weighing, false representation of the contents of the package, or false report of weight, or by any other device or means, whether with or without the consent or connivance of the carrier, its agent or agents, obtain transportation for such property at less than the regular rates then established and in force on the line of transportation, shall be deemed guilty of fraud, which is hereby declared to be a misdemeanor, and shall, upon conviction thereof in any court of the United States of competent jurisdiction within the district in which such offense was committed, be subject for each offense to a fine of not exceeding \$5000 or imprisonment in the penitentiary for a term of not exceeding two years, or both, in the discretion of the court.

If any such person, or any officer or agent of any such corporation or company, shall, by payment of money or other thing of value, solicitation, or otherwise, induce any common carrier subject to the provisions of this act, or any of its officers or agents, to discriminate unjustly in his, its, or their favor as against any other consignor or consignee in the transportation of property, or shall aid or abet any common carrier in an such unjust discrimination, such person, or such officer or agent of such corporation or company, shall be deemed guilty of a misdemeanor, and shall, upon conviction thereof in any court of the United States of competent jurisdiction within the district in which such offense was committed, be subject to a fine of not exceeding \$5000, or imprisonment in the penitentiary for a term of not exceeding two years, or both, in the discretion of the court, for each offense; and such person, corporation, or company shall also, together with said common carrier, be liable, jointly or severally, in an action on the case to be brought by any consignor or consignee discriminated against in any court of the United States of competent jurisdiction, for all damages caused by or resulting therefrom.

Another part of the same section provides the same penalties for any officer or employee of any railroad who shall by the same means cause an unjust discrimination to be made in rates between one shipper and another. We know from reports and investigations already made public that the state of things described in these sections had become common. And while it is fair that merchants should be condemned as well as railroad men, it should not be forgotten that the responsibility for the condition of things which demanded this legislation rests largely upon the carriers themselves. By special agreements with shippers in the past to carry certain articles below the regular tariffs by billing them under false weights or descriptions these competing railroad agents have urged upon shippers the very practices which the carriers have been denouncing, and thus fastened the objectionable underbilling upon the whole business community. In this as in so many other things in trade it is the most unscrupulous railroad agent or shipper who sets the standard for all the rest. It is this standard which it is the province of Government to regulate. The old idea that Government should let everything alone to regulate itself is not now followed. We have laws regulating the employment of children and the compulsory stoppage of work on Sundays, for example. If these were left to conscience any single manufacturer or dealer who should hire only children or work Sundays could soon compel every competitor to do the same. Thus we find Government regulating, not competition, but rather the conditions under which competition shall be carried on. So in the matter of underbilling.

We have no doubt that the new law will in the end be beneficial, though it may at

first work disturbance in those lines where business had settled down under the old system of getting a low rate because everybody else did and carriers contracted to give it. If the classification upon any article is too high, or if the tariff rate from any part of the country to any other part is so great as to be prohibitory, let the fact become known and let proper measures be taken for bringing about a change. In the interest of good business this is better than to meet one wrong by another or to disguise the shipment. In this matter of false representation and consequent cut rates the merchant who attempts to defraud is more easily detected than the carrier who underbills to give some shipper an advantage. But under the law we expect to see justice done to all parties concerned.

Protection of Maritime Commerce.

England relaxes no effort in her ambition to surpass all other powers in the strength of her naval armament. Increased expenditure by rivals for the same end operates as an incentive on her part to redoubled exertion. She realizes the preponderance of her maritime commerce as compared with that of other nationalities, and that just here is her most vulnerable point, to be guarded at any cost. The subject acquires a fresh interest just now in Great Britain from the fact that Lord Brassey, a recognized authority in naval affairs, a few days ago addressed a meeting held under the auspices of the London Chamber of Commerce—with any number of admirals and members of Parliament among his auditors—at which he sought to demonstrate the present insufficiency of the British navy and the necessity of more liberal expenditures upon this arm of the national defense. He pointed out that other powers less exposed on the open sea in case of hostilities would be enabled to employ their entire available force in offensive warfare. For this reason, therefore, the Admiralty in past experience have found it of the first importance to "seal up" the enemy by a blockade, keeping watch in the offing, thus limiting the power for mischief, rather than attempt to protect 40,000 ships and upward of 9,000,000 of tons scattered all over the world. But blockading service is more arduous than before the days of steam, as pointed out by Admiral Hornby in a supplementary speech, the modern blockading force being a constant consumer of coal, and consequently unable to keep continuously at sea. This fact makes needful an adequate auxiliary force in reserve.

These united arguments in favor of increased expenditure, deemed imperative to insure the continued naval supremacy of England, were made conclusive by a comparison with France and Russia. It was shown by a tabular statement that within the last 26 years England has expended in the construction of new vessels fully \$250,000,000, while France expended for like purposes \$162,000,000, and that in the present year the difference against France is nearly as three to two. Despite this present and prospective preponderance in favor of England, Lord Brassey declared that so far from being satisfied, the rate of augmentation "ought to be four to two," a sentiment that was warmly applauded. All efforts, the speaker contended, should

be concentrated on "the finest and fastest vessels the constructors of the period could produce." He emphasized the value of unarmed cruisers and expressed special satisfaction with the assistance to be obtained from the mercantile marine for its own protection. All the leading mercantile powers—Italy, Germany, the United States and France—have given liberal encouragement to the building of steamships capable of conversion into fast-sailing cruisers. Admiral Hornby, whose magnificent views of the requirements of the British navy have excited much remark, not only concurred in the demands of his predecessor, but insisted that at least 300 cruisers would be wanted at the outbreak of war.

Naval authorities at Washington will doubtless take note of proceedings in London and govern themselves accordingly. A practical hint is conveyed by the expression of one of England's best naval authorities to the effect that the *furor* that accompanied the introduction of iron-clads and armored fleets is being succeeded by a wholesome reaction, and that swift cruisers, comparatively unprotected, constitute, in fact, the right arm of the national defense. Herein we find a tacit recognition of principles that are fully accepted in the practice of the Naval Board of the United States. At the same time, heavy armaments, dynamite guns, torpedoes and kindred warlike appliances all have their appropriate place. To provide plants on a scale commensurate with the demands of modern warfare must for years to come tax the best energies of all leading commercial powers. The United States cannot afford to pose as an indifferent observer of events.

The Blast Furnaces March 1.

As will be seen from the details given below, the capacity in blast has slightly increased, although there has been a falling off both in the anthracite and in the charcoal plants. This is due to an increase in the capacity of the coke furnaces. Although the number has not been greater, the output has been somewhat heavier.

On the first of the month the status of the anthracite furnaces was:

Anthracite Furnaces March 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	24	11	3,286	13	3,702
New Jersey.....	13	5	2,183	8	2,382
Spiegel.....	3	3	220	0	0
Pennsylvania:					
Lehigh Valley....	44	24	8,739	20	6,707
Spiegel.....	1	1	70	0	0
Schuylkill Valley..	38	24	8,916	14	4,120
U. S. Susquehanna Valley	17	11	3,642	6	1,256
Lebanon Valley....	16	13	6,307	3	1,193
U. S. Susquehanna Valley	22	11	4,555	11	3,420
Total.....	178	103	37,937	75	20,880

For a year past our records show the following:

	Furnaces in blast.	Capacity per week.
March 1.....	103	37,937
February 1.....	107	39,187
January 1, 1889.....	107	38,728
December 1, 1888.....	99	34,879
November 1.....	95	33,645
October 1.....	95	33,728
September 1.....	92	33,541
August 1.....	93	33,397
July 1.....	92	32,478
June 1.....	99	32,418
May 1.....	96	31,003
April 1.....	94	30,496

March 1.....	98	28,596
February 1.....	97	29,969
January 1.....	118	38,206

There have been no changes in New York or New Jersey. In the Lehigh Valley Crane is now running four out of five, Thomas eight out of twelve, Bethlehem two out of seven, Glendon two out of five, Coplay one of three and Lehigh both. In the Schuylkill Valley Norristown and No. 3 Phoenix blew in during February, while Merion went out. No change is reported from the Upper Susquehanna or from the Lebanon Valley, while in the Lower Susquehanna Valley one of the Chickies furnaces went out for repairs and improvements. Montour went out on the 2d.

The month opened with the following coke furnaces in blast:

Coke Furnaces March 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	3	1	1,144	2	2,300
Pennsylvania:					
Pittsburgh district.....	18	18	21,695	0	0

Wisconsin.....	3	2	1,085	1	500
Missouri.....	6	2	1,135	4	1,560
Colorado.....	2	1	490	1	450
The South:					
Virginia.....	12	9	4,021	3	2,117
Kentucky.....	4	4	1,290	0	0
Alabama.....	22	18	10,543	4	1,850
Tennessee.....	11	10	4,854	1	290
Georgia.....	2	1	501	1	275
Total.....	213	150	100,757	63	32,708

As compared with previous months, these figures stand as follows:

	No. of furnaces.	Capacity per week.
March 1.....	150	101,737
February 1.....	150	98,518
January 1, 1889.....	157	103,720
December 1, 1888.....	151	101,748
November 1.....	146	94,695
October 1.....	137	85,481
September 1.....	133	81,082
August 1.....	122	74,355
July 1.....	121	69,543
June 1.....	128	75,427
May 1.....	130	75,815
April 1.....	128	70,644
March 1.....	128	68,892
February 1.....	126	73,912
January 1.....	143	83,101

In the Pittsburgh district all the furnaces are active. Clinton, operated by a syndicate of creditors of Graff, Bennett & Co., is again working. Laughlin & Co. have reconsidered their plan of tearing down their two old furnaces, having repaired and started one of them. The other has been dismantled. This increases the number of furnaces in Allegheny County to 19. The new Carrie is rapidly approaching completion, and will be ready not later than May 1. We may note that the output of the two Isabellas for February was the largest in their history, being close upon 3000 tons per week for both. Soho, too, made a good record for a new furnace.

Nothing is reported from the Shenango, Juniata and Conemaugh or Youghiogheny valleys, except that Charlotte was banked for a few days for repairs. In Maryland Catoctin, which was banked during February, was blown in. The West Virginia furnaces are making good records, their aggregate February product being 10,860 gross tons. In the Mahoning Valley Thomas resumed on the

27th ultimo, and Girard lost 10 days to make repairs. In the Hocking Valley Glasgow and Floodwood are out, leaving only Akron, Bessie, Crafts, Fannie, New York and Winona at work. Among the other Ohio furnaces no changes have taken place. The Illinois furnaces produced in February 88,009 gross tons, including spiegel, against 53,494 tons in January, the decrease, of course, being due to the stoppage of the Union plant.

The only facts worthy of recording in connection with the Southern pig iron producers are that the new No. 2 North Birmingham furnace, of the Sloss Company, blew in the 12th ultimo, and that Bibb stopped work. In the near future the second De Bardeleben, the fourth Ensley and the Trussville furnaces will be added to the list, the latter awaiting only the laying of the sidings. Sheffield, too, expects to see some of its completed stacks make their first cast at an early date. In Kentucky the second Ashland started on the 20th ultimo.

The condition of the charcoal furnaces was as follows:

Charcoal Furnaces March 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New England.....	14	8	605	6	495

In New York Copake was to blow in again on the 10th inst. In Pennsylvania Mont Alto is still repairing, but will soon resume, and Pine Grove is expected to be ready for work early next month. In Virginia all the furnaces are idle. Walton and White Rock are, however, now getting ready for a blast. In Kentucky Bellefonte has probably stopped producing at this writing. In the Hanging Rock Region Bloom and Mount Vernon are getting ready. Jefferson will be out of blast at least three months for lack of charcoal. Michigan furnaces did well in February, making a total of 15,365 gross tons, as compared with 15,906 tons in January. Hinkle and Minneapolis continue to do good work in Wisconsin. In the South Gadsden is to start this month and Round Mountain reported that it would resume on the 4th inst.

The Warren Tube Works, at Warren, Ohio, which cost \$250,000 to erect three years ago, were on Tuesday appraised at \$30,000, and will be offered at sheriff's sale April 13. The sheriff on Tuesday levied on the property of the Lewisburg Nail Works, at Lewisburg, Pa., on execution issued on judgments confessed on the company's paper, amounting to \$32,000. Most of the indorsers are the directors of the company, and they took this step to save themselves as far as possible. There is also a mortgage of \$35,000 on the plant. The works were shut down.

CORRESPONDENCE.

Ball Bearings.

To the Editor: I notice in *The Iron Age* of February 21 an old acquaintance, "Ball Bearings," whom I supposed had departed from active life years ago. I believe its introduction to the mechanical world came partly through the writer by assisting in its adaptation to certain purposes, but without any claim to its invention, that being due to Mr. Kirk, who designed it for the reduction of friction upon the axles of light carriages. A full account of it and of its application to several steamers built at Philadelphia for taking the thrust of propeller shafts will be found in a communication to the *Artisan*, March number, 1856, published in London. This plan was also applied to take the weight of cranes in a large machine shop in this city previous to its publication in the *Artisan* and subsequently to the support of rudders in large ships. No doubt Mr. Grant's designs are original with him, but the many years which have elapsed since their first application to the identical purpose named by him is another example of the Scriptural aphorism, "There is no new thing under the sun." W. J.

PHILADELPHIA, March 6.

Our correspondent, who is a very widely known mechanical engineer, does not, we believe, appreciate quite correctly the motive which led *The Iron Age* to publish Mr. Grant's designs for ball bearings. In the majority of cases probably their application will not be claimed to be new. The leading point in our estimation was the fact that through the development of the Simonds machine the cost of manufacturing true balls for bearings has been so much reduced that their introduction has been made far more widely possible. In order to demonstrate what may be accomplished by the use of ball bearings, we expect shortly to illustrate a machine intended for unusually heavy work and the durability of which has been greatly increased by the introduction of ball bearings throughout. While reducing the wear and tear, it does the same work it formerly did with less power.

The Economy of Recuperative Gas Heating Furnaces.

To the Editor: The Ajax Forge Company, of Chicago, have at their works two of my recuperative gas heating furnaces, one running since November, 1887, in connection with a train of rolls and other machinery, and is heating rails in lengths of 2 feet to 5 feet; the other is running in connection with a steam hammer in front and a power-former on one side of it, and is heating car axles or piles of scrap for the hammer and sometimes rail sections for both machines. The work-chamber of these furnaces is accessible from three sides, and the new furnace has doors in front and one side. To each furnace is attached a vertical tubular boiler 4 x 10 feet with fire-box, forming the lower part of the stack. Both furnaces run day and night, and the steam made in these boilers is run into the main steam-pipe to help run the machinery of the works.

The rail furnace has to heat 28,000 pounds of rails, the capacity of the machinery, from cold to bright yellow in 22 hours or 1270 pounds in one hour, and consumes every 24 hours 6000 pounds of Illinois coal, or 250 pounds per hour. It has a hearth of 7 feet 6 inches by 5 feet 3 inches, with three doors. One of these is used for drawing while another is being charged. No cold

air enters the doors to chill the hearth and oxidize the charge; the shrinkage of metal due to heating is 2 per cent. Recently the amount of water evaporated by the rail-furnace boiler was measured by meter and found to be 347 cubic feet per 25 hours, or 868 pounds for one hour. An ordinary tubular boiler, evaporating at a rate of 8½ pounds of water from and at 212° per pound of Illinois coal, would require 124 pounds of coal to evaporate those 868 pounds of water from 50° to steam of 70 pounds pressure. In comparing the efficiency of this furnace with that of furnaces which do not furnish steam, these 124 pounds of coal have to be deducted from the total amount of 250 pounds, leaving 126 pounds of coal for heating purposes, which is equivalent to 198 pounds of Illinois coal per ton of rails heated from cold to bright yellow, the waste being 2 per cent. This every-day practice is considerably below the capacity of the furnace and the effectiveness of the system, because

1. The work of the furnace is limited by the capacity of the machinery; it has heated at the rate of 48 pounds of rails per square foot of hearth per hour and can do more.

2. The recuperator of the furnace is limited in size, on account of the mill floor being low down on the water in the ground.

3. The capacity of the vertical boiler (put up to economize space) is too small, as shown by the heat escaping from the top of the flues.

The new hammer furnace works quick and hot; it heats two car axles in one open door to soft white heat in 15 minutes—regular time, 20 minutes—with a shrinkage of metal equal to 2 per cent.; it will also heat 10 piles of 150 pounds each in 25 minutes—regular time, 30 minutes. These furnaces work with a continuous flame (no reversing) and occupy but little more space than ordinary heating furnaces. They can be built of any size and to suit special purposes.

Respectfully yours,

JOHN ZELLWEGER.

162 LA SALLE STREET, CHICAGO, ILL.

The Metal Exchange and Pig Iron Warrants.

To the Editor: The very interesting discussion which has for the last few weeks been carried on in your columns anent the newly established company for storing pig iron on warrants, and especially the thoughtful letter from Mr. Hull, as published in *The Iron Age* of February 8, prompts me to say a word or two on behalf of the members of the New York Metal Exchange, who naturally look upon this new departure with much interest. We believe that to encourage speculation in great commodities of trade is a good thing, not only in systematizing the speculation which will inevitably exist as one of the impulses of human nature, and removing many of the elements of unnecessary risk, but also and perhaps even more, by relieving those who manufacture, consume or deal in a given commodity for such a profit as represents only the legitimate reward of their industry and return on their capital from the necessity of taking speculative chances of price, under which they lie when there is no distinct class of speculators to assume these risks.

But apart entirely from the ethics, as it were, of speculation as ordinarily incident to a warrant system of storage, it seems almost incredible that any one should dispute for a moment the benefits of a large stock of goods in moderating the violence of fluctuations, and the danger to trade in the absence of such a stock; and even more incredible that speculators should have failed to grasp the abnormal position of iron in this respect. It is as if a great city

like New York should depend for its water supply on the casual flow of streams in its vicinity, without providing by means of reservoirs for such a reserve as would supplement the natural sources in the event of drought or meet an unexpected consumption as the result of sudden activity in factories using water or a spell of warm weather that would increase the demand for drinking and bathing purposes. If we can imagine a community so imprudent as to place themselves in such a predicament, we can readily picture their sad plight in case of need and the eager competition of capital to control the few days' supply of water that would be available under such circumstances.

Yet precisely a similar condition exists in regard to iron to-day, and the many industries dependent upon that useful metal are at the mercy of the purely speculative elements of the country, which may at any moment seize upon and corner every pound of iron available for immediate needs, with a very small expenditure of capital. Or the article may actually corner itself in case of a marked revival of consumption, just as happened in the early months of 1879. At that time, or at the beginning of that year, the furnaces had on their hands unsold but 126,000 tons of iron, and stocks in second hands had become so far reduced as to be altogether inadequate to meet the extraordinary demand which then sprung up with the revival of trade. The inevitable result was a "boom" of colossal proportions, whose disastrous collapse has led every one to dread a repetition. The few speculators who were shrewd enough to grasp the situation at the proper time made money, but the net result to those actually engaged in the production or use of iron was a serious loss.

How near we are to a similar experience may be readily seen when we consider that although the actual stock in sight is larger now than it was nine years ago, the proportion to annual output is a trifle less, being 4½ per cent. at the end of 1879, and only 4⅓ per cent. of the production at the end of 1888, while the stocks which are not held by the furnaces are even smaller now than then and the current price is hardly \$1 per ton higher. Contrast this showing with that in Great Britain and we may judge how weak are our safeguards as compared with those which have been accorded by the use of the warrant system abroad. Cozmal's stores have for years contained an amount of iron never less than 70 cent. of all the iron produced in Scotland annually, and at present hold over 1,000,000 tons, just about as much as was made during 1888. The various stocks which can be traced through England and Scotland aggregate over 2,000,000 tons, or seven times as much as the reserve held in this country, although the British annual production averages not more than 500,000 tons above the American, the respective figures being 7,500,000 to 8,500,000 tons and 6,000,000 to 6,500,000 or 7,000,000.

The results are very apparent. While our prices are ranging from \$17 to \$25, the extremes in foreign quotations are rarely more than \$2 a ton apart. At the time of the boom of 1879-80 we saw an advance of \$25 and a decline of \$20 inside of 18 months; but the highest price in the Scotch market was only \$8 above the lowest during this period, although the wild fluctuation in our market had a strong effect on the foreign one. Our permanent range of price is higher than that in Glasgow and Middlesboro' for a variety of reasons, but English and Scotch ironmasters enjoy a steady market, from which they can in the long run be more certain of a remunerative business than our own furnacemen, who are strangers to any condition of affairs other than a hand-to-mouth dependence on the changes of the market. For this regularity of trade the foreign

makers are chiefly indebted to the reaction upon one another of systematic speculation and the warrant system that prevails in a number of the British iron centers. The speculators not only allay extreme fluctuations by their readiness to buy at each decline or sell out whenever a slight rise shows them a small profit, the many interests involved constantly operating as a check upon each other; but the speculative contingent also serves another purpose in the new capital which it attracts to investment in iron, creating, as it were, a new kind of consumption, which absorbs the increased stocks brought into being by the warrant system. Without the latter there will still be speculation, but it will be of the hurtful kind that aggravated the natural corner of 1879; and it is of this kind that we stand in danger to-day. For there cannot well be imagined a more likely chance for making a large sum of money than for a few gamblers in the public necessity to buy up the ridiculously small supply of iron in sight, and hold the iron trade at their mercy. At the first sign of a rapid growth in consumption, such as is sure to come sooner or later, we may depend upon it that the opportunity will be availed of; for there is not a single commodity of importance in which there is such a paucity of reserve to act as a balance-wheel upon prices as is the case with iron. Rarely less than 25 per cent. of the year's crop of wheat, corn, cotton or coffee is carried in stock; but our stock of iron is no larger than it was when we produced annually three-fourths of our present output; is one-seventh that carried by a country possessing but a slightly larger trade, and is, as Mr. Hull has already pointed out, barely sufficient to meet the absolute needs of the people if our furnaces were to simultaneously shut off their blast for a single fortnight.

This is a dangerous situation for all except the men who may hope to be successful in the eventual speculation, and it behooves the really conservative element of the trade to carefully consider the fact that the stock of iron grows steadily less in proportion to the need for it, and to do their best to remedy this by lending a cordial support to any measures that will encourage the accumulation of a suitable reserve.

TALLMADGE DELAFIELD,
President New York Metal Exchange.
NEW YORK, March 8.

John Ericsson.

This illustrious engineer was born July 31, 1803, in the province of Wermland, Sweden. He died in this city on Thursday night last. The accompanying engraving, for which we are indebted to *Harper's Weekly*, is pronounced by his secretary, S. W. Taylor, to be the best portrait. His father, Olof Ericsson, was proprietor of mines, his mother, Sophie, being the daughter of an iron-master. Nils, John Ericsson's elder brother, rose to be baron, colonel of engineers, chief of the state railways, and with his three sons sat in the Swedish Diet. At the age of 10 John Ericsson constructed a miniature sawmill and a pumping machine that attracted the notice of Count Platen, chief of the great ship canal intersecting the Swedish peninsula. At 12 the youthful contriver was made a cadet of mechanical engineers; the following year a leveler on the canal. At 17 Ericsson entered the army as ensign and rapidly reached a lieutenantancy in consequence of his beautiful military maps, which had attracted the special attention of King Charles John (Bernadotte).

When about 22 years old Lieutenant Ericsson constructed a flame engine of 10 horse-power, and journeyed to London in 1826, on leave, to introduce it. Once

there he resigned his commission. The resignation was accepted, but first he was promoted to a captaincy. He has never returned to his native country, but from it has received many honors and decorations, while in 1867 a great granite monument, quarried by the unpaid labor of the miners, some of whom had worked for his father, was set up with gala festivities in front of his mansion, inscribed "John Ericsson was born here in 1803."

During the next few years in England Ericsson produced about 40 machines, of which a third were patented. They included a file-cutting device, an instrument for taking soundings (still in use), a hydrostatic weighing-machine, an apparatus for making salt from brine, a pumping engine, a rotary steam engine and a famous system of artificial draft for steam boilers, dispensing with huge smoke-stacks and economizing fuel. To the steamship *Victory*, in 1828, he applied the principle of condensing steam and returning the water to the boiler; and four years later he gave to the *Corsair* the centrifugal fan-blowers now generally used in American steam vessels. In 1830 he introduced in the locomotives *King William* and *Adelaide* the link motion for reversing steam-engines. In 1834 he superheated steam in an engine on the *Regent's Canal Basin*.

In 1829 the Liverpool and Manchester Railway had offered a prize for competing locomotives. Ericsson planned and hurried to completion an engine, the *Novelty*, in seven weeks. The *London Times* of October 8, 1829, said that in speed it "far excelled" all competitors; that "it was the lightest and most elegant carriage on the road yesterday, and the velocity with which it moved surprised and amazed every beholder. It shot along the line at the amazing rate of 30 miles an hour." But Stephenson's *Rocket* proved superior in point of traction. "In locomotive engineering," wrote John Bourne nearly half a century later, "nothing more original or more elegant has been produced than the *Novelty*." Ericsson in 1829, nearly three-score years ago, constructed a steam fire-engine employed in putting out a fire in the Argyle Rooms. Another the next year guarded the Liverpool docks; a third was sent to Berlin. Ten years later, in 1840, the Mechanic's Institute of New York gave its large gold medal to Ericsson for the best system of fire-engines.

His famous caloric engine was produced in 1833. The scientific world of London hailed it with astonishment. Lardner, Ure, Faraday and Sir R. Phillips gave special attention to it. The high temperature evolved prevented that first machine from becoming practical, while 20 years later, in 1853, a voyage of the caloric ship *Ericsson*, a vessel of 2000 tons, 260 feet long, from New York to Washington and back, showed that, though economical in fuel, the new heated air motor could not produce speed enough at sea for commercial purposes, nor compete on any large scale with steam. Still it has been applied successfully in more than 6000 engines to minor useful purposes—pumping, printing, hoisting, grinding, telegraph instruments, sewing-machines, and so on. The American Academy of Arts and Sciences awarded the gold and silver medals of the Rumford premium to Ericsson "for his improvements in the arrangement of heat, particularly as shown in his caloric engines of 1858." This was the second bestowal of the Rumford medal in this country.

But we go back now to chronological order, and come upon that device of supreme importance, the screw propeller. In 1837 Ericsson built a tug, 40 x 80 feet, with 3 feet draught, having two propellers of 5½ feet diameter, invited the British Admiralty to inspect it, and towed their barge at a rapid rate; but their lordships solemnly concluded that as the motive power was in the stern the novel

craft would not steer! Ericsson in 1839 came to America and in 1841 began to build the *Princeton*, the first naval vessel that ever carried her machinery under the water-line, out of the reach of hostile shot. This vessel dictated reconstruction to the fleets of the world. The *Princeton* included other inventions of Ericsson—a direct-acting steam engine of unusual compactness; a telescope smokestack, in place of the tall ordinary pipe; a centrifugal blower in the hold; a gun carriage with machinery for taking up the recoil, the self-acting lock allowing the gun to be fired accurately. The *London Mechanics' Magazine* has said: "The undivided honors of having built the first practical screw steamer, the first screw war ship, the first cupola (turret) vessel, belong to John Ericsson."

To this first turret vessel we now come. Such a device had been offered by Ericsson in 1854 to Napoleon III, and in the fall of 1861 he proposed it to our Navy Department. By extraordinary energy and executive skill the *Monitor* was launched, with steam machinery complete, 100 days from the laying of the keel plate, and arrived in Hampton Roads just in time to defeat, March 9, 1862, the Confederate iron-clad *Merrimac*, which had destroyed the *Cumberland* and Congress and was about to sink or disperse the rest of the Government's wooden fleet. But for the *Monitor* the whole face of the war might have been changed and European interference attempted.

A fleet of iron-clad vessels of the *Monitor* type was built with extraordinary rapidity after the victory at Hampton Roads. Six of them, in Charleston Harbor, within 52 days, were struck by hostile shots an aggregate of 629 times without one penetration of side armor, turret or pilot-house. The *Weehawken* defeated and captured the Confederate ram *Atlanta*, and the *Montauk* destroyed the *Nashville*. In 1864 the monitors captured the ram *Tennessee*. Russia, Sweden, Norway and Turkey adopted the American turret system, and when the *Miantonomoh* crossed the ocean even the British construction yielded, and carried it out on a far larger scale. During the last years of his life Ericsson proposed, for defensive war, to destroy the tremendous naval structures his system caused to be built up. His last iron vessel, 180 feet long, carried a submarine 16-inch gun 30 feet long, to discharge a projectile weighing 1500 pounds, and containing 300 pounds of gun-cotton, against an ironclad's hull, beneath the customary water-line armor belt, with such effect that water-tight compartments would be of no avail. As Ericsson called his locomotive *Novelty* and his impregnable battery *Monitor*, so he called this latter creation *Destroyer*.

The variety of Captain Ericsson's work was only less remarkable than its intrinsic importance. In 1851, at the London World's Fair, he exhibited an instrument for measuring distances at sea; a hydrostatic gauge for fluids under pressure; a gauge for the volume of water passing through pipes; the alarm barometer; a pyrometer; a measure for fluids by the velocity with which they pass through definite apertures; a sea-lead for use without rounding the vessel to the wind. His contributions to the Centennial Exhibition of 1876 are described in a volume of 600 quarto pages. Among his scientific investigations were remarkable computations of the influences tending to retard the earth's rotary motion, including the weight of material taken from below the earth's crust and piled above it by the hand of man.

Favored by the possession of a robust constitution and ample means, Ericsson was able to devote many years exclusively to the investigation of solar heat, and to the determination of the mechanical energy which the great luminary has in store for

mankind when the coal fields become exhausted. A sun motor, illustrated in "Nature," vol. xxix., page 217, was erected by the experienced engineer 1883 on his premises in Beach street.

The Reading Failure.

A meeting of the creditors of the Reading Iron Works was held at the office of the company in Philadelphia recently. George F. Baer, a director of the company and also its counsel, read a statement of the financial condition of the corporation, which showed the total liabilities to be \$1,927,783.22 and assets \$2,439,595.09. It was agreed to appoint a committee of three to conduct the mills temporarily. On this committee the company and the creditors were represented, the former by the appointment of Director Simon Seyfert and the latter by Mr. F. Patterson, a heavy creditor. F. W. Swink, the general manager of the works at Reading, was the other member chosen. The committee will continue in control for the time being, and in the meantime a careful appraisal of the assets will be made. For this purpose a second committee of five was named, and upon this the creditors and the company were given representation. The members of the committee are John Cole, of New York; John H. Hagan, of Philadelphia, a prominent iron man; R. McIlvaine, of Reading; William Frich and Albert Foster, of the Philadelphia and Reading Railroad Company. Another committee will go to work at once and prepare a plan of reorganization. This committee will report at a meeting to be held on Thursday, if possible, or if not then at a meeting the date for which will then be agreed upon. The members of the committee are all bankers and are as follows: President Rogers, of the Traders' Bank; E. T. Clark, Edward H. Nichols and Peter Hollis. A statement of the assets and liabilities is as follows:

Assets.

Real estate—tube works plant....	\$406,772.88
Rolling mill.....	88,000.00
Furnaces.....	318,750.43
Scott foundry.....	357,728.13
Sheet mill.....	206,573.11
Steam forge.....	107,700.00
Ice machine plant.....	4,214.99
Iron ore, leasehold and fixtures...	23,985.09
Gibraltar Iron Works.....	64,137.13
Camden Tool and Tube Works....	35,000.00
Water-works, Reading.....	17,700.00
Limestone quarry.....	6,500.00
Scarborough land.....	2,068.50
Jenkins purchase.....	4,076.36
Indian real land, Kansas.....	1,732.36
Bedford coal land.....	5,000.00
Hartford ore land and fixtures....	2,717.42
Geo. Russell, real estate.....	400.00
Real estate & dwellings, Reading	45,600.00
Lehigh avenue real estate.....	100,000.00
Sundry real estate.....	11,850.00
Boone property.....	1,538.68
Wm. Crouse property.....	429.00
Chester land.....	26,575.50
Stocks, bonds and mortgages.....	47,293.25
Materials, goods and supplies at works.....	252,392.30
Work on two cotton presses.....	30,000.00
Stock in warehouse.....	98,406.50
Book accounts due to company, general.....	65,581.20
Book accounts due to company, warehouse.....	70,118.98
Bills receivable.....	8,145.76
Cash.....	19,603.32
Total.....	\$2,439,595.09

Liabilities.

First mortgage issue.....	\$590,000.00
First mortgage held for hunter dower.....	10,000.00
Bills payable.....	630,790.69
Open accounts due by company, general.....	194,059.71
Open accounts due by company, warehouse.....	28,240.53
Loans.....	170,000.00
Indorsements on bills received on unfilled orders.....	287,692.29
Wages unpaid.....	11,000.00
Total.....	\$1,927,783.22
Leaving a balance of assets of....	501,811.87

The above statement does not take into account in the liability column the capital stock of the company, which amounts to \$1,050,000, consisting of \$550,000 in preferred stock, which was issued in 1884 to the creditors in the failure of the company in 1881, and on which 7 per cent. interest has been paid, and \$500,000 in common stock. Adding this capital stock to the liability account would leave an apparent deficit of \$548,188.13. The report of the committee appointed to make

sels would also suffer. The blockade of the American coast by a German fleet would soon arouse England and France, as cutting off their trade would very speedily draw those powers into antagonism. The advantage of the Samoan troubles if they go no further will be to show the necessity of a greater activity in rebuilding the navy.

In connection with his researches, Admiral Porter has prepared the following exhibit of the ships of the German navy:

Name	Crew.	Speed.	Tons.	Battery— No.	Caliber.	When built.
Preussen and Friedrichder.....	587	14	6770	4	10.25	1873
Grosse.....	2	6.70	...

* Wood. † Sister ships to the Viper: Weepe, Biene, Scorpion, Muecke, Basilisk, Cameleon, Crocodile, Natter, Salamander and Hummel. ‡ Sister ships to Bismarck: Blucker, Stosch, Moltke, Gueisanan (1879), and Stein (1879), with two more of improved type building in 1885. § Sister ships to Carola: Olga, Maria and Sophia. † Building in 1885 two sister ships not yet named to replace Nympe and Medusa (of same class as the Alexandra).

an appraisement may change somewhat the figures in the asset column, as those given are taken from the books of the company, which are based on the original cost price.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., March 12, 1889.

The possibilities of the Samoan situation will for some time allay any apprehension as to the surplus. The startling reports concerning the Nipsic were a subject of profound concern in administrative circles. The discrediting accounts since received have allayed the excitement somewhat, but the President and his counselors have considered the situation and its possibilities very carefully, and are ready to act promptly should the crisis come. At the Navy Department there is also much activity. The Government will await further information, and unless some overt act of hostility shall have been committed the Berlin conference will be permitted to run its course in the line of an amicable settlement if practicable. The most careful study of the situation and its possibilities from a naval standpoint has been given by Admiral Porter. He admits that the navy is not sufficiently strong to cope with the German ships at present, but the ability to build ships and plenty of them with ample resources of money and material is in our hands. The Admiral says that a fleet of fast privateers to prey upon German commerce could be fitted out in 60 days at an outlay of not over \$50,000,000. There are 600 German steamers afloat which would be destroyed or driven from the sea. The sailing ves-

The Government has issued orders to accelerate the work on the vessels now being constructed, and the new ships authorized will be hastened through the preliminaries and gotten under way as speedily as possible. The opinion of Senators and Representatives in the city is decidedly in favor of the most comprehensive measures to meet the emergency. If the Samoan controversy should necessitate an extra session, the building of ships and manufacture of materials of war would involve an outlay of fully \$200,000,000, a large share of which would be expended in steel and iron. The stimulus to activity in the metallurgical industries would be without precedent. By July 1 contracts will have been let increasing the navy by over 15,000 tons.

The Ordnance Department of the army is making very satisfactory progress on the proposed gun foundry at Watervliet Arsenal, West Troy, N. Y. The plans have been completed and advertisements for proposals to construct the buildings have been made public. The plans for the machinery have also been prepared. General Benet is in hopes of having the foundry in such a state of advancement that the work of manufacture of guns will begin at the earliest possible day. In the fortification bill for the fiscal year of 1889-90 is an item of \$35,000 for the assembling of guns, which was the amount asked by the Ordnance Department as all that will be required for the next year. General Benet says that the gun foundry at Watervliet will, in a very short time, be one of the finest establishments of the kind in the world.

Australia will contribute £35,000 annually toward new British war ships.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 96 and 97 Washington street, CHICAGO, March 11, 1889.

Pig Iron.—The volume of business is still shrinking. While some dealers continue to report a fair run of orders, others have been unable to sell more than a few carloads of Iron during the entire week. At the same time, there is a decided diminution in the pressure to sell by furnace companies. Some of them have disposed of so much of their anticipated product for the year that they are asking advanced prices, which, of course, takes them out of the market for the time being. Others are instructing their agents to solicit no more orders for future delivery, having adopted the policy of offering Iron only when they accumulate a stock of some grade for which they have no contracts. It is reported that one of the strongest furnace companies in the South, financially, will shortly blow out their furnaces and await the return of better prices. This indicates the feeling in that section. Lake Superior Charcoal is in but limited demand, yet prices are sustained. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Coke, No. 1, \$16 @ \$16.50; No. 2, \$15 @ \$15.50; No. 3, \$14.50; Chicago Scotch, No. 1, \$17.50; Lake Superior Charcoal, Nos. 1 and 2, \$19.50; Nos. 3 to 6, \$20; American Scotch (Blackband), No. 1, \$18 @ \$19; Jackson County Silvery, No. 1, \$18 @ \$18.25; other Ohio Soft Irons, No. 1, \$17.25 @ \$17.50; Southern Coke, No. 1 Foundry, \$16.25 @ \$16.75; No. 2 Foundry and No. 1 Soft, \$15.75 @ \$16; No. 3 Foundry, \$15 @ \$15.50; Gray Forge and No. 2 Soft, \$14.50 @ \$14.75; Tennessee Charcoal, No. 1, \$19.

Bar Iron.—An improving demand is noted in some quarters, and there is a slight revival of Car work, with sales of small quantities for this purpose during the week. Prices are no higher, but, on the contrary, the market has been disturbed by reports of Iron of good quality being offered at rates far below anything hitherto considered necessary to effect sales. Carload lots of Good Common Iron are ordinarily quoted at 1.60¢ @ 1.62½¢, half extras, f.o.b. Chicago, but these prices are shaded for large lots or good specifications. Store prices still range from 1.80¢ to 2¢, according to quantity and quality.

Structural Iron.—So far as can be ascertained, no large orders were placed, but fair prices are now being made of small lots. Prices are unchanged.

Plates, Tubes, &c.—Dealers report a very fair week's business, but no orders were taken running above 25 to 50 ton lots. Plenty of work is still in sight, and the prospects are quite bright in this branch of the trade. Collections, however, are not so good as they should be. Quotations are unchanged.

Sheet Iron.—Jobbers are beginning to place their orders with manufacturers of Black Sheets for summer and fall delivery. The movement in this direction is unusually early, but they do not propose to get caught again as they were last fall. Manufacturers' prices range at about 2.90¢, f.o.b. Chicago, for No. 27 Common Black. Sales are being made from store at 3.10¢ @ 3.20¢ for No. 27, but trade is very light at present. Manufacturers' agents have had a very good week in Galvanized, mill orders being much larger than for several weeks, while warehouse stocks have also been drawn upon quite actively. Jobbers quote small lots at 65 % off for Juniata and 65 % and 2½ % off for Charcoal, but manu-

facturers' agents claim to be getting 62½ % and even 60 % for small lots of Juniata.

Merchant Steel.—Nothing new has occurred in this line. While prices are very low, they do not seem to attract consumers, and business is very dull. A leading Steel house notes as a curious feature of its February trade that the number of separate sales was much larger than for many months, while the aggregate tonnage was smaller than usual, indicating small stocks among its customers and their almost unanimous determination to buy only from hand to mouth. Quotations are unchanged.

Steel Rails.—The sales of the week have aggregated about 6000 tons, ranging from a 2000-ton order to a carload. While no improvement in the immediate demand can be noted, the manufacturers are feeling a little more cheerful over the prospect. Several deals are in progress, involving considerable quantities, and it is felt that as the season advances more Rails will certainly be needed by the railroads than they can now foresee. Quotations continue at \$30 @ \$30.50, according to quantity.

Railway Supplies.—More activity is reported now than at any time since the year opened. This is merely a comparative statement, however, as business is by no means good. Quite a large sale of Steel Splice Bars was made during the week, and a number of contracts were entered for Spikes and Bolts. Competition among the manufacturers is very keen, and the following quotations can probably be shaded on large lots: Splice Bars, 1.75¢; Spikes, 2¢; Bolts, with Hexagon Nuts, 2.65¢.

Old Rails.—The last sales of Old Iron Rails reported were made at \$21, but the quantity now to be had is very limited, and as holders are quite stiff in their views it is difficult to determine what the market price is at present. Although this would seem to warrant the expectation of higher prices, dealers are conservative, and the best posted are inclined to believe that no further advance will be made. Old Steel Rails are worth \$14.50 @ \$15 for short lengths; \$18 @ \$20 for long lengths or \$16.50 as they run. Old Car Wheels are variously quoted by dealers at \$18.50 @ \$19, but no transactions of consequence have transpired.

Scrap.—Old material is moving, but only in small quantities, consumers buying sparingly. The railroads are offering a great deal of Scrap at present, so that stock is abundant. An inquiry for a large lot of Mixed Steel is in the market, which is something novel. Mixed Country Scrap is worth \$13 @ \$14. Regular quotations to consumers are as follows, per ton of 2000 lb: No. 1 Railroad Shop, \$19 @ \$20; Mixed Track, \$18 @ \$19; Fish-Plates, \$21; No. 1 Mill, \$14 @ \$15; Pipes and Tubes, \$13 @ \$14; No. 2 Mill, \$9.50; Axles, \$25; Horseshoes, \$18 @ \$19; Machinery Cast, \$13; Stove Plate, \$10.50; Cast Borings, \$8.50; Wrought Turnings, \$11 @ \$12; Axle Turnings, \$13; Mixed Steel, \$10.50; Coil and Leaf Steel, \$15; Tires, \$15 @ \$16.

General Hardware.—Business in Shelf Hardware is not evenly distributed at present, some houses reporting a most excellent state of trade, while others note a decided falling off. Prices appear to be at a standstill. The manufacturers of the coarser classes of goods are inclined to curtail production, and with a little increase in the demand their prices would be decidedly firm. As to the jobbing trade, while there is very sharp competition in progress, the disposition is growing to try to get a little more profit out of their business this year than last. Margins have been cut so closely that it is necessary to do an enormous trade to secure

even a reasonable return for a year's work and risk. In the Heavy Hardware line a similar condition of trade prevails, some houses finding the demand very light, while others are enjoying a good run of business. Collections are very good for the season.

Nails.—The situation is unchanged from the manufacturers' standpoint. They are maintaining prices and making but small sales either of Steel or Wire Nails. The jobbers are stiffening up a little, but have not changed their regular quotations, which are as follows: \$2 @ \$2.05 for small lots and \$1.95 for carloads of Steel Nails, and \$2.40 for small lots and \$2.35 for carloads of Wire Nails.

Barb Wire.—While the demand has been very good, prices have shown no indication of improvement. Small lots of Painted are quoted at 2.75¢ @ 2.80¢ and carloads at 5¢ @ 10¢ per 100 lb less, with Galvanized at 60¢ per 100 lb more. The quotation of 2.65¢ in last week's issue for small lots of Painted was a typographical error. It should have been 2.75¢.

Pig Lead.—Consumers are apathetic, finding the demand for their products very light. A few carloads have been sold at 3.55¢ for Eastern shipment, but the local trade is not inclined to bid even 3.50¢.

Rogers, Brown & Co., who for the past eight years have occupied an office at 98 Dearborn street, Chicago, announce their removal March 15 to the Rookery Building, at Adams and La Salle streets. They will occupy room No. 309, on the first office floor. Quite a movement of Iron firms is in progress to this building. Rogers, Brown & Co. represent 23 furnaces, mainly Ohio and Southern.

The firm of Low & Woodruff has been succeeded by C. E. Woodruff & Co. as manufacturers' agents, at 121 Lake street, Chicago. They are Western agents for Oliver & Roberts Wire Company and the Pittsburgh Wire Nail Company, as well as for manufacturers of Bar and Sheet Iron, Binders' Twine, Refrigerators, Bolts, Nuts, &c.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St. (PHILADELPHIA, Pa., March 12, 1889.)

Pig Iron.—The market remains in about the same condition as noted a week ago. Prices are unchanged, while the demand is still slow, although large enough to absorb the local supply without affecting prices. Offerings from distant points are smaller than they were some time ago, and as reports West and South continue to be favorable makers in this vicinity are inclined to maintain firm quotations, with some degree of confidence that further improvement is only a question of time. The discouraging feature is that consumers do not see their way to a very active demand in the near future, so that orders from them are a little uncertain. Then all hope and the majority seem to expect a good business during the spring and summer months, but for the present it is more a matter of faith than an accomplished fact, so that purchases are made with a great deal of caution. Prices are believed to be at actual rock bottom; this seems to be conceded everywhere, but in spite of that consumers are not taking large lots. They argue that if the demand improves they can "catch on" at a very trifling advance, if not at to-day's figures, and it is not worth while to buy stuff unless they can see their way to use it. Hence with this feeling of indifference it is not to be expected that the market will show much vigor, although, as already mentioned, holders are firm, in sympathy with the West and South,

and also because of the comparatively light supply of good local Irons. The conditions, therefore, are all favorable for improvement if the right kind of a start is made, but whether it will be made or whether things will drift along as they are is for the future to disclose. Present prices are \$18 at tide or No. 1 Foundry, \$17 for No. 2 and \$15.50 for Gray Forge, with 50¢ more, or in some cases 50¢ less, according to circumstances. The majority of sales of good Irons during the week have been at quoted rates, or possibly a shade less to a very desirable customer, but on the whole the market shows an encouraging degree of strength, considering its environments.

Foreign Iron.—No sales of importance have been made, although bids of about \$19, c.i.f., duty paid, could be had for Bessemer. Asking prices as follows: Bessemer, \$19.50 @ \$20, c.i.f., duty paid; Spiegeleisen, \$28.25 @ \$28.50, c.i.f., duty paid, for 20 %.

Blooms.—The usual movement is being made, at about last week's prices, the range being as follows: \$28 @ \$28.50, at mill, for Nail Slabs; \$29 @ \$30 for Sheet-Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for Flange purposes; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 @ "Bloom" ton of 2464 lb.

Muck Bars.—The demand is smaller than for some time past, and prices show irregularity without much strength. The best makes are held at about \$27, delivered, although some are quoted at \$26 @ \$26.50, but buyers seem indifferent, and bids are hard to get except for small lots.

Bar Iron.—There is more doing in small lots, but large orders are scarce, so that mills are getting very little work ahead. The demand is, in fact, the poorest for years, and not only are prices at the lowest, but mills can only be run to about half or two-thirds their capacity, so that work cannot be turned out economically. At present the outlook is very discouraging, as there are no inquiries likely to lead to much improvement. The demand for Car building has fallen off to almost nothing, and the same may be said in regard to Skelp Iron, although at this season a very sudden turn might occur at any moment. Meanwhile prices are irregular and weak, ranging from 1.70¢ to 1.85¢ for Refined Bars, 1.70¢ @ 1.75¢ for Grooved Skelp and 1.85¢ @ 1.90¢ for Sheared, with no demand of special importance so far as known.

Plate and Tank Material.—There has been more demand for the past few days, including an order for Ship Plates to the extent of about 800 tons. There is also some demand for Boiler and Tank Plates, and quite a good demand for Bridge Plates. Prices are very low, however, and to stand any reasonable chance of securing an order offers must be made at figures that can hardly return a new dollar for an old one. Nominal quotations are about as follows (but on large lots lower figures have to be accepted): 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates; 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.3¢ @ 3.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3¼¢; Fire-Box, 3¼¢ @ 3½¢.

Structural Material.—There is nothing new on the market, and the feeling is rather gloomy. Specifications on old contracts are coming in a little more freely, so that the mills are fairly busy for the time being, but there does not appear to be much new business in sight at the moment. Prices remain as before, viz.: Bridge Plate, 2¢ @ 2.1¢; Angles, 1.95¢ @ 2.05¢; Tees, 2.4¢ @ \$2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

Sheet Iron.—The general demand is only fair, although there is a good inquiry for specialties, which is likely to result in several large sales before the end of the week. Prices remain as before for small lots:

Best Refined, Nos. 26, 27 and 28....3 @ 3¼¢
Best Refined, Nos. 18 to 25....2½ @ 3¢
Common, ¼¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28....4 @ 4¼¢
Best Bloom Sheets, Nos. 22 to 25....3½ @ 4¢
Best Bloom Sheets, Nos. 16 to 21....3½ @ 3¼¢
Blue Annealed.....2½ @ 2½¢
Best Bloom, Galvanized, discount.....65 %
Common, discount.....67½ %

Steel Rails.—The market is still dull, and, while it is believed that things are shaping in the right direction for improvement, bids for large lots from the right kind of buyers are not to be had at present. Meanwhile a fair business is being done in small lots of Rails at \$27.50 @ \$28, at mill, and a considerable demand is reported for Blooms, Billets, &c., which, in a measure, renders the mills independent of a good deal of the Rail trade unless from such parties as make their trade desirable. Plenty of Rails could be sold by taking bonds in payment, but in the present state of the money market cash or its equivalent is a *sine qua non*.

Old Rails.—No sales to report as regards spot delivery. Lots delivered along lines of railroad in the interior are taken at \$24 @ \$24.75, but there are very few transactions on the seaboard. Shipments of T's are offered at \$23.75, and lots in store at \$24.50, but buyers manifest no interest in deliveries of this character.

Scrap Iron.—Firm and in good demand. Desirable qualities freely taken at rates quoted below: \$20.50 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice \$22; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$23 @ \$24; Old Car-Wheels, \$17 @ \$18, Philadelphia.

Wrought-Iron Pipe.—The demand is fair for the season and a great deal of work is under financial consideration, and while the outcome will undoubtedly be very large, ultimately, there may be some delay before reaching a definite conclusion. In the meantime prices are weak and irregular, with nominal discounts as before, viz: Butt-Welded Black, 55 %; Lap-Welded Black, 65 %; Butt-Welded Galvanized, 45 %; Lap-Welded Galvanized, 55 %; Boiler Tubes, 62½ %.

Nails.—No improvement can be reported in the condition of the Nail trade. Some of the mills have stopped work, but there is a good deal of pressure to realize in some quarters, so that prices are badly demoralized. Lots from store are quoted at \$1.90 @ \$2, but carload lots of some makes are offered at extremely low figures without meeting a very ready demand even then.

St. Louis.

OFFICE OF *The Iron Age*, 212 N. Sixth st.,
St. Louis, March 11, 1889.

Pig Iron.—The improvement noted in last week's report continues, and it now looks as if bottom had been reached and the time for improvement has arrived. Furnaces do not appear anxious to dispose of their product to any great extent, and in some cases on brands that are popular are asking a clean advance of from 25¢ to 50¢ @ ton. Gray Forge is quite active, and some good-sized orders have been placed during the past few days, and figures that were quoted three weeks ago would not be entertained to-day. One lot of 1000 tons was taken a few days ago by a local manufacturer on a basis of \$14, delivered here. Pig mills, machine shops, foundries, stove manufacturers, &c., are all busy, and will soon be in the market to

replenish their stocks, which they allowed to run down in consequence of the depressed condition of trade. A more hopeful feeling is expressed all around, and inquiries are coming in that speak well for the future of the market. Prices are firm, and the figures quoted herewith are generally adhered to, and only in rare cases are concessions of any moment obtained. We quote as follows for cash, f.o.b. St. Louis.

Southern Coke, No. 1 Foundry, \$15.25 @ \$15.75
Southern Coke, No. 2 Foundry, 15.00 @ 15.25
Southern Coke, No. 3 Foundry, 14.25 @ 14.75
Gray Forge..... 13.50 @ 13.75
Ohio Softeners..... 17.50 @ 20.00
Lake Superior Charcoal..... 21.00 @ 21.50

Missouri.

Charcoal Foundry, No. 1..... 16.00 @ 16.50
Charcoal Foundry, No. 2..... 15.00 @ 15.50

Tennessee.

Charcoal Foundry, No. 1..... 17.50 @ 18.50
Charcoal Foundry, No. 2..... 16.75 @ 17.50
Connellsville Coke, f.o.b. East St. Louis, \$4.70; St. Louis, \$4.85.

Bar Iron.—The demand for Bars is very satisfactory and some good-sized orders are being booked, but at prices that are anything but remunerative. Railroad work is improving and its influence is being felt to a certain extent in this department. Notwithstanding the activity prices are so low that there is little or no margin for profit, and it is claimed that in some cases actual cost is not realized. Small lots from store are quoted at \$1.80; Carload lots are quoted at from \$1.65 to \$1.75, according to circumstances.

Barb Wire.—There is no improvement in this branch, as far as prices are concerned, and it is evident that manufacturers will be compelled to wait until the spring demand sets in to enable them to advance prices to a paying basis. The volume of business is satisfactory and indications point to a largely increased demand for spring consumption. Prices are quoted as follows: For carload lots Two and Four Point Painted, \$2.80; carload lots Two and Four Point Galvanized, \$3.40, f.o.b. St. Louis; less than carload lots, 5¢ additional.

Cleveland.

CLEVELAND, March 11, 1889.

Iron Ore.—Activity in Ore circles during the past week seems to have been confined almost exclusively to negotiations with the vesselmen regarding lake freights for the season. The result has been several season charters from Escanaba to Lake Erie ports at \$1.10, which means a season rate of \$1.20 from Marquette and about \$1.30 or \$1.35 from Ashland. Two or three charters from the last-named port, and also from Two Harbors, are reported at \$1.30. The rate from Escanaba seems to have been permanently fixed at \$1.10. This rate not only includes Ore delivered at Cleveland, but also at Buffalo for the Eastern furnaces. Negotiations are known to be pending for substantial quantities of Ore to the furnacemen in the East, who have hitherto used foreign Ore almost exclusively. The Anthracite district affords an entirely new market for dealers in Lake Superior Ore and promises to take care of any possible surplus. Although numerous inquiries have been received from the furnacemen in the Mahoning and Shenango Valleys during the week, it is said that no new Ore beyond that already mentioned in these columns has been sold. The fact that freight rates have been practically established will, however, hasten the opening of the market.

Pig Iron.—Increased firmness and additional advances in prices are reported. The steady demand for Iron has been unaccompanied, however, by any excited views about prices. Sellers seem indifferent about extending sales beyond the

Iron likely to be produced from the Ores already on hand. Prices are about 25¢ per ton above last week's quotations. Mill Irons are selling freely at about \$14.75 @ \$15, and all grades of Bessemer Iron are reported firmer. The following are quotations:

No. 1 to 6 Lake Superior Charcoal.....	\$20.50 @ \$21.50
No. 1 Strong Foundry, Bessemer quality, per ton.....	17.00 @ 17.50
No. 1 Strong Foundry, per ton.....	16.00 @ 17.00
No. 2 Strong Foundry, per ton.....	15.00 @ 16.00
No. 1 American Scotch, per ton.....	17.00 @ 18.00
No. 2 American Scotch, per ton.....	16.00 @ 17.00
No. 1 Soft Silvery, per ton.....	17.00 @ 18.00
Mahoning and Shenango Valley Neutral Mill Irons, per ton.....	14.00 @ 15.00
Mahoning and Shenango Valley Red Short Mills, per ton.....	14.50 @ 15.50

Old Rails.—The market is still dull, with \$21 @ \$21.25 given as a fair price for Old Americans.

Nails.—Steel Wire Nails are now quoted at \$2.35, with no changes reported in other grades.

Ferdinand Schlesinger, president of the Chapin Mining Company, announces that M. A. Hanna & Co. have been appointed sales agents for the Chapin Ore. Existing contracts on Ore on Lake Erie docks will be settled by H. P. Lillibridge, who has been appointed general manager of the Chapin Mining Company.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, March 11, 1889.

Pig Iron.—There has been a fair volume of business in Pig Iron during the past week, but no special activity. The changes in prices have not been marked, but the tendency has been toward improvement, and on some grades of Southern Coke Iron there has been an advance of 25¢ per ton realized, which places them on a level with the production of Northern furnaces, which latter brands were held more firmly than Southern output during the break in the market. Charcoal Iron has been relatively easier than Forge grades, and Ohio Softeners and Silveries are reported in larger supply than will sell readily, but there has been no pressure to sell. It is mainly the large and strong buyers who have confidence in the market and are desirous of buying round lots for future delivery, yet even such buyers are not disposed to pay any material advance and no very large contracts have been reported closed, but there have been several 1000-ton lots. Gray Forge has sold at \$13.25; No. 1 Foundry at \$15 and Mottled at \$12.25 cash. The following are the approximate prices current here at the close for cash, f.o.b.:

Foundry.

Southern Coke, No. 1 (new classification).....	\$15.00 @ \$15.50
Southern Coke, No. 2 (new classification).....	14.50 @ 14.75
Southern Coke, No. 3 (new classification).....	14.00 @ 14.25
Ohio Soft Stone Coal, No. 1.....	15.00 @ 16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.00
Mahoning and Shenango Valley.....	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.00
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

Forge.

Strong Neutral Coke.....	13.00 @ 13.50
Mottled Neutral Coke.....	12.00 @ 12.50
Gray Forge.....	13.00 @ 13.25

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	21.00 @ 22.00

Manufactured Iron.—There has been a moderate volume of business without new features or essential change in prices.

Nails.—There has been a moderate demand and a steady market without essential change in prices. 12d @ 40d sell at \$1.95 @ \$2 per keg, with 10¢ rebate in

carload lots at the mills. Steel Nails sell at \$1.90 @ \$2, and Steel Wire Nails at \$2.55 @ \$2.60 per keg.

Old Material.—There have been moderate sales and a steady market for Old Rails at \$21 @ \$21.50, and for Old Wheels at \$18 @ \$18.50 per ton, spot cash.

Detroit.

WILLIAM F. JARVIS & Co., successors to Charles Himrod & Co., under date of March 11, 1889, report as follows: While there is undoubtedly a somewhat better feeling, yet the market here is by no means active. Other sections report an advance on some grades, but so far the rise has not reached this market. It is customary for most of the large buyers in this locality to place orders for 6 to 12 months' supply and have the Iron shipped as they may require during that time. Such furnaces as are willing to contract on this basis when prices are at the lowest point have no difficulty in disposing of their output; but those that sell only as they make realize better prices, although they do not sell in such large lots. Most of the Lake Superior charcoal furnaces are maintaining prices, but we have heard of some cutting being done, but to no great extent. With a quiet but firm market we quote as follows:

Lake Superior Charcoal, all numbers.....	\$19.50 @ \$20.00
Lake Superior Coke, all ore.....	18.75 @ 19.25
Lake Superior Coke, cinder mixed.....	17.75 @ 18.25
Standard Ohio Black Band.....	18.75 @ 19.25
Southern No. 1.....	17.00 @ 17.50
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	16.50 @ 17.00
Jackson County (Ohio) Silvery.....	18.25 @ 18.75
Old Wheels.....	18.50 @ 19.00

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, March 11, 1889.

Pig Iron.—The status of prices is now being looked upon with some degree of anxiety. For the past few days there has been a perceptible lull in the advance that was inaugurated some three or four weeks ago and there is not the continuous advance that was expected by most of the producing element South. Prices have not declined from the highest point reached, but now appear to be at a standstill. It is true that buying is very active and large blocks are being disposed of almost every day. Many large consumers are now buying ahead as much as the disposition of the producers will admit. It is evident that considerable quantities are being bought for speculation, although as yet but little has passed under the control of warehouse receipts. To what extent these transactions will occur will depend much upon the price in the future, for with but few exceptions this manner of handling their output is not looked upon with the highest degree of favor by the principal Southern producers. There are certain brands of Southern Irons that are still maintaining their position in the markets and are realizing \$14 @ \$14.50 for No. 1 at the furnaces, but many brands are being sold for \$12.25 @ \$13 for No. 1, f.o.b.

Louisville.

LOUISVILLE, KY., March 11, 1889.

Pig Iron.—The market has been quiet during the week, with few sales. Parties are in the market for Iron for long delivery, but their views are so low that furnaces are not disposed to sell. There is a good demand for Car-Wheel Irons, especially for deliveries running throughout the year, but offerings are being made lower than Lake Superior Car-Wheel brands have been sold here at any time in the past. Old Wheels are freely offered,

and some have been sold as low as \$17. We quote as follows:

Southern Coke, No. 1 Foundry, new classification.....	\$14.75 @ \$15.25
Southern Coke, No. 2 Foundry, new classification.....	14.25 @ 14.75
Southern Coke, No. 3 Foundry, new classification.....	13.75 @ 14.25
Gray Forge.....	13.25 @ 13.75
White and Mottled, different grades.....	12.75 @ 13.25
Silver Gray, different grades.....	13.00 @ 13.50
Southern Charcoal, No. 1 Foundry.....	16.25 @ 16.75
No. 1 Mill.....	14.75 @ 15.25
Southern Car-Wheel, standard brands.....	21.75 @ 22.75
Southern Car-Wheel, other brands.....	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry.....	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry.....	19.50 @ 21.00
Hanging Rock, Cold Blast.....	20.75 @ 22.75

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave., PITTSBURGH, March 12, 1889.

The general Iron and Steel industries continue in an unsettled and unsatisfactory condition. Overproduction, not only in this district but throughout the whole country, is the great source of the present state of affairs, but there is comfort in the fact that there is always a largely increased consumption of everything in this line in the spring and summer seasons, and it is confidently expected that orders will be coming forward pretty freely within the next few weeks. One of our best-informed manufacturers, who has given the matter a good deal of study, says that almost every purchaser of Iron and Steel in this district is losing money. Pig metal, he says, has fallen \$1.75 @ \$2 per ton since last fall, while the finished products have declined from \$3 to \$5 per ton. He says many of the mills would shut down only for the fact that they have their regular customers, who buy from them the year through, and they must keep them supplied, and this, too, at market rates, even if without profit. The same authority says in regard to wages; "The puddler gets \$5.50 in the Pittsburgh district, while the average price paid in all other parts of the United States is \$3.75 per ton and less. The wages paid in all other departments are proportionately greater than at mills in other districts. The Pittsburgh district pays the highest wages in the United States. This is one of the main reasons why we cannot run our mills at a profit under present circumstances. By the Pittsburgh district I mean all plants west of the city."

The coal trade is also in a very badly demoralized condition and additional failures are feared. All the down-river markets are very much overstocked and prices now ruling do not cover lay-down cost from Pittsburgh, and there there appears to be no demand. Some of our oldest river coal operators say that in all their experience they never knew the business to be in as bad a condition as it is at present. The coke interest is also sympathizing with others, but as yet it is not so badly demoralized.

Pig Iron.—There is an increasing demand and the market is steady at the improvement noted in our report of a week ago. Consumers generally are buying freely, and some of them have covered their wants for from 30 to 60 days. Mill Irons have advanced 25¢ per ton, as compared with the lowest; there was no change in prices during the past week, and the market is steady, but unchanged. City furnaces are pretty well sold up, and there is now a chance for furnaces in other localities to sell in this market, but they are at a disadvantage in the matter of transportation, which is a big factor in the present condition of affairs. Consumers claim that there is nothing in the market for the products to justify them in paying more for the raw material; on the contrary, they say that the latter is higher relatively than the former, but they nearly

all feel like stocking up, as they usually do at this season of the year. There is an improved demand for Foundry Irons, and Bessemer Iron is steady at the recent advance. We quote prices as follows:

Gray Forge Neutral.....	\$14.25 @ \$14.50,	cash
All Ore Mill.....	15.50 @ 16.00,	"
White and Mottled.....	13.50 @ 14.00,	"
No. 1 Foundry.....	16.00 @ 16.50,	"
No. 2 Foundry.....	15.25 @ 15.50,	"
No. 1 Charcoal Foundry.....	23.50 @ 24.00,	"
No. 2 Charcoal Foundry.....	21.50 @ 22.00,	"
Cold Blast Charcoal.....	25.00 @ 27.00,	"
Bessemer Iron.....	16.50 @ 16.75,	"

Included in the sales reported were some 7000 tons Bessemer Iron at prices ranging from \$16.50 to \$16.80, cash, and a lot of 1200 tons Neutral Gray Forge at \$14.50, cash, which is the ruling for standard brands.

Muck Bar.—There is some inquiry for futures, but very little for present delivery. We continue to give \$27, cash, as the ruling price, and consumers have no trouble in obtaining all they want for present or near-by delivery at the price quoted. Producers do not care to contract for delivery two or three months hence at the price quoted.

Manganese.—Sales of Ferromanganese at \$58.50 @ \$59, cash, for 80 %, with more doing of late. Spiegel is still quoted at \$28.50 @ \$29 for 20 %.

Manufactured Iron.—There is nothing new to note. Business continues light for the season, and prices are unsatisfactory and irregular, and it is difficult to give reliable quotations in consequence. It is hoped, however, that there will be a largely increased demand as the spring season becomes more advanced. And until there is no improvement in prices can reasonably be looked for. For best quality of Iron prices may be quoted on a basis of 1.70¢ for Bars, 60 days, 2 % off for cash, but poorer qualities can be obtained for considerably less. Skelp Iron is still quoted at 1.60¢ @ 1.65¢ for Grooved, and 1.90¢ @ 1.95¢ for Sheared.

Wrought-Iron Pipe.—There is a fair business, but no improvement in prices, which continue irregular and unremunerative. It is reported that an order for 18 miles of 10-inch pipe was placed here during the past week. Discounts are quoted as follows: On Black Butt-Welded Pipe, 60 %; on Galvanized do., 52½ %; on Black Lap-Welded, 70 %; Galvanized do., 57½ %; Boiler Tubes, 65 and 5 %; 2-inch Tubing, 11¢ per foot, net; 5½-inch Casing, 32¢ @ 33¢ per foot, net.

Old Rails.—There is more inquiry, but no sales have been reported for several weeks, in the absence of which we may quote \$23 @ \$23.50. Holders look for a pretty stiff market as soon as the demand opens up, and it is thought that some of the mills in the Shenango and Mahoning valleys will be on the market before long. Old Steel Rails quoted at \$17.50 @ \$18 for short and \$19 @ \$20 for long lengths.

Steel Rails.—The mills here continue to quote at \$28, cash, for small lots of from 1000 to 2000 tons, but a large order could be placed for considerably less. It is said that some large orders have been booked here at but little over \$26, cash. The Rail department of the Allegheny Bessemer Company will be in full blast in a few days; this is claimed to be one of the most complete mills in the United States, having been supplied with all the latest appliances and improvements. The Edgar Thomson mill has been doing some big work, having turned out one day last week 1150 tons of Rails.

Billets, &c.—Bessemer Steel Blooms and Billets are still quoted at \$27 @ \$27.50, cash, as to size, delivery, &c. Sale of 2000 tons Domestic Bloom Ends, at \$18, cash. Domestic Rail Crops may be quoted at \$18 @ \$18.50.

Merchant Steel.—The market for all kinds of Merchant Steel continues in a very demoralized condition; one of our oldest manufacturers remarked yesterday that he never knew the business to be in a worse condition than it is at present. Prices are being cut to such an extent that there is no margin for profit.

Railway Track Supplies.—Prices remain unchanged. Spikes, 2.10¢, 30 days; Splice Bars, 1.70¢ @ 1.75¢; Track Bolts, 2.75¢ with Square and 2.85¢ with Hexagon Nuts.

Old Material.—Demand continues light, while prices remain unchanged. No. 1 Wrought Scrap, \$20, net ton; Wrought Turnings, \$13 @ \$13.50; Car Axles, \$24.50 @ \$25; Cast Scrap, \$14.50 @ \$15, gross; Cast Borings, \$11 @ \$12; Old Car-Wheels, \$19.

Birmingham.

Office of *The Iron Age*,
28, Wilson House,
BIRMINGHAM, ALA., March 11, 1889.

Pig Iron.—The most notable thing in the Iron business of the Birmingham district is a perceptible stiffening, with very little selling. The Sloss Steel and Iron Company are well sold ahead, and, having got somewhat better prices than have been prevailing for some months, are cutting no figure in the local market. The Tennessee, Coal, Iron and Railroad Company furnaces here have light stocks, but are inclined to hold firmly in the conviction of an early better condition of the market. There has been a gratifying improvement in the business methods of furnace plants. Heretofore too many of the companies in this district have put up expensive plants, chiefly with the idea of enhancing the value of property, lands, &c., to sell early and get quick profits. Now there are signs of the business of Iron-making falling into the hands of real Ironmasters. When this occurs it is believed by the older and wiser heads that the Birmingham Iron district will be fixed on a better-paying, more substantial basis than ever. Movements are on foot for the erection within a few miles of Birmingham of four or five more furnaces, some by new and others by old companies. The Mary Pratt, the smallest, a 40-ton furnace, is out of blast. Interest in Steel-making is greater than ever. Reese & Henderson, of patent process fame, are in the city, and a visit from A. S. Hewitt and his brother-in-law, Edward Cooper, is arousing attention. Mr. Carnegie's recent visit here, and the favorable comments of himself and his distinguished companions, seem to have attracted more attention than ever to the advantages of Birmingham. There is a hopeful expectation also of improvement in the business situation generally to come from the conduct of the new Administration.

New York.

Office of *The Iron Age*, 66 and 68 Duane street,
NEW YORK, March 13, 1889.

American Pig.—The market has been quiet during the past week, reports of irregularities cropping up from time to time. We understand that the anthracite coal companies propose to lower the prices to the blast furnaces, that the railroads are about to afford them some relief, and that a reduction in price of Ore from Northern mines is imminent. Taken together, these reductions may enable Northern furnacemen to lower cost somewhat. We continue to quote for standard brands Northern Iron No. 1, \$17.75 @ \$18; No. 2, \$16.25 @ \$17, and Gray Forge, \$15 @ \$15.50, all at tidewater. Southern Irons have been offered at considerably lower prices for Foundry brands.

Scotch Pig.—The market abroad has continued its advance; still sales here are

restricted and prices remain: Coltness, \$20.50 @ \$21; Shotts, \$20 @ \$20.50; Langloan, \$20 @ \$20.50; Summerlee, \$20.25 @ \$20.50 and Dalmellington, \$19.25 @ \$19.50.

Ferromanganese.—The market is fairly active and firm, with Ferro selling at \$56 @ \$57. Spiegeleisen is dull and nominal.

Structural Iron.—Manufacturers report that considerable bridge work is offering, chiefly in small lots. During the past month or two quite a number of large contracts have been placed, among them the Brooklyn Elevated, the St. Louis Bridge, and the Pittsburgh improvement of the Pennsylvania Railroad. Among the orders now on the market is a bridge at Rochester which will call for about 800 tons. Prices on bridge work, however, continue very unsatisfactory, it being stated that they are lower to-day than they have ever been before. We quote Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 1.9¢ @ 2.1¢; Tees, 2.35¢ @ 2.5¢, and Channels and Beams, 2.8¢ on dock. It is reported that the North Chicago Rolling Mill Company have now joined the Beam Association, so that the only concern not a member of it is the Allentown Rolling Mill Company, who manufacture only smaller sizes.

Plates.—We quote Iron Tank, 2¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3¼¢ @ 4¢.

Bar Iron.—We quote: Carload lots on dock, half extras, Common, 1.65¢ @ 1.7¢; Medium, 1.7¢ @ 1.75¢, and Refined, 1.75¢ @ 2¢.

Steel Rails.—We note sales aggregating about 30,000 tons by two Eastern mills, chiefly for Southern railroads. Twenty-three thousand tons of the above was taken by one mill, which has acquired by purchase a part of the allotment of one of the idle mills, the Board of Control last week having decided not to increase the allotment for the present. It is understood that the Western mills were opposed to such an increase for the present, their sales to date having been considerably less, proportionately, than those of the mills east of the Alleghany Mountains. The Board of Control reports sales to March 1 of 590,850 tons, the allotment being 790,850 tons. The shipments up to March 1 by the Rail mills were 142,787 tons. In the West the market appears to be quiet, the only sale reported being that by a Pittsburgh mill of 10,000 tons. There have been a number of rumors in reference to the consolidation of the North Chicago Rolling Mill Company, the Joliet Steel Company and the Union Steel Company. It is understood that the arrangements have been practically carried out, and that the details are now being arranged, the plan being ready to be submitted to the stockholders of the three companies for their approval. It is reported that the capital is to be \$25,000,000, \$5,000,000 to be paid in in cash for working capital, and to provide for a number of improvements, including erection of Plate mills, &c.

Wire Rods.—There has been some business in Foreign Rods at \$41.50.

Old Rails.—The market is dull, with light supplies and a moderate demand. We quote nominally \$23 @ \$23.50.

Scrap Iron.—There is a fairly good demand, and prices are steady at about the following prices for cargo lots: No. 1 Scrap, \$20 @ \$21, delivered on boat; Turnings, \$13 @ \$14, do; Cast Scrap, \$15.50 @ \$16, do; Cast Borings, \$10; Horseshoes, \$23 @ \$24; Coil and Leaf Steel, \$20, to boat.

Track Fastenings.—We quote Spikes \$2, delivered; Angle Bars, 1.75¢ @ 1.80¢, and Nuts, 2.65¢ @ 2.75¢.

Financial.

Fine weather has a cheering influence, but a serious crisis in Paris, troubles among iron manufacturers, depressions in the coal market, lower prices for wheat, all had an unsettling tendency, and the inauguration ceremonies served to distract attention in business circles. Nevertheless, traffic is heavy contrasted with the entire suspension during the "blizzard week" one year ago, and among New York dry goods jobbers there is a firm tone, attended with a healthy condition both as to supply and demand. Respecting the volume of trade in the country at large, the aggregate clearing house returns of all leading cities for three weeks past indicate a gradual decline compared with the same time last year. Even with this abatement there was an increase of 13.3 % during the week ended March 9, and there was a like increase both in and outside of New York. Boston increased 10.5; Philadelphia, 23.9; Chicago, 23; St. Louis, 10.1; San Francisco, 7.5; Baltimore, 13.1; Pittsburgh, 10; Cincinnati, 23.4; Louisville, 24.8; Kansas City, 20.5; Milwaukee, 16.1; Denver, 47.7; Detroit, 15.7; St. Paul, 22; Minneapolis, 27.1; Omaha, 41.1; Cleveland, 23; Richmond, 34; Duluth, 83.6; St. Joe, 28. Stagnation at several points in the Northwest is ascribed to the light wheat crop and unusually mild winter. Governor Merriam, at St. Paul, says: "I look for a quiet business year. The great decrease in building railroads has cut off a tremendous amount of business all over the country. There has not only been a reduced traffic on railroads, but with it a decreased amount of general business. With decreased earnings comes the discharge of employees, and the large number of laboring men out of employment naturally affects the community at large. In addition to this, in Minnesota we were very unfortunate in losing a large portion of the wheat crop, and the State is much poorer than a year ago at this time. The effect of the loss is necessarily felt in all commercial circles." In various directions satisfaction is expressed that the Interstate Commerce Commission has begun to assert its powers under the recent amendments to the law. A meeting will be held at Chicago to-morrow to consider export rates. Business failures in the United States last week numbered 241, against 195 a year ago.

The Stock Exchange markets were irregular, and in several instances there were important declines, influenced chiefly by foreign advices. On Thursday there was no special feature, dullness prevailing. On Friday the market was chiefly affected by the cutting of rates by roads in the Northwest and by depression in the iron trade, resulting from the collapse of the Reading Iron Company. On Saturday the market was sold down after the receipt of news of a panic on the Paris Bourse, the result of a heavy decline in Comptoir d'Escompte and Métaux shares. The bears proceeded to attack the general list. St. Paul, Reading, Union Pacific and Lackawanna all declined heavily. The theory of the bears was that the panic in Paris would directly affect speculation in copper shares and possibly prevent the success of the English syndicate interested in this metal. It was also suggested that gold might have to be exported. On Monday there was an improved tone at the close, after free selling to realize and a renewal of bear pressures. Solicitude was expressed concerning the anthracite shares, the measures of relief possible seeming to be limited either to a reduction of prices or a lessened output of mineral. On Tuesday the market was

dull but prices were steady. The news from the West was contradictory, one report saying that Mr. Walker would not and another that he would accept the position tendered him. The reduced prices for coal officially announced had no effect.

Government bonds are quoted as follows:

U. S. 4½s, 1891, registered.....	108
U. S. 4½s, 1891, coupon.....	107½
U. S. 4s, 1907, registered.....	128½
U. S. 4s, 1907, coupon.....	129½
U. S. currency 6s.....	120

The nomination of George C. Tichenor, of Illinois, to take the place of Judge I. H. Maynard as Assistant Secretary of the Treasury, is favorably received. Mr. Tichenor has been a special agent of the Treasury Department since 1878, during which time he has made a special study of customs methods with reference to under-valuations and other alleged irregularities. This is the first time for at least 20 years that an expert in customs laws and regulations has been appointed to this position.

The weekly statement of the New York banks showed a decrease of \$3,722,250 in surplus reserve, which now stands \$3,545,860, against \$11,487,300 on March 10, 1888, and \$7,998,350 on March 12, 1887. The increase in loans of \$4,069,100 was not unexpected. The currency movement was against this city, the West drawing freely, and Sub-Treasury operations resulted in a loss. Specie decreased \$3,290,400, showing the effect of the interior movement; and legal tenders decreased \$262,900. Deposits increased \$675,800. The quarterly statement of the condition of New York City national banks again makes a very favorable showing. The aggregate loans and discounts are reported at \$308,520,600, in comparison with \$284,076,200 at the date of the last reports.

The money market was more active, with a good inquiry and comparatively few lenders. Offerings were confined to trust companies and institutions other than banks. Commercial paper is less sought for, as the banks generally have filled up with this line, and the supply is only fair. Rates are 4½ % for 60 to 90 day indorsed bills receivable and 4½ to 5½ for four months' acceptances. The Washington Trust Company of the city of New York have been incorporated, with a capital stock of \$500,000. Ex-Assistant Treasurer Charles J. Canda and Solicitor of the Treasury Alexander McCue are members of the company. The New York Chamber of Commerce recommends the repeal of the Saturday half-holiday law, despite the fact that the chamber favored the measure at the time of its enactment. It is intimated from Washington that Secretary Windom will make no immediate change in the policy of the Treasury. The total amount of bonds purchased to date under the circular of April 17 is \$124,558,550, of which \$51,337,300 were 4 per cents and \$73,221,250 were 4½ per cents. The cost of these bonds was \$145,231,588, of which \$65,925,899 was paid for the 4 per cents and \$79,305,689 was paid for the 4½ per cents.

In view of the recent amendment of the Interstate Commerce act authorizing the commission to direct when joint tariffs shall be made public, the commission has ordered that all advances and reductions in joint rates, fares and charges shown upon joint tariffs established by common carriers subject to the provisions of the act to regulate commerce shall be distinctly scheduled and be conspicuously posted ten days prior to the taking effect of any such advance, and three days prior to any such reduction. Each of the railway carriers comprising the Trunk Line Association is notified to appear before the Interstate Commerce Commission in Washington on Saturday next, for the purpose of fully setting forth and showing

what their export rates are and how these export rates are made by each of the companies, and also for the purpose of giving each of the carriers an opportunity to be heard.

The imports of merchandise at this port during the week were valued at \$11,761,000, of which \$4,000,000 represents dry goods. Since January 1 the aggregate is \$101,617,000, against \$98,870,000 for the same time last year and \$90,802,000 in 1887. Exports were \$7,698,595, making the total since January 1 \$69,067,000, against \$59,520,700 last year.

Exports of specie from this port last week amounted to \$556,000. Total since January 1 \$6,373,000, as compared with \$5,443,000 last year. The imports were \$186,000.

Metal Market.

Copper.—The demoralization and excitement in everything connected with Copper on the Paris exchange, reflected in London in the decline both in the metal itself and in shares, at one time carried the spot price in latter city from £64 a week ago to £47 early in the week, and futures from £64 to £51. It was stated that for a moment £46 was reached for spot. Then, however, the reaction set in and yesterday there was an improvement to £58, spot, in order to close at £56, futures having recovered to £52. Comptoir d'Escompte shares closed at Paris at 385 francs, and those of the Société des Métaux, after rebounding to 150 francs, again closed at 117.50, while Rio Tinto wound up at 341.25. It was furthermore called from Paris that the Rothschilds and Barings were in negotiation with the syndicate to assume its holdings at a reasonable figure. It was subsequently cabled that the arrangements which the Société des Métaux was trying to effect with the Copper mines to prolong to 12 years the present contract, had fallen through. While every disposition was shown by the Bank of France to come to the assistance of the syndicate, and while similar efforts were made by certain London banking concerns to help bridging over its financial difficulties, a somewhat improved feeling was fostered, and there was added a readiness on the part of mining companies to carry their output for the next two months, thus opening the prospect of some substantial relief. Henry R. Merten & Co. make the stock of Copper in England and France and afloat thereto from Chili and Australia as follows: February 28, 1889, 218,140 tons; January 31, 1889, 109,528 tons; December 31, 1888, 101,105 tons; February 29, 1888, 52,593 tons; February 28, 1887, 59,546 tons; January 1, 1888, the visible supply in England, France and the United States was 54,098 tons, and on December 31, 1888, 151,995 tons. London dispatches reported that 8000 tons of Copper Matte were sold from London yesterday to Germany at 10½ @ 11/8 unit, or a little over 10¢ per lb, and that 12¼ per unit is now bid. It was also reported that 1000 tons of Bars were sold at £57. Some little speculative trading has meanwhile been done on our Metal Exchange in good merchantable, whereof 56,000 lb April were sold at from 15¢ down to 14.60¢; 140,000 lb May at 14.35 @ 13.50; 28,000 lb June at 14¢; and 28,000 lb July 13.18¢, while Lake was offered at 16.30¢, spot, 16.10¢ March, and 15.50¢ April. Subsequently 140,000 lb good merchantable were sold at 12.75¢ @ 12.90¢ for May and 25,000 lb Lake at 16¢. During the first few days of the week 1200 tons changed hands in London. To-day, with the advance there lost again, Lake closes at 15¢ @ 16¢, spot, nominally.

Tin.—Tin declined from £94. 17/6 a week ago to £94. 12/6 yesterday, for spot, futures giving way from £95. 15/ to £95.

7/6; sales reaching 350 tons in the London market. We have been steady here, with a moderate business doing, 20 tons March at first selling at 21.30¢, but subsequently easing off somewhat, March and April ranging between 21.15¢ and 21.30¢, and May at 21.25¢ @ 21.40¢. Later on, a better feeling obtaining, spot brought 21.25¢ @ 21.50¢; Tin closes steady this morning at 21½¢ @ 21¼¢, spot. *Tin Plates.*—While the English market has continued exhibiting great firmness, with an upward tendency for forward delivery, the market here has developed no new features of an encouraging nature, the sentiment still being one of flatness and indifference. The following are the closing quotations in large lines $\frac{3}{4}$ box: Liverpool quotes Coke 18/ @ 18½; Siemens-Martin Steel, Charcoal Finish, \$4.75 @ \$5.50; Terns, \$4.12 @ \$4.25; Coke Tins, \$4.22½ @ \$4.30, and Wasters \$4.12½ @ \$4.15.

Lead.—Sales have not exceeded 400 tons at 3.75¢ for Common Domestic, with no buyers toward the close at over 3.75¢, 3.80¢ being asked. St. Louis remains steady at 3.45¢ @ 3.50¢.

Spelter.—Has been rather sparingly offered, yet in the absence of an active local demand there has been continued flatness, with prices indifferently well sustained at 4.80¢ for Common Domestic, and Silesian, nominally, 5½¢.

Antimony.—A light trade has prevailed at 12¢ for Hallett and 13¼¢ for Cookson.

New York Metal Exchange.

The following sales are reported:

THURSDAY, March 7.	
25,000 pounds Lake Copper, March.....	15.75¢
25,000 pounds G. M. Copper, April.....	15.00¢
25,000 pounds G. M. Copper, May.....	14.35¢
25,000 pounds G. M. Copper, June.....	14.00¢
25,000 pounds G. M. Copper, July.....	13.80¢
FRIDAY, March 8.	
25,000 pounds G. M. Copper, April.....	14.00¢
112,000 pounds G. M. Copper, May.....	13.50¢
15 tons Lead, June.....	3.80¢
96 tons Lead, April.....	3.80¢
MONDAY, March 11.	
25,000 pounds G. M. Copper, May.....	12.90¢
112,000 pounds G. M. Copper, May.....	12.75¢
TUESDAY, March 12.	
10 tons Tin, May.....	21.20¢
25,000 pounds Lake Copper, spot.....	16.00¢
WEDNESDAY, March 13.	
25,000 pounds G. M. Copper, March.....	13.75¢

Coal Market.

The Coal trade awaited with anxiety a meeting held on Monday to fix the spring opening prices. It is understood that there was a sharp divergence of opinion, a number of those present holding that a reduction would only weaken the market. The final action was the adoption of a scale 10¢ to 15¢ below those of the spring of 1888, as follows, to take effect immediately: Broken, \$3.75; Egg, \$3.90; Stove, \$4.15; Chestnut, \$4. The opening prices for the spring months for four years compare as follows:

	1886.	1887.	1888.	1889.
Grate.....	\$2.85	\$3.55	\$3.75	\$3.75
Egg.....	2.85	3.80	4.00	3.90
Stove.....	3.25	4.15	4.25	4.15
Chestnut.....	3.00	4.00	4.25	4.00

The reduction compared with winter prices made last December for White Ash is, on Grate, 20¢; Egg, 40¢; Stove, 50¢; Chestnut, 65¢. Compared with spring prices for 1887, the changes are much less striking, amounting only to 10¢ @ 20¢ on the larger sizes. Bituminous Coal prices are fixed at \$2.60 $\frac{3}{4}$ ton, f.o.b. at tidewater, the same as last year. No arrangement has yet been made with the Beech Creek interest, from which fact it is argued in some quarters that the so-called "pool" must become inoperative. No definite contracts are announced, but report says that in several instances a number have been secured by Clearfield and

Cumberland parties. Production at all the mines for the week ended March 9 was 485,752 tons, an increase of about 8000 tons compared with the previous week, but a decrease of nearly 200,000 compared with the same week in 1888. Since January 1 the aggregate is 5,285,000, against 5,961,000 for the same time in 1888.

Regardless of the new prices, Stove Coal afloat is selling by individuals at \$4 @ \$4.10, and Chestnut, \$3 90 @ \$4.10. Lehigh, otherwise hard Coal, prices were made on Wednesday, too late for this publication.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, March 13, 1889.

The Copper market has been very unsettled, responding more or less to various statements and rumors. The most favorable announcement, and one upon which sufficient confidence centered to cause prices to advance to £58 for prompts, was that identifying the Matheson Company, of London, with recent negotiations. At the request of representatives of the syndicate, this firm, it is said, has undertaken the sale of the entire stock now under syndicate control. It is understood that a limit on price has been fixed, but, further than that the figures shall not be below the original cost to the syndicate, no information on this point is given. It is semi-officially announced that, in order to facilitate matters, the existing contracts with the mines have been modified, all companies giving assent to a restriction of production. The extent of the curtailment is not stated, but competent authorities express the belief that the plans are sound as a means of restoring affairs to a more normal basis. The machinery, it is understood, will be under the control of the Mathesons.

Interviews with the Rothschilds, Mertons, Strauss and others of prominence, on Tuesday, elicited the opinion in those quarters that under the new arrangement the syndicate would be able to steady the market at prices that would likely bring consumers in. This led to prompt selling up to £55. 10/ @ £56 at the close of business on Tuesday. The market opened weak and unsettled to-day (Wednesday), however, with free offers of prompts at from £53 down to £48, futures as low as £46, and comparatively few buyers of either. Best Selected English Copper has dropped to £60, sellers, with sales light and no improvement apparent in the demand.

With respect to the announcement that some 8000 tons Matte have been sold at

11/ $\frac{3}{4}$ unit, for Germany, I learn, upon investigation, that it correctly represents facts. About 1000 tons of Bars have been sold during the week at £57, also to go to Germany. The market for shares, while still unsettled, is showing greater firmness.

Block Tin has been somewhat adversely affected by the movements of prices of Copper, these having influenced speculative sentiment in some degree, although leading to no forced selling. Under almost complete neglect the price for Straits declined to £94, but quickly recovered, in sympathy with the better turn in Copper, and touched £94. 15/.

Holders of Pig Iron warrants have been realizing freely on this week's advance and the "bears" have sold largely again the last few days. Makers' brands are strong at a further advance, the Continent and Canada being good customers. There is practically no demand from America. The exports to the States during February were about 7000 tons. The make of Hematites has been lessened considerably owing to strikes that forced the damping of nine furnaces. Others are, however, likely to be relighted.

The demand for Tin Plate has improved, particularly from the States, with prices about the same as those offered last week. The question of the formation of an American syndicate to purchase works is being discussed at Swansea, but nothing definite on the subject can be learned. The exports to the States during February were 28,000 tons, against 22,000 tons the corresponding month last year.

Large sales recently are reported of Old Iron Rails for Italy. The prices are not stated, but understood to be below those generally asked by holders.

The demand for Steel of nearly all descriptions, as well as for Iron, is something enormous, and prices still show a rising tendency in all sections. Requirements for consumption and export alone necessitate heavy purchases, but some impetus to operations is given by suggestions of other syndicates in the trade than the one now under way to control Steel Rails.

The fluctuations in prices during the week include 6d to 2/6 rise on Scotch Pigs, 3d on Cleveland Pigs, 6d on Hematites, 1/3 on Steel Rails and Billets, 2/6 on Steel Slabs, 6d on Steel Blooms and 3d on Bessemer and Siemens Steel Tin Plate.

Scotch Pig.—Business has continued active, and prices are again higher nearly all through.

No. 1 Coltness, f.o.b. Glasgow.....	55/6
No. 1 Summerlee, " ".....	54/6
No. 1 Gartsherrie, " ".....	51/3
No. 1 Langloan, " ".....	53/6
No. 1 Carnbroe, " ".....	46/3
No. 1 Shotts, " at Leith.....	58/6
No. 1 Glengarnock, " Ardrossan.....	50/6
No. 1 Dalmellington, " ".....	45/6
No. 1 Eglinton, " ".....	44/6

Steamer freights, Glasgow to New York, 5/; Liverpool to New York, 10/.

Cleveland Pig.—There is still a brisk trade, and the market continues strong. No. 1 Middlesboro', G.M.B., 39/6; No. 3 ditto, 37/.

Bessemer Pig.—Transactions have been large, and the market is strong at a further advance. West Coast brands, mixed numbers, 47/9 @ 48/, f.o.b. shipping point.

Spiegeleisen.—A fairly active business, but no change in prices. English 20¢ quoted 80/, f. o. b. N. W. England shipping point.

Hardware.

Goods continue moving in fair volume, but trade is perhaps a little disappointing, as orders do not cover the quantity of goods anticipated by some who have been expecting an exceptionally active trade. While there is thus some complaint, there is little reason to doubt that the amount of business compares well with other years, and, with the advance of the season, it is expected that a very satisfactory trade will be done. Prices are without material change and collections fair.

Barb Wire.

The New York market shows more signs of activity, and prices are steadily maintained on a basis of 3.5 cents for carload lots Galvanized Four-Point, with the usual deliveries. Small lots are held at 3.8 cents, and 3-ton lots at 3.6 cents.

Washburn & Moen Mfg. Company, Worcester, Mass., and I. L. Ellwood & Co., De Kalb, Ill., issue a joint circular dated Chicago, February 28, addressed to dealers in and consumers of Barbed Wire, in which they call attention to the litigation in regard to Barbed Wire patents and their action against infringers. They allude especially to their suits against the Braddock Wire Company and the St. Louis Wire Mill Company, and their efforts to bring the same to trial.

The Iowa Barb Wire Company, 93 Reade street, are putting on the market a line of Barb Wire with a new barb, to which they refer as follows:

It is apparent that the tensile strength of Barb Wire is not affected by the size of Wire used for the barbs, and that if a lighter barb will answer equally well the saving in weight is clear gain to the consumer. To this end, we now make a Two-Point Barb Wire which we call the "Texas barb." The barb will be flattened nearly one-half, thereby saving one-third the weight of the barb, or about 10 per cent. of the total weight of the Barbed Wire. Our price for this Wire will be 10 cents per 100 pounds, extra, which represents about one-third of the gain to the consumer in weight as compared with other barbs.

Wire Nails.

There is a fair demand for Wire Nails, and prices are without material change. In some cases, however, slight concessions have been made indicating that the market has not yet the strength which it has been hoped would characterize it. Quotations are on the basis of about \$2.25 to \$2.30 for carload lots at factory.

Cut Nails.

There has again been some irregularity, due chiefly to offerings at a low price of a lot of Nails which, it is claimed, were rejected recently by a railroad company. Otherwise the movement is quite satisfactory in volume, considering the season. We quote: Iron Nails in carload lots on dock \$1.80 @ \$1.85, and small lots \$1.90 @ \$1.95.

The Demand for Cheap Goods.

We print below a significant and suggestive communication, which comes from a gentleman occupying an influential position among Hardware manufacturers, whose very extensive familiarity with the trade in all parts of the country, as well as his knowledge of business methods in Europe, give to his views an especial weight. It will be seen that he refers to the demand, on the part of the jobbers especially, for low-priced goods without much regard to their quality, and regards this as one of the mischievous features of the trade, for which he proposes a somewhat radical

remedy, suggesting not only the wisdom of manufacturers in seeking to establish direct relations with the retailers, but also the organizing of something in the way of a manufacturers' syndicate, with headquarters in the leading Hardware centers:

The great fault of the American buyer, especially in the Western market—referring more particularly to that section of the country between the Alleghanies and the Rockies—is that they will not consider quality. If a manufacturer goes to them with an Auger Bit, a Plane Iron or any other leading line of Hardware which is made by a number of different manufacturers, the invariable response of the buyer to the manufacturer is: "Oh, a Shovel is a Shovel, and a Chisel is a Chisel, and you see our trade don't care; it is a matter of price. You may see some advantages in your quality, and it may be a little better, but you make us pay for the difference and the trade won't stand it. A farmer comes in and calls for a Pitchfork and nine times out of ten he will take the cheapest one." So in vain the manufacturer pleads that his goods contain stock that costs him more than his neighbor, that he finishes them more highly than his competitor, that he is more careful in the inspection and details of his business, and that his goods actually cost more. The buyer turns him off and will not take his goods, and the manufacturer goes away despondent because he cannot compete with his low-price neighbor. The only course for the manufacturer is to consult his own interest and place himself in closer connection with the small trade, selling to them at what would be a low price and yet net the manufacturer a little profit which would otherwise be swallowed up by the jobber. The foreign merchant is different. He is willing to stand by an old-established house and handle the article which he knows to be first class in every respect, and so represent it to his customers, and he is more willing and more apt to pay a fair price.

We believe the policy of the manufacturers in this country should be to place their own houses in the principal buying sections of the West—say, Chicago, St. Louis, Kansas City and St. Paul; and if necessary where the manufacturer has only a limited trade let several of them pool their interests at various points and sell their goods through this syndicate, hiring their own stores, salesmen, clerks and travelers, and charging up the expenses according to the business done by each house. It might be expensive at first, but it would pay in the long run, for the manufacturer would have his goods introduced and a call established for them, and not place himself at the mercy of some large jobber who would buy one large bill of him and the next month turn round and buy of some competitor if he could make 24 per cent. by so doing. Our own belief is that the retailer and the manufacturer are coming more closely together every year, and the manufacturer who caters most closely for the retail dealers' trade is the one who will win in the long run, for he is working for his own interest, finding and meeting the wants of his trade. These the jobbers are prone to cover up and make the manufacturer believe his goods are not suited to the market, when the simple truth is they can make more money by handling some other line, and the manufacturer goes away with the idea that his Plows and Shovels are unsuited to the particular market in which he has been trying to sell them, and it would be too much expense to alter his styles. In many ways we can see from a manufacturer's standpoint how he is often hoodwinked out of the trade which he could otherwise cater to and handle nicely.

Miscellaneous Prices.

The following are the list prices of the Never Break Spiders, which are put on the market as the beginning of a line of Stamped Steel Hollow-Ware by the Bronson Supply Company, Cleveland, Ohio. The list is subject to a discount of 50 per cent.:

No.	Diam. of Bot'm. Inch.	List.
7.....	8	\$0.65
8.....	9	.75
9.....	10	.90
10.....	11	1.10
12.....	12	1.30

The following is the price list of D. W. Bosley & Co., Chicago, Ill., for their Rubber Floor Scrubbers and their Bar and Counter Cleaners, and is subject to a discount of 50 per cent.:

Rubber Floor Scrubber.

- No. 1.—Ash Block, 1½ inch; Rubber ¾ inch thick. Ash Handles, 4½ feet long.
No. 1, Heavy, Pure Rubber, per dozen.—12-inch, \$8; 14-inch, \$9; 16-inch, \$10; 18-inch, \$11.
No. 2.—Ash Block, ¾ inch; Rubber 3-16 inch thick. Ash Handles, 4½ feet long.
No. 2, Light, Pure Rubber, per dozen.—12-inch, \$5; 14-inch, \$6; 16-inch, \$7.

Rubber Bar and Counter Cleaner.

- Imitation Walnut, Oil Finish, Block ¾ inch; Rubber 3-16 inch thick, per dozen.—12-inch, \$3.50; 14-inch, \$3.75; 16-inch, \$4.

The Peerless Rubber Window Cleaner is sold from the following list, which, in gross lots, is subject to a discount of 60 per cent.:

- 8-inch, per doz.. \$4.20 | 14-inch, per doz.. \$6.00
10-inch, per doz.. 4.80 | 16-inch, per doz.. 7.50
12-inch, per doz.. 5.40 | 18-inch, per doz.. 9.00

The manufacturers of Common Carriage Bolts were in convention last week, and the question as to the feasibility of advancing prices, as well as other matters connected with the organization, received careful attention. It was not deemed advisable to make any change in prices, but action was taken which it is thought puts the combination in a still better position than heretofore.

Humason & Beckley Mfg. Company, New Britain, Conn., and 80 Chambers street, New York, issue the following revised discount sheet applying to their catalogue, January 1, 1888:

Page.	Dis. per cent.
4-10. Hammers.....	40
10. Tack Claws.....	50
11. Nail Sets.....	50&10
11. Screw Drivers.....	60&10

F. A. Reiher & Co., Chicago, Ill., issue a circular showing, in convenient form, their different patterns of Transom Lifters, of the manufacture of which they make a specialty. They call special attention to their new No. 801 Self-Locking Transom

Lifter, the improvement in which consists in the combination of the handle fastened to the operating rod, connected with the flat stationary locking and guiding bar, placed at the lower end, which is referred to as locking the long operating bar securely in any desired position and preventing it from being bent, displaced or broken. A full description of their Lifters is also given in their catalogue. Their discounts applying to their list January 1, 1887, are as follows:

Bronzed Iron Rods.....50, 10&2%
Brass or Real Bronze.....30%

The manufacturers of Tackle Blocks, who have for some time been considering the feasibility of a more satisfactory understanding in regard to production and prices, have consummated an arrangement which is expected to give this line a greater regularity than has recently characterized it

G. & M. Nolin, Skowhegan, Maine, manufacturers of Scythes, Grass Hooks and Sheep Shears, quote their Grass Hooks and Hay Knives to the retail trade at the following prices:

Grass Hooks, per doz.....\$2.25
Hay Knives, per doz.....10.00

Items.

The Terry Mfg. Company, Horseheads, N. Y., have issued a new catalogue, in which they describe their Hardware specialties and call attention to their foundry and machine shop. Descriptions are given of their Standard Bracket, Double-Braced and Thimble Bracket Rack, the Terry, Ideal, Leader and Favorite Hangers, Stay Rolls, Door Pulls, Wire Cutters, Harness Hooks, Chest Handles, &c.

Westcott Chuck Company, Oneida, N. Y., in their illustrated catalogue of Westcott's Patent Chucks, describe two styles of Drill Chucks, the Little Giant Improved and the Oneida, and five styles of Lathe Chucks, Scroll Combination, Geared, Plain, Universal, Independent and Cut-Off. The special features of these Chucks are explained, with illustrations showing clearly their construction.

The Toledo Block Works, Toledo, Ohio, issue a neat and convenient catalogue representing their Wood and Wrought-Iron Tackle Blocks, Lignum-Vitæ and Iron Sheaves, &c., and alluding also to their Sidewalk Lights, Gratings, Iron Fencing, Stairs, &c.

Bonney Rapid Vise Company, Clinton, Iowa, issue a four-page price list, describing their Rapid Transit, New Giant, Patent Never Slip Pipe and Bench, and other new patent Rapid Vises. They expect before long to issue a 20-page catalogue of these Vises with some recent improvements.

D. C. & H. C. Reed & Co., Kalamazoo, Mich., issue a catalogue in which they describe a line of Floating Spring Tooth Harrows, One and Two Horse Spring Tooth Corn Cultivators and Broadcast Seeders. It describes a variety of implements and machines, in which some improvements have been made within the past year.

Sargent & Greenleaf, Rochester, N. Y., for whom Sargent, Greenleaf & Brooks are agents, 43 Franklin street, Chicago, Ill., issue a very elegantly printed revised price list of their Key Locks, Bolts, &c., in which they represent their line of Mortise Locks, Night Latches, Cabinet, Trunk and Chest Locks, Tin Box Locks, Padlocks, Sub-Treasury, Safe Door Safety Deposit Locks and other fine goods. Their Combined Lock and Latch for outside doors of dwellings is prominently illustrated, and the excellence of its construction and its security emphasized. It is evident that the company have added many new Locks to their line, while at the same time older styles have been improved. Sargent,

Greenleaf & Brooks, 48 Franklin street, Chicago, have also issued a new price list of this line, without illustrations. They are offered as especially adapted to the wants of the best Western Hardware trade. Attention is particularly called to their Adjustable Spindle for Knobs.

E. T. Barnum, Detroit, Mich., has issued his spring supplement which relates to Roof Crestings, Counter Railing, Iron and Wire Settees, Chairs, &c. Wire and Iron Window Guards, Stable Fixtures, Fire Escapes, and an extensive variety of Builders' Wire and Ironwork.

A gentleman connected with the trade in Agricultural Implements who has recently returned from a trip to China refers as follows to the tools used in that country and the lack of enterprise manifest in their antiquated forms:

The one thing that struck me most forcibly of all the queer things to be seen there was the wretched Agricultural Implements the people use. I am in that line of business myself, you know, and that is the reason, I suppose, why the want of good tools impressed me so much. If the Chinese are as shrewd and inventive as they claim to be, why have they used for thousands of years a plow that is simply a broad blade fastened to one rough handle and never cuts the ground deeper than 6 inches, generally 2 or 3? They thresh yet with a stone roller and winnow by tossing the grain into the air. For a harrow they use the hoe, and everything else about the farm is on a similar scale. The nation is largely composed of farmers and there ought to be a splendid market there for American Implements. One great obstacle in the way, of course, is the conservative spirit of the people, and another their extreme poverty; but if they could once be waked up to the possibilities that lie in the use of decent farming tools, the magnitude of the demand that would ensue would well repay the pioneer manufacturer who risked some money in the endeavor.

Thomas H. Chubb, Post Mills, Vt., has issued a handsome and comprehensive retail catalogue for the present year, showing a large line of Fishing Rods and Anglers' Supplies, most of which are referred to as of his own manufacture, the others being made to order and carefully selected, so that anglers can depend upon the goods as being as represented. The catalogue opens with a description of Chubb's Hexagonal or Six Strip Bamboo Rods, the different patterns of which are illustrated. Illustrations are also given showing some of the different departments of his factory. Reels in large variety, Flies, Hooks, Spoons, Fly Books and miscellaneous Anglers' Supplies are also prominently represented.

F. Roloson, Baltimore, Md., issues his catalogue with appendix, in which new patterns of Refrigerators and Buffets are illustrated and described.

A. J. Jordan, 612 Washington avenue, St. Louis, Mo., issues a circular calling attention to his line of AAA1 Cutlery, in which he alludes to his extensive establishment running through from Washington avenue to St. Charles street, and his factory in Sheffield, England. The extent and excellence of his assortment are alluded to, and a number of illustrations given representing some specialties and leading goods in his line.

Bullard & Gormley, dealers in Builders' Hardware, Cutlery, Tools, &c., 106 Lake street, Chicago, have secured the adjoining store, No. 108, and intend to fit it up as an exhibit and salesroom of Builders' Hardware Specialties. They intend to exhibit full-size working models of such articles as they shall select, and will have experienced retail Hardware salesmen to explain them and set forth their merits. They will also canvass architects, owners

and builders in the interests of the same. They will make no charge for standard goods, the profit on the sales being expected to pay for the trouble taken and expense incurred. Special arrangements will be made with manufacturers of new articles which are to be introduced. They solicit correspondence with manufacturers on this subject.

The *West Coast Trade*, alluding to the leading business houses of Tacoma, Wash., refers at some length to the Tacoma Hardware Company, John Macready & Co. and Hunt & Mottet. The Tacoma Hardware Company were organized two years ago and are referred to as having met with excellent success and carrying one of the largest and most complete stocks of Hardware on the coast. John Macready & Co. are said to be the oldest Hardware establishment in the city, having been founded by John Macready, of Sioux City, Iowa, who entered the firm in 1888 and has given special attention to the building up of the business since that time. Hunt & Mottet claim the honor of being the pioneer jobbers of Hardware, having embarked in the business in 1884. They have recently increased their capacity for handling goods by the addition of a 35 x 120 feet basement in the Coggswell Building.

Announcement is made by the Wire Goods Company, Worcester, Mass., that they have purchased the entire stock and plant of F. O. North & Co., Boston, Mass., and will add their line of Automatic Blind Fixtures to their regular list of manufactures. They send out a circular relating to these goods and illustrating their construction and use. They also issue a new page for their catalogue, in which they give revised list prices on their Universal Double-Joint Chain and illustrate its use as a sash chain. A page also refers to Chain Links.

Rector & Wilhelmy Company, Omaha, Neb., issue an attractive 52-page price current, relating principally to seasonable goods. It contains quotations, which are given in cipher, the key being prefixed. It is prefaced by the following circular to the trade:

We trust you will preserve this circular, because you will find in it many goods that your customers will call for from time to time, and you can make sales by it and make money on the sales. Because it will serve to remind you that we want your business, and that you can save time and money by placing it with us, because we make prompt shipments, low prices, and don't substitute; give special attention to mail orders and guarantee careful selection of goods and bottom prices, and because you can order goods from us, get them in and sold, the money in your pocket and more goods on the way before your goods are in from the East. "A nimble nickel makes a fat dollar." Your inquiries and orders solicited. Prices always right. We invite attention to the fact that we are direct importers of Tin Plate, receiving same direct from the makers in Wales through the Omaha Custom House. This assures our trade a first-class grade of Plate in perfect condition and free from the manipulations of tricky importers and brokers. Our Tinto Terne is the finest in finish and working qualities ever sold for the money, and the genuine Calland Brand has no superior. Write us for special prices on large lots.

William H. H. Bixler & Co., Baltimore, Md., have improved their Patent Oyster Winder during the past season, giving it a much wider spool. This permits the use of a larger rope and adapts the Winder more particularly to oyster beds in deep water. This Winder is referred to as popular and in general use on the oyster grounds of Maryland and Virginia, and as having been used to a limited extent on Long Island Sound and neighboring oyster grounds. They have lately been ap-

pointed Southern agents for Richardson's Steerers and the Eureka Ice Crusher, and are also agents for the Somerset, which is referred to as something new in steering machinery.

St. Joseph Pump Company, St. Joseph, Mo., issue a new edition of their circular relating to the Perfection Water Elevator and Purifying Pump. They illustrate the construction of the cup or bucket and its use in the pump, pointing out the advantages possessed by it. They also give price list.

It will be seen by the advertisement on page 47 that the long-established business of the late George S. Arnold is offered for sale. For those desiring to engage in this line of trade—plumbing, gas-fitting, stoves, mantels, &c.—the opportunity is deserving of their attention. Full particulars may be obtained from the administratrix, Eva G. Arnold, corner State and Crown streets, New Haven, Conn.

The Northwestern Rubber Company have succeeded to the business of both the Hamilton Rubber Company and R. T. Whelpley, of Chicago. They will maintain at 141 Lake street, Chicago, the sole Western agencies of the factories of the Hamilton Rubber Company, the Star Rubber Company and the New York Woven Hose Company. The new company is a corporation with a paid-up capital of \$100,000. R. T. Whelpley is treasurer and Edgar Whitehead secretary. They desire to impress upon the trade that they are not jobbers in the sense of middlemen, but are the direct agents and distributors of the product of the companies above named and carry in stock a full line of their goods, to be furnished at manufacturers' prices. They notify the customers of the Star Rubber Company that on the 18th of February the injunction issued against them by the Boston Woven Hose Company was dissolved in the United States Circuit Court at Trenton, N. J.

Hartley & Graham, 17 and 19 Maiden lane, New York, have issued a price list, March, 1889, of Guns, Revolvers, Ammunition and Sporting Goods. Besides illustrating, with list prices, the leading goods in these lines, it calls attention to the fact that they are agents for the Union Metallic Cartridge Company, Bridgeport Gun Implement Company, Remington Arms Company and other manufacturers.

Cleveland Spring Company, Cleveland, Ohio, issue a small price list of their Carriage, Wagon and Seat Springs, of which the different patterns are illustrated. They emphasize the claim that they make Springs with solid steel heads without seam or weld. They also issue circulars relating to their new Triple Duplex Carriage Gear, and the American Chief and Lone Star Duplex gears.

Jones Hollow-ware Company, Baltimore, Md., manufacturers of Enameled, Turned, Round and Plain Hollow-ware, have appointed King, O'Connor & Co., Baltimore, Md., their exclusive selling agents for the South. They will carry a stock of the goods at their warehouse, 11 West German street, and will be in a position to guarantee prompt shipments at lowest market rates. A similar announcement is made by the Mount Carmel Bolt Company, manufacturers of Wood Screws, Tire and Stove Bolts, Rivets and Washers, Mount Carmel, Conn., who have also appointed King, O'Connor & Co. their exclusive selling agents for the South.

The new catalogue of the Cleveland Twist Drill Company, Cleveland, Ohio, represents very satisfactorily their line of Increase Twist Drills, Self-feeding Reamers, Taps, Cutters, &c., of which a large assortment is thus offered to the trade.

They have very much improved and enlarged some of the lists, among which may be mentioned Nos. 111, 116, 118 and 120, and they have added No. 113 Dowel Point Drills and No. 115 Bit Stock Counter-sinks. They refer to the fact that their Drill has a flute of equal area from the point to the shank, and that each Drill is carefully inspected after every operation. They refer also to the fact that they are the sole manufacturers of Miller's Patent Self-feeding Reamers. Micrometer calipers are used throughout their entire factory, and parties ordering special tools are requested to give sizes wanted in thousandths of an inch. The catalogue also represents the Drill Cases made by the company, of which three sizes are offered to the trade. Since moving into their new factory they advise us that they have had all the business they could handle, and the prospects for the year are regarded as exceptionally good.

That Boy and His Future.

BY KNARF.

There is so much and so many things that go to make up a man's character, so many causes for defeat or success in life, so much in the make-up of the man, as a whole, that to analyze these perfections and defects is a Herculean task. The inherited dispositions and pre-dispositions are the easiest to cultivate or the hardest to overcome. Things bred in the bone crop out through life, however much external enamel has been put on by society, education or cultivation. No character is perfect at the first, and it is a part of the necessary work of life, a labor at which we must continue, to change these defects to the standard of our perfections to insure a perfectly rounded life. This is a work to be begun early in life—so early, in fact, that few boys or young men are capable of going it alone, but need sage advice and persistent looking after at the start, and a start in the right direction is almost always indicative of the ending. The natural trend of a boy's mind, if not wrong, should be encouraged, and all the natural aptitudes taken advantage of, in selecting what will be for him his prospective life-work. The writer's opinion, strengthened by years of experience, and an assurance that he was started wrong in his life-work, is this: That every boy should have a trade or profession. Almost every boy shows a predisposition for books or tinkering. Of course there is a certain percentage of men that never amount to anything, others who do not appreciate advantages given them, but this does not lessen the responsibility of the natural guardian of the boy to try and start him right. A father said to me: "My son of 14 has no idea or desire to accumulate money, and no appreciation of money value; he wants to read all the time. I wanted to make a business man out of him, but there is no business in him." Upon inquiry, I found travels and history were the boy's delights, and my advice was to put the best of such books in his way, and if his likings did not change to give him a college education and let him choose a profession. He is not a delicate boy, but large for his age, robust, and enjoys exercise, and has a constitution that, with care, will permit of a large amount of hard work. Another father, a mechanic, of German extraction, in conversation said: "It is hard for me to get along, particularly now. I have two boys and a girl to whom I am giving a good public school education, also music, and when the boys are old enough they shall learn a trade; and if they can't get along then, they couldn't if they were millionaires. The music will give them a cordial reception in the best society wherever they go." To me this was the most sensible plan of education I had ever heard.

We take it for granted that the moral

and religious training is an accepted necessity, so I will not enlarge upon that at this time. It is a deplorable fact that our most skilled workmen in mechanical departments are foreigners, and they are skilled because they thoroughly understand their trade. While the range and extent of a mechanic's trade has been curtailed by developments in machinery, yet, what he has to know should be as thoroughly known as when the carpenter went to the woods to cut the timber for the house. A great mistake is made in not lending the apprentice your experience, and encouraging him with the thought that dirt and drudgery will not be his life always, but that the highest degree of perfection leads to higher planes. After a start has been made and the young man finds he is not suited to the business he has chosen, it is no always a sign of a fickle nature to want to make a change. The sooner a person gives up a line he don't like the better for him. No man can make a success of anything that he can't enter into heart and soul. A lawyer of note was sitting cross-legged on a tailor's bench at 22: a doctor had medical books stuck under the counter in the country store at 18, and so we might name many more instances of the same kind. As a tailor or clerk these men would never have been a success. Circumstances are often such that a man can't make a choice, but is pushed on by the inevitable to work at something ungenial, and something he is unfitted for by education, disposition and temperament. To that person I would say, change as soon as you can. Life is too short to waste time and energy on something out of which you cannot get satisfactory results. If you can make a living out of what you are not fitted for, you can make a big success of what you like. It often takes moral courage and grit to make such a change, but when your mind is once made up, and the opportunity offers, don't hesitate.

There are fewer failures in trades than in mercantile life. In the latter only one-tenth that start succeed. The weekly reports of failures throughout the United States show that 200 or 300, for one reason or another, have failed to connect and have shut their doors. On the other hand, I have never known a good mechanic to be long without a place to work, however many poor workmen may be unemployed. Those who strike are not included in the above statement. The history of the results of strikes has been that the striking workman has failed to secure any higher rate of wages than the man who has independently and unaided by societies put his labor and skill into the market for what it would bring.

Young men are anxious to go into business for themselves, to be their own boss. This is very enticing, but, as a rule, they have little or no idea of the expenses, responsibilities and small results that are contingent upon such a move. Passing along the business portion of the town they see stores with attractive stocks of goods, warm and comfortable inside, and it seems so easy to run a store. But they little know the worry and trouble piled up behind the smiling face of the proprietor, of the bills payable and unpaid accounts receivable, of the loss in the last year's business as shown on the inventory just taken and of the unexpressed yearnings to be as free from care as the envious young man on the outside.

The buyer and head of a wholesale house said in my presence that he would gladly exchange his work with any porter in the house and pull up goods all day on a hand elevator. The methods of doing business are changing so rapidly, the competition is so strong, the mass of people are becoming each year more conversant with the value of goods by reading circulars and price lists sent broadcast over the land, that the business man must

continually hustle to even make a living. Losses on book accounts, losses on old and depreciated stock, rapid change of styles—all these and many other things cut a deep notch in the merchant's profits. The time is passed when the merchant can say to a customer: "If my price don't suit you leave the goods." The veracity of the average customer may well be questioned, as there is no hesitancy on their part to mention a price at which your competitor offered them the same article. Rather than acknowledge that they are wrong they will pay your asking price somewhere else.

Real estate investment will pay better than a business enterprise, as a rule. It is safe to say that any piece of property has doubled in value in the past 25 years. It is also safe to say that very few business houses in the country 25 years ago are in existence to-day. If the young man has a few hundred dollars, instead of going in business, and consequently giving up his situation, let him buy a lot. Buy it in the part of the town or city that is growing most—the direction in which the town is moving. Buy the best lot you can, even if you have to borrow some money to pay for it. By saving you can soon wipe out the debt, and it will be an incentive for you to save. Usually it is not a good idea to have interest to pay, unless you have interest coming in to offset it, but you will be excused in this case, as the advance in your property will more than offset the interest. As soon as your lot is paid for you will have no trouble in borrowing money enough to build a house and rent it. Then your rent will pay your interest and some be left to apply on your principle. By this time people will begin to notice you and say, "He is a saving boy," "a thrifty fellow." You will think more of yourself and others will think more of you. Very soon people in tight places will offer you bargains in property and before you are ten years older you will be on the way to wealth.

The advice to the young man is equally good for the parent or guardian. Start the boy by helping to pay for a piece of property; it will encourage him and also teach him the value of money in the paying of his part of it. The habit of economy and saving will be of incalculable value to him in the future. It will give him standing and prestige. There is hardly a town you can go into that you will not have pointed out to you lots or pieces of land which your informant will tell you could have been bought for so-and-so five or ten years ago, and that he had the money to buy with and now sees how foolish he was not to buy. You say to him: "Why not buy some lots now?" "Oh no; they ask too much money for them." And that was the reason he did not buy five or ten years ago—they were too high then, and in ten years more he will see the mistake he is now making. Of course, in some of the older Eastern villages property is decreasing in value; in the same localities merchants' sales are growing less each year; people, especially the young men, are seeking homes where there is more life—these are the places to invest.

We do not suppose that all readers of *The Iron Age* will invest in real estate after reading this article, and for this reason the chances for young men who have a little money—or should have—and want to invest are all the better. Ask any business man of experience if in the past 10 or 20 years he would not have made more money by investing in real estate and working on a salary than he has made in his business and then abide by his decision.

Witherbees, Sherman & Co., of Port Henry, are about to make exhaustive experiments on magnetic separation. At an

early day the Ball-Norton machine is to be tried, followed by the Wenstrom, Edison and others.

The Coke Trade.

Advices from the Connellsville region are to the effect that a slight improvement in the demand for coke has taken place, and production and shipments have increased to some extent. There has also been a stiffening in prices and there is not so much cutting being done in order to effect sales. While the price of coke has been published for some weeks as \$1.25 per ton, it is known that there has been a large amount sold under this figure. It is believed that if the demand continues to improve, the published price will be more easily obtained than is the case at present. For the week ending on March 2 there were 12,151 ovens in blast, 1110 idle and 720 in process of construction. During the two previous weeks there were 12,383 ovens in blast and 878 idle. The shipments for the week ending on March 2 were as follows: To Pittsburgh and river points, 1200 cars; to points west of Pittsburgh, 3520 cars; to points east of Connellsville, 1160; total, 5880 cars. The figures for the previous week were as follows: Pittsburgh, 1200 cars; West, 2820; East, 1100; total, 5120. The increased shipments west of Pittsburgh are due to the fact that a number of large furnaces which have been overstocked with coke have commenced to receive shipments again. Prices may be quoted nominally as follows: Furnace coke, \$1.25; to dealers, \$1.35; foundry coke, \$1.50; crushed coke, \$2.20; all on board cars at ovens, per ton of 2000 pounds. Freight rates from ovens to Pittsburgh, 70 cents per ton; to Shenango Valley, \$1.35; Cleveland, \$2.80; Chicago, \$2.75; East St. Louis, \$3.20. Foundry prices at Western points are quoted as follows: Chicago, \$4.25; St. Louis, \$4.70; Louisville, \$4.70; Kansas City, \$6.75; Toledo, \$4.00; Buffalo, \$4.00. In the latter place, Reynoldsville coke is quoted at \$3.25 and at Chicago at \$4.25. New River coke brings \$4.25 at Chicago and \$4.75 at Louisville.

A company composed of Maine and Illinois capitalists has purchased over 2100 acres of iron-ore land in the vicinity of Bluffton, Ala., and have so far advanced that they are now asking bids on a coke furnace having a capacity of 100 tons per day. The concern alluded to is called the Bluffton Land, Ore and Furnace Company, which is now shipping 200 tons of brown ore daily to Tennessee furnaces, preparations being under way to increase the output to about 500 tons per day. Bluffton is on the Selma Division of the East Tennessee Valley and Georgia Railway, and two miles from the East and West Railway of Alabama. S. H. Keller, of Williamsport, Pa., is building for the Bluffton Company a large hotel.

Steel pipe has been adopted by the city gas companies of Chicago in preference to wrought-iron pipe for making connections between the mains and houses. The two kinds of pipe had been previously subjected to very thorough comparative tests, which the steel pipe is reported to have endured the most satisfactorily. The quantity which will be used this year will be about 1,000,000 feet. The manufacturers of steel pipe regard their victory in this contest as of much importance.

When Secretary Whitney relinquished his office he left as a legacy to his successor the responsibility for building eight new vessels, authority for whose construction was given by the Fiftieth Congress during its session. The list includes three

2000-ton cruisers or gunboats, vessels somewhat larger than the Yorktown, just finished, and similar to that vessel in many respects, although embodying many new features. There will be two 3000-ton cruisers. These vessels will be smaller by 1000 tons than the new cruiser Newark, but by law they are required to attain the extraordinary speed of 20 knots an hour. A great ironclad of 7500 tons, a protected cruiser of 5300 tons and a small gunboat of 800 tons burden complete the list. Designs for these vessels have already been prepared by a naval board and await approval by the Secretary. Meanwhile, in anticipation of that approval, Commodore Wilson, of the Construction Bureau, has added to the force of draftsmen employed in preparing the details of the designs, and it is believed that advertisements for proposals for building some of the vessels could be issued within two months.

It is stated that Perry & Co., stove manufacturers, of Albany, N. Y., and at 86 Beekman street, this city, have obtained an extension from their creditors of 6, 12, 18, 24 and 30 months, on liabilities of about \$330,000, a large part of which was for borrowed money. The committee of creditors appointed to take charge of the matter consists of Robert C. Pruyn and Edgar Cottrell, of Albany, and a member of the firm of Nash, Spaulding & Co., of Boston. It is understood the firm's indebtedness is to be liquidated by the collection of the bills and accounts receivable due the firm, which will require considerable time. It is said that John S. Perry has also transferred all his individual property, estimated at \$80,000, to the committee of creditors as security for the payment of the firm's debts. The Perry Stove Company who have succeeded to the business of the firm, were incorporated January 1, 1889, with an authorized capital stock of \$500,000, and take the plant and foundry of the old firm, valued at \$345,000. Arthur A. Thompson, the manager, at 86 Beekman street, said that Perry & Co. had just obtained the extension of 6, 12, 18, 24 and 30 months, which would be paid out of the bills and accounts receivable as collected, and that the liabilities were about \$330,000. He wished it to be distinctly understood that the extension was solely of the debts of the firm of Perry & Co., and had nothing whatever to do with the Perry Stove Company. The latter took the plant and foundry as the contribution of the Messrs. Perry to the capital stock of the company, and the company have a cash capital of \$200,000.

The freight rates on pig iron from the Shenango Valley, Pa., and the Mahoning Valley, Ohio, have been advanced to \$3.30 per ton to New York and \$4.30 to Boston. The new rates will go into effect on Monday, the 18th inst.

The Navy Department has postponed from March 15 to April 3 the time for receiving proposals for the construction of an armored coast-defense vessel. This order of postponement was Secretary Tracy's first official act.

Some of the Board of Directors of the Panama Canal Company propose that the Tehauntepec Ship Railway Company shall substitute their system for the proposed canal on the unfinished part of the work, about 42 miles. The estimated cost for building the canal for this distance is \$160,000,000. The ship railway would cost \$40,000,000.

The Emigration Commissioners at this port in their report to Washington ask that the power transferred from them to the Treasury Department not long ago may be restored.

New Anthony Wayne Washers.

The Anthony Wayne Mfg. Company, of Fort Wayne, Ind., have just completed what will be designated to the trade as

rectangular, as is done in other machines of this kind. This obviates the catching of clothes on the corners, which would occur in the use of a square shaft, causing a dragging motion in addition to making

Fig. 1.—The Improved Anthony Wayne Washer.

Fig. 3.—Interior View of Nos. 2 and 3.

their New Nos. 2 and 3 Washing Machines. The accompanying description and illustrations have more especial reference to the No. 2 machine, the No. 3

the machine run hard or heavy. The upper portion of this shaft and the small bevel gear-wheel (14), Fig. 2, are cast in one piece, thereby avoiding all possibility of

Fig. 2.—Construction of Anthony Wayne Washer.

being but a modification in a few minor details of the No. 2. In reference to the engravings, Fig. 2 illustrates the wooden

post or shaft has a good bearing for its journals above and below, and the socket

(12), Fig. 2, is held in its place by the arch, into the feet of which it is recessed, so that the whole gearing is made as one piece and cannot get out of order. The wooden post in the new machine is entirely below the lid, and is fastened to the iron by being driven into a socket and held in its place by an iron pin through the post. Journaled in a bearing in the central and highest portion of the arch (5) is a vertical metal shaft (10), having a socket (12) at its lower end, which rests upon the plate (6) and is provided with a deepening collar (13), which lies in an opening in said plate, the whole forming an immovable bearing or journal for the shaft (10). Cast upon the lower end of the socket piece and forming one piece with the vertical shaft (10) is a miter gear (14), having a horizontal shoulder (15) resting upon a plate (6); inserted in the socket of the metal shaft is a cylindrical shaft (16) of wood attached to the metal socket shaft by means of a transverse pin (17); this wooden shaft passes down through an opening (18) in the lid, which is closed by the collar (13) of the metal shaft. Upon the lower end of the wooden shaft is mounted a dasher or agitator (19). Through the center of the disk of agitator is an opening large enough to admit of a free motion of the lower section of the wooden shaft. Upon the upper and central portion of the arch (5) is the journal (25), upon which the miter gear (26) meshing with miter gear (14) revolves. This miter-wheel has a hub 8 inches long, providing a steady motion, and cannot be thrown out of gear with miter gear (14) when in motion. This miter-wheel (26) is cast with four nipples, two near the center (27) and two near its periphery (28), between which the actuating lever (30) is forced, the same being bolted to a brace connecting the spokes of the wheel. This gives an exceedingly firm and durable connection for the lever, which may be quickly attached or detached. Another improvement in this machine is the corrugated stave and bottom, which form a regular washboard all around and in the bottom of the machine. It is pointed out that in other machines the ribs that form the washboard are nailed to the sides and bottom, which is avoided in this machine, in which the corrugation is formed on the solid stave and bottom, giving the machine a chance to dry, and thus increasing its durability. Fig. 3 gives a view of the interior of the machine, illustrating this feature. Two sizes of these washers with corrugated staves are made, No. 2 being the large family size and No. 3 a smaller size for family use.

Florida orange growers predict that in a few years the States of Florida, Louisiana and California will be able to supply the entire demand for this delicious fruit. The pecuniary motive for engaging in orange culture is sufficiently strong, as appears from the fact that while an acre devoted to the culture of cotton will produce a crop worth \$50, a well-established orange grove will yield \$300 an acre at the low price of \$1 a box. George R. Fairbanks, president of the Florida Fruit Exchange, in an address before the American Pomological Convention, recently held at Ocala, said: "When we realize that more than one-fiftieth of the orange trees in Florida are bearing, we are amazed at the possible and probable future development of this industry." The present total domestic production is about 4,000,000 boxes, of which California and Louisiana furnish about one-quarter, and the imports from abroad amount to about 3,000,000 boxes in addition.

Among the departmental decisions of the Canadian Customs is one making the rate both on round iron galvanized rods and on galvanized bar iron 30 per cent.

Steel Spider.

The accompanying illustration represents an article put on the market by the Bronson Supply Company, corner of Lake and Coe streets, Cleveland, Ohio. It is the first of a line of steel hollow-ware for which they have adopted the trade-mark "Never Break" as applied to hollow-ware. These goods are described as stamped from

Steel Spider.

heavy cold-rolled pickled steel and finely finished. Besides the durability of these goods the point is also made that they are superior to the common goods, inasmuch as they are made from a homogeneous steel, which will not absorb the grease, and are therefore more cleanly and more easily cleaned after using. It is claimed that in cooking any article of food with them the absorption of the article cooking is impossible, thereby preventing imparting the taste of one kind of food to another, as is often the case when the vessel used for cooking is made from a material of a porous nature like cast iron. These spiders are made in the following sizes: 7, 8, 9, 10 and 12 inch. The prices at which they are sold are given in the Trade Report.

Bartlett's Bit Box.

The accompanying illustration represents this article, which is put on the market by Geo. H. Bartlett, 79 Chambers street, New York. This box, which is made of wood, has, it will be seen, holes in it to receive bits of the different sizes,

Bartlett's Bit Box.

the cut representing one adapted for a full set of 32 1/4 quarters. The hinges are, it will be observed, so constructed as to allow the cover to be raised clear of the shanks of the bits, and then tipped back. When the box is closed the jointed pieces of brass which constitute the hinges are inserted in the apertures made in the box

to receive them, so that the cover rests tightly on the box, where it is fastened by the hook shown. With this construction, if desired, the top of the box with the hinges can be entirely removed from the box, and replaced by simply reinserting brass bars. The points made in regard to this box are: That the bits are thoroughly protected and separated, so that they cannot get loose or come in contact

with one another; that there are no catches or springs to get out of order, and that the size of each bit is plainly stamped in the box. This is referred to as a convenience in actual use, as the location of any bit can be seen at a glance. These boxes are made to contain any assortment of bits desired, the following being the regular sizes: 4, 6, 8, 10, 12 and 16 sixteenths; 4, 5, 6, 8, 12, 14 and 16 sixteenths, and a full set of 32 1/4 quarters. These boxes are, we are advised, meeting with a demand from the jobbing trade, who by means of them are enabled readily to make up their own assortments.

Combined Ventilating and Check Rail Window Sash Lock.

White & McLure, Penn Building, Pittsburgh, Pa., for whom H. C. Mechling, 12 Cliff street, New York, is agent, are put-

Fig. 1.

Fig. 2.

Holman's Combined Ventilating and Check Rail Window Sash Lock.

ting on the market the sash lock represented in the accompanying illustrations, Fig. 1 showing the part attached to the top or sides of lower sash and Fig. 2 the part attached to upper sash. The lock, Fig. 1, is operated by a slide and screw, the thumb piece of which is shown in the cut. This slide terminates with a flat butt end in which is a semicircle which engages with the sphere attached to the vertical screw, Fig. 2, the latter being adjustable to any height required. The manufacturers make the following points in regard to this lock: That it has an adjustable screw for any width of sash; that the lock can be used on either side of sash or on top of

lower sash and will lock the window at any desired point with safety; that by using the lock on top corner of lower sash the upper sash can be dropped and fastened, or the lower sash raised and the upper one dropped, thus giving ventilation to the room and securely locking the window; that this lock can be employed as a ventilator by the use of the adjustable screw, which can spread the sashes apart or draw them together; and that by its use rattling is prevented. The sash lock is made in Tucker and plain bronze, japan and nickel.

New Mail Box.

The Henry C. Hart Mfg. Company, Detroit, Mich., are offering to the trade the article illustrated herewith. By an ingenious arrangement pilfering from the box

New Mail Box.

is prevented, as the hand cannot be inserted far enough into the slot to reach the mail deposited within. The box is of artistic design, and the point is made by the manufacturers that besides its utility the elegance of finish which is given to it makes it very ornamental. A spring lock with key is employed, and the opening is referred to as adjustable. The goods are made in antique brass and Saxon bronze, and are packed one dozen boxes in a case.

More than 105,000 people were carried to Washington over the Pennsylvania Railroad during the inauguration period and were delivered in Washington before noon of March 4. It took 210 trains of 10 cars each to convey this immense throng, with an average of 50 persons to a car. All trains were run in sections, and in many cases the number of sections to a given train reached ten. This is the largest number of people that the Pennsylvania Railroad have handled at any one time since the Constitutional Centennial in 1887, when it carried 175,000 people inside of a very few days. The revenue to the company from the inauguration travel will amount to \$500,000.

Proposals have been received in Montreal from the Allan steamship proprietors for the establishment of a Government line across the Atlantic, to run in connection with the Canadian Pacific Railway and the proposed fast line of steamers on the Pacific. It is stated by a member of the firm that the question involves an expenditure of \$5,000,000. At present the Allans are under a temporary agreement with the Government as to carrying mails.

The Electric Dust and Crumb Pan.

In the illustrations presented herewith we show two views of a combined dust and crumb-pan which is being offered the

Electric Dust and Crumb Pan.—Fig. 1.—Perspective View.

trade by Reardon & Ennis, of No. 311 River street, Troy, N. Y. Fig. 1 shows a perspective view of the device, while Fig. 2 presents the plan or top view. The shape of the article, as may be inferred from an inspection of the illustrations, is round, although the makers state that they are not confined to this particular form. It is provided with sloping sides, the angle being such as to allow the dust to be easily swept into the hollow receptacle at the center of the pan. The base is broad, rendering upsetting difficult, while the edges are so made as to prevent warping

Fig. 2.—Plan or Top View.

or twisting out of shape. In use it may be pushed from place to place with the foot and held firmly when desired. By reference to the engraving, it will be seen

The Flexible Back Curry Comb.

that two styles of handles are employed, one made of wire, with a loop to hold a whisk-broom, and the other constructed of malleable iron and riveted to the side of the pan. The former style of handle is so made that it is capable of being locked into ears, holding in a vertical or horizontal position. In this form it is designed for use as a crumb-pan. The in-

tent of the manufacturers is to place these goods upon the market in a neat and attractive form and at prices which cannot fail to command attention. Patents covering the main features of construction are already pending.

The Flexible Back Curry Comb.

The accompanying illustration represents a new curry comb which has been brought out by the Freeport Hardware

Acme Gas Furnace.

Company, of Freeport, Ill., and is sold to the retail trade by Hibbard, Spencer, Bartlett & Co., of Chicago. It is made with a leather back, to which rows of iron teeth are riveted, as shown in the cut. This form of construction insures perfect flexibility, so that the comb can be used to advantage around the joints of animals, over their legs and in depressions in their bod-

comb." The retail dealer is thus provided with the means of calling attention to this new addition to his stock.

Acme Gas Furnace.

The Buffalo Dental Mfg. Company, of Buffalo, N. Y., are offering for tinner's use an improved form of furnace for heating solder coppers, a general view of which is shown in the accompanying engraving. A portion of the side of the furnace is

broken away, clearly indicating the position of the coppers when being heated. In the construction of the furnace the arrangement of parts is such that two flames issue horizontally from narrow slits, and, meeting under the soldering iron, envelop it as they rise. It will be noticed from an inspection of the cut that there is a clear space just below the iron, so that any solder dropping from the iron falls through the burner and is caught upon a tray placed below. By this means clogging of the burner is impossible. The furnace is almost wholly of cast iron, the top of the hood being flat and provided with a grid-hole for use in melting solder or heating articles to be soldered. The manufacturers state that either one or two irons may be heated at a time, as may be desired. The openings for the admission of air have been so arranged that the flame is protected from drafts, and the furnace may be used before an open window without the least trouble. The mixing tube is covered with a jacket, perforated below and opening into the interior of the hood. There is a slide on the mixing tube for the purpose of closing the air inlet when desired, and thus control the quality of the flame. The hood and jacket are locked on to the body of the burner, and secured by the nipple on which the rubber hose is slipped. The principal features of construction form the basis of a patent now pending.

An oil refining and shipping depot in connection with a new steamship line to Antwerp is being prepared in Philadelphia in anticipation of an extensive foreign trade. Wm. L. Elkins, of that city, is president, backed by capitalists in Pittsburgh who have at command \$1,000,000 for immediate use. There will be four piers 630 feet long and a double decked shed of almost equal length.

Ideal Sash Pulley No. 2.

This sash pulley, shown in the illustration herewith given, is made by the Stover Mfg. Company, Freeport, Ill. The points made in regard to it are: That it has a cone bearing axle pulley, noiseless and free in operation, easily and quickly applied, requiring no screws or brads to hold it in place, and when in the frame making a perfect fit. It will be seen that there are lugs or projections on either side of the

*Ideal Sash Pulley No. 2.*

case for spacing the auger holes, and these lugs are also referred to as holding the pulley in the frame after it is applied, thus serving a double purpose. In applying the pulley four holes are bored with a $\frac{1}{8}$ inch bit on a straight line parallel with the parting groove, using the markers on the pulley case for locating the center of the holes. The pulleys are furnished either ground or unground wheels, and are packed in kegs of about 25 dozen and barrels of 125 dozen.

Enterprise Cork Puller.

The accompanying illustration represents this article, which is made by the Enterprise Mfg. Company, Philadelphia, Pa., for whom J. C. McCarty & Co., 97 Chambers street, New York, are agents, and shows the style in which it is made for attachment by screws to table, counter

*Enterprise Cork Puller.*

or other fixture. It is also made with a clamp, so as to be conveniently attached or detached as desired. The sliding barrel and both handles are described as nickel-plated. It is referred to as exerting great pulling power where the strain is greatest and as being simple and effective.

E. N. Robinson, general superintendent of the San Jacinto Tin Company, reports that an English Company has purchased the property and reorganized in London,

England, under the name of San Jacinto Syndicate, Limited. The capital stock is \$1,500,000. The syndicate bought all the property known as Rancho Sobriente de San Jacinto, near Riverside, in San Bernardino County, Cal. Under the management of the new company the tin mines on the ranch will be thoroughly developed.

An Electric Coal Cutter.

One of the newest and latest applications of electric power to mining work can be seen daily in operation at Mr. T. C. Heimes' Drane Colliery, near Osceola, Clearfield County, Pa. Here a most interesting application of motors for mining work has been devised by F. H. Lechner for operating a coal cutter by electricity. Mr. Lechner is well known as being not only the first inventor of coal-cutting machinery, but also the first to operate compressed air in mines for this purpose. It soon became evident to Mr. Lechner that the best results could only be obtained by operating the motor and cutter apart, as otherwise the size and weight of the cutter with the motor mounted upon it would prevent its easy transportation to the mine. In order to do this the following arrangement has been adopted in the mine before mentioned, and has proved very successful:

The motor, which is a 10 horse-power of the Sprague type, is mounted upon a truck, running upon rails, so that it can be easily handled and hauled from one position to another as occasion requires. The entire weight of the motor is less than 1000 pounds. The cutter operated by the motor, which in this case in the New Lechner, is set in position in the room to be cleared, and is connected with the motor by a $\frac{1}{4}$ -inch rope belt, running in V-shaped grooved sheaves, one being on the motor and the other on the cutter. This connection is long enough to allow the motor to be operated 30 feet away from the cutter, and has been set in a position in this mine 1600 feet away from the dynamo. The motor is held in position by guys at the point of use. By means of screw jacks that can be easily adjusted to any height with loose sheaves upon them the cutter can be operated from any angle from the motor, and the connection is made taut by moving the truck upon which the motor rests, and securing it in the right position by guys.

All mining engineers are familiar with the difficulty attending the working of the cutters in the limited space generally allotted them in mines, and how essential it is to have each machine divested of every pound of surplus weight. They also know what care must be exercised in moving it with great iron crowbars, to prevent injury to the more delicate parts of the mines, and however careful, how frequent it is that connecting-rods and other parts are so impaired that the machine has to be sent to the shop. Then how the rugged action of the engines shake everything loose on the machine, however firmly they may appear to be adjusted. All this is removed by the absence of the engines, the machine running as smoothly as a buzz-saw, and as a consequence, cutting with the same facility. By this plan three machines can be operated by one motor, for when one room is out the motor can at once be hauled to another room where a machine is in readiness and position, cut that room and pass to a third while the coal is being removed from the first two, and the cutters being again placed in position.

It was found, upon a preliminary trial of this apparatus at the Osceola mines, that by its use two men are able to excavate 100 tons in 10 hours, and that they can move the cutter as often as desired without any auxiliary aid. It has been

estimated that the cost of equipping a mine for the purposes of operating machinery with electricity is only about one-half the cost of equipping with compressed air, and the price of maintenance shows about the same proportion of saving.

Snow Armor.

In a recent official test at Frederikshal, Norway, of the virtues of snow for breastworks, one was constructed 20 m. long, 1.4 high, and 3 m. thick at the ground, sloping up to 1.5 or even 2 m. thick at top. It was made by the soldiers rolling large snowballs, putting them in a row, and then filling the interstices with snow packed tight by means of snow shovels, swords, bayonets, &c. Shots were fired from Garmann guns at a distance of only 50 m. Seven shots aimed at the upper portion, about 3 dm. below the top, went clean through, the thickness of the breastwork at the points of penetration varying from 1 to 1.58. Three aimed at about 0.6 or 0.7 below the top remained in the snow and were afterward dug out. It appeared that one of them penetrated to a depth of 1.25, another of 1.20, and a third to a depth of 1.23 only. The snow was quite free from fragments of ice; but the projectiles were all found to be flattened and broadened toward the front. At the time of the experiment, the thermometer stood at $+2^{\circ}$ C. Water was poured over the breastwork and next day it was found covered with a coating of ice. Ten shots were fired, but at a distance of 100 m., and with a result contrasting remarkably with the lesson of the day before. The snow wall was penetrable easily, and the shape of the projectiles was not altered. Seven of them went through where the intrenchment was about 1.59 to 1.63 m. thick, and they could not be found afterward. Of the other three projectiles, two were found at a distance of 8 m. behind the breastwork, and one immediately behind it. Evidently the mass became less compact, or more porous after the freezing, and was more easily penetrable. Colonel Hertzberg draws the conclusion, from the experiments, that if the face of the breastwork is not sloping, but the wall is made to have a minimum thickness of 2.50 m., a rampart of snow may defy any kind of projectiles fired from any distance.

Oil as Fuel.—At the convention of the National Electric Light Association, M. J. Francisco took up the subject of the use of oil as a fuel. He stated that during the past few months the following facts have been gleaned from an extensive correspondence on this subject with parties who are using liquid fuel. The Boston and Albany Railroad Company, after a careful test made in their shops by a Lehigh University professor, say that the cost of fuel is about the same. Though they purchase their coal in large quantities at one time and secure low rates, they prefer liquid fuel, because it is clean and requires no firemen, and gives a better supply of steam. Day, Cordage & Co., of Boston, claim that with Cumberland coal at \$4.50 per ton and liquid fuel at \$1.15 per barrel, they save 15 cents per 100 horse-power per hour, and the oil is preferable. The Fairbanks Scale Company, of Vermont, report that they find it a great saving over coal, while the boilers are heated evenly the entire length; also that the insurance companies have not increased their rates. T. P. Brown, manager of the Toledo, Columbus and Southern Railway, reports a saving of 33 per cent. of the price of coal by using liquid fuel; also that 2 barrels of oil equal 1 ton of soft coal, while manufacturers on his road find it only costs one-half as much as coal for their stationary boilers.

CURRENT HARDWARE PRICES.

MARCH 13, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

THE IRON AGE

THURSDAY, MARCH 21, 1889.

Automatic Vertical Tapping Machine.

The accompanying engravings show a vertical tapping machine, designed for tapping nuts from $\frac{1}{4}$ inch up to 2 inches, or larger, if desired. The machine is made by the National Machinery Company, of Tiffin, Ohio. They are made in the form

are suitable for $\frac{1}{4}$, 1, $1\frac{1}{2}$ or 2 inch. On the driving shaft is a beveled pinion which drives a vertical shaft in the center of the column. On the lower end of this shaft, just below the beveled gear, is a pinion which meshes with a large spur-wheel shown plainly under the bed-plate of the machine in the sectional view. This large wheel is secured to a vertical shaft, which

a sufficient end motion of the tap spindles to raise the taps out of the nuts, and also to allow them to tap clear through the nuts. At the upper end of each of the tap spindles is a 3-inch pitch double-threaded screw, surmounted by a disk, which is loose on the spindle. On top of the central column is a sleeve, which is prevented from rotating with the column

AUTOMATIC VERTICAL TAPPING MACHINE, BUILT BY THE NATIONAL MACHINERY COMPANY.

illustrated in order to do away with the labor of raising and lowering the heavy tapping spindles, which are made of 2 $\frac{1}{4}$ -inch steel and carry a gear-wheel, tap-holder and filled tap. When revolving, the machine raises each tap as it comes before the operator, who need not be, of necessity, a skilled mechanic. The belt pulley is loose on the horizontal shaft, and is constructed so that it can be made fast to the shaft for light work, or it may be arranged to drive the shaft by an external back gear for heavy work. The speeds

carries another pinion meshing into teeth cast in the lower edge of the pan, which is by this means caused to rotate at the rate of one revolution to 33 of the tap spindle. Allowing 30 revolutions on the tap, there will be some three or four revolutions left after the nut has been tapped, during which, to change the tap, replace the nut, &c. The vertical shaft also carries a large pinion, with very wide face, into which the six gears of the tap spindles mesh. The length of face of the large central pinion is large enough to allow of

by a spring on a frame supporting the top of the center column. This sleeve carries a spiral rack and flat bench, followed by an incline. As each tap spindle comes around its screw engages in the spiral rack, which raises it; when it reaches its highest position the disk on the top of the shaft passes over it and down the incline, the spindle drops down and the tap enters the nut which has been placed for it. The pan is filled with water to within 2 inches of the top, and has $\frac{1}{4}$ inch of oil on its surface. The nut is submerged in oil

while being tapped. The spindles are provided with patent tap holders, which permit of their being removed and emptied when filled with nuts without stopping the machine, which will tap 6000 to 8000 4-inch nuts in 10 hours.

The Redemann-Tilford Steel Process.

For some time past a number of accounts have reached us of a new process for treating steel, brought out in Louisville by the Redemann-Tilford Steel Company, of that city. We have not been able to secure an intelligible description of the method itself, which appears to consist of heating steel to a certain temperature, according to the results to be obtained and the character of the metal. The heated steel is then plunged into a "chemical composition," in which it is allowed to cool. H. J. Tilford, the secretary of the company, has forwarded to us a number of documents to show what has been accomplished. It appears that an application was made to the Pittsburgh Steel Casting Company for some of the metal from which the cast gun was made. They had none of it left in convenient pieces, but forwarded pieces from a 9-ton wheel, which was approximately the same metal. After treatment they were returned, the Pittsburgh Steel Casting Company reporting on the matter as follows:

Our superintendent, Mr. Hainesworth, who examined them, noticed small cracks on end where drilled and expected them to fly to pieces with light blow of hand hammer. The foreman was instructed to test them under a 1000-pound steam hammer, with a pressure of steam estimated at 70 pounds on a 12-inch piston, which, of course, exerts a greater force than the weight of ram itself. The pieces were placed on support 6 inches apart, as shown on sketch inclosed, the fall of ram being 14 inches. The hardened piece, 2½ inches diameter, was struck 11 blows before breaking; this we considered a very strong piece of steel; grain fine and silky. We could not machine the outside, but could drill in end after breaking. The toughened piece of steel, 2½ inches in diameter, was the strongest piece of steel our superintendent has ever seen. It stood the following test: 17 blows steam hammer; then piece reversed and struck 14 blows steam hammer; no break; then nicked all around and struck 10 blows steam hammer; 8 blows 280 pounds weight falling 24 feet; 1 blow 1950 pounds weight falling 24 feet; broke; grain fine and silky. A piece of each will be expressed to you, marked *88. It certainly was a remarkable change in the steel.

A report of tests made at the works of Carnegie, Phipps & Co. gave the following:

	Toughened.	Hardened.
Tensile strength.....	88,820	98,600
Elastic limit	48,870	83,600
Elongation.....	9 % (in 2 in.)	0.06 % (in 4 in.)
Reduction of area.....	14.04 %	none.

In an affidavit made by G. W. G. Ferris, of Ferris & Co., inspectors, report the following as the results of tests made by him:

	Treated.	Untreated.
Elastic limit.....	96,720	50,320
Maximum load.....	141,700	72,460
Elongation:		
In 4 inches.....	8.25	8.00
In 8 inches.....	5.50	11.00

A later test showed an elastic limit of 118,850 pounds and a maximum load of 167,250 pounds per square inch, with an elongation of 6 per cent. in 4 inches.

So far as the chemical changes are concerned, the following analyses were reported by W. L. Abbott, of Carnegie, Phipps & Co., Limited:

	Carbon.	Silicon.	Sulphur.	Phosphorus.	Manganese.
Treated and annealed.....	0.46	0.061	0.058	0.100	0.89
Treated bath.....	0.46	0.049	0.05	0.098	0.92
Tempered water.....	0.20	0.042	0.074	0.148	0.90
Not treated.....	0.25	0.042	0.062	0.150	0.90

Dr. Fricke, of Carnegie, Phipps & Co., Limited, reports the following:

	Treated B.	Not treated.
Carbon.....	0.45	0.28
Silicon.....	0.040	0.044
Phosphorus.....	0.110	0.162
Sulphur.....	0.052	0.072

The samples were received through J. B. Booth & Co.

Manual Training.

The subject of industrial training is treated thoughtfully in a report to the Pennsylvania Legislature by a commission appointed by that body, comprising the presidents of the Pennsylvania State College,

branch of the general school system, or of a special course in connection with one or more schools. The manual training schools introduce into their curriculum the same educational studies as are found in other schools, and aim thus to develop the intellectual faculties not less than the physical. In the same way shop-work, when introduced as a part of the prescribed course of any public school, is not allowed to diminish the amount of attention given to other studies; and it is found that the school time which would thus at first sight appear to be lost to those studies is fully made up and often more than made up by the increased freshness, aptitude and mental alertness which the pupil acquires from his manual exercises.

AUTOMATIC VERTICAL TAPPING MACHINE.—SECTIONAL ELEVATION.

the president of Girard College and others well qualified to investigate the subject. The commission prepared a bill for the general introduction and maintenance of a system of manual training in connection with the public schools, and ask for an appropriation of \$500,000 to carry their scheme into execution.

The new movement for popularizing manual training as a part of public school instruction, the report states, began about ten years ago with the establishment of the St. Louis Manual Training School. Since that time, but particularly within the last five years, it has spread very rapidly, until it has come to be a factor of the greatest importance in public education in many parts of the country. An account of the most important institutions of this kind in the United States appears in the appendix to the commission's report. Some of these institutions are of a special character, privately supported, and others form a

The commission are persuaded that manual training processes in the public schools have become well enough established to enable any community to enter upon them intelligently and successfully; that the training involves no great expense or difficulty, and that it should be introduced as rapidly as possible into every grade, beginning with kindergarten work. It will not diminish the vigor and efficiency of the public schools, but will increase both; it will not divert our children away from industrial pursuits, but direct them toward them; it will not result in the teaching of trades by the public schools, but will train the body of youth intelligently prepared to enter upon all trades; it will not interfere with the highest intellectual training of those who are designed for professional pursuits, but will give a body of common knowledge and common skill which will be of incalculable value to the students of all professions; it

will not lower the standard of instruction, but will elevate it; and apart from its influence on the schools, it will help to give dignity and efficiency to every form of useful labor. Wherever an attempt has been made to introduce manual training into the public schools—whether in a special school, as in Philadelphia, or in the general system, as in New York, New Haven and many other places—whether it has been supported by appropriations from the municipal treasury or by private contributions of public-spirited citizens, the result has been the same; teachers, pupils and parents vie with each other in their testimony to its healthful and beneficial influence.

48-Inch Hydrostatic Car-Wheel Press.

In this press, which is made by the Putnam Machine Company, of Fitchburg, Mass., the ram has two speeds. The

tons. Adding Georgia we make a total of 65,000 tons. In January the output was 66,575 gross tons, thus showing an increase from 2147 tons a day in January to 2328 tons a day in February.

Turner, Dickinson & Co.'s New Foundry.

Among the recent additions to the manufacturing establishments of Chicago is the foundry of Turner, Dickinson & Co. It is located on the Omaha branch of the Chicago, Milwaukee and St. Paul Railroad, very close to Holstein Station, at which all passenger trains stop. The lot is 816 feet long by 132 feet wide, and is bounded by Hoyne avenue, Churchill street and Zelma place. These streets and the railroad running alongside the property prevent the erection of other buildings close enough to interfere with light and ventilation. Over half of the lot is retained for yard

the walls of the building. The roof is also strengthened by trusses placed outside of the building instead of taking up valuable space inside. The entire ground floor of the molding-room is entirely free from pillars, permitting the unobstructed use of the cranes. The central space between the hanging floors is 52 feet by 60 feet, and its height enables a large swinging crane to be put in, which reaches over its entire area and has a lifting capacity of 15 tons. An unusually large ventilator with large windows runs the full length of this central section. Light molding or snap work will be done on the hanging floors, which so greatly increase the available space that 62 molders can easily work in this one room.

The cupola stands outside of the molding room, in one of the rooms between it and the yard. An elevator conveys stock to the cupola from the yard. It is of the ordinary pattern and will melt 25 tons a day. A

48-INCH HYDROSTATIC CAR-WHEEL PRESS, BUILT BY THE PUTNAM MACHINE COMPANY.

plunger of the quick-acting pump is 24 inches, and of the high-pressure pump $\frac{1}{4}$ of an inch. Both plungers act in concert to a pressure of 15 tons, after which the smaller one does the work up to a pressure of 150 tons, if required. This gives a double quick action to the ram up to the point when the larger plunger ceases to work. The cylinder is lined with copper, and the ram is 84 inches in diameter and has a run of 20 inches. The foot-block is suspended on rolls and is adjustable to position. The press weighs 7500 pounds and is furnished with roller lifting jack, pressure gauges, lock-up safety valve, liquid tank, return weights and counter-shaft having tight and loose pulleys 18 inches in diameter by 5 inches face.

In February 18 coke furnaces, which were in blast a part or the whole of the month in Alabama, produced 41,094 gross tons of pig iron. One furnace did not report its output, which is estimated at 3200 tons, making a total of 43,294 gross tons. It must be remembered that the month had only 28 days. In the same time the Tennessee blast furnaces produced 20,008

purposes, into which a side track runs for the convenient receipt of stock and shipment of goods. Sheds are built on both sides of the track for the storage of sand, coke, wood, &c. The arrangement of the foundry buildings is peculiar and worthy of detailed mention. They are built of brick, with gravel roofs, and have as many windows in the sides as a due regard for the strength of the walls will permit. The entire ground space covered is 100 feet by 132 feet, the buildings extending the full width of the lot. A depth of 40 feet next to the yard is one story high, and is divided into a number of rooms, including the shipping-room, cleaning-room, tumbling-room, cupola-room, case-room, engine-room, pattern-room, machine shop, &c. The remainder of the structure, 60 feet deep by 132 feet long, is the molding-room, extending a height of 50 feet in the clear in the center and 30 feet on the sides. This room is unusually light, and its height enables a hanging floor, 40 feet by 60 feet, to be constructed on each side, midway between the roof and the ground. These floors are suspended from the roof and are also partly supported by heavy trusses extending along their inside edges between

Baker blower is used. Another cupola is shortly to be erected at its side which will have a capacity of 10 tons. A Buckeye automatic cut-off engine of 60 horse-power operates the blower, tumbling barrels and other machinery, consisting of drills, bolt cutters, taps, &c., used in finishing. The core-oven is 17 feet long, and is fitted with a railroad track, so that an iron car can be loaded with cores, pushed in, and after the cores are baked it is drawn out, saving the handling of the cores.

A specialty of light fine castings is made by these works, and their products are consequently of a miscellaneous character, running from hardware to piano frames, embracing door hangers, fire-escape platforms, steps, round-house hoods, &c. The manufacture of the latter is especially difficult, as the castings are very thin yet of large size. To be used in connection with these hoods cylindrical pipes are cast running from 2 to 6 feet in length, 20 inches in diameter and but $\frac{1}{4}$ inch thick. Although composed of young men, the firm are doing very creditable work, overcoming difficulties which have prevented older establishments from rendering entire success to their patrons.

Universal Milling Machine Attachments.

In our issue of January 17, 1889, we described and illustrated a universal milling machine built by Pedrick & Ayer, Philadelphia. In this issue we present several engravings intended to show the method of working several important attachments. In Fig. 1 the cutter arbor supporting bar is run out, and is provided with center support and bracing harness, which prevent any tremor of the bar. On the arbor is a 12-inch inserted tooth mill, suitable for milling and sizing out between flanges of castings, &c. The harness is also used when large cutters are placed a long distance from the spindle, or when heavy boring is done. The slots in the braces (these are upside down in the cut) allow the platen to be raised or lowered by simply loosening the two screws. The four following cuts show the work that may be done with the vertical or angular attach-

at an angle bevel gears may be cut. Spur gears up to 5 feet in diameter can be cut with this attachment. Fig. 2 shows the attachment arranged for drilling holes parallel with the platen. In Fig. 3 a V-block is being milled at an angle of 90° , the horizontal feed being used. By using other tools the whole piece can be finished with one chucking except the base. Fig. 4 shows how angle cutters can be milled and bevel gears cut. The index head can be turned around to any angle. With work held in a chuck, hollow mills, counter bores and a great variety of tools can be cut in this position. The index has a circular base, with a graduated plate with a tongue fitted to slot in milling machine platen. When in use for ordinary straight milling a spring pin holds the head square; for angular work the pin is pulled out of position from the bottom index-plate, which is divided into 360 divisions—a feature that will be appreciated. The head is centered to bottom plate by a king

angle. The jaws, of hardened steel, are 8 inches, with a depth of 2 inches, opening $5\frac{1}{4}$ inches. Fig. 6 represents the machine used as a horizontal boring mill. By extending cutter arbor supporting bar and using a fixture with bushings to receive the boring bar holes 12 inches deep can be bored out. By substituting a traveling head boring bar with an automatic feed on the outer end cylinders from 8 to 14 inches can be readily bored out. The knee platen and bearings are of sufficient strength to support heavy weights, and the machine has power enough to drive the bar with heavy cuts.

Electric Welding.

By invitation of H. A. Royce, general manager of the Thomson Welding Company, of Lynn, Mass., members of the Boston press witnessed an interesting exhibition of electric welding at the station of the Malden Electric Company, Malden,

Fig. 1.

Fig. 2.

UNIVERSAL MILLING MACHINE ATTACHMENTS, BUILT BY PEDRICK & AYER.

ment, which is secured to the head of the machine by four bolts. It is driven by a socket fixed in the spindle of the milling machine, which is key-seated to fit the keyed stud in the attachment. Through the medium of a pair of miter-wheels this stud drives a spindle at right angles to the vertical attachment. This spindle is geared with a shaft in line with it, which is utilized as a cutter or saw arbor for cutting racks, sawing up stock, &c. This shaft runs in bronze bearings, and can be removed from the attachment by means of the two clamp-screws in the clamp bearings. This attachment can be used either vertically, horizontally, or at any angle around the center, the base being graduated to register its position. Cutter arbors or boring bars can be used in either end of the main spindle. For rack-cutting there is no limit as to length, while for boring or milling castings of irregular shape or troublesome to hold in other tools it will be found very useful. In cutting large gears the cutter spindle is placed vertically and the index head at right angles to the platen. The gear blank is then fed in line with the main spindle of the milling machine. By setting the platen

bolt, and is held to platen in its various positions by two steel bolts and clamps. The spindle is of steel, 8 inches in diameter, threaded to receive a chuck-plate; it has a taper reamed hole through it from 2 to $1\frac{1}{4}$ inches at small end. The worm and worm-wheel are accurately made and compensating for wear. For cutting spirals the worm gets its motion from a pair of spiral gears instead of miter or bevel gears; they are inclosed to exclude the chips and dirt; the index wheel is also completely covered for the same purpose. Spirals, either right or left, can be cut. Bevel gears and bevel cutters can be cut on this head with the vertical and angular attachment. The universal vise shown as an attachment in Fig. 5 is adapted to swing from a horizontal to a vertical plane or at any angle therein. A graduated plate, with a central stud, fills the hole in the base of the vise, enabling it to be set at any angle. It can be held in any position on the trunnion by clamping the body of the vise with the two nuts shown in the cut. A graduated dial on the trunnion, marked by degrees, gives the angle to which the vise can be thrown, facilitating the milling or planing of work at an

Mass., on Monday evening, March 4th. The following experiments were successfully made on three machines of graduated capacity, welding $\frac{1}{8}$ -inch copper rod, $\frac{1}{4}$ -inch brass rod, $\frac{1}{4}$ -inch iron rod, 1-inch iron rod, 2-inch iron rod and 2-inch iron pipe. The operation consumed from 8 to 75 seconds, according to the size of the pieces welded. To show the strength of the weld, a rod was twisted until it broke, but not at the welding point. The welding plant consists of a dynamo of special construction, wound for supplying alternating currents of 800 volts potential, and three welders or welding coils, which are so constructed as to transform the currents supplied by the dynamo into currents of very low electric motive force. The welders consist of a core of iron composed of disks of sheet iron bolted firmly together, through the center of which passes a copper tube, constituting the secondary of the machine. Coils of fine copper wire are then inserted through the tube or secondary and over the core of iron, the fine coils forming the primary of the machine. The currents from the dynamo are sent through the primary coil, and by induction heavy welding currents of low electric-motive

force are generated in the secondary. These currents are made to pass directly through the pieces to be welded, and when the metal is heated pressure is applied and the weld thereby completed.

These machines were illustrated some months since in *The Iron Age*, but since that time they have been modified so as to

The New Appraiser's Stores.

It appears from Washington dispatches that the vexed question concerning the location of the appraiser's stores in this city has been finally settled by a decision of the Treasury Department favoring the up-town location. This selection is in ac-

size of the present stores on Laight street, a few blocks below. The price paid is less than \$500,000. When the improvements contemplated by the Dock Department on Thirteenth avenue are completed, between West Eleventh street and Twenty-third street, the new stores will front on the river. The buildings that occupy the

UNIVERSAL MILLING MACHINE ATTACHMENTS, BUILT BY PEDRICK & AYER.

be scarcely recognizable. They now are adapted for riveting, forging, and shaping metals. Three of the machines are to be sent to the Paris Exhibition, together with an interesting collection of samples showing the work done. Mr. Royce presented to the gentlemen present a souvenir of the occasion in the shape of a single bar composed of copper, brass, German silver and iron welded together by the electric process.

cordance with the recommendations of the New York Chamber of Commerce, and the contract for the purchase of the site now made is the conclusion of negotiations pending when Mr. Fairchild vacated his office. Nothing remains but to perfect the title and erect the necessary buildings. The site purchased is the block bounded by West, Bank, Bethune and Washington streets, convenient to the wharves of the principal steamship lines, and is twice the

site at present are tenanted by the Star Card Company, T. & R. Patterson, lumber dealers; the De la Vergne Refrigerator Machine Company, the Whiting Putty and Paint Works, W. H. Dougherty & Co.'s iron works, a box factory, a rubber-paint works and John J. Budd. The frontage on West street is 285 feet depth, on Bethune street 360, on Washington street 230 and on Bank 370, and the area is about 93,000 square feet, or over two acres. The

decision now reached must commend itself to the judgment of all merchants who have observed the tendency of the foreign commerce of the port to concentrate on the North River side of the city, midway between the upper and lower sections and at a point not far removed from the prominent business center. It now becomes of the first importance to erect a structure commensurate with the requirements, present and prospective, of the leading commercial emporium of the United States, one that shall be not only commodious but practically indestructible by fire or the lapse of time, and which shall command every facility for transacting business expeditiously and at the minimum of expense. Architectural effect is a minor consideration, but cannot be wholly ignored.

W. B. Belknap.

Few men not in public life had so wide a circle of acquaintance, and few in any station have been more sincerely mourned than William B. Belknap, whose death is announced at Louisville, Ky., February 24, in the 78th year of his age. Prominent as he has been in mercantile and manufacturing enterprise in the West and South, he was socially almost as well known in the East, whither his journeyings in search of health and necessary recreation frequently brought him in his later years.

Mr. Belknap's early life intimately associated with the first beginnings of the great iron manufacturing industry of Pittsburgh. He was of the family that gave to the world the well-known Dr. Jeremy Belknap, the historian of New Hampshire. His father, Morris B. Belknap, who as well as the son was born in Brimfield, Mass., was a man of versatile talent. While by preference devoted to science, he studied at one time law and at another time divinity at Harvard College. But more than all he was impelled by that spirit of restless activity which Washington Irving so humorously describes as characteristic of the typical Yankee. Married in 1807, he moved in the same year to the frontier at Marietta, Ohio, where he knew intimately both Aaron Burr and Blennerhassett, visiting the latter at his island home, and leaving on record his belief that the famous "Burr's Expedition" was not undertaken with any treasonable intent. From Marietta he went to Lexington, Ky., and returned to Brimfield in 1810. From Brimfield he moved again to Worcester, Mass., where the strong bent of his mind toward science and mechanics led him to engage in manufacturing. Still another move was made in 1816, when he went to Pittsburgh, Pa., where at once, without previous experience in anything of the kind, with no models before him, and without skilled assistance, he set himself to what became his life-work, the construction of furnaces and rolling mills. The first rolling mills of Pittsburgh were built under his supervision, and there still exists at least one of his structures, which with little if any alteration is running and doing good work to this very day. The so-called skilled workmen that were imported from England proved so incapable that Mr. Belknap was forced to take the tools from their hands and show them—and he showed them successfully—how to do what he himself had never seen done.

After 11 years of sound, honest work Pittsburgh was fairly started, with no small obligation to this man's genius, on the road to manufacturing wealth, and it was time for another move. He heard of the rich mineral deposits that lined the shore of the Cumberland and Tennessee rivers. He started for Nashville, where, armed with cordial letters from Andrew Jackson, whom he visited at the Hermitage, he proceeded alone and on horseback to explore the spurs of the Cumber-

land Mountains and other portions of the State. As a result of his investigation reported to the bankers Yeatman, Woods & Co., of Nashville, the latter gentlemen determined to erect furnaces and a rolling mill in Stewart County, and here the subject of our sketch, Wm. B. Belknap, was called upon at the early age of 18 to begin his long and successful business career.

His father had left his wife and six children, of whom William was the oldest, at their country home on Pine Creek, near Pittsburgh, while he was prospecting in Tennessee. William was going to school to the Rev. Jos. Stockton, in Allegheny, but doubtless he had got the most valuable part of his education at play among the driving wheels and rolls of his father's big mills, which he had watched him construct and put into operation. He was already in his early teens a sort of *pater familias*, and the younger children looked up to him as they continued to do through life. The order came to him from his distant father to select and purchase the machinery for an iron furnace, and to come to him from Pittsburgh, bringing with him machinery, household furniture, family and all. One can well believe that that must have been an extraordinary youth on whom a father could venture to impose such a formidable task. But the machinery was judiciously bought, and the lad, with his valuable freight, animate and inanimate, was soon voyaging down the Ohio. He left behind him delightful memories of his school days and of his intimate fellowship with other bright boys, like his lifelong cronies, Geo. K. Shoenberger, of Cincinnati, and John H. Shoenberger, of Pittsburgh, weighty names subsequently in the iron industry and in the development of those great cities. He kept a warm corner in his heart always for his boyhood friends, and those friendships became subsequently an important factor in his business career.

Reaching the falls of the Ohio at Louisville, where there was then no canal, the boat had to be relieved of her cargo to enable her to pass the rapids. Young Belknap saw to the unloading of his heavy machinery, to its carting through Louisville to below the falls, and finally to its loading again at Shippingport. It was a tedious job, taking two or three days before the boat was again on her way to the mouth of the Cumberland. The landing place on the Cumberland River—no town, but a ferry crossing only—was reached in the night-time, and our schoolboy delivered the family furniture and the machinery all safe and sound to his father, awaiting their arrival on the river bank. But Dr. Joseph Stockton's pupil was no schoolboy now. No university could have educated him so fast as that trip down the river. When he arrived at that river landing he was already a man, and ready to do a man's part in the world. For two years he assisted his father, disbursed the money and attended to much of the business incident to building and running several furnaces, which, including the Hillman and other leading charcoal furnaces, are still in operation and noted for the quality of their iron. He was feeling advanced and mature, we can imagine, when he attained his nineteenth birthday, and, knowing that his father would keep on all his life building furnaces and rolling mills for sheer love of it, he obtained permission to mount a horse and seek his fortune wherever it might be awaiting him.

He found it for the time being at Hickman, Ky., then called Mill's Point, on the Mississippi River, about 40 miles below Cairo—a fertile but then unwholesome section, where he made money in merchandising, but lost his health. At first in business for himself, he subsequently associated himself with two young men from Louisville, Ky., and, expanding their operations, a branch house was established

at Moscow, and still another later at Vicksburg, Miss., of both of which Mr. Belknap had charge. In a few years a snug little fortune, as was supposed, had been made for all the members of the firm, and Mr. Belknap sold out to his partners; but before a settlement could be made the fierce financial revulsion of 1838 swept over the country, and the three young men who had thought themselves passing rich were wholly bankrupt. His bankrupt debts Mr. Belknap subsequently discharged dollar for dollar, as fast as he could earn money to pay them. It is not an unmixed evil for a young business man to be roundly bankrupted early in his career. It is better to have lost and paid than never to have lost at all. Mr. Belknap's money was gone, but a valuable lesson remained, which enabled him to weather subsequent financial storms with hardly the loss of a spar. And now he must wander, like his father before him. He goes to Texas, then to St. Louis and to Cincinnati; but finally, in 1840, he settles down in Louisville, Ky., as agent of his boyhood friends, G. K. & J. H. Shoenberger, of Pittsburgh.

In 1848 he married Miss Mary Richardson, daughter of William Richardson, president of the Northern Bank of Kentucky. In 1847, having prospered in business, he bought, in conjunction with Capt. T. C. Coleman, a partly built rolling mill, which they completed and entered upon the manufacture of iron of such superior excellence as speedily built up a reputation all over the South and laid the foundation for several Louisville fortunes. His separate merchant business of iron and heavy hardware was kept up under the firm name of W. B. Belknap & Co., in which he was associated with his brother, Mr. Morris L. Belknap. The firm has since expanded into the corporation of W. B. Belknap & Co., managed by his sons and his son-in-law, and well known as one of the most important hardware houses south of the Ohio River.

His mature life has been identified with the development of Louisville. Caring nothing for public honors, he was earnestly devoted to its welfare. No new scheme for promoting it wisely could be broached, as by charitable institutions, by libraries, by manufacturing enterprises, large or small, to which he was not ready to give both his money and his time. He was active in the Sanitary Commission, the Refugee Commission and other beneficent agencies of the war period. He was never afraid of the laboring oar. His charities were constant, but quiet always and avoiding publicity. He was especially fond of intellectual companionship, and few men of distinguished merit visited Louisville without receiving invitation to his hospitable board. During the war, in which he earnestly espoused the Union side, he virtually kept open house for the brilliant throng of federal officers of whom Louisville was headquarters. The list of those entertained by him would embrace the most distinguished names that illumined the battle-fields of the Southwest, from Grant, Sherman, and Thomas down through a multitude of worthy subordinates. All over the Union are men who will long remember the gracious figure of their host—for Mr. Belknap was a man of strikingly handsome and dignified appearance, and the most courteous manners based upon innate refinement and goodness of heart. It is pleasant to think that in his old age he had all that can best console declining years, as "honor, love, observance, troops of friends."

C. P. Huntington, the railroad magnate, is credited with having bought 1,000,000 acres of land in Lower California, where he is building a railroad, and is said to contemplate a development of that section of country.

WILLIAM B. BELKNAP.

The Buffalo Exhaust Fan.

The peripheral portion of the shell or case of this fan is cast in one piece, to which the center plates are fitted, metal to metal, without the interposition of any foreign substance whatever. The Buffalo Forge Company, of Buffalo, N. Y., the makers of this fan, claim as the result of this construction that the fan is practically one piece, and that, under any service, the bearings must always be in perfect alignment with the rest of the machine. The journals are long and heavy and are supported by the arm having planed surfaces fitted accurately to the body of the fan. By a perfected system of gauges and templates it is claimed the

jectiles fired at them at a distance of 30 feet from the muzzle, but the compound armor showed the best results.

A New Brass Mill.

We have alluded in the past to the fact that a new brass mill is in course of construction at Bridgeport, Conn., by the Aluminium Brass and Bronze Company. Those identified with it are men long connected with the metal industry of the Naugatuck Valley, the president being Frederick J. Kingsbury; the treasurer, William Powe, for many years with the Ansonia Brass and Copper Company; the secretary, Frederick J. Kingsbury, Jr., and the me-

carry a pressure of 125 pounds per square inch. In immediate proximity to it is to be the 1000 horse-power compound engine, the largest yet constructed by the builders, Watts, Campbell & Co., of Newark, N. J. The main shaft of this engine drives the seven sheet trains, which are located in the main building, which is 267 x 84 feet. The wire rod train is placed in the lower right hand l, 76 x 70 feet, which also contains two heating furnaces. The main engine drives also the slitting machine and the wire-drawing benches, which are placed along one wall of the main building. The muffle-room, 120 x 84 feet, is located in the upper left hand l, the shipping-room, 51 x 60 feet, being alongside of it. The independent structure

THE BUFFALO EXHAUST FAN, BUILT BY THE BUFFALO FORGE COMPANY.

different parts of the fan are so well proportioned and fitted each to the other that at the highest speed there is practically no vibration. Both bearings of the exhaust fan are on one side, leaving the inlet entirely unobstructed.

Charles A. Ashburner has just submitted to the United State Geological Survey a preliminary statement showing that the total production of coal of all kinds increased from 129,975,557 short tons in 1887 to 145,363,744 tons in 1888. The value in 1887 was \$182,556,887, which increased to \$208,129,806 in 1888.

In the trials on board the Nettle, at Portsmouth, England, to determine the relative efficiency of compound (or steel-faced iron) armor and solid steel, two samples of compound and eight of solid steel armor were tested. Two of the solid 10-inch plates withstood the Palliser pro-

chanical superintendent, Charles S. Morse, who has also extended experience in brass manufacture. Dr. Leonard Waldo is electrical engineer. The principal aim will be to produce a high grade of sheets, rods and wire, with the aid of silicon and aluminium alloys, under the Cowles patents. The plant is located on an 8-acre tract on the Housatonic Railroad and the Pequannock River, and is expected to be in operation toward the end of May or early in June. The main buildings are now completed, being of brick, with a very handsome iron roof built by the Berlin Bridge Company, of East Berlin, Conn. The buildings have the following form:

The L on the lower left, which is 58 x 64 feet, contains six boilers built by William Lowe, of the Bridgeport Boiler Works, to

shown in the sketch has the casting-room, the metal storeroom, and the cabbaging-room in an upper floor, the cabagging being the compression of scrap by hydraulic presses preliminary to its introduction into the melting pots with new stock.

Beginning at the casting house, which is 153 x 62, and contains 40 furnaces, one of the main features as a departure from the ordinary practice is that the slabs and bars cast will not be raised from the pit, but will be allowed to drop into the story below, thus avoiding a good deal of labor. They are carried directly to the rolling mill in cars, the track being on the same level.

In its rolling mill practice the new works will differ very widely from the generally accepted methods. Aluminium and silicon bronze and brass are considerably harder than the corresponding common alloys. The company propose first to adopt a combination of the brass and copper practice—that is, it is the intention to break

down hot and finish cold. Then their machinery is designed much stronger than is usual, and will be run at higher speed. It is being built by the Waterbury-Farrell Foundry and Machine Company, of Waterbury, Conn., of whose work the company speaks in strong terms, and the Farrell Foundry, of Ansonia. The rolls are being made by the A. Garrison Foundry Company, of Pittsburgh, Pa. The two heating furnaces for the hot rolling are located in the L in which the rod train is placed. The capacity of the plant fully employed is rated at about 6,000,000 pounds of sheets and rods and about 1,500,000 pounds of wire. The company are building a dock on the river, and are dredging a channel, which will enable them to handle the necessary coal readily. A well is being sunk into which river water for the condensers will be conducted.

The plant was located at Bridgeport, after mature reflection over the possible advantages offered—for instance, by the cheap fuel of the West. It was not placed in the Naugatuck Valley chiefly because of the additional cost of coal. At Bridgeport the plant is close to the great metal manufacturing points in Connecticut, and there is little trouble in drawing from the population of skilled workmen the necessary supply of labor. A departure in the direction of methodical work will be the establishment of a chemical and mechanical laboratory.

The Aluminium Brass and Bronze Company have adopted the use of Cowles alloys after thorough study of their characteristics, being convinced of their greater strength and their resistance to corrosion. A series of very interesting tests has been made with silicon bronze wire for electrical purposes. A wire 0.0632 inch in diameter, weighing 64 pounds to the mile, and a resistance of 23.8 ohms to the mile, showed a tensile strength of 262 pounds and an elongation of 2.4 per cent., and underwent from 110 to 126 twists. The principal advantage of such silicon bronze wire is that there is less trouble in handling it and that the number of poles, one of the great items of cost, is greatly reduced. It is stated that while the number of poles for hard drawn copper wire ranges between 36 and 43 per mile, the poles carrying silicon wire may be placed 1000 feet apart.

The following analyses of ores from the mines of the Bluffton (Ala.) Land, Ore and Furnace Company were made by J. H. Pratt, of Birmingham, Ala.:

	Clay Bank.	High Bluff.	Roland Bank.	Hickory Tree Bank.	Cleveland-Miliken Bank.
Ferric oxide.....	78.49	79.97	84.16	83.20	78.71
Silica and sand....	5.52	6.75	2.86	2.69	4.97
Phosphoric acid....	1.19	2.34	2.31	2.06	2.77
Water combined..	10.74	11.02	11.15	10.95	10.80
Moisture at 100° C.	0.99	0.32	0.65	0.60	0.60
Metallic iron.....	54.88	55.98	58.91	58.24	55.10
Phosphorus.....	0.52	1.02	1.01	0.90	1.21

The principal development thus far has been made at the Clay Bank.

Mr. G. L. Walker, of Plymouth Foundry Company, Plymouth, Mass., has recently returned from a two-months' trip to the Pacific Coast. Mr. Walker combined business and pleasure and enjoyed a satisfactory amount of both.

A jury at Greensburg, Pa., gave a verdict of \$4798 against Carnegie Brothers, the amount of damage done to a fruit farm by smoke caused by burning coke on lands adjacent. Judge Hunter ruled that inasmuch as the coal used for the manufacture of said coke was not mined on the premises, but shipped there from other localities, the company, he believed, was liable for any damage done the plaintiff's property.

Automatic Steam Hammer.

In the steam hammer here illustrated the frame, or housing, where the anvil passes through is bored true to receive the top of the anvil, which is turned off to fit. The advantage gained by having the ram and anvil in line will be readily seen; all that is required in making the dies for

side. The makers of this hammer, the Knoxville Car Wheel Company, of Knoxville, Tenn., in addition to the special dies can also furnish dies for making railroad coupling pins.

The Atkinson Car Spring Works, of Chicago, are in no way disconcerted at the suits recently brought against them by

GUILD'S AUTOMATIC STEAM HAMMER.

special work is to make them true to the shank of the die, when they will come exactly in line. The ordinary die can also be turned around to any angle desired. The valve is a simple piston having two packing rings. The steam-chest is lined with a brass bushing formed with a series of holes drilled to correspond with the annular recess in the steam-chest. This construction obviates the necessity of projecting the post and gives a free passage for the steam. The valve is balanced and very easy to handle, while it may be easily got at, as all its connections are on the out-

residents of the neighborhood for maintaining a nuisance. President F. M. Atkinson states that these suits have been instigated by parties having ulterior motives, which will be demonstrated in due time. The condition of the works has been investigated by the Board of Health, in accordance with the complaints made, and the officers found that fish oil was not being used for tempering, and that care was taken by the company to avoid the creation of disagreeable odors by having the tanks covered with exhaust fans drawing off the fumes. Gas furnaces are used

for heating the steel, so that but little smoke is made by the works. The hammers complained of are very light, the heaviest being but 80 pounds, so that not much jarring could be done by them. The absurdity of the charges brought against these works is shown by the fact that they are located in a district almost wholly given up to manufacturing. They are surrounded by malt houses, distilleries, tanneries, rolling mills, &c., all making more or less smoke, many yielding stenches of the most disagreeable character, and some being exceedingly noisy. The suits entered have been appealed, steps have been taken to check further prosecutions, the company's operations have not been interfered with, and the pecuniary consequences have been insignificant. This statement is due to the company in view of the sensational reports which have been published concerning them.

Locked Wire Rope.

E. G. Spilsbury, managing director of the Trenton Iron Company, Trenton, N. J., presented at the New York meeting

that they may be readily designed to meet the requirements of every particular case and that the flexibility may be increased by the method adopted in laying up the rope. The total tensile strength of the locked rope represents a higher percentage of the aggregate tensile strength of the individual wires. The weight per foot for the same size is of course greater than that of the ordinary wire rope, being about 50 per cent. more. It is pointed out, however, that the greater bearing power will allow of a smaller size of rope. The cost of the locked rope is about double that of the ordinary stranded rope, but it is claimed that increased life compensates for it. Some of the data gathered during years of use in English collieries point to this conclusion.

On the score of safety the fact is emphasized that when one wire breaks it is not loose, but being locked by its neighbors, merely tends to create an irregularity at the socket and gives timely warning of its condition. On long ropes the lessened weight through greater strength is an important consideration. In mines it lessens the dead-weight and allows of going to greater depth without heavier engines, or

cles they make the partly-finished product, carrying it, with the aid of a good deal of special machinery, to the point desired by their customers. Thus we are informed that they make the axle boxes for childrens' carriage axles by the million. They produce also twisted and plain copper lightning-rod tubes. They report that in a number of small articles the high price of copper during the past year has led to the substitution of cold-rolled steel for it, some of the brass and copper manufacturers themselves placing considerable orders for some specialties. Some of the specimens shown exhibit a capacity for undergoing torture which few familiar with steel would credit the metal with.

Company Stores in Illinois.

The following bill, directed against "company stores," has been introduced in the Illinois Legislature, and is making progress toward enactment into a law:

"That it shall be unlawful for any person, company, corporation or association now engaged or hereafter to be engaged in any mining or manufacturing business in this State to engage in, or be interested in, directly or indirectly, the keeping of a truck store or controlling of any store, shop or scheme for the furnishing of supplies, tools, clothing, provisions or groceries to his, its or their employees while so engaged in mining or manufacturing.

"Every person, company, corporation or association found guilty of violating Section 1 of this act, either by himself, its or their agents, servants or employees, or partners, shall be guilty of a misdemeanor for each and every day such business is done in violation of said section, and on conviction will be liable to a fine for each offense of not less than \$50 nor more than \$200, to be recovered in the name of the people for the use of the school fund, and any person having knowledge of the fact that said section has been violated may make complaint and cause summons or warrant to be issued, and if conviction follows and fine be paid such person shall be entitled to one-half the fine when collected, to be paid by order of court to such person.

"It shall be unlawful for any person, company, corporation or association, employing workmen in this State, to make deductions from the wages of his, its or their workmen, except for lawful money, check or draft actually advanced, without discount, and except such sums as may be lawfully garnished in the hands of such employer by process of a court, and except such sum as may be agreed upon between employer and employee which may be deducted for hospital or relief fund for sick or injured employees. Any deductions made from the wages of any workman in this State, except as provided in Section 3 of this act, may be recovered in any appropriate action before any court of competent jurisdiction, together with such reasonable attorneys' fees as the court in its discretion shall think proper, and no offset or counterclaim of any kind shall be allowed in such action or proceeding.

"All attempts to evade or avoid the provisions of this act by contract or otherwise shall be deemed a violation thereof, and for every violation, in addition to the civil remedy provided for in Section 4, there shall, on conviction, be a fine imposed of not less than \$50 nor more than \$200 for each offense. Nothing in this act shall be so construed as to include the business of farmers or farm laborers or servants."

Senator Farwell, of Illinois, is one of a number of capitalists, British and American, who have purchased a tract of 200,000 acres in Durango, Mexico, for stock-breeding purposes.

SPECIMENS OF LOCKED WIRE ROPE.

of the American Institute of Mining Engineers a paper on the locked wire rope invented by an English firm—George Elliott & Co.—and introduced into this country by the Trenton Iron Company. In ordinary wire rope, flexibility can only be secured by making the number of wires to the strand large and by choosing a small gauge of wire. The result is that the wear of the rope is limited practically to less than one-half of the diameter of the individual wire. The outside wires—those which come into contact with the wearing surfaces—are those which determine its life. A serious source of wear is that the rope running over a sheave is apt to cause the formation on its face of diagonal grooves. When the rope does not happen to raise up to match these grooves, it slips into them, causing additional abrasion. In ordinary ropes, too, a broken wire in the strand is apt to curl up. With cable traction rope, there is danger that it clogs the grip of the cable rods.

The Elliott locked rope differs in its construction from the ordinary stranded rope in that it is composed of wires drawn to special section, as shown in the accompanying engravings, the section being such that the individual wires are locked by their neighbors. Our engravings indicate a few of the many combinations possible under this system. It will be noted

results in a saving of power. Another point of consequence in some mining operations is that there is no tendency to twist in the shafts. Until now the ends of the locked rope have been united by brazing, the ordinary methods of splicing being of course out of the question. It is the intention of the Trenton Iron Company to use electric welding, however. Some tests made with that process have given very encouraging results.

The Wilmot & Hobbs Mfg. Company, of Bridgeport, Conn., manufacturers of cold-rolled steel, have more than doubled their capacity during the past two years. The bulk of their product is steel in coils or strips, a form particularly suitable for automatic machinery in subsequent operations. They produce this steel in the range of No. 5 and 6 gauge, down to Nos. 33 and 34, the maximum width being 8 inches. The steel is used for a wide range of articles, among them keys, sewing-machine attachments, parts of clock movements and locks. They produce metal for penholder tips, stove trimmings, partly finished blanks for the watch-cases of anti-magnetic shields, steel, electric, toy and sleigh bells, caster tubes, bicycle pedal tubes, music-stand tubes, butted or lock-seamed tubes, &c. In all these arti-

THE WEEK.

St. Paul newspapers expatiate upon the advantages offered by that city as a manufacturing center. They are apprehensive that Minneapolis and Duluth may attract industries more strongly, especially as the former has decided to raise \$400,000 for the purpose of establishing a gas and water pipe manufactory in competition with Louisville, Cincinnati and St. Louis. The *Dispatch* says: "We ought to roll our own construction, merchant, sheet and plate irons, light rail sections, make our own chains and nails, supply all our neighbors with pressed and glazed brick and tiles, have a fair share of the railroad car making profits, build engines, ship tow-ropes and twines all over the nation made from wild weeds, grind our natural ochers into paint, secure the supply of tin from the Black Hills and sell the millionaire packers their tin plates, make paper from Mississippi rushes, and spin linen from Dakota golden rod and sunflowers. These are all possibilities—strange as it may seem—which St. Paul men will do well to consider."

The steamship City of New York is fulfilling the prediction of her builders, now that her machinery is running more smoothly. She left Queenstown March 7, and arrived at the bar at 8.30 a.m., 14th inst., beating her best previous record. Her time was 6 days, 14 hours and 7 minutes.

The Chilians, after running a line of steamships for several years between Valparaiso and Panama, are now practically independent of English influence on that coast, so far as concerns the foreign trade. What is known as the South American Steamship Company have a fleet of English-built steamers, all flying the Chilean ensign, with two more in process of construction, and have recently acquired certain exclusive rights from the Government, together with a subsidy that will amount to between \$100,000 and \$150,000 a year, in consideration of which the company are to keep up a regular fortnightly service between Valparaiso and Panama without transshipment of passengers or freight. This will insure a regular line of transportation between the United States and the countries of South America, in connection with the Pacific Mail Steamship Company and the Panama Railway; and since the new company have materially reduced the rates of freight and passage on their route, and are catering especially for the American trade, there is every reason to expect a present development of the commerce between the countries.

The Anchor line of steamers has purchased the Kelsey property in Brooklyn for \$510,000. The property includes three piers and slips, between 500 and 600 feet of water front and 4 or 5 acres of ground, a grain elevator with 750,000 bushels capacity, and several general storage warehouses. Extensive improvements will be made.

A formidable submarine ram has been invented by William R. Cavett, foreman of the Porter Machine Company, in Pittsburgh. The boat will be flush with the water-line, and will have a turtle-shaped back, covered with heavy steel plates. In the forward part of the vessel will be a heavy cylinder, similar to those used on engines. It will be about 15 feet long and will contain a piston-rod 12 or 15 inches in diameter. This piston will extend through the bow of the boat and will be the ram proper. It will be propelled by a force of steam amounting to from 50 to 150 tons, sufficient to pierce the side of the heaviest ironclad at one blow. The business end of the ram will be made cup-shaped, so that the sharp edges will take hold anywhere they happen to strike. Mr.

Cavett promises a speed of 20 to 22 knots an hour. He says that he has computed the striking force of the piston, and estimates that, with a 60-ton force, it will knock a plate from the heaviest man-of-war afloat. Only six men will be needed on board the boat, and the only vulnerable place on the craft will be a small glass-covered aperture about a foot square for the wheelman. So small and compact will be the wicked little vessel that it can be carried on board a man-of-war and can be used in encounters at sea as well as for harbor defense.

The commissioners nominated for the Samoan conference at Berlin are John A. Kasson, William Walter Phelps and George H. Bates. Mr. Bates is about 40 years of age, a Democrat and a warm friend of ex-Secretary Bayard's. He is a son of the ex-Chancellor of Delaware and a lawyer of high standing in Wilmington. Mr. Bates was appointed by Secretary Bayard as special commissioner to investigate our Samoan relations, and made a long and exhaustive report to the Department on December 10, 1886. William Walter Phelps and John A. Kasson have acquired an intimate knowledge of diplomacy through service as United States Ministers in Europe, Mr. Phelps having been Minister to Austria in 1881, and Mr. Kasson Minister to Austria in 1877 and to Germany in 1884.

Mexican railroads are shown by an official report to have been costly in construction, owing to engineering difficulties, but they have contributed greatly to the prosperity of the country by making its resources available and opening new districts for colonization. The oldest line in Mexico, the Mexican Railway, connects the capital city with Vera Cruz, and is some 300 miles in length, and is laid in a manner that would compare favorably with any railroad in England for finish and solidity of construction. The line with greatest mileage is the Mexican National Railway, extending about 2000 miles, but its usefulness is greatly impaired by the narrow gauge which it has adopted, thus putting it practically out of touch with other systems. The next in importance is the Mexican Central Railway, connecting Paso del Norte with Mexico, with a main line of 1223 miles in length. Like the other lines, it is well constructed. The other railways are the Mexican International Railway, open from El Paso to Torreon, a distance of 517 miles, but with easier gradients than the lines previously named; the Inter-Oceanic Railway, intended to connect the Atlantic and Pacific through the capital, of which 240 miles were open when the report was compiled, and the Mexican Southern Railway, with small progress made up to the present time.

Harry Fraser Worthington died in this city last week, aged 44. He was the eldest son of the late Henry R. Worthington, inventor of the Worthington pumps. He had been in business, and 12 years ago was a member of the New Jersey Legislature, but for several years he had been an invalid.

An extensive purchase of lands on the Jersey flats, about a mile distant from the Statue of Liberty, has just been completed by the Pennsylvania Railroad Company for dock and wharf purposes. This will give the company a shore line of 3660 feet. The plans for improvement comprise a wall at the exterior line, open for the passage of ships to a basin within. The openings will be at a dozen points, the sections to be connected by trestlework with warehouses and depots on the solid filling. By this means a vast system of basins, piers and connecting roads will be formed, with facilities for commerce and passenger traffic. The railroad company will begin

filling in with rock and refuse. That work alone will take several years, and the estimated cost is \$9,000,000. The area to be given over to commerce is larger than that of the entire city of Bayonne. In addition to the railroad taking its freight business to the new terminus, it is said that the steamship lines now controlled by the company will have their piers there, and that two new lines to Europe will be established.

Buffalo papers say there is good authority for stating that the Canadian Pacific Railroad will be extended to that city from Toronto, by way of Niagara Falls, and that the company will probably build an independent bridge.

The New York Chamber of Commerce formally approved resolutions supporting the plan proposed by the Dock Commissioners "to afford a reasonable and practical mode of giving a certain, positive, additional accommodation" to the shipping interests of New York "without any injury to the channels or to existing conditions and facilities."

A water-power company at Buffalo wishes to obtain a charter with the object of creating a great water power by tunneling through to the bottom of the Niagara gorge, and by means of an open ditch supplying manufacturing establishments between Buffalo and Suspension Bridge.

A rapid transit bill, prepared by Mayor Grant, has been introduced in the New York Legislature. Its aim is to provide a speedy, durable and safe method of transportation between the upper and lower parts of the city, and to attain this end as speedily as possible after the plan has had popular approval. To sum up, the bill enables the city, through its own agents, to create the franchise, makes it public property in the hands of the city, and provides for private agencies in its operation only after the city has approved of the road which is to be built and operated, its routes, plans for its construction, and the terms and conditions of the charter under which the operating corporation is to derive its power.

Since the death of Captain Eads the Tehuantepec Ship Railway Company has been under the direction of Col. James B. Andrews, the associate of Eads in his great works at the South Pass Jetties and the St. Louis Bridge. Its recent president was Secretary Windom, the present Secretary of the Treasury, who was elected soon after the company's organization. The New Orleans *Times-Democrat* learns through Capt. E. L. Cortell that the Mexican Government has made another proposition to hasten progress on the work. The Government promises to guarantee 5 per cent. interest on the \$60,000,000 worth of bonds, the sum considered requisite for the construction of the railway, in case the company's earnings should not be as much as 5 per cent.; or, if this interest falls below \$3,000,000 a year, the Mexican Government proposes and promises to make up the entire amount of that deficit to the stockholders.

The attempt to restore the 3-mill tax on manufacturing corporations in Pennsylvania was defeated on a test vote in the Legislature.

John Huntington, of the firm of McIntosh, Huntington & Co., of Cleveland, Ohio, who was formerly extensively engaged in the roofing business, has given the munificent sum of \$200,000 to institutions in that city. He made a number of valuable inventions and obtained patents for improvements in furnaces, methods of refining and machinery for manufacturing barrels. When the Standard Oil Company was formed by the combination of a number of companies, Mr. Huntington

and his inventions were taken into the new organization. It was here that he laid the foundation for his present fortune. He is still interested in the Standard, has large vessel interests, is the vice president of the Cleveland Stone Company, and has other property which yields him a handsome revenue.

The annual report of the State Superintendent of the Banking Department relative to savings banks and trust companies, just transmitted to the Legislature, contains some interesting facts in relation to the savings of the people. The report only includes State institutions. The increase in the number of depositors and the amount of deposits since 1860 has been surprising. Then New York had 273,697 depositors and only \$58,178,160 due depositors, an average amount of \$208.91 for each account. Now there are 1,362,852 depositors, with a total of \$523,677,515 due depositors, and an average amount of \$384.25 for each account. The population of the State, according to the last census, was 5,082,871, and allowing for the increase, it is safe to say that one-quarter of the entire population has a bank account in these State banks. One in four of the population

Speaker Graves has introduced a resolution in the Minnesota Legislature declaring that the United States should compete for the commerce of the world; that money should be appropriated from the Federal Treasury for the construction and operation of steamship lines from New York to European ports and to South American ports; also from San Francisco and Tacoma to Japan and Australia. As England has already entered into engagements with the Canadian Pacific Railroad Company for the maintenance of a steamship line to Japan and Australia and has already established steamship communication with all commercial countries, the action here advised comes rather late, but it is a wholesome sign when the West begins to wake up to the necessity of extending our foreign markets.

The elevated railroads in this city, which paid nothing for the right of way before obtaining their charters, are now doing something in that direction. Last week the largest judgment yet awarded in any single action against the Manhattan Company was given by Judge Ingraham in the Supreme Court in favor of the Sixth Avenue Surface Company. It appeared in evidence that, with one or two exceptions, there has not really been a first-class apartment house erected on Sixth avenue from Forty-second to Fifty-ninth street since the building of the elevated railroad, and the plaintiff's property had suffered more than any other. The awards aggregate \$95,000. The usual injunction accompanies the decision, forbidding the operation of the road after 30 days unless the judgment is satisfied.

Cordage manufacturers in New York City deny that a "twine corner" is in contemplation, but contend that binder twine this year may be 25 per cent. higher than last year, owing to the demand outrunning the supply and the inability of manufacturers to control the raw material. The effect on the farmer is to compel him to pay about \$6 more this year for say 150 pounds of twine, enough to bind 100 acres of grain. A dispatch from Fargo, Dak., states that it is proposed to establish a large twine factory there and manufacture flax fiber into twine. Last year there were 329,288 acres planted to flax in the Territory.

The appointment of Abraham D. Hazen to be Third Assistant Postmaster-General gives much satisfaction. To Mr. Hazen, while formerly in that position, is due the credit for the extension of the registry

system to parcels of merchandise, which has proved so great a convenience to the public during the past 11 years, and has brought about a substantial reduction of rates by the express companies.

A freight contract between the Northwestern Transportation Company, better known as the Anchor line, on Lake Erie, and the Baltimore and Ohio Railroad will almost double the lake traffic at Erie during the coming season. Three iron steamers have been added to the fleet.

The lake shipyards are all busy, encouraged by the profitable rates of freight realized by vessels in the lake traffic. At Detroit the Dry Dock Company alone are employing nearly 1600 men, and have in course of construction nearly a dozen steamers, valued at \$2,000,000. The steel steamer City of Detroit is nearing completion. Secretary McVittie, of the Dry Dock Company, says the aggregate tonnage which will be placed on the lakes this season will approximate 100,000 tons.

Collector Magone, of this port, expresses himself strongly in reference to contract labor, claiming that the present law designed to exclude immigrants under previous contracts is inoperative, that the criminal classes, convicts and anarchists have a better chance of landing without objection than an honest man. He would have every immigrant medically examined to determine his sanity, and exclude all who have been convicted of a crime.

The annual rush to Europe by the steamship lines from New York promises to be larger this season than ever before, mainly on account of the attractions of the Paris exhibition. The active season will begin earlier than usual, as nearly all the berth-room on the various steamers from about the middle of April to the middle of July has already been engaged. Some of the lines will run as many as three steamships a week, calling into the service a considerable fleet of extra steamers. On the line to Antwerp a large number are booking through to Paris, as the run from Antwerp is only six and a half hours.

The increasing indebtedness of Canada in no way dampens the ardor of those who advocate grand schemes of internal improvement. Not long ago a scheme for a ship railway somewhere down in the Maritime Provinces was approved, regardless of cost, and the Chamber of Commerce at Toronto have just adopted a report favoring the construction of a ship railway from Georgian Bay to that city, at a cost of \$12,000,000.

The Paterson, N. J., silk manufacturers are rushed with orders. Broad goods are increasing in favor.

The coastwise transportation business this season has been very good, both by the land and water routes. The orange trade, now drawing to a close, was heavy beyond precedent. Strawberries are backward.

Quantities of structural iron are being distributed on the line of the Pennsylvania Railroad in Jersey City for the elevation of the tracks.

The Quaker City cold storage warehouse about to be erected in Philadelphia, it is claimed, will be the largest of its kind in the United States. The interiors of the brick walls are to be lined with three thicknesses of wood, between which are to be several thicknesses of the "Kelly" insulating cell paper. Each floor will be divided into 15 compartments. All of the windows in the compartments have four or five glazed sashes in each, and there will be five elevators, each provided with an air lock.

There was but one proposal received by the Navy Department for supplying the machinery of the armored cruiser Maine,

now building at the New York Navy Yard. This bid was made by the Quintard Iron Company, of New York (N. F. Palmer, Jr., & Co.), and amounted to \$735,000.

Business men in Philadelphia are restless under the steady decline for several years past of the commerce at that port. The grain export trade of Philadelphia has declined from nearly 31,000,000 bushels in 1879 to 1,809,215 bushels in 1888. The petroleum export of Philadelphia reached its highest point in 1887—3,227,422 barrels—which was nearly one-half of the amount exported from New York for that year. But it declined in 1888 to 2,657,743 barrels. In other respects the loss of trade with foreign ports is too apparent to be concealed. Several commercial bodies are attempting to devise a remedy. A committee of the Board of Trade is pressing its inquiries in every direction. *Per contra*, it is said that while there has been a great falling off of late in the exports of two great staples—grain and petroleum—this loss has more than been made good by increased imports, so that, upon the whole, the commerce of the port is on the upward grade.

The new Secretary of the Navy, Gen. Benj. F. Tracy, in a speech delivered at a club dinner in Brooklyn on Saturday night, spoke of the necessity for continued naval enlargement. He said: "What has been transpiring on the Isthmus, in South America and in the Pacific has impressed upon the American people the fact that we need and must have a navy—a navy that can cope with any nation in the world—not to make war, but that we may be able to maintain peace with dignity and honor. That work was begun some six years ago, and the foundations have been laid by my predecessors broad and deep. Fortunate shall I be if I can succeed in erecting the superstructure on the foundations they have laid. Although we are late in commencing the construction of a navy, such has been the vast improvement in the building of armored war ships in the last few years that we have lost nothing by delay. There has been more progress in this direction in the last six years than in the 25 years preceding." As for himself, in the administration of the navy he would indulge in no rash promises as to what he hoped to accomplish.

Agriculture and manufactures in South Carolina are in a prosperous condition, constantly attracting a larger capital. The Charleston *Courier and News* is authority for the statement that while in 1877 the value of the principal crops was \$28,186,080, in 1885 the value had risen to \$41,081,195, an increase approaching \$13,000,000, and in 1888 the aggregate reached \$44,135,000. While in agriculture the total value of products now falls materially below that of 1860, there is in manufactures a large and significant gain over the ante-war period. The capital now employed in all manufactures is three times that of 1860, and the value of the products two and a half times what it was then. In 1880 manufactures contributed 23 per cent. of the value of the entire industrial product of the State; in 1887 the ratio derived from that source was 31½ per cent., and doubt is expressed whether any other State in the Union can show an increase equal to this. The rapid growth of cotton manufactures seems to indicate that this form of industry is particularly adapted to the natural conditions of the State. The number of spindles has increased from 35,000 in 1870 to 82,334 in 1880, and for the year just expired it is officially estimated at 250,000 spindles. The value of the products of the forests is increasing still more rapidly.

MANUFACTURING.

Iron and Steel.

On Monday, the 18th inst., a 10 per cent. reduction in the wages of the employees of the Catasauqua Mfg. Company, of Catasauqua, Pa., went into effect. The reduction affected about 600 hands.

Capitalists of Youngstown, Ohio, have about concluded arrangements for the building of an extensive bridge works in the suburbs of Hazleton, on or near the site of the Morse Bridge Works, which were destroyed by fire. The organization will be known as the Youngstown Bridge Company, with a capital stock of \$100,000, all of which has been subscribed. Application has been made for a charter, the incorporators being B. F. Boyd, Hamilton Harris, Robert Hunter, L. E. Cochran and John Neilson. The company expect to be in operation in three months and employ 100 men.

S. S. Hartranft, a son of ex-Governor Hartranft, of Pennsylvania, has been placed in charge of the blast furnaces of Brown, Bonnell & Co., at Youngstown, Ohio. Mr. Hartranft was recently furnace manager for the Brier Hill Iron and Coal Company, also at Youngstown.

The small Russia sheet-iron works, built near Freeport, Armstrong County, Pa., in 1887, are for sale. The works were intended to produce Russia sheet iron from purchased sheets. The principal piece of machinery is a Morgan steam hammer.

The Iowa Barb Wire Company, of Al-lentown, Pa., who now employ 250 hands, are about to build a Garrett mill for rolling rods from 4-inch steel billets. The new mill will be 160 x 210 feet, with a capacity to roll from 30,000 to 40,000 tons of rods per year.

The South Birmingham Coal and Coke Company have been organized at Salem, Roanoke County, Va., with a capital of \$1,000,000. Charles G. Emery, of New York, is one of the directors. The company will erect 100 coke ovens and a furnace at once.

It is reported that the Centre Iron Company, of Bellefonte, Pa., have increased their capital stock to \$150,000 and are considering the advisability of adding a rolling mill to the present plant.

A company is being organized in Philadelphia to operate the Gem Furnace, at Mines Station, on the Shenandoah Valley Railroad, which was sold out by the sheriff a few weeks ago. It was bought in by D. W. Flicker, superintendent of the railroad company, acting for Philadelphia capitalists, who are now forming the company. Applications have been received already for all the stock that will be issued.

The two stacks of the Brier Hill Iron and Coal Company, at Youngstown, Ohio, are in blast, with good prospects of continuing in that condition.

The new steel rail plant of the Allegheny Bessemer Steel Company, at Duquesne, Pa., is now in successful operation. The company have adopted the process of rolling rails without reheating between the blowing-mill and the finishing rolls. The rail is taken out of the pit, taken to the blowing-mill, and from that on to the finishing rolls without being reheated. It is stated that the company have sufficient orders on their books to keep their plant in constant operation for three months.

The failure was announced last week of the Lewisburg Nail Works, at Lewisburg, Pa. The company were organized about three years ago as a stock company, but about a year ago were reorganized as an incorporated company with a capital stock

of \$50,000. John F. Duncan is the president and Truman H. Purdy, of Sunbury, treasurer. The company also ran a store in connection with the works and employed 100 hands. The past year they have lost between \$5000 and \$10,000 in bad debts, and the failure of the Reading Iron Works, one of their largest debtors, was the immediate cause of the failure. On the afternoon of the 12th inst. the sheriff levied on all the property of the works on executions issued on judgments confessed on the company's paper, amounting to \$32,000. Most of the indorsers are the directors of the company, and they took this step to save themselves as far as possible. There is also a mortgage of \$35,000 on the plant. The works were shut down. It is probable that the affairs of the old concern will be wound up and that a new company will be formed.

It is reported that Irondale Furnace, Preston County, W. Va., will blow out about April 1, and will remain closed for an indefinite period. The cause is said to be a want of ore, the new mines opened by the company having proved unsatisfactory.

The nail factory of P. L. Kimberly & Co., Limited, at Sharon, Pa., which has been idle for the past three months, was put in operation on Monday, the 11th inst. The factory contains 40 nail machines.

Some extensive improvements will soon be commenced at the Edgar Thomson Steel Works, of Carnegie Brothers & Co., Limited, at Braddock, Pa. A new 10-ton converter will be put in, in addition to those already in use. A telegraph machine will be put up to transfer the ingots from the converting department to the blooming mill. Several other new devices will be introduced, which will permit of considerable saving in skilled labor. New labor-saving machinery of the latest pattern will be placed in the blooming mill, which will greatly increase the capacity of the works. A saw that will cut three rails per minute will be added. The entire plant will be overhauled, and wherever improvements can be made it is the intention of the firm to make them.

The rolling mill of the Kittanning Iron Company, Limited, of Kittanning, Pa., which has been idle for about two months, resumed operations on Monday, the 18th inst. Muck iron is the principal product of the plant, the greater part of which is shipped to Pittsburgh.

The entire plant of the Bellefonte Iron and Nail Company, Limited, at Bellefonte, Pa., resumed operations in full on Monday, the 18th inst., after an idleness in the various departments ranging from one to three weeks.

J. B. Carr & Co., of Troy, N. Y., are making two suits of 2½-inch chain, 230 fathoms each, for two of the largest ships ever built at Bath, Me. These chains are made in two shots for each vessel—i. e., 100 fathoms and 120 fathoms each, thereby doing away with any shackle except the anchor shackle. The 100 fathom shot weighs 30,000 pounds and the 120 shot 38,000 pounds. The 100 fathom is B. B. and the 120 fathom shot is B. B. B. chain.

The Moran Bolt and Nut Works, in St. Louis, were destroyed by fire on the 13th inst. The stock was valued at \$30,000 and was totally destroyed. The machinery was valued at \$25,000 and will be damaged to the extent of \$20,000. Mr. Moran places the damages to the buildings at \$10,000. There was no fire about the place, and how the flames so completely originated is mysterious. Fifty hands were employed in all, and 30 machines were used.

Robert Bentley, general manager of the Ohio Iron and Steel Company, at Lowellville, Ohio, furnishes the following com-

parative analyses of some well-known brands of imported Scotch and the No. 1 Ohio Scotch foundry iron:

	No. 1 Ohio Scotch.	Coltness.	Imported Scotch Glengarnock.
Metallie iron.....	91.52	90.26	90.70
Silicon.....	3.12	3.30	2.83
Manganese.....	1.41	1.77	2.13
Graphitic carbon.....	3.24	3.27	2.68
Combined carbon.....	0.08	0.60	0.85
Phosphorus.....	0.46	0.44	0.54
Sulphur.....	0.02	0.04	0.04

It is reported that the Pottstown Iron Company, of Pottstown, Pa., have decided to have their blast furnace rebuilt this spring and that the contract has already been given out. The contract consists of four hot stoves 19 feet in diameter and 65 feet high, blast-pipe, receivers, and a stack 14 feet in diameter by 154 feet high.

The New Castle Wire Nail Company, of New Castle, Pa., will commence the erection of an extensive rod mill during the present month. It will be built adjacent to the nail factory. An order for a 2300 horse-power engine has been placed with the Southwark Foundry and Machine Company, of Philadelphia, while the A. Garrison Foundry Company, of Pittsburgh, have been given the contract for four trains of rolls.

Machinery.

The Ranken & Fritsch Foundry and Machine Company, of St. Louis, have recently secured a contract for an entire outfit of machinery for a new plate glass works to be built in Pennsylvania. The contract is a large one, and will require from 25 to 30 cars for its shipment.

Among the recent sales made by A. B. Bowman, of St. Louis, dealer in machinery and machinists' tools, are: One large engine to operate an electric light plant at Portia, Ark.; one to run a coal screen at Josslin, Mo.; one to Eureka Springs, Ark., and one to Mexico to be used in a large flour mill. Three large Vulcan hammers were sold in St. Louis, and a complete machine shop outfit at Topeka, Kan., consisting of lathes, planers, engines and boiler, drill press and small tools for machine and blacksmith shop. A heavy order was also placed with Mr. Bowman by the Missouri Pacific Railroad.

Curtis & Curtis, of Bridgeport, Conn., will have three pipe-threading machines at the Paris Exposition; one working right and left from ½ to 2 inches, another 2½ to 4 inches, and the third 4 to 6 inches. These machines will be employed on the piping for the American section and will afterward form a part of the exhibit.

The Universal Radial Drill Company, Cincinnati, Ohio, are distributing to their friends in the trade a monthly calendar sheet directing attention to their manufactures. The March calendar, which is before us, presents an engraving of their radial drill Nos. 2, 1 and 0, while the border is embellished with a picture of the old-time Egyptian drill operated by a bowstring. On the back of the card is a list of the tools they make and a large illustration of their works.

A. L. Ide & Son have received a 10-year contract for lighting the streets of Springfield, Ill., with arc lights of 2000 candle-power, at \$137 per year for each light. In connection with this contract they have agreed to furnish incandescent lights for commercial use at a price not to exceed the cost of gas of equal illuminating power at \$1.50 per 1000 feet. Also to furnish current for electric motors from ½ to 10 horse-power within 2000 feet of their station at a cost not to exceed \$100 per year for each horse-power for ten hours' use per day. They will erect a new station of sufficient size to enable them to operate the street railways, of which Mr. Ide is president, by electricity. The same firm

have also received an order from the Union Iron Works, of San Francisco, to deliver within three weeks two Ide engines of 150 horse-power each and one of 100 horse-power. They have received orders for 10 engines in the last two weeks, all to be delivered within 30 days, which necessitates running their works nights. Their new works are in full operation, and are turning out from two to three engines per week.

A battery of boilers exploded at the West Point Boiler Works, in Pittsburgh, last Thursday, causing the death of five men and completely wrecking the building.

The Pittsburgh Locomotive Works during the past year have turned out 95 new locomotives and repaired 14. It is the intention of the firm to gradually increase the output to about 250 engines a year. Each year finds a new building added to the already large works in Allegheny, and a member of the firm remarks that during the coming year several more will be added.

A company has been organized at Chicago under the name of the North-Western Street Railway Gas Motor Company, to manufacture street car motors and motors for manufacturing and domestic purposes and for furnishing propelling power. The capital is \$5,000,000, and the incorporators are Francis A. Bates, Edward T. Getchell, and Jefferson Hodgkins.

Midgley & Emerson, of Beaver Falls, Pa., manufacturers of wire belting, have the contract to furnish the main belt to run the machinery for the American exhibit at the Paris Exposition to be held during the coming summer. It will be 20 inches wide and 60 feet long. It will be shipped to Paris in the course of a few weeks.

We have received from E. P. Allis & Co., of Milwaukee, an illustrated catalogue of sawmill machinery made by them. This includes machinery embodying the latest improvements made by the firm, and also comprises a description of all the machines used in the modern sawmill.

The New York Belting and Packing Company have secured as their Southeastern agents the Atlanta Rubber Company, of Atlanta, Ga. This firm will carry a complete assortment of the New York Belting and Packing Company's vulcanized goods, from which an order can be filled without delay—a fact of interest to every one handling mechanical rubber goods in that section of the country.

The business of F. Lunkenheimer, known as the Cincinnati Brass Works, manufacturer of general brasswork and lubricators, carried on for the last 26 years, has been incorporated, and will be continued under the style of the Lunkenheimer Brass Mfg. Company, of Cincinnati, Ohio. The capital stock is \$250,000, all paid in. Fred. Lunkenheimer is president and manager, and Edmund Lunkenheimer is secretary and treasurer.

The Long & Jervis Foundry and Machine Company have removed from Decatur to Florence, Ala. Contracts have been made for three buildings, the machine shop being 50 x 100 feet; foundry, 50 x 90 feet; blacksmith shop, 30 x 50 feet. The capital of the company is \$25,000. A specialty will be made of architectural iron work and machinery of various kinds.

The following officers for the ensuing year were elected by the Standard Car Heating and Ventilating Company, of Pittsburgh, last week: Geo. Westinghouse, president; C. H. Jackson, vice-president and assistant treasurer; Robert Pitcairn, treasurer; A. T. Rowan, secre-

tary; Elmer L. White, assistant secretary, and H. H. Westinghouse and John Caldwell are the other directors.

An iron and brass foundry will shortly be established at Apollo, Pa. Casper Kettering is at the head of the new enterprise. At present facilities will be put in for making 6 and 8 ton castings. Two 10-ton and one smaller steam cranes will be put up at once; also two cupolas of from five to eight tons capacity.

The annual meeting of the stockholders of the Union Switch and Signal Company, of Pittsburgh, was held last week. The report of President George Westinghouse was read. It showed the earnings of the company for the year to be \$678,226.33. The expenses were \$561,481.62.

Hardware.

Ludlow-Saylor Wire Company, St. Louis, Mo., manufacturers of and dealers in wire, wire goods and art metal work in iron, brass, electro-bronze, &c., report a largely increased trade during the past two months. They have recently fitted up the office of Laconia Mfg. Company, Bedford, Me., and have also taken a large order for copper screening from St. Louis Water Works.

The New Process Twist Drill Company, Taunton, Mass., formerly doing business under the laws of the State of Maine, has been reorganized under the laws of Massachusetts, with the following officers: B. L. Dwinell, president; P. H. Corr, Treasurer; A. L. Lincoln, agent; W. F. Kennedy, clerk; J. E. Pope, superintendent. New machinery has been added and the capacity of the factory greatly increased, notwithstanding which they are running overtime on orders.

Anthony Wayne Mfg. Company, Fort Wayne, Ind., write us that their superintendent, Mr. Wichman, during one week last month sold over 1600 of their washing machines.

The works of the Nimick & Brittan Mfg. Company, of Pittsburgh, manufacturers of builders' hardware, have been idle for several weeks on account of the refusal of the employees to accept a reduction of 10 per cent. in wages tendered by the firm some time ago. It is expected that the trouble will be amicably arranged during the present week and that the works will again resume operations. The firm gives employment to about 250 men and boys.

Clement Mfg. Company, Northampton, Mass., manufacture both solid and hollow-handle cutlery in many styles, selling their product to silver-platers, who plate the goods and put them on the market. Their works are capable of producing 400 dozen per day.

In our issue of last week we made mention of the fact that the Wheeling Hinge Company, of Wheeling, W. Va., had made a reduction of 10 per cent. in the wages of their employees, and that a number of the employees had refused to accept the same. We are since advised that the men have accepted the reduction and returned to work. The entire plant is now being operated to its full capacity.

When the 50 new wire-nail machines now being constructed for the wire-nail factory of Carnegie, Phipps & Co., Limited, at Beaver Falls, Pa., are placed in position the capacity of the factory will be increased from 1800 to 2800 kegs of wire nails every 24 hours.

The Three Cornered Wire Nail Company, of Pittsburgh, who have been in process of organization for some months, are almost ready to begin the manufacture of nails. The company have recently secured the lease of the Nellis Agricultural Works, at the corner of Allegheny avenue and Re-

becca street, Allegheny City, Pa., and are now engaged in fitting up the works with the necessary machinery. The plant will be equipped with 42 Taylor wire nail machines, the invention of William Taylor, who is the general superintendent of the Three Cornered Wire Nail Company. The company will draw their own wire by a new process also invented by William Taylor, for which he has been granted patents. The company will manufacture all sizes of wire nails and expect to secure their share of the trade. The erection of a rod mill will also be commenced at an early date. J. C. Williams, the president of the Curry University, of Pittsburgh, is the president of the new concern.

J. W. Fiske, 21 and 23 Barclay street, New York, manufacturer of ornamental iron, bronze and zinc work, is constantly adding new goods to his line, such as guards, racks, mangers, &c. His assortment of brass and bronze goods in this line is especially complete, and he has recently fitted up J. B. Houston's stable, in this city, at a cost of \$5000.

Miscellaneous.

A press dispatch from Roanoke, Va., under date of the 15th inst., says: "The South Birmingham Coal and Coke Company were organized yesterday at Salem, this county, with a capital of \$1,000,000, with D. B. Strouse president and T. J. Schickel secretary and treasurer. Chas. F. Emery, of New York, is one of the directors. The company own 3000 acres of coal land 15 miles south of Birmingham, and will erect 100 coke ovens and a furnace at once. The principal office will be at Salem."

The Mount Torry Mining Company were organized in Winchester, Va., on the 15th inst., with a capital stock of \$1,500,000. B. H. Richards, of Baltimore, was elected president. The object of the company is to mine the manganese and iron ores on the Mount Torry furnace property, which lies between Buena Vista and the Crimora mines, in Augusta County. The company propose to begin operations at once.

Among recently authorized corporations in Illinois are the following: C. F. Scone Mfg. Company, Chicago; capital, \$50,000; to manufacture special machinery; incorporators, N. A. Ransom, R. J. Stone, C. F. Stone. Mills Permutation Lock Company, Chicago; capital, \$100,000; to manufacture locks; incorporators, J. Mills, J. Gard and F. C. Rowe. Keystone Lock Company, Chicago; capital, \$200,000; to manufacture light hardware; incorporators, William A. Gardner, Wallace Rice, Perley Hale. Leonard & Izard Company, Chicago; capital, \$800,000; to deal in engines, electrical appliances and supplies of all kinds; to build railways, furnish experts in electrical engineering work; incorporators, H. Ward Leonard, E. M. Izard, H. K. Tenney.

J. Bucknall Smith, in the first of a series of articles on wire and wire rope printed in the *London Engineer*, states that "probably no finer example of wire-rod rolling can be cited than that to be seen at Messrs. Pearson & Knowles' iron and steel rolling mills near Warrington, and where one patent rod mill is capable of rolling from 370 to 400 tons of No. 5 gauge rods per week." In this country there are a number of Garrett trains which can do very much better than that.

Owing to the recent fire at the Anaconda mines, Superintendent Marcus Daly has ordered the Chambers syndicate mines to shut down, and 600 men are out of work. The loss by the fire is estimated at more than \$1,000,000, and there was no insurance.

The Iron Age

New York, Thursday, March 21, 1889.

The Outlook in the Iron Trade.

Meteorologically speaking, Pittsburgh seems have become temporarily a center of low barometric pressure for the iron trade, judging from some of the reports emanating from that place which have been given considerable currency. Were it not a little early before the annual struggle over the wages question, we would be inclined to regard them as preparatory to the coming campaign. The condition of affairs in the iron trade in Pittsburgh and elsewhere has not been satisfactory for a considerable time past. Our reports from every leading market in the country have accurately reflected it, and they have during the past few weeks shown flashes of light in the general gloom. As a matter of fact, March thus far has brought some isolated instances of improvement, which have given rise to the hope that the worst is over. Repeated disappointments have shaken the faith of the most sanguine, and with the overwhelming array of evidence of a discouraging character it takes unusual courage to express a belief in a more cheerful future. Persistency in predicting better times must ultimately be rewarded by final success. But few would be inclined to listen to sanguine views, and fewer still would act upon them.

The one great fact which is disturbing the minds of all interested in the iron and allied trades is the enormous production, notably of pig iron. Our monthly statistics show that we are making at the rate of over 7,750,000 gross tons this year, or more by 1,250,000 tons than in 1888. Such figures are well calculated to make anything but bearish arguments seem very feeble, and yet we think some points deserve consideration which make this alarming total appear less pregnant with coming disaster. First of all, then, we must insist that it is safer to divide the year 1888 into its first and second half, in order to bring out important facts. The apparent consumption of the first half—that is, the production, plus the imports and the fluctuation in the stocks—was 3,058,880 gross tons. In the second half it reached 3,628,753 gross tons. The latter figure is probably somewhat too high, because the stock statement at the close of the year did not include Bessemer iron held by consumers. Still the fact remains that in spite of constant complaints of poor business generally, in spite of the fact that the rail trade was very poor, the country consumed at the rate of over 7,200,000 gross tons of pig iron during the second half of 1888. Unfortunately we have only got the figures of the production of Bessemer pig in the two periods of last year. They stood 1,178,508 tons for the first and 1,463,310 tons for the second. Now, the production of steel rails for the corresponding time was 692,197 gross tons and 672,139 tons, which would represent respectively, allowing 12½

per cent. for waste, 778,722 and 756,157 tons as the quantity of pig consumed for rails. In other words, other articles than rails absorbed 807,867 more tons of Bessemer pig in the second half than in the first half.

The influence of the rail trade is naturally uppermost in the minds of the majority of those who study the situation. With the wretched state of affairs among the railroads themselves, the outlook is certainly discouraging enough, and yet the sales up to March 1, according to official reports, were 590,850 gross tons, to which must be added at least 40,000 tons for the new mill. Last year at the same time the forward sales were 565,629 tons, so that the amount of business booked is somewhat larger this year. Now, up to March 1 the deliveries were 147,787 gross tons, against 98,361 gross tons in 1888. The actual make, therefore, has been greater in nearly the same proportion. Official statistics to *The Iron Age* show that the rail mills having their own blast furnaces—viz.: Lackawanna, Pennsylvania, Edgar Thomson, Cleveland, Joliet, North Chicago and Union—produced in January 150,256 gross tons of pig iron, or at the rate of 4847 gross tons per day. In February the output was only 115,187 tons, or at the rate of 4112 tons per day, a falling off of 5145 tons per week. Of course only a part, which it is impossible to segregate, goes into rails, but the fact remains that there was a notable falling off in the product. Is not this the possible explanation of the recent slight rise in Bessemer pig in the West, which has puzzled so many, and was brought about by the buying of two large Pittsburgh mills, not included in the list of the works enumerated above?

In discussing our imports for 1888 in *The Iron Age* of February 14 we dwelt on the fact that their restriction, under present and prospective prices at home and abroad, would give a material addition of work to our home producers, provided the demand in this country remained in 1889 what it had been in 1888. Should the relative prices on both sides of the Atlantic be maintained, would it seem unreasonable that the imports of the following articles would be reduced as follows?

Articles.	Imports 1888.	Reduction 1889.
Pig iron.....	196,891	100,000
Steel rails.....	60,839	50,000
Steel blooms and billets.....	108,687	50,000
Wire rods.....	101,312	50,000
Totals.....	468,330	250,000

We believe that there is nothing sanguine in this estimate, considering the fact that our steel mills are well stocked with spiegeleisen; that there is no chance whatever of selling foreign rails here when they command \$28 at tidewater, and foreign cannot be laid down for less than \$40; that foreign billets and blooms are a few dollars higher than the domestic article, and foreign wire rods are driven out of the market, excepting a few points near the seaboard.

We are far from denying that the situation is grave, that we are producing pig iron at an excessive rate, and that we must be piling up notable quantities. But we hold that consumption outside of the rail trade is heavier than the majority in the trade have any conception of, that the rail trade is as heavy this year as it was in

1888, and that, furthermore, there is the prospect of more work through the crowding out of foreign products.

If we were not consuming pig iron and other products at a rate at least as great as we did during the second half of 1888—that is, at a rate of 7,200,000 tons or more—we would be piling up iron at the rate of over 45,000 tons a month. The course of the markets during January and February certainly does not justify the assumption that we are adding to stocks at anything like that rate.

Proposed Consolidation of Chicago Steel Interests.

Premature announcement was made last week by the public press of the consolidation of the North Chicago Rolling Mill Company, the Joliet Steel Company and the Union Steel Company. This consolidation has not yet been effected. We have been advised for some time of the movement in progress to accomplish this end, but have refrained from making any allusion to it at the request of those interested, who desired that negotiations should first attain a decisive stage. It will be some time in May before this point can be reached, and therefore all that is now said on the subject must be regarded as conditional. The managers and leading stockholders of the three companies are in favor of the proposed consolidation and are making arrangements to perfect it. But there are many details to be covered, individual opinions are to be harmonized, and the plan of consolidation must be ratified at stockholders' meetings of the three corporations before it can be put into practical operation. So far as known no insurmountable obstacles are to be encountered, but in a scheme so vast and covering such a variety of interests it would not be remarkable if something would develop to prevent its consummation. The great financial strength of each of the companies is in itself an argument against consolidation which may be urged by influential stockholders when they come to consider the subject in their general meeting. If two of the companies were weak and struggling for existence their owners might be expected to embrace gladly a proposition to relieve them of their burden, but this is far from being the case. It is believed, however, that no opposition of this kind will be met and that the stockholders of each company will be found to favor the scheme of consolidation by a very large majority.

The course of procedure in the organization of the new company, according to information received, is about as follows: The North Chicago Rolling Mill Company, possessing a special charter, will hold a meeting of stockholders early in May to vote upon a proposition to increase the capital stock of the company from its present issue of \$6,000,000 to probably \$25,000,000, also a proposition to authorize the purchase of the property of the Joliet Steel Company, and another proposition to authorize the purchase of the property of the Union Steel Company, or a consolidation of interests, as may be found preferable. In the meantime the stockholders of the other two companies will hold meetings to vote upon propositions to sell their property or consolidate with the North Chicago Rolling Mill Company.

The value of all the properties has been carefully determined and agreed upon, so that it is known what the consideration will be in case these preliminaries are settled favorably. A new company, probably named the Illinois Steel Company, will be formed to succeed the North Chicago Rolling Mill Company; the stock will be distributed to the stockholders of the original companies on an agreed basis, and the business of all will then be conducted under one management. No watered stock of any description will exist in this concern. Stock will only be issued by the company for value received in lands, buildings, machinery, cash and other assets of all descriptions. It will not be a trust, as some of the newspapers have termed the consolidation, but will be a purely legitimate business enterprise of large proportions. It is expected that after the consolidation is effected a cash capital of \$5,000,000 or more will be available for the purposes of the company. It is no part of the design of the managers of the various companies to in any way advance the selling price of their product, but rather by combining the experience and ability of all connected with the various organizations to produce finished materials on the most scientific and economical basis, so as to permit of the products being sold, if necessary, at lower figures in the future than in the past, insuring thereby the permanent existence of these industries, more particularly in Chicago and its neighborhood.

The properties to be included in the consolidation are the North Chicago Rolling Mill Company, who have at South Chicago a three-converter Bessemer plant, a Bessemer steel-rail mill and four blast furnaces; at North Chicago a two-converter Bessemer plant, a steel-rail mill, a structural-steel mill and two blast furnaces; at Milwaukee, mills for the manufacture of bar iron, fish plates, &c., a nail factory and two blast furnaces. The Joliet Steel Company have at Joliet a two-converter Bessemer plant, a steel-rail mill, a wire-rod mill and two blast furnaces. The Union Steel Company have at Chicago a two-converter Bessemer plant, a steel-rail mill and four blast furnaces. The total number of Bessemer converters is nine, and the total number of blast furnaces is 14. A new blast furnace is partly completed at Joliet. The annual capacity of the united works would be about 800,000 tons of pig iron, 900,000 tons of steel ingots, 850,000 tons of steel rails and 125,000 tons of miscellaneous products. At present the steel-converting capacity of some of the plants is greater than their rolling capacity, while in others it is less. In the associated operations of the works this inequality could be corrected, and other obvious advantages would be gained.

If the consolidation should be effected, its consequences would be momentous to the Northwest. Present advantages would be retained and strengthened, with the effect of considerably reducing competition from Eastern establishments engaged in the same line of business. Other branches of trade would be taken up by the new company as rapidly as they could be handled. The manufacture of structural material in all its varieties would assist in the localization of the bridge-building industry. The erection of plate mills would encourage the establishment of steel shipyards at

Chicago, where none now exist, although the business men of that city are heavily interested in lake shipping. A very long stride would be taken toward making Chicago industrially independent of the East, and the source to which the Northwest would look more than ever before for its supply of heavy material.

The Crisis in Copper.

Events have followed one another in rapid succession in copper, although the happenings have occurred almost exclusively on the other side of the Atlantic. The Comptoir d'Escompte has failed in spite of the aid extended it by the Bank of France, which is identified with the Government, and Morrison, Kekewisch & Co., who were the recognized London agents of the syndicate, have suspended. The Société des Métaux, too, is going into the hands of a liquidator. A heavy fall has taken place in the London market, where Chili bars have fluctuated between £35 and £40 for a day or two.

Here everybody is at sea. The Metal Exchange is getting a good deal of notoriety out of a system of bids and offers, ridiculously far apart, from which settling prices are made up which go out as quotations for the metal. As a matter of fact, no business has been done there lately, and *bona-fide* consumers could not secure metal for immediate use at anything like the prices named. There are so few sellers, and even a smaller number of buyers, that business is practically suspended.

The position is briefly this: What copper there is in stock in this country is held by the syndicate's agents, or by the bankers who have taken it over as collateral for loans to the Comptoir d'Escompte and the Société des Métaux. To what extent the American stock has been turned over to the Bank of France and those who acted with it lately and to what extent it is controlled by the banking houses here who were the fiscal agents of the speculators is not clearly apparent. None of this copper has been put on the market here. The mining companies who have co-operated with the Frenchmen—and they represent by far the greatest proportion of the output—have nothing to sell. They delivered as fast as they produced until the recent conference in this city. Then they agreed to stop deliveries under their contracts, from the 15th of March till the 15th of May, their credits being extended for two months, and to reduce the output by 20 per cent., the net price being put at 13 cents. Under this agreement the American mines are practically bound for two months to come, since, so far as they are concerned, the Société has thus far lived up to its contracts. Its failure will leave them with a year's extra large dividends as a remembrance of a Frenchman's folly. It is not likely that their position will be modified in any important particular until their representatives, who have gone abroad, have conferred with the leading interests abroad.

The principal element of uncertainty here grows out of the fact that the mines and the syndicate have made contracts with consumers for delivery of copper till the end of May at 16½ cents. It is obvious that something must be done to relieve the strain which this implies.

Manufacturers will buy outside brands where they can pick them up, at a much lower price, and may be able to reimport American copper returned duty free from abroad in the original packages. There is always the possibility, too, that some of the bankers involved may prefer to make a loss now to taking their chances of anything tangible being patched up in the future. We have reasons for the belief that the American mining companies, appreciating the situation, are discussing the question of canceling the April and May deliveries, with the object of combining with the actual holders of the stock of the metal in joint sales to consumers at a considerably lower basis, say 12½ or 13 cents for Lake copper.

The point now is to reach some basis which will inspire confidence among manufacturers and the whole trade which handles copper manufactures in one form or another. While the present chaos lasts no one who can possibly defer purchases of material into which copper enters will think of buying. While the uncertainty lasts it will be well to pay no attention to the nominal quotations which are so widely published. Because somebody jocularly inclined bids 5 cents for Lake copper and somebody in a jaunty way asks 16 cents, it does not by any means follow that the mean 10½ cents represents the market.

The Tidewater Soft Coal Pool.

After many weeks of negotiation the leading producing regions of bituminous coal destined for the Atlantic Coast north of the Chesapeake have perfected an association. Seven districts are interested in the movement, being in their importance in the order named: The Cumberland, Clearfield, Pocahontas, New River, West Virginia Central and Reynoldsville. The operators of the Beech Creek district have not yet signed the agreement, but are understood to be favorable to the association formed.

Broadly, the plan has the following features. The operators of the different regions appoint the members of a governing board, the Cumberland and Clearfield districts each having two, the others each one. The board has the power to determine what quantity of coal may be required by the markets, fix the prices and make the allotments to the different districts, by percentages. It has the right to revise these decisions, as occasion may require, the assent of the representatives of five of the regions being necessary. The agreement defines the territory of the pool as north of the Chesapeake and the Delaware, and provides that no member of the association shall have the right to deliver coal, by all-rail, into Connecticut or Rhode Island, or in certain territory in Eastern Massachusetts. Commissions to middlemen are fixed, rebates to customers and the guaranteeing of freight rates are prohibited, and the provision is made that all sales shall be made at tidewater at the prices fixed by the Governing Committee.

All complaints of irregularities must be submitted in writing to a commissioner, Galloway C. Morris, of Philadelphia, to whom very wide powers are given. Before the 15th of each month each producer must forward to the commissioner a sum equal to 20 cents on the total tonnage of the

preceding month. These sums remain in the treasury as a guarantee fund until three months' payments have accumulated. Then upon the payment of the fourth month's amount, the sum contributed in the first month is returned, and so on. In this manner about \$100,000 will accumulate in the treasury. Any infringements of the agreement are punished by the commissioner, who draws from the guarantee fund a sum in the form of a penalty of 20 cents a ton on the quantities involved in the violation. The penalties go into a compensating fund, out of which sums are given to those who have not shipped their allotment, any possible surplus being afterward distributed among the other concerns. The agreement is to be binding until March 1, 1892, a period of three years, the operators in the different regions distributing their allotment among themselves. The regions themselves have been allowed the following percentages:

	Allotment per cent.
1. Cumberland, Md.....	30½
2. Clearfield, Pa.....	30½
3. Norfolk and Western, Pocahontas, Va.....	14½
4. Chesapeake and Ohio, New River, W. Va.....	11
5. Beech Creek, Pa.....	7½
6. West Virginia Central.....	5½
7. Reynoldsville, Pa.....	1½
Total.....	100

The only change made, as compared with last year's allotment, is that the Cumberland and the Clearfield districts each have turned over ½ per cent. to the Pocahontas Flat Top district. It is estimated that the total tonnage will be about 5,500,000 tons, of which the Transatlantic steamship lines take about 1,000,000 tons, while a large part of the remainder is required by the New England railroad companies. The Governing Committee has announced the opening prices at \$2.60, f.o.b. Norfolk, Newport News, Baltimore, Georgetown and Philadelphia, and \$3.50, alongside, New York.

Such, broadly, is the general plan of the new pool from which the miners of soft coal for tidewater markets expect to realize fairly remunerative prices. They state that last year the profits were moderate, even in the most favored regions; that in other districts the operators have lost money, and that in one conspicuous case the appearance of prosperity has been given for stock-jobbing purposes. It is stated that the managers of a railroad, interested also in the coal district it serves, have bought coal at the mines. The railroad company, it is claimed, carried coal at very low figures—as low as 37 cents for a haul of 400 miles—undertaking also the selling of the coal. In this way the railroad has been used to advance the coal interest, the stockholders of the carrier being bled to put money into the pockets of the insiders, who are getting the coal stock ready for the public.

The price of soft coal to consumers, it is claimed, is not, therefore, unduly high, and does not place any burdens upon the manufacturer in the New England States. It is argued that however low the fuel might be put into the yards of New England iron manufacturers, no relief would be afforded them in their struggle against the inevitable tendency of the business to desert that section. It is urged that so far as the miscellaneous metal industries of that busy section are concerned, the fuel question with them is a minor point. So

long as New England manufacturers are far in advance of any of their competitors as ingenious mechanics and far-sighted business men, and so long as they have such a race of skilled workers to draw upon to fill their shops, they will control the trades in which they are now dominant. Manufacturers who are abandoning cheap water power for steam can certainly not claim that they are paying unduly high prices for their fuel.

While the advantages held by New England manufacturers will be fully recognized by every one familiar with that prosperous section of the country, it would seem a somewhat startling argument that their virtues should be made the pretext for placing burdens upon their shoulders. Especially since the West has been blessed with the cheap fuel utilized during the past few years, New England manufacturers have become more and more alive to the necessity of lowering their coal accounts. They have generally undertaken everything which might lower the cost of power. They have sought diligently to improve their boiler practice and have made heavy outlays in the direction of the most modern engines. They will view with alarm and dissatisfaction the steps which have been taken to enhance the cost of coal by pool methods. It is probable that they have more cause for uneasiness now than they have ever had, because the Seaboard Association has the appearance of greater strength than formerly.

American and Russian Petroleum Exports in 1888.

We are now in possession of statistics from Batoum, Russia, relating to the receipts of Caucasian petroleum at that port by rail from Baku, and the shipments from there to Russian ports and foreign countries. The stock at Batoum on December 31, 1888, is also given. The receipt of these details enables us to form some idea as to what Russian competition with our own petroleum really amounts to at present. The total shipments of petroleum from our oil regions amounted last year to 26,470,654 barrels of 42 gallons, leaving a stock on hand on December 31, 1888, of 18,595,474 barrels, as compared with 28,354,299 barrels, thus showing a decrease of stocks at the close of last year of 9,758,825 barrels. As the export in 1888 amounted to about 16,000,000 barrels, it appears that the domestic consumption reached about 10,000,000 barrels, constituting a total of 26,000,000 barrels delivered, representing 992,000,000 gallons of raw oil. The total runs during the year fluctuated between 1,200,000 and 1,400,000 barrels per month, May being the heaviest, with 1,449,298. While the total production of the year was 16,259,975 barrels, the deliveries from old stock and current production reached, as we have shown, about 26,000,000 barrels, therefore exceeded the output of the year by some 10,000,000 barrels. This fully demonstrated the effect of the shut-down movement inaugurated in September, 1887. The actual export of crude and refined, reduced to gallons crude, compares as follows with that of the previous year:

	1887. Gallons.	1888. Gallons.
New York.....	479,654,495	471,627,348
Philadelphia.....	193,776,717	166,380,036

Baltimore.....	12,741,061	6,886,325
Boston.....	5,609,544	4,693,722
Perth Amboy.....	23,434,260	21,611,707
From St. Louis by rail to Mexico.....	1,683,540	2,000,000
Total.....	715,902,617	673,149,638

The shipments of refined from New York alone were as follows:

	1888. Gallons.	1887. Gallons.
Countries.....		
England.....	48,711,457	50,969,977
Germany.....	88,450,153	74,906,882
Sweden and Norway.....	3,216,921	4,617,271
Denmark.....	2,352,219	3,510,832
Belgium.....	34,844,705	35,648,409
Holland.....	23,774,785	34,031,424
India and Siam.....	23,775,000	24,988,020
China and Japan.....	29,026,880	25,444,246
East Indies.....	21,423,892	22,357,620
Africa.....	3,229,947	8,851,845
Australia.....	6,782,340	4,238,564

It will be seen that the general falling off has not been more than about 6,000,000 gallons, or 2 per cent.—a mere trifle—and that it has only occurred to any great amount in our shipments to Holland, for which Germany has indemnified us. In other words, the Germans diverted some considerable business to their ports from the Dutch ports. The most interesting feature in our competition with Russia is that in the countries in which the Russians make the greatest efforts to supersede us—in India, China and Japan, as well as in the East Indies—New York shows a gain with refined petroleum. We may not lose ground there if we slacken our efforts in shipping always the very best to those regions, but at all events there is some consolation to reflect that there has actually been no loss of trade to speak of in our supplying non-European countries with the refined article from our port.

The receipts at Batoum last year consisted of 50,708 tank cars of petroleum, distributed as follows:

	Tank cars.
The Caspian-Black Sea Petroleum Company.....	20,848
Nobel Brothers.....	6,460
Burkhardt & Co.....	6,221
Rychner & Co.....	2,760
Naschauer & Co.....	2,420
Sundry consignees.....	11,994
Total.....	50,703

The tank cars contain 600 poods each, or together 30,421,800 poods, shipped as follows:

	Poods.
Russian ports.....	4,370,500
England.....	5,573,891
Turkey, Egypt and Syria.....	5,367,890
British India.....	4,369,466
Austria-Hungary.....	2,814,556
China.....	1,764,500
Japan.....	622,144
Germany.....	769,000
Italy.....	1,398,143
Belgium.....	1,420,170
Holland.....	97,550
France.....	114,900
Bulgaria, Roumania and Servia.....	285,600
Spain and Portugal.....	63,900
Total.....	29,032,210
Stock in Batoum, December 31, 1888,	1,389,590
Total supply.....	30,421,800

As the American petroleum barrel holds 9 poods refined, the total number of American barrels shipped from Batoum last year amounted to 3,225,700; adding thereto the stock at the close of last year of 154,300

barrels, it is shown that the total supply equaled 3,880,000 of our barrels, and that the aggregate export thence, including the Russian Black Sea ports, was only about one-fifth of what the United States shipped abroad. The shipments inland on the Volga and by rail amounted last year to about 10,000,000 poods additional.

CORRESPONDENCE.

Pig Iron Warrants.

To the Editor: Since writing you on the 20th I am in receipt of your issue of the 21st, and have read with interest the second batch of criticisms on the warrant company. With such a great variety of ideas as to what the warrant company is, it would be strange if there were not a great variety of criticisms. I am struck particularly by the great number of theoretical remedies advanced to correct the evils of the iron business, and that the writers lose sight entirely of the fact that these theories have never been lived up to and never will be.

Every iron-maker sees clearly when depression comes what his neighbor ought to do, but loses sight of the fact that said neighbor never has done and never will do that particular thing. The rich furnaceman argues that the poor furnaceman who cannot hold his stock ought to stop, but the poor furnaceman does not stop. He has obligations to meet, and runs his furnace to meet them. He argues that the rich furnaceman who can stop ought to do it. But the latter goes on piling up his stock, doing what he thinks to be to his interest, not what the general interest demands. It has been so in the past, and it will be so in the future.

Another writer says that no man has a right to build a furnace who has not money enough to run it, and loses sight of the fact that no matter how correct his theory is, it will not stop the objectionable practice. Furnace building, like other building, always costs more money than is estimated, and will do so as long as the world lasts. Builders start in with the belief that they have enough, but the actual cost always exceeds their estimate.

The question the iron-producer has to meet is, What is the best practicable remedy to apply to the business as it is? instead of satisfying himself of the great good that would come to him if the conditions were as they ought to be. Let them treat actual problems by actual experience, and not by worn-out theories. There is no better theory known than the free trade theory, but practical men know that its correctness ends when its practical application begins. Just so with the theories that have been advanced to correct the disadvantages existing in the iron business.

There are several conclusions pertaining to this question that are worthy of consideration.

1. That if, through some means, the needs of the iron business could be met, the evils existing corrected and discrepancies and differences adjusted, it would be a very desirable thing for that interest.

2. That a combination of the iron interests of the United States would hardly be possible, and, if possible, would not be desirable, as it would antagonize the public and bring about legislation to protect the public.

3. That a responsible company whose power is limited to issuing warrants over which they can hold no control has no objectionable features and might be used as a means of bringing about needed reforms in the iron trade.

4. That during each season of depression the rich furnaces submit to a long period of losing prices, looking forward to the

time when the poor furnaces will be out of their way and they can get the benefit of high prices; whereas, when the high prices come Great Britain, who has held her surplus stock under a warrant system, puts millions of tons in the American markets and thereby gets a large share of the benefit which our own furnaces should and under the warrant company's plan would reap.

5. That the country does not over-produce as long as it produces less than it consumes.

6. That it is more to the interests of the American furnaces to run constantly and supply our own demand fully than to lie idle part of the time and let the British furnaces furnish part of our supply.

7. That iron could be made cheaper if some means were adopted that would enable our furnaces to run steadily, instead of stopping during dull years.

8. That the carriage of iron on the local storage system, through which furnacemen pile up iron and borrow money on it, is a temporary and makeshift device, and therefore is unwise and unprofitable and can never result in stability or a large carriage.

9. That the carriage of stocks on the storage system, like the Marshall iron in Pittsburgh and the Philadelphia and Reading iron in Pennsylvania, must always be "a menace to the market," because it is not a permanent carriage.

10. That a system that would take the surplus iron off the hands of the producer at fair prices and provide a permanent carriage of that iron until needed would be a great relief to the producer.

11. That this can only be accomplished through a powerful and responsible company who can issue a negotiable warrant that will have sufficient standing to insure its being sought after and carried with confidence by the investor.

12. That every commodity that has been put in shape for investment has not only been permanently carried, but has brought about the result of reducing the fluctuations in the price of that commodity to a minimum and keeping the prevailing prices reasonably near the actual value.

13. That investment cannot continue or exist in any article without absorbing a certain amount of that article.

14. That every class of reliable security that investors have once taken hold of they have continued to carry to the full extent of issue.

The fear that such carriage by the investor would result in depressing the market is utterly groundless, and arises through unfamiliarity with the results attending the listing of other good securities.

Some writers fear that if such a carriage of iron by the investors were inaugurated the iron would be thrown on the market in case of a panic, to the great demoralization of prices. This is another plausible theory that actual experience in other securities disproves. In a panic investors always throw on the market the class of securities that, although quoted high to-day, may possibly be worth nothing to-morrow, and make haste to invest their money, instead, in some security that they know must always represent an absolute value. The very want of confidence in a great many of the articles of investment and the certainty in the value of iron might make a demand enough for the warrants to advance the price of them.

Many who have thoroughly examined the subject acknowledge that the warrant company is the only safe means of affording relief to the iron business. They are not only heartily and earnestly in favor of the warrant company, but are coming forward to co-operate with it. Furnaces representing an annual capacity of 770,000 tons, distributed over four iron-producing States, have already accepted

these facilities, and signed contracts with the company for 20 years. Additional furnaces representing an annual capacity of 650,000 tons have approved of the plans of the organization, and agreed to make contracts which only await the formal ratification of their boards of directors.

The fact that the warrant company cannot buy or sell pig iron warrants puts it entirely out of the reach of criticism. They can, however, refuse to take iron that is not up to the standard grade; hence they can bring about a uniform classification. They can refuse to deliver iron without a receipt; hence they can protect furnaces against short weight. Many writers acknowledge that the warrant company would be a benefit if it could be made a success, but cite a great many obstacles to its success. No obstacle has been suggested hitherto that the company is not willing to take upon itself the burden of overcoming. The warrant company stands on its merits. If it is a good thing it will endure and prosper. If it is a bad thing it will not, and, as one of your correspondents remarks, "It is here; let us give it a trial." Very truly,

GEORGE H. HULL,
President American Pig Iron Storage
Warrant Company.

NEW YORK, March 5, 1889.

This subject having been thoroughly ventilated, we must now consider the discussion closed.—EDITOR.

Motive Power at the Paris Exposition

The exhibits in the main hall of the Palais de Machines will be arranged in six rows extending lengthwise of the building. Four of the rows will be 50 feet wide, and two 38 feet. There will be four lines of main shafting, one to each of the four wide rows. Steam will be supplied by boilers placed in one of the courts, and so arranged that the different types may be examined. The total power is estimated at about 40 tons of water evaporated per hour. Steam will be supplied, says *Industries*, by a variety of boilers, all of which will be placed in one of the courts, so that the visitor may conveniently compare the different types of steam generators. The total power of the boilers is estimated at about 40 tons of feed-water evaporated per hour. The following firms are among the exhibitors in the boiler department: Belleville, de Mayer, Knap (London), Babcock & Wilcox (Glasgow), Davey Paxman (Colchester), Wehyer & Richmond, Fives-Lille, Dayde & Pillé, Roser, and Dulac. The distribution of steam to the various engines will be effected by underground steam-pipes laid in conduits throughout the length of the main building. The size of the pipes is calculated so as to give a maximum velocity of flow of 38 feet per second. Various boiler pressures will be used, but in the majority of cases the pressure will be between 90 and 120 pounds per square inch. To provide for the condensing engines, there will be two water mains running parallel with the steam-pipes, and both 2 feet diameter—one for the cold-water service bringing the water to the condensers, and the other for the return of the warm water. The administration pays the exhibitors of boilers, who supply steam for the general service, at the rate of 8500 francs (£340) per ton of steam delivered per hour during seven hours per day, and 180 working days. Should steam be required for a longer period than seven hours daily, the administration makes a further payment of 6 francs for each ton of steam; and if the exhibition should be prolonged beyond the 180 days, the payment will be 5 francs for each ton of steam supplied. Taking an average of 26 pounds of steam per horse-power hour, it will be seen from the

above figures that the administration pays at the rate of about $\frac{1}{4}$ d. per horse-power hour.

Of steam engines there will be shown a great variety, and the following are among the more important firms exhibiting in the motive power department: Société d'Anzin, Davey Paxman, Société le Phenix, Société de fabrication des locomotives et des machines de Winterthar, Société d'Oerlikon, André Berger de Thaur, Société alsacienne de constructions mécaniques de Mulhouse, Le Cruesot, Fives-Lille, Thomas Powell, Lecouteux et Garnier, Société française de matériel agricole de Vierzon, Biétreix, Boulet, Wehyer et Richemond, and Cail. The so-called "machine Casse," made by the Fives-Lille Company, will be the only example of the beam engine. This will be of 600 horse-power. The administration pays 40 francs per horse-power supplied during the whole time the exhibition is open, viz., seven hours per day for 180 days; and if the power is required after this period the payment will be $\frac{1}{4}$ d. per horse-power per hour. The four lines of shafting will be supported on bearings fixed to a system of standards, cross girders, and longitudinal girders, the latter also serving as supports for the traveling platforms, which will run the whole length of the main hall. These will be electrically worked, and used as travelers during the installment of the exhibits, and later on for the convenience of visitors, who will thus be carried from one end of the machinery hall to the other. The supply of feed and condensing water for a plant of boilers and engines representing about 4000 horse-power is a matter of some importance. The total quantity of water required per day is estimated at 6000 tons, or 850 tons per hour. The water will be pumped from the Seine and stored in elevated tanks of 166 tons capacity, the pumping plant being in duplicate, one by M.M. Quilacq & Meunier (Wheelock engine) and the other by M. Thomas Powell, Rouen (Worthington steam pumps). The water will be carried to the machinery gallery by a main of 2 feet diameter placed along the Avenue Suffren.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., March 19, 1889.

A few days ago a prominent Pennsylvanian, a friend of Secretary Windom, observed that Pennsylvania was getting nothing in the distribution of Administration favors and that New York was getting the lion's share. The Secretary replied, jokingly, "Well, you see, New York gets the offices, and we will give Pennsylvania protection."

This piece of pleasantry had more in it than might be thought. It is evidently the purpose of the Administration to prepare a scheme of customs duties which will afford ample protection to every industry which can be fostered to success in the United States, making the reduction of revenue more upon a restrictive policy toward foreign importations than upon reduction of duties, which invariably results in increased revenues. The Senate bill, with some improvements, will form the basis of the Administration measure.

The appointment of Mr. Tichenor to the Assistant Secretaryship of the Treasury, charged with the consideration of revenue questions and customs appeals and decisions, is in itself a guarantee of a vigorous protective policy. His long service in the office of supervising agent of the Treasury, and his familiarity with every branch of the customs business, are assurances of a fixed line of construction of tariff statutes on the side of protection.

It is understood that as soon as the administrative routine is well established the work of collating the material on hand for a tariff measure will be taken up. It is not improbable that Congress will be called into extra session about October to consider revenue matters in advance of the regular business of the session, which will be exceptionally important, relating particularly to an elaborate system of naval construction and coast defense.

The Bureau of Construction in the Navy Department is displaying considerable activity in preparations for the new vessels authorized by the late Congress. The vessels now building, authorized and provided for, and the latest list will when completed enable the United States to make quite a show on the ocean. The present Congress, however, when it gets to work on naval affairs, from all indications expressed by Senators and Representatives in convention, will provide for a long list of all classes of modern steel-armored and unarmored vessels. The new list comprises an armored steel cruising monitor not less than 3000 tons, 7500 indicated horse-power and maximum speed 17 knots an hour; a cruiser of the Vesuvius type, a dynamite gun battery, speed 21 knots an hour; two steel cruisers or gunboats, 800 to 1200 tons, and one large ram for harbor defense.

Deoxidized Bronze.

A representative of *The Iron Age* paid a visit recently to the foundry of the Deoxidized Metal Company, of Bridgeport, Conn., of which L. H. Bacon is president, O. C. Smith is secretary and treasurer and W. W. Keys is superintendent. The works are equipped with 23 crucible melting holes, which are to be supplemented in the near future with a large reverberatory furnace, to be heated with oil, capable of melting 10,000-pound charges. The foundry is to be enlarged by the addition of a building on adjoining property recently acquired, which is to be 80 x 180 feet, and is to be used chiefly for heavy loam work. Until now the largest castings of deoxidized bronze made were the rings of digesters for the bisulphite wood pulp process, which weighed 8500 pounds. Five rings and top and bottom casting composed such a digester 22 feet long, 7 feet 8 $\frac{1}{2}$ inches in diameter and weighed 28,000 pounds. Soon larger digesters are to be made, weighing 45,000 pounds, the company having orders for 19 of these large and 17 small digesters. Tests made in 1886 by Dr. T. M. Drown, of the Massachusetts Institute of Technology, proved the resistance of the metal to the corrosive action of bisulphite of lime. Experiments were made later, in 1887, by Prof. P. De P. Ricketts, of the Columbia School of Mines, from whose reports we tabulate the following results:

	Time.	Weight taken, grams.	Residue, grams.	Loss, grams.
Hot concentrated sulphuric acid.....	10 days	42.9816	41.9415	1.0401
Cold 50 % sulphuric.....	3 months	38.7500	38.7142	0.0418
Hot 50 % sulphuric.....	10 days	38.7142	38.6425	0.0717
Cold sulphurous acid.....	4 months	36.9640	36.9325	0.0315
Hot sulphurous acid.....	10 days	36.9325	36.8470	0.0855
Cold sulphurous acid with 5 % sol. sodium hyposulphite.....	4 months	39.2405	39.1738	0.0617
Cold solution with calcium and magnesium chlorides.....		39.0289	38.9115	0.1174
Cold conc. ammonia.....	4 months	38.2185	37.7550	0.5500

The fact that the use of the flux employed in melting by the company, which we understand consists chiefly of bor-

shavings, does remove the sub-oxide of copper so fatal to sound casting; of copper alloys is proved by the following analyses of Calumet and Hecla copper and deoxidized copper:

	C. & H. 1	C. & H. 2	C. & H. 3	Deoxidized.
Metallic copper.....	99.854	99.63	98.10	99.89
Sub-oxide of copper.....	0.233	0.324	1.95	0.07
Iron.....	0.015	0.011	...	0.01
Tin.....	0.021	0.01
Silver.....	0.012	0.024	0.08	0.08
Phosphorus.....	trace	...	trace	...

So far as the effect of deoxidizing upon the strength of copper is concerned, we may note the following results of tests made at the Watertown Arsenal: A deoxidized hard copper wire 0 104 inch diameter broke under a tensile strain of 69,730 pounds per square inch, showing a contraction of area of 1 per cent., a second similar wire showing 69,960 pounds and 2 per cent. respectively. A later report by W. N. Harris, chief engineer U. S. N., shows that 27 specimens of an alloy consisting of 88 parts of copper, 10 parts of tin and 2 parts of zinc, made by the Deoxidized Metal Company, and by the navy yards at Portsmouth, N. H., New York, and Norfolk, Va., showed that the tensile strength of the bronzes of the company was greater by 65.8 per cent. and the elastic limit was 58 per cent. better. The elongation was 53 per cent. less and the reduction of area 36 per cent. less.

The company use the alloy for a wide range of castings, like cylinders, pumps, bells, car trimmings, journal bearings, tuyeres for blast furnaces. They make also as a specialty very handsome and neat advertising articles, like letter openers, paper cutters and paper-weights, and have produced a wide variety of bronze nameplates for engine builders, machinists and manufacturers, among those supplied being the Westinghouse Company; the Lane & Bodley Company; the Eagle Iron Works, Detroit; Russell & Co., of Massillon, Ohio; the Benham Hydraulic Motor Company, of Providence; the National Water Purifying Company; the Ellithorpe Air Brake Company; P. T. Hodge Company, of Detroit, Mich.; Union Machine Company; Strong Locomotive Company; H. R. Worthington; the Vulcan Iron Works and John Mollenhauer & Co. An additional specialty of the company is the production of anti-friction metals and babbits.

Boys who have undergone mechanical training in the appropriate department in Girard College, Philadelphia, have comparatively little difficulty in securing good places in which to commence business. This statement is confirmed by the superintendent of mechanical instruction. Said T. Mason Mitchel, the gentleman referred to: "There are boys in South America, who have gone from here, earning \$2500 and \$3000 a year. They are all through the West, in New York and the Eastern States. The agent whose business it is to obtain places for the boys has very little trouble now, and we have many demands for the boys. They generally leave when they are about 15 or 16 years old, and with the knowledge they have obtained in this department many of them secure positions in workshops and manufacturing establishments paying them \$4 or \$5 a week. After that the boy must work out his future for himself. The trade of machinist seems to have the preference among the boys, and to this calling more go than either to wood-working, foundry-work or mechanical drawing. The advantage of school-taught mechanics gives the boy a standing upon entering workshops much above the raw beginner, and if he has proved a worthy student his acquirements are soon discovered, and his time under instruction in the shop is shortened, and he is generally paid much higher wages."

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., March 19, 1889.

Pig Iron.—The market has been very quiet since date of our last report, and while quotations are unchanged prices are not as firm as they were a week ago. One of the leading producers remarked that "he had seen a much worse market than the present one, inasmuch as Iron could be sold at a price. Concessions of from 10¢ to 25¢ per ton would enable them to place a great deal of Iron, while there had been times when it would have been impossible to sell large lots at anything near the market." This appears to voice the general sentiment—viz., that while the market is dull buyers could easily be found by shading prices a few cents per ton. The truth is that sellers cannot afford to make concessions, for which reason they seem determined to get current quotations or abandon the business, but it is impossible to say what conditions may be forced upon sellers before things take a turn. It is doubtful if any furnace is making money at to-day's rates, and not a few have it in mind to reduce their output unless things make a more encouraging showing within the next three or four weeks. Whether this will be the case or not is very hard to foresee. Under ordinary circumstances there ought to be an improvement, and the general drift of opinion is that such will be the case within the next 30 or 60 days. But unless the Southern and Western production can be marketed to their local trade it will be impossible for the East to show much rallying power. Efforts to secure bids during the past few days, especially for Southern Irons, do not afford much hope that such will be the case, although there is always a possibility of sudden changes in this respect, and while things are gloomy enough at the moment, a great deal might be said on the other side of the question. As, for instance, the low stocks, as well as the low prices of Iron. The probability of large crops during 1889, as well as the very satisfactory prices realized for those of 1888, is also an important factor. Then again, while trade is undoubtedly suffering by reason of the unsettled conditions of the railway interests, it is more than probable that these matters are already in much better condition than they were during 1888. The worst has been realized, improvement has already commenced, and it is contrary to the progressive spirit of the business community to believe that everything is going to the bow-wows. Then again, there is a disposition in some quarters to regard the financial difficulties in Paris as likely to cause some trouble here. Is it not more reasonable to regard the condition of the British Iron markets as more nearly affecting the United States? The cable dispatch to *The Iron Age* on March 13th had the following: "Holders of Pig Iron warrants have been realizing freely on this week's advance and the 'bears' have sold largely again the last few days. Makers' brands are strong at a further advance, the Continent and Canada being good customers. The demand for Steel of nearly all descriptions, as well as for Iron, is something enormous, and prices still show a rising tendency in all sections. Requirements for consumption and export alone necessitate heavy purchases. The fluctuations in prices during the week include 6d to 2/6 rise on Scotch Pigs, 3d on Cleveland Pigs, 6d on Hematites, 1/3 on Steel Rails and Billets, 2/6 on Steel Slabs, 6d on Steel Blooms and 3d on Bessemer and Siemens Steel Tin Plate." It is only fair to look at both sides of the question,

and while the immediate position of the Iron trade is far from satisfactory, there are gleams of sunshine as well as clouds of darkness. As to prices, the range for all qualities may be given about as follows for tidewater deliveries: No. 1 Southern to choice Pennsylvania, \$17 @ \$18.50; No. 2 do., \$16 @ \$17, and Gray Forge, \$15 @ \$15.50. Between these extremes sales are made according to quantity, quality, &c., the bulk of transactions being at medium figures.

Blooms.—There is a good deal of inquiry for Steel, and bids are made at extremely low figures, but sales appear to be on the basis of last week's prices, say: \$28 @ \$28.50, at mill, for Nail Slabs; \$29 @ \$30 for Sheet-Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for Flange purposes; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 per "Bloom" ton of 2464 lb.

Muck Bars.—There is a little more interest shown in this department, and prices seem to be a trifle steadier. Sales are reported at from \$26.50 to \$27, delivered, and these may now be considered fair average prices.

Bar Iron.—The market remains in the dull condition possible, the absence of large orders for car building and pipe making being greatly missed at this season. There is very little demand except from stores and the smaller class of consumers—or large consumers who take only small lots—and at very irregular prices. As a matter of fact, there are no prices that leave a profit to the manufacturer, but there are plenty that are said to be below cost of production. This, of course, cannot continue much longer, but in the meantime it appears to be the general condition of things in this vicinity. Nominal rates are from 1.75¢ to 1.85¢ for best Refined Bars, but there is plenty of business done at less than the inside figures for what is claimed to be first quality Iron. Grooved Skelp is nominal at 1.70¢ @ 1.75¢, and Sheared at 1.80¢ @ 1.85¢.

Plate and Tank Material.—The demand is a little better in some respects, although not large enough to cause any special activity. Orders for several hundred tons of Ship Plate have been distributed around, and it is expected that other fair-sized orders will be given out shortly, but prices are at the lowest point yet reached, with no indication of stiffening until the demand becomes more active. Nominal quotations are about as follows: 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates; 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.3¢ @ 3.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3¼¢ @ 3½¢.

Structural Material.—There is nothing new to report this week. Some of the mills are busier on specifications of material sold some time ago, but there is very little new work at the moment, although it is expected that a considerable amount of bridgework will come out within the next few weeks. Prices are about as quoted before, viz.: Bridge Plate, 2¢ @ 2.1¢; Angles, 1.95¢ @ 2.05¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

Sheet Iron.—The demand keeps up very fairly, considering the depression in other departments. Sales are well up to the average for the season, and prices are steady at about the following quotations for small lots:

Best Refined, Nos. 26, 27 and 28.... 3 @ 3¼¢
Best Refined, Nos. 18 to 25.... 2½ @ 3 ¢
Common, ¼¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28.... 4 @ 4¼¢
Best Bloom Sheets, Nos. 22 to 25.... 3½ @ 4 ¢
Best Bloom Sheets, Nos. 16 to 21.... 3¼ @ 3½¢
Blue Annealed..... 2½ @ 2¾¢
Best Bloom, Galvanized, discount..... 65 ¢
Common, discount..... 67½ ¢

Steel Rails.—The demand has not been important, but the feeling is becoming more confident and prices are very steady. It is possible that \$27.50 at mill might be accepted for specially desirable orders, but \$28 is the usual quotation, with a number of sales at that figure for small lots. The general impression is that prices will begin to improve soon, and that the lowest figures were made some time ago.

Old Rails.—There is very little doing, but prices seem to be without much change. There is less inquiry, and it might not be as easy to place large lots as it was recently, but the limited supply enables sellers to secure from \$24 to \$24.50 for lots delivered at mills near by. Nothing doing in lots in store or to arrive, so that \$23.50 @ \$24.50 are nominal quotations. A lot of 500 tons special quality of T's was sold here to-day at \$25, f.o.b. cars.

Scrap Iron.—The market is dull, and unless to parties actually in need of supplies it would not be easy to effect sales at last week's prices, although quotations are nominally as before, viz.: \$20.50 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice \$22; No. 2 do., \$14 @ \$15; Turnings, \$18 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$23 @ \$24; Old Car-Wheels, \$17 @ \$18, Philadelphia.

Nails.—No improvement whatever. Several mills have stopped, and although there is a material decrease in the output, prices appear to be as demoralized as ever. Nominal quotations are \$1.90 @ \$2 from store, but carload lots are sold at all sorts of prices, according to brand, necessities of seller, &c.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington Street, CHICAGO, March 18, 1889.

Pig Iron.—Dealers report a very quiet week. Some of them have been fortunate enough to book a fair tonnage, but it has been mainly in the closing of deals which have been in progress for some time. But little has occurred to indicate the tendency of prices, although some buyers have put forth "feelers" which have convinced them that for the present at least concessions will not be made by the manufacturers of Coke Irons. Bottom, therefore, seems to have been touched in this market, and while manufacturers are not hopeful of an early advance, yet they feel confident of maintaining values for some time at about their present range. Speculative inquiries have been received from outside parties who would be willing to invest at close prices, but they were not successful in finding manufacturers willing to meet their views, although quite a considerable number of furnace companies were approached for the purpose. A large contract for Castings, amounting to about 2200 tons, was awarded by the builders of the Milwaukee Avenue Cable Road to a distant foundry at prices below the bids made by Chicago parties. The proposed consolidation of the three steel companies is regarded with much interest by the Pig Iron trade, as it is believed that their large furnace capacity, which is not now wholly needed for their own requirements, may be partly diverted into the general market. This would cause such a competition for business that distant furnaces would have but a slight chance to dispose of any of their product here except in the case of those making special qualities. A revival of activity in the Steel Rail trade, however, would very considerably change this aspect of affairs. The demand for Lake Superior Charcoal is still dormant, but it is believed that large consumers would anticipate their usual buying season if the makers were inclined to lower their prices. Cash quotations are as follows,

f.o.b. Chicago: Lake Superior Coke, No. 1, \$16 @ \$16.50; No. 2, \$15 @ \$15.50; No. 3, \$14 @ \$14.50; Chicago Scotch, No. 1, \$17.50, for small quantities; Lake Superior Charcoal, Nos. 1 and 2, \$19.50; Nos. 3 to 6, \$20; American Scotch (Black-band), No. 1, \$18 @ \$19; Jackson County Silvery, No. 1, \$18 @ \$18.25; other Ohio Soft Irons, No. 1, \$17.25 @ \$17.50; Southern Coke, No. 1 Foundry, \$16.25 @ \$16.75; No. 2 Foundry and No. 1 Soft, \$15.75 @ \$16; No. 3 Foundry, \$15 @ \$15.50; Gray Forge and No. 2 Soft, \$14.50 @ \$14.75; Tennessee Charcoal, No. 1, \$19.

Bar Iron.—The condition of business has not improved, but the mills are not now soliciting orders with as much vigor as they were. Prices are too low to make large orders for future delivery at all desirable, unless raw material should be considerably cheapened. Quotations on mill lots of Good Common Iron range from 1.57½¢ to 1.62½¢, half extras, f.o.b. Chicago, with some mills willing to do a little better on desirable specifications. Store prices continue at 1.80¢ @ 2¢, according to quantity and quality.

Structural Iron.—In this line extreme dullness is reported. The season has not yet fairly opened, although the weather has latterly been so favorable for building that an active demand for material could have been reasonably expected, with so much work in sight. Prices are unchanged.

Plates, Tubes, &c.—Large transactions in Plates have occurred. The heaviest order was taken by J. T. Ryerson & Son, aggregating about 1000 tons of Steel, for conduits for the Milwaukee Avenue Cable Road, on private terms. A number of smaller orders ranged from 20 to 80 tons. Store business was also quite satisfactory. Very low prices were made on mill orders, but store quotations are unchanged.

Sheet Iron.—The demand for Black Sheets for present requirements is very limited, but large orders could be secured for late summer and fall delivery if the mills were willing to enter them at current quotations. Buyers have pretty thoroughly tested the manufacturers on this point, but have found them disinclined to meet their wishes. Prices are so low that the manufacturers believe a lower range of values hardly possible, and they prefer to keep themselves in a position to profit by an improvement if it should come along in the meantime. The mills making the best grades of Sheet Iron are understood to be pretty well filled with orders from the general trade, so that they are able to maintain this attitude. Quotations on mill lots of No. 27 for delivery range at about 2.85¢ @ 2.90¢, f.o.b. Chicago. Small lots of No. 27 are sold at 3.10¢ @ 3.20¢ from store, but the movement is now quite light.

Galvanized Iron.—A very remarkable change has taken place in the business done by manufacturers' agents. Orders have been received for large quantities. The apparent opening of spring and the very mild weather have evidently stimulated all classes of business consuming Galvanized Iron. Buyers are so urgent in numerous instances that agents have been obliged to wire their orders to give dispatch. If trade continues at its present pace this month will show the heaviest sales ever made by some of the houses represented here. Prices are unchanged, small lots being still quoted by jobbers at 65 % off for Juniata, and 65 % and 2½ % for 'harcoal, while manufacturers' agents ask from 2½ % to 5 % more on similar lots.

Merchant Steel.—The demand for Tool Steel increased considerably during the past week, some dealers reporting a growth in business of fully 50 % on the previous week. The resumption of quar-

rying and other outdoor work has evidently caused the improvement. Prices are unchanged.

Steel Rails.—No sales of any consequence were made during the week. Manufacturers are accepting the situation as cheerfully as possible under the circumstances, believing that a better trade will surely come along in the course of the summer. Quotations are unchanged at \$30 @ \$30.50.

Old Rails and Wheels.—No transactions in Old Rails have come to light. Holders ask \$21, and bids of \$20.80 have been refused. There is nothing doing in Old Car-Wheels. Holders will not accept \$18.50, but insist that they must get \$19.

Scrap.—A little more inquiry from consumers is noted, but actual business is light. There is apparently no market for Wrought Scrap, but small sales have been made of low grade material. Cast is very quiet. The inquiry for Mixed Steel referred to last week did not result in business. Quotations are nominally unchanged.

General Hardware.—The demand for Shelf and Heavy Hardware has quickened very decidedly, and most jobbers report an excellent trade in progress. Stocks of staple goods are diminishing very rapidly and a firmer feeling is perceptible in the lines which have latterly been most depressed. The advance in Screws has presumably checked sales for the time being, but, as stocks in distributors' hands are known to be light, an early revival is anticipated, which may be hastened by the intimations now circulating of another advance in contemplation by the manufacturers. Collections are not so good as they have been, quite a large percentage of the country trade asking for a little more time, desiring bills dated ahead and resorting to devices for deferring payments usual when they are not able to make prompt collections from their own customers.

Nails.—Jobbers are still in control of this market, selling Steel Nails at \$1.95 for carload lots and \$2 @ \$2.05 for small lots, and Wire Nails at \$2.35 for carload lots and \$2.40 for small lots; but their stocks are being depleted, and they are talking of advancing prices to correspond with manufacturers' rates. Wire Nails are especially firm.

Barb Wire.—The remarks concerning Nails are applicable to Barb Wire, which is still being sold by jobbers at 2.75¢ @ 2.80¢ for small lots of Painted, with the usual reduction for carloads, and Galvanized at 60¢ @ 65¢ @ 100 lb advance over Painted. A firmer feeling is developing among the jobbers, and it would not be surprising if a slight advance should soon take place.

Pig Lead.—Dealers report rumors of large sales at 3.55¢ to the local trade, but on investigation they have ascertained that the bulk of the Lead sold was for shipment. A better inquiry is noted at the close of the week.

Cincinnati.

Office of The Iron Age, Fourth and Main Sts.
CINCINNATI, March 18, 1889.

Pig Iron.—The local market for Pig Iron has been quiet throughout the week. A few large contracts have been negotiated, but all have not been consummated. The bulk of business has been confined to carload lots, but several sales of 1000-ton lots have been effected—one lot of 1500 tons, one of 1200 tons and one of 1000 tons, all of Foundry grades, at the same range of prices as were quoted a week ago. Also 1000 tons Gray Forge Iron at \$13.25 and 1000 tons ditto at \$13.50, cash, here. There has been little call for Car-Wheel

Iron, but the offerings have been small. A keen observer of the situation remarks that the light present consumption of Pig is the weakest factor in the market, foundries, rolling mills and agricultural works alike showing a light business. Prices of the higher grades of both Foundry and Forge Irons are well sustained, and even the lower grades are not quotably lower. Neither buyers nor sellers are as decided or pronounced in their views as they were a few weeks since, and the undercurrent has a neutral tint. The following are the approximate prices current here at the close for cash, f.o.b.:

Foundry.	
Southern Coke, No. 1 (new classification)	\$15.00 @ \$15.50
Southern Coke, No. 2 (new classification)	14.50 @ 14.75
Southern Coke, No. 3 (new classification)	14.00 @ 14.25
Ohio Soft Stone Coal, No. 1	15.00 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 15.00
Mahoning and Shenango Valley	16.50 @ 17.00
Hanging Rock Charcoal, No. 1	21.00 @ 22.00
Hanging Rock Charcoal, No. 2	19.00 @ 20.00
Tennessee and Alabama Charcoal, No. 1	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2	17.00 @ 18.00

Forge.	
Strong Neutral Coke	13.00 @ 13.50
Mottled Neutral Coke	12.25 @ 12.50
Gray Forge	13.00 @ 13.25

Car-Wheel and Malleable Irons.	
Southern Car-Wheel	20.00 @ 25.00
Hanging Rock, Cold Blast	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable	21.00 @ 22.00

Manufactured Iron.—The market has ruled slow and easy, even agricultural works, which are usually busy at this season, showing a small order-book; mills and foundries are alike dull, but prices are without change of importance.

Nails.—There has been a fair demand and a steady market for both Iron and Steel. 12d @ 40d sell at \$1.95 @ \$2 per keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$2, and Steel Wire Nails at \$2.55 @ \$2.60 per keg.

Old Material.—There has been a fair demand and moderate sales of Old Rails at \$21, cash, here, but Old Wheels have remained quiet, though steady, at about \$18.50, cash, at Cincinnati.

Cleveland.

(CLEVELAND, March 18, 1889.

Iron Ore.—About 600,000 tons of new Ore have been sold in Chicago during the past week, but the details of the sale are very rigorously guarded. Outside of the Minnesota Ores involved in the transaction there is little basis upon which to establish prices. Much of the Ore is from the Norrie mine, whose stockholders are also stockholders in the consolidated mills of Chicago and vicinity. More of it is of a grade of Bessemer Ore something below such standards as the Republic and Champion. Considerable Minnesota Ore was also included in the lot. All of the Ore was sold at mine prices and, from the best evidence obtainable, the Minnesota Ore brought a price equivalent to \$4.50, f.o.b. vessels at Two Harbors. Six or seven of the most prominent Ore men in the city were at Chicago last week completing the negotiations. About half of the Ore will go to Chicago by rail and the other half on boats belonging to the purchasers, with an aggregate tonnage of 500,000 tons. None of the sales comprising this large transaction is contingent upon vessel rates or freight charges from the mines to the shipping ports. The representatives of the mining companies are now at home responding to the vigorous inquiries for new Ore pouring in from every quarter. A sale of Minnesota Ore for far Eastern delivery is reported to-day at a price said to be equivalent to \$5.75, f.o.b. vessels Buffalo. It is not known definitely how much Ore is involved in the last-mentioned sale.

but it is believed that the amount is not less than 40,000 tons. Negotiations are now pending for considerable Chapin Ore to be sent to the same furnaces at prices equivalent to \$5.15 or \$5.20, f.o.b. vessels Buffalo. All of the Ore companies in this city are anticipating liberal orders from this new market, which seems likely to make a surplus production out of the question. The heavy buyers in the Mahoning and Shenango valleys have yet to close contracts for new Ore, although everything now indicates the immediate opening of the market at an average advance of about 80¢ or 40¢ over last season's opening prices. Three additional vessel charters are reported to-day at \$1.10 from Escanaba, and there is now every indication of this figure being agreed upon as a season rate from that port, although 125,000 tons of Minnesota Ore will be carried to Buffalo, at the rate of about 30,000 tons per month, at \$1.25 ¢ ton.

Pig Iron.—The market continues to improve both in firmness and prices. Sales of Bessemer and Foundry Irons have occurred during the past week at an advance of from 25¢ to 50¢ over last week's quotations. Many heavy purchasers are evidently in the market with the purpose in view of piling up their stocks before any additional advances are reported. Sellers view the situation calmly, and seem in no mood for forcing sales or pleading for purchasers.

Manufactured Iron.—Common Bar at 1.60¢, at the mill, is not particularly strong, and Sheets are weak at present prices, based upon No. 24 at 2.75¢.

Scrap Iron.—A small lot of Old Axles sold during the week for \$24.50. Some improvement is noted in the market for Rails, old Americans now being quoted at \$21.75 @ \$22.25, with several sales at the former figure.

Pickands, Mather & Co., dealers in Lake Superior Iron Ores and exclusive agents for the Minnesota Iron Company, the Chandler Iron Company and the Colby, Milwaukee and North Champion mines, have opened an Eastern office at 222 South Third street, Philadelphia. Edmund D. Smith & Co. are the Eastern agents of the firm.

St. Louis.

Office of *The Iron Age*, 212 N. Sixth st.,
St. Louis, March 18, 1889.

Pig Iron.—The general condition of the market remained unchanged. There is a fair demand, but buyers seem rather indifferent and are not disposed to pay any advance for future supplies. It is evident that large consumers are holding off, anticipating a lower scale of prices, but furnaces are firm in their determination not to cut prices, and are refusing to sell for more than a few weeks ahead. Prices are holding up very well considering the dullness of the past week, and are being strictly adhered to as quoted herewith:

Southern Coke, No. 1 Foundry, \$15.50 @ \$16.00
Southern Coke, No. 2 Foundry, 15.00 @ 15.25
Southern Coke, No. 3 Foundry, 14.50 @ 14.75
Gray Forge, 18.50 @ 14.00
Ohio Softeners, 18.00 @ 21.00
Lake Superior Charcoal, 21.00 @ 21.50

Missouri.

Charcoal Foundry, No. 1, 16.00 @ 16.50
Charcoal Foundry, No. 2, 15.00 @ 15.50

Tennessee.

Charcoal Foundry, No. 1, 17.50 @ 18.50
Charcoal Foundry, No. 2, 16.75 @ 17.50
Connellsville Coke, f.o.b. East St. Louis, \$4.70; St. Louis, \$4.85.

Bar Iron.—There is considerable business being transacted in this department, and during the past week some good-sized orders were taken for railroad work. Prices are weak and unsettled, and it depends entirely upon the size of the order

what terms are made. Small lots from store are quoted at \$1.80; carload lots from \$1.65 to \$1.75, according to circumstances.

Barb Wire.—It is difficult to ascertain anything that is of an encouraging nature, either as regards prices or amount of business being transacted. Mills are spasmodically employed, and there is no demand that can be relied upon to continue for any length of time, and the only symptom that can be construed into being favorable is the opening up of country roads, allowing farmers an opportunity of laying in stocks of Wire for spring consumption. Prices show no improvement whatever, and unless the demand increases very shortly are likely to be lower, as there is very little trade to go round, with too many after it. Prices are quoted as follows: For carload lots Two and Four Point Painted, \$2.80; carload lots Two and Four Point Galvanized, \$3.40, f.o.b. St. Louis; less than carload lots, 5¢ additional.

Detroit.

WILLIAM F. JARVIS & Co., under date of March 18, 1889, report as follows: While no large sales have been reported in this market during the past week, there has been a greater number of carload and 50-ton orders, and inquiries have been received from so many different points in the East that it looks as if an active buying would soon take place. The present warm weather, if it continues for any length of time, will hasten the opening of navigation, and buyers for early navigation delivery will place their orders earlier than usual. The Detroit and Cleveland Steam Navigation Company start their boats between Detroit and Cleveland on Wednesday of this week, and rates to Eastern points will therefore be less and will allow Irons in this section a better chance to compete for Eastern business. We quote as follows:

Lake Superior Charcoal, all numbers	\$19.50 @ \$20.00
Lake Superior Coke, all ore	18.75 @ 19.25
Lake Superior Coke, cinder mixed	17.75 @ 18.25
Standard Ohio Black Band	18.75 @ 19.25
Southern No. 1	17.00 @ 17.50
Southern Gray Forge	15.00 @ 15.50
Southern Silvery	16.50 @ 17.00
Jackson County (Ohio) Silvery	18.25 @ 18.75
Old Wheels	18.50 @ 19.00

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,
CHATTANOOGA, March 18, 1889.

Pig Iron.—Notwithstanding there is an active demand and heavy movements of Iron, prices still remain about stationary and without the advance that was anticipated some three or four weeks ago. Very little Iron, however, is accumulating in the yards and many of the furnaces are shipped up close, and unless the stack be running freely on No. 1 orders for this grade for immediate shipments are declined. The situation appears to be about in this condition: Very active demand, heavy shipments and very low prices. How long this condition of the Pig Iron market will continue appears to be so far an unsolved problem. Under the general rules that govern commercial affairs, as well as the still more active demand that will undoubtedly arise as the spring advances, it can hardly be otherwise than that prices will advance within a short time. The uncertainty of the future, however, has very strongly induced furnaces to continue to sell their outputs at present figures, and many of them have made contracts that extend quite far into the year. The best grades from furnaces that have a reputation are commanding the high prices named last week, and those furnaces that make an off-grade and those

whose reputation is not fully established are disposing of their output at 25¢ to 75¢ off. Purchases for speculative purposes are just now a little off, although there is still an occasional transaction on this account.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
PITTSBURGH, March 19, 1889.

The general Iron and Steel trade has not improved much the past week. The Iron failures and assignments within the past few weeks at different points throughout the country have had a bad effect upon the trade. We are assured that there are mills booking orders at prices that do not cover actual cost of production, and these are getting the bulk of the business, but it is only a question of time when the works will pass into the hands of assignees, and probably be sold out for the benefit of the creditors.

The river Coal trade continues in a very depressed condition. Since the first of the present month nearly 12,000,000 bushels have been shipped away from Pittsburgh by river, and all the down-river markets are overstocked and very dull, with prices away down to lay-down cost, if not below the same.

Pig Iron.—The market has been less active the past week, the volume of business reported having been considerably below that of the two preceding weeks. However, notwithstanding there has been a falling off in the demand, prices are still maintained, and sellers are apparently not any more numerous than buyers. Our city furnaces are all sold up, and are making no effort to obtain additional contracts. Furnaces in the Shenango and Mahoning valleys are not anxious to sell in this market at present prices, as they say they can do better at home. Bessemer appears to be more inquired for than any other kind, and is firmer in consequence. Foundry Irons have been a little more active during the past few weeks, but the demand is chiefly of a hand-to-mouth character. We quote prices as follows:

Neutral Gray Forge	\$14.50 @	cash
All Ore Mill	15.50 @	16.00
White and Mottled	14.00 @	14.25
No. 1 Foundry	18.00 @	18.50
No. 2 Foundry	15.25 @	15.50
No. 2 Charcoal Foundry	21.50 @	22.00
Cold Blast Charcoal	25.00 @	27.00
Bessemer Iron	16.75 @	16.00

The only sale of Bessemer Iron reported was 1000 tons, at \$16.80, cash; we can also report a sale of 1200 tons Gray Forge at \$14.50, cash, which appears to be the ruling price.

Spiegel and Manganese.—The upward movement in Manganese noted in our last report still continues, and the prices of a week ago cannot now be duplicated. The price now quoted is \$60 ¢ ton for 80 ¢. Spiegel remains about as last quoted—\$28.50 @ \$29 for 20 ¢.

Muck Bar.—There is no change to note in the general position of the market; demand continues light, especially for immediate delivery; some sales could be made for future delivery, but makers do not appear disposed to contract ahead at present prices. We hear of some small sales at \$27, cash, for immediate delivery, and some of the brokers intimate that it can be bought for less.

Manufactured Iron.—Trade continues slow for the season, and prices are unsettled and unsatisfactory; it is thought, however, that there will be an improvement in the demand before the close of the month. We quote Bars at 1.65¢ @ 1.75¢; Plates, 2.10¢ @ 2.15¢; No. 24 Sheet, 2.50¢ @ 2.75¢; Skelp at 1.05¢ for Grooved, and 1.95¢ for Sheared; all 60 days, 2 ¢ off for cash.

Nails.—The Nail trade continues dull, and the prospect for improvement is not very encouraging at present; usually there

is a good trade in March, but at present there is very little doing. Pittsburgh makers continue to hold firmly at lower rates, which they claim afford only a small margin for profit. We continue to quote at \$1.90 for 12d to 40d, 60 days, 2 % off for cash.

Wrought-Iron Pipe.—There is a very fair business; the demand is increasing, but prices show no improvement, and the latter is the discouraging feature connected with the business. It is claimed that orders have been taken within the past few weeks at prices that, under the most favorable circumstances, do not more than cover actual cost of production. This being the condition of the market, some firms are making but little effort to obtain business. Their main object is to hold their regular customers if possible. Discounts are quoted as follows: Black Butt-Welded Pipe, 60 %; Galvanized do., 52½ %; Black Lap-Welded, 70 %; Galvanized do., 55 % @ 57½ %. These quotations apply only to car lots. Boiler Tubes, 65 and 10 % off regular list; 2-inch Tubing, 11¢ per foot, net; 5½-inch Casing, 32¢ @ 33¢ per foot, net.

Old Rails.—There is more inquiry, but there have been no sales reported in this market for some weeks. American Tees are quoted nominally at \$23 @ \$23.50. While there is not much doing, the belief obtains that prices will rule higher as soon as the demand opens up, as the visible supply is small and steadily growing less.

Steel Rails.—The local market remains much the same as noted a week ago. The movement on foot among manufacturers for better prices meets with approbation here, provided it is carried out in good faith. It is well known that the prices current for some time past have been unsatisfactory and unremunerative. It is believed that there will be an improved demand before long, as prices are low and buyers may become aroused to the possibility of an advance. For small orders prices are still quoted at \$28 @ \$28.50, cash, but large orders can be placed for considerably less.

Blooms, Billets, &c.—There is not much inquiry, and in the absence of recent sales may be quoted at \$27.50, cash. Domestic Bloom and Rail Ends quoted at \$18 @ \$18.50, cash.

Railway Track Supplies.—Spikes are lower and we now quote at 2¢, 30 days, free on cars in Pittsburgh; Splice Bars, quotable at 1.70¢ @ 1.75¢, and Track Bolts at 2.75¢ with Square and 2.85¢ with Hexagon Nuts.

Merchant Steel.—There is no improvement in the demand, and prices continue unsettled and unsatisfactory.

Old Material.—Demand continues light and prices weak. No. 1 Wrought Scrap, \$19 @ \$19.50, net ton; Wrought Turnings, \$13 @ \$13.50; Car Axles, \$24 @ \$24.50; Cast Scrap, \$14.50 @ \$15, gross ton; Cast Borings, \$11 @ \$12, gross; Car-Wheels, \$19 @ \$19.50; Old Steel Rails, \$17.50 @ \$18 for short and \$19 @ \$20 for long lengths.

Louisville.

LOUISVILLE, KY., March 18, 1889.

There have been a fair number of sales reported during the last week in 100-ton lots. Two sales of 1000 tons each, one Lake Superior, the other Southern Forge and Bright Irons, are the largest sales reported. The prices were low, but at an advance over the lowest sales so far. It is hoped that the market from now on will show a slight improvement, and some of the largest buyers state that they think

prices during the spring and summer will advance probably \$1 per ton. We quote as follows:

Southern Coke, No. 1 Foundry, new classification.....	\$14.75 @ \$15.25
Southern Coke, No. 2 Foundry, new classification.....	14.25 @ 14.75
Southern Coke, No. 3 Foundry, new classification.....	13.75 @ 14.25
Gray Forge.....	13.25 @ 13.75
White and Mottled, different grades.....	12.75 @ 13.25
Silver Gray, different grades.....	13.00 @ 13.50
Southern Charcoal, No. 1 Foundry.....	16.25 @ 16.75
No. 1 Mill.....	14.75 @ 15.25
Southern Car-Wheel, standard brands.....	21.75 @ 22.75
Southern Car-Wheel, other brands.....	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry.....	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry.....	19.50 @ 21.00
Hanging Rock, Cold Blast.....	20.75 @ 23.75

New York.

Office of The Iron Age, 66 and 68 Duane street, New York, March 19, 1889.

American Pig.—The market is quiet, with only a moderate amount of business being transacted. As reported last week as probable, we note elsewhere the lower opening prices for Ore made by Withersbees, Sherman & Co., of Port Henry, N. Y. We quote for standard Northern brands, tidewater delivery, \$17.50 @ \$18 for No. 1 Foundry; \$16.25 @ \$17 for No. 2 Foundry, and \$15 @ \$15.50 for Gray Forge.

Scotch Pig.—The market is very quiet, and there is little doing, in spite of the fact that Iron cannot be laid down at present prices on the basis of cost in Scotland. We quote: Coltness, \$20.50 @ \$21; Shotts, \$20 @ \$20.50; Langloan, \$20 @ \$20.50; Summerlee, \$20.25 @ \$20.50 and Dalmellington, \$19.25 @ \$19.50.

Spiegeleisen and Ferromanganese.—We note a sale of about 5000 tons of 20 % Spiegeleisen to a Rail mill at private terms. Several additional negotiations are under way, the market being \$28 @ \$28.50. A number of lots of Ferro were sold at \$57 @ \$58 for 80 %.

Structural Iron.—Very little new work of magnitude was closed during the week under review. The Rochester bridge alluded to was taken by a local concern. Prices continue low, without any immediate prospect of recovery. We quote: Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 1.9¢ @ 2.1¢; Tees, 2.35¢ @ 2.5¢, and Channels and Beams, 2.8¢, on dock.

Plates.—We quote Iron Tank, 1.9¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3¼¢ @ 4¢.

Bar Iron.—We quote: Carload lots on dock, half extras, Common, 1.65¢ @ 1.7¢; Medium, 1.7¢ @ 1.75¢, and Refined, 1.75¢ @ 2¢.

Steel Rails.—Sales have been light, not aggregating more than about 6000 tons East and West. There are some new orders in the market, and a number of those already alluded to have not been closed. Prices now are firm at \$27, at mill, as Eastern mill efforts to buy a shade lower than this have been unsuccessful. This is equivalent to \$27.75 @ \$28, at tidewater, according to location of mill, and represents an advance of about \$1 per ton over the lowest point reached, which was a shade under \$26, at mill. It is reported, too, that Pittsburgh has withdrawn its lowest figures, which were \$26 @ \$26.50, and is now asking \$27 @ \$27.50, at mill, for large quantities. Negotiations are pending for the purchase of an additional allotment at about \$25 a ton by an Eastern mill.

Wire Rods.—There has been a sale of about 500 tons at a sterling price, and Basic Rods continue steady at \$41 @ \$41.50. Belgian Acid Rods have been

offered by one party lately as low as \$39.25. In Pittsburgh the mills are full of business, the selling price being \$41 @ \$41.50, at mill, which prevents Foreign Rods from going far inland.

Old Rails.—We note a sale of 500 tons of American Old Rails from a road in this vicinity at \$23. In the West the tone is better.

Track Material.—The market is dull at \$2 for Spikes, and \$1.75 @ \$1.85, delivered, for Angle Bars.

Scrap Iron.—While there is more inquiry for No. 1 Scrap, prices as a whole remained unchanged. We quote for cargo lots: No. 1 Scrap, \$20 @ \$21, delivered on boat; Turnings, \$13 @ \$14, do.; Cast Scrap, \$15.50 @ \$16, do.; Cast Borings, \$12.50 @ \$13.50, and Horseshoes, \$23 @ \$23.50.

Coal Market.

The adoption of a spring schedule of prices, announced a week ago, serves to illustrate one of those cases where reduction fails to reduce. This results from a failure on the part of the transportation companies to reduce tolls simultaneously to correspond with the reduction in prices per ton. The position meanwhile is practical stagnation, buyers and sellers alike hesitating so long as the toll question is pending. Confidence is expressed that by April 1 a definite understanding will be reached by all parties. The Hard Coal men last week accepted prices substantially the same as those previously named for Free Burning, so that quotations are uniform. The figures for different periods, therefore, compare as follows:

	Broken.	Egg.	Stove.	Chest.
Winter circular	\$3.95	\$4.30	\$4.65	\$4.65
Present	3.75	3.90	4.15	4.00
	20	40	50	65

The Lehigh Valley and Lehigh Coal and Navigation companies and the Reading agreed upon the following at the mines: Broken and Egg, \$2.35; Stove, \$2.60, and Chestnut, \$2.40. The spring prices last year were: Broken and Egg, \$2.50; Stove, \$2.75, and Chestnut, \$2.60, while the winter prices for the season of 1888-89 were \$2.65 for Broken and Egg, \$2.90 for Stove, and \$2.75 for Chestnut.

The lowest rates quoted of individual Coal are: Stove, \$4.25; Chestnut, \$4, alongside. Production at the mines for the week ending March 16 is 514,457 tons, an increase of 28,705 tons compared with the previous week, and an increase of 174,000 tons compared with the same week in 1888. Since January 1 the increase is 489,000 tons compared with the corresponding date last year.

The Seaboard Association agreed to the following schedule, which is now in effect: F.o.b. at Philadelphia, Norfolk, Newport News, Baltimore and Georgetown, \$2.60 per ton of 2240 lb; f.o.b. at South Amboy, Perth Amboy, Weehawken, Hoboken and Port Liberty, for shipments to points outside of the harbor of New York, and also destined to points on the Hudson River north of Fifty-seventh street, and to points on the East River east of Hell Gate, \$3.15 per ton; f.o.b. at Elizabethport and Port Johnson for shipments to points on the Hudson River north of Fifty-seventh street and to points on the East River east of Hell Gate, \$3.05 per ton; f.o.b. at South Amboy, Perth Amboy, Elizabethport, Port Johnson, Weehawken, Hoboken and Port Liberty, for shipments to points on the North River south of Fifty-seventh street and to points on the East River west of Hell Gate, \$3.25 per ton, but all sales made as delivered alongside in the harbor of New York, south of Fifty-seventh street, North River, and on the East River west of Hell Gate, shall not be less than \$3.50 per ton of 2240 lb so delivered. We present details con-

cerning the organization of the association editorially.

The case of Cox Brothers & Co. against the Lehigh Valley Railroad is being heard before the commission at Washington.

Financial.

Little improvement is yet visible in general trade, as there are too many disturbing influences. Still, the distributive movement is spoken of as satisfactory in most departments, favored by mild weather and facilities for transportation remarkably good for this early date in the season. The Hudson River is open to Albany, and heavy freights will soon be moving on the canals. In the coal regions the canals were opened last week, the earliest day on record. The clearings of 40 cities for the week ended March 16 were \$1,056,524,425, compared with \$689,278,657 for the corresponding period (blizzard week) last year. The percentage of increase this year was 54.4 %. Outside of New York the gain was 28.6. New York increased 75.6, Boston 33.1, and Philadelphia 46.4 %. As concerns the crops, favorable reports are received from the Weather Bureau. In the Northwest the season is declared to be from one to three weeks in advance. The most demoralizing feature within the last few days is the financial situation in Paris, growing out of the threatened dissolution of the copper syndicate. All speculative articles were more or less affected. Wheat, previously declining, took another downward turn and breadstuffs weakened in sympathy. Cotton dropped to some extent. Provision traders find a free outlet for their hog products, but prices were weak owing to large receipts. Business in dry goods was more active than before this season, although the spirit of trade and the volume of transactions were scarcely up to expectations. The strike in Fall River gave a firmer tone to cotton goods. Grocers had a fair business, with sugar tending higher. The acceptance by Commissioner Walker of the chairmanship of the Western Railroad Association was well received, but the renewed cutting of rates by several roads served to neutralize any favorable indications, and prompted Judge Cooley to remark that offenders must suffer where the law has been violated. The Interstate Commerce Commission discussed the subject of making through export rates to the disadvantage of New York and adjourned for two weeks.

The Stock Exchange markets were unsettled and toward the close of the week there was heavy selling on reports of the suspension of the Société des Métaux and of the placing of the Comptoir d'Escompte in the hands of a liquidator. The week opened with lower coal stocks, following the reduction in the prices of coal. Another drop took place on Friday, influenced by fear of trouble between Austria and Serbia, and news of the engagement of gold for export to Europe. Saturday's bank statement had no unfavorable influences. The selling of St. Paul, Lake Shore and other stocks was followed by reaction. On Monday Boston houses sold very freely, and there were but few exceptions to the general depression. On Tuesday prices fluctuated widely, closing with a small gain in the general list. The Chicago, Burlington and Quincy's annual report proved more unfavorable than was expected. The results for the year are a net loss of \$8,000,000. Though neither the fixed charges nor any dividend was earned, 5 per cent. was paid.

The weekly bank statement shows a loss of \$477,425 in surplus reserve, which item now stands at \$3,068,435. This loss was due to the expansion of loans to the

amount of \$3,335,000. Deposits increased \$3,914,100. The increasing demand for accommodation and the indisposition of banks and trust companies to loan except to regular customers suggests the probability of firmer money for some weeks to come, especially in anticipation of the April settlements, unless the Treasury should purchase bonds in much larger amounts. Commercial paper is firmer at $4\frac{1}{2}$ @ $4\frac{1}{2}$ % for 60 @ 90 days indorsed bills; $4\frac{1}{2}$ @ $5\frac{1}{2}$ % for four months; longer dates, $5\frac{1}{2}$ @ $6\frac{1}{2}$ %.

United States bonds are quoted as follows:

U. S. 4 $\frac{1}{2}$ %, 1891, registered.....	107 $\frac{3}{4}$
U. S. 4 $\frac{1}{2}$ %, 1891, coupon.....	107 $\frac{3}{4}$
U. S. 4%, 1907, registered.....	128 $\frac{1}{2}$
U. S. 4%, 1907, coupon.....	129 $\frac{1}{2}$
U. S. currency 6s.....	120

A syndicate is said to have purchased \$30,000,000 worth of Government bonds, which, it is believed, the Secretary of the Treasury will take during April. It is stated that the five railroads controlled by the Poughkeepsie Bridge syndicate will all be merged into one company, with a capital of \$8,000,000. Charles H. Worth & Co., Boston pork packers, are reported to have made an assignment, with \$750,000 liabilities.

The market for sterling was not in the least influenced by the news from Paris, and it is probable that it will not be materially affected if the Comptoir d'Escompte should be sustained. Still, with discounts in London at the bank minimum and sight sterling so close to the gold exporting point, there is a possibility of gold shipments as an exchange operation. With reference to events in Paris, a member of the house of J. & W. Seligman & Co., which until recently had financial relations with the syndicate, is reported as saying that not even the wealth of the Rothschilds could sustain the syndicate on the present plan of operations for two or three years. The most suitable course would be to get rid of its 120,000 or more tons of copper in a way that would cause the least disturbance. Sterling is firm at \$4.86 $\frac{1}{2}$ @ \$4.89 $\frac{1}{2}$.

The imports of merchandise at this port during the week were \$9,925,486, of which \$2,860,000 represent dry goods. Since January 1 the aggregate is \$111,542,000, against \$107,240,000 for the same time last year and \$99,843,000 in 1887.

The exports of specie from this port last week amounted to \$2,113,250, making a total since January 1 of \$8,486,000, as compared with \$5,985,000 for the same time in 1888.

The Bureau of Statistics reports of exports for February show a decrease of about \$1,800,000 as compared with the exports for February, 1888. There is a decrease of about \$10,000,000 for the eight months ending February 28 as compared with the corresponding eight months of last year, but for the first two months of the present calendar year there is an increase of about \$600,000. The exports of corn for February show an increase of about \$2,000,000, of oats an increase of \$500,000, of wheat a decrease of \$700,000, and of wheat flour a decrease of about \$1,200,000.

The shipments of petroleum for the week were exceedingly large, aggregating 4,965,928 gallons, making a total since January 1 of 25,762,810, as compared with 19,113,666 gallons shipped during the corresponding period of last year. Latest advices from Hong Kong say that Russian kerosene oil is not wanted even at \$2 per case, while American oil has been taken freely at \$2.30 @ \$2.50.

The Harvey Steel Works, at Newark, N. J., a new concern which was built to work on the Harvey patents, began rolling yesterday.

Metal Market.

Copper.—The failure of the Société des Métaux, of Paris, and its inability to carry out the contracts it concluded with Copper mining companies in this country and elsewhere, have radically changed the position of the metal in the leading markets of the world and all the producing countries. To judge from the cablegrams received from Paris and London, all is confusion for the moment and in a state of transition, so that it will not unlikely take several days ere it is known what will be done with the Copper on hand for accounts of the defunct syndicate on both sides of the Atlantic, or part of it, and whether all the bankers' guarantees on now repudiated contracts will hold good. The solution of these questions, which cannot be obtained in a day or two, nor in the course of several weeks, probably, and the action of *bona fide* consumers in the meantime will determine the price of Copper thenceforward, surrendered once more to the legitimate influences of the demand and supply, and, after continued fluctuations, the metal will then settle down to greater steadiness. For any bankers or groups of bankers to attempt exercising a control is a matter not deserving consideration of a serious kind, we should say, after the experience of the past 18 months. The demoralization is too deep-seated and widespread, and nothing but legitimate commercial influences can restore a rational equilibrium. Last year we had the experience with Tin, which declined in the early summer to £75, in order to gradually recover a figure which was still low enough to allow consumption to take hold of the metal for legitimate wants. Speculation then has a chance to assist in regulating the price. When we last reported the price of Copper in London was £51; last night it was £40, spot, and £38, futures, and closed to-day at £39 @ £40 for Chili Bars, spot. Quotations here have been too ridiculously wide apart to serve as a criterion of the state of affairs; hence they may be looked upon as entirely nominal. We discuss the situation editorially.

Lead.—Has been dull and weak, 400 tons being sold at 8.70¢, at which it closes nominally, as there are no more buyers thereat. The Western quotation is 3.50¢ @ 3.55¢, with a rather confident feeling as regards impending spring developments.

Spelter.—The recent weakness and decline to $4\frac{1}{2}$ ¢ Common Domestic has provoked a better spot and future demand, so that the price named could not be shaded toward the close. An early spring opening would benefit the metal materially.

Antimony.—A steady jobbing trade has been going on at 12¢ for Hallett, and 13 $\frac{1}{2}$ ¢ for Cookson.

Tin.—At the time of our last report spot Straits commanded £94. 10/, and futures £95. 7/8; they stood respectively £98. 5/ and £94. 10/ yesterday, with sales of 450 tons in the meantime. After settling down to a more quiet tone, sales were made in this market at 20.95¢ @ 21.05¢ for 50 tons May, 10 tons June at 21.20¢, and 20 tons July at 21¢ @ 21.20¢. Yesterday 20.90¢ was bid for spot, March and May, and 20.95¢ for April, with sellers at 20.20¢ for spot and March, and 21¢ @ 21.05¢ for April and May. Spot Tin closes at 21 $\frac{1}{2}$ ¢ to-day. **Tin Plates.**—While the English market has continued firmly sustained, business here has been on a restricted scale merely. The following are the closing quotations, in large lines, 3 box: Liverpool quotes Coke 13/ @ 13/3; Siemens-Martin Steel, Charcoal finish, \$4.75 @ \$5.50; Terns, \$4.12

@ \$4.25; Coke Tins, \$4.22½ @ \$4.30, and Wasters \$4.12½ @ \$4.15.

New York Metal Exchange.

The annual report of the New York Metal Exchange shows that the receipts were \$12,418.07, while the disbursements were \$11,815.78. The invested property of the concern is valued at \$55,538.52, which includes the building with \$46,106.25. This property is equal to an average of \$165.30 on each certificate of membership outstanding.

The following sales are reported:

THURSDAY, March 14.	
10 tons Tin, April.....	21.20¢
128 tons Lead, April.....	3.77½¢
100 tons Lead, August.....	3.87½¢
100 tons Lead, spot.....	3.75¢
FRIDAY, March 15.	
16 tons Lead, May.....	3.77½¢
28,000 pounds G. M. Copper, March.....	14.00¢
SATURDAY, March 16.	
48 tons Lead, spot.....	3.72½¢
16 tons Lead, March.....	3.72½¢
16 tons Lead, May.....	3.75¢
96 tons Lead, September.....	3.85¢
MONDAY, March 18.	
10 tons Tin, June.....	21.20¢
10 tons Tin, July.....	21.20¢
10 tons Tin, May.....	20.95¢
10 tons Tin, July.....	21.00¢
TUESDAY, March 19.	
30 tons Tin, May.....	21.00¢
10 tons Tin, May.....	21.05¢

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, March 20, 1889.

The situation of the Copper market is still chaotic. The Comptoir D'Escompte has secured an advance of 40,000,000 francs from the Rothschilds and others, but even this fails to clear up the uncertainty in regard to the signature of that institution given in connection with contracts between the syndicate and the mines. It is certain, however, that nothing decisive will be undertaken before the American delegates arrive, on this matter or with respect to any new combination. Their assent is essential to the conclusion of an effective agreement. The Société des Métaux was unable to meet engagements Monday, and brokers, in order to protect themselves, sold at any price they could obtain. One transaction in Bars was made at £35. Brokers formerly employed by the syndicate have ceased taking up Bars delivered on contracts and are unlikely to make purchases. The collapse of the syndicate is, in fact, generally believed to be final. Since Monday the open market has displayed more firmness under the stimulus of improved demand; prompts sold at £39 @ £39. 10/, and futures subsequently moved up to £38 @ £39, at

which sales were reported of three months. Best Selected is £45 @ £46, nominal.

Block Tin was virtually neglected until within a few days and prices declined under the influence of the depression in Copper. The demand has increased the last few days, particularly for consumption, and prices have improved. Straits shipments the first half of March to England and America were 860 tons.

Speculation in Pig Iron warrants has been large and influenced in a degree by the collapse in Copper, which induced free selling. The consumptive demand is steadily increasing, and this fact, together with a marked decrease in the stocks, has caused firmer prices again. Additional furnaces are blowing in. Some brands of Scotch are again higher, and Middlesboro' Pig is 6d up, but Hematites have been sold at a slight reaction from the highest figures.

In Tin Plate there has been a large American business at 6d advance on previous purchases. Inquiries and orders are increasing daily, and prices continue to harden.

Old Iron is held at somewhat higher prices, owing to the firmness of the general market, but the demand is not brisk. America is buying little.

Present high prices tend to restrict business in the Steel department to some extent, and except in Rails and shipbuilding sorts the trade is only fair at present. Makers have not changed their prices for Iron Bars, Sheets, &c., but report a strong and fairly active market.

Scotch Pig—Prices are maintained throughout, the market continuing active:

No. 1 Coltness, f.o.b. Glasgow	55/6
No. 1 Summerlee, " "	55/
No. 1 Gartsherrie, " "	55/
No. 1 Langloan, " "	55/6
No. 1 Carnbroe, " "	46/
No. 1 Shotts, " at Leith	55/6
No. 1 Glengarnock, " Ardrossan	50/6
No. 1 Dalmellington, " "	45/6
No. 1 Eglinton, " "	44/6

Steamer freights, Glasgow to New York, 5/ Liverpool to New York, 10/.

Cleveland Pig.—There has been a continued brisk trade, and prices are strong. No. 1 Middlesboro', G.M.B., 39/6; No. 3 ditto, 37/6.

Bessemer Pig.—A large business has been done, but at slightly lower prices. West Coast brands, mixed numbers, 47/6, f.o.b. shipping point.

Spiegeleisen.—The demand is fair and prices remain firm. English 20 % quoted 80/, f. o. b. N. W. England shipping point.

Steel Rails.—The market continues strong and the demand fairly active. Heavy sections quoted at £4. 7/6, and light sections £4. 15/ @ £4. 17/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—There is a good demand for these and prices are firm. We quote £3. 19/3 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—Only a fair trade reported, but sellers very firm. Bessemer, 2½ x 2½ inch, £4. 6/3, f.o.b. at N. W. England shipping point.

Steel Slabs.—The demand moderate and prices a shade easier. Bessemer £4. f.o.b. at N. W. England shipping point.

Old Rails.—Business moderate and buyers and sellers apart. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 7/6 @ £3. 10/, c.i.f., New York.

Scrap Iron.—Sellers are firm, but only a moderate business passing. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Crop Ends.—Small sales making at previous prices. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

Tin Plate.—Transactions have further increased and the market continues strong. We quote, f.o.b. Liverpool:

1C Charcoal, Allaway grade.....	15/3 @ 15/9
1C Bessemer Steel, Coke finish.....	13/9 @ 14/
1C Siemens.....	14/ @ 14/3
1C Coke, B. V. grade.....	13/3 @ —
Charcoal Terne, Dean grade.....	12/6 @ 13/

Copper.—Market still unsettled, but closing firmer. The quoted prices at the close were: Bars, £39. 10/ @ £40 for spot; £38 @ £39, nominal, for three months' futures. Best Selected, £45 @ £46, nominal.

Manufactured Iron.—There continues to be a good trade in this branch at steady prices. We quote, f.o.b. Liverpool:

	£ s. d.	£ s. d.
Staff. Ord. Marked Bars.....	@ 8 2 6	
Common.....	@ 5 12 6	
Staff. Bl'k Sheet, singles.....	7 12 6 @	
Welsh Bars (f.o.b. Wales).....	5 2 6 @ 5 5 0	

Tin.—The market rather slow, buyers and sellers apart. Straits quoted at £94 @ £94. 5/, spot, and £94. 15/ @ £95 for three months' futures.

Lead.—Very little doing, but prices steady. Quoted at £12. 10/ for Soft Spanish.

Spelter.—The demand moderate, but prices steady. Quoted at £17. 5/ for ordinary Silesian.

Foreign Markets.

EQUIVALENTS.

	Cents.

Florin (Netherlands).....	40.2
Florin (Austria).....	35.9
Wlirels (Portugal).....	11.08
Wlirels (Brazil).....	54.6
Mark (Germany).....	33.5
Pounds.....	2.306
Kilogram.....	134.
Picul.....	134.

CHILL.

VALPARAISO, January 18, 1889.—Copper.—During the fortnight under review sales were made on the spot to the extent of 18,204 quintals at \$25.86 @ \$26.40 per quintal. Then the official cable quotations from London were still £98 or thereabout. The same, however, inspires no confidence, exporters being afraid of French financial affairs; so that nothing could be sold now except at a material decline. Coal.—Newcastle has been paid 40/ @ 41/ on the spot, while for distant floats 42/6 @ 45/ is asked, but there is no disposition to pay such a price. Exchange.—90 days' sight on London may be quoted 24½d. —Weber & Co.

BELGIUM.

BRUSSELS, March 9, 1889.—Iron.—The Belgian Iron market has been firmly sustained during the week. Current production of our works is moving off steadily, the higher figures being submitted to quite readily. As for the foundry branch, it should be mentioned that the export trade leaves a good deal to be wished for, but this is compensated for by an all the greater domestic demand. Old Iron, having also risen in price, is about the best indication that raw material remains scarce and wanted. Following are the quotations to-day in francs & kg: Foundry, 4.85 @ 6.30; Forge Pig, 4.70 @ 5.80; Merchant No. 1, 12.50 at Belgian stations; 12 f.o.b. at Antwerp; Beams at Belgian stations, 12; f.o.b. at Antwerp, 11.75; Angles, respectively 13.50 and 13; do for Vessels, 14.25; Sheets, No. 2, 15.50; do Steel, 18. It should be added that Thyle-Château has sold some Beams at 12 @ 12.10, f.o.b. at Antwerp, which shows the tendency of the market.—*Moniteur des Intérêts Matériaux.*

GERMANY.

HAMBURG, March 9, 1889.—Iron.—Advices from the Rhenish Westphalian Iron market continue reassuring. Great firmness prevails, there being no abatement in the demand. Pig Iron has been lively at stiff prices, especially as regards Spiegel, firmly held as heretofore at 63 marks per ton. The rolling mills absorbing increased amounts of Forge Pig; the latter is as well sustained as ever at 53 @ 54, while Foundry Pig is unaltered. Thomas is in lively request at 45; Bessemer is still rather dull; English at 46; White Luxembourg is worth 35 @ 37 marks and Gray 44 @ 46. Germany produced last year 4,229,484 tons of Iron, against 3,977,341 in 1887. Of this amount, 2,064,060 tons were Forge Pig and Spiegel; 395,873 Bessemer; 1,253,873 Thomas, and 516,232 Foundry

Fig. Merchant Iron continues doing tolerably well for domestic use, although the margin made is moderate; for export the trade therein still flags; all other Finished Iron is doing remarkably well. The demand revives for Wire products likewise. Foundries, machine shops and car-making establishments all prosper. We quote Wire Rods, 120 @ 125; Steel Rails, 120 @ 122, and ditto. for Mines, 110 @ 115.—*Borsenhalle.*

EAST INDIES.

MANILA, March 11.—*Hemp.*—Our market has been quiet at \$16.25 per picul, against \$7.78 1/2 same date last year, equaling 1/2 ton, cost and freight, £52. 12/6, against £28. 15/. There cleared for the United States since last cable 7000 bales, against none last year, and since January 1 32,000, against 30,000; there remained loading for ditto 17,000, against 8000. Cleared for England since January 1, 61,000 bales, against 61,000 bales; loading for ditto, 4000, against 35,000; cleared for all other ports, 7000, against 13,000; receipts at all other ports since last cable, 12,000, against 10,000, and since January 1, 131,000, against 113,000 last year and 85,000 in 1887. Freight.—\$7.50, against \$5. Exchange, 6 months' sight, 3/7 1/2, against 3/3 1/2.—*Kerr & Co., per cable direct, to Mr. Charles Nordhaus, New York.*

COLOMBO, January 31, 1889.—*Plumbago.*—A moderate amount of activity has prevailed at following quotations, in rupees, per ton: Large Lumps, 145 @ 170; Ordinary Lumps, 125 @ 160; Chips, 80 @ 95; Dust, 40 @ 65. *Coir Yarn.*—No. 1 to 4 may be quoted 7 @ 12 rupees per cwt. Following are the shipments of *Plumbago* since October 1: To England, 28,280 cwt.; to Hamburg, 4419; to Antwerp, 2806; to Bremen, 456; to India, 21; to Australia, 88, and to the United States, 35,088; together, 71,108, against 104,223 in 1888; 83,072 in 1887 and 64,550 in 1886. Exchange.—We quote 6 months' sight 1 1/2-16d.—*Walker Brothers, through their agent, Mr. John W. Greene, New York.*

PENANG, February 15, 1889.—*Tin.*—Receipts for the fortnight amounted to 10,500 piculs, of which Europeans took 8000, while Chinese bought the balance and 1500 piculs besides. The market opened at \$36.50 per picul, advancing yesterday to \$37.40, but to-day there are no buyers.—*Schmidt, Kustermann & Co.*

HOLLAND.

ROTTERDAM, March 7, 1889.—*Tin.*—Since the beginning of the month but a light trade has been done, at \$7.75 @ 58 Banca, spot; Billiton, do. at 50 @ 57.50, and the latter to arrive 57.50 @ 57.75. The following statement shows the position of Banca Tin in Holland on February 23, from the official returns published by the Dutch Trading Company:

	1889.	1888.	1887.
Import in February, slabs.....	11,700	13,001	13,171
Total, two months, slabs.....	26,700	36,400	25,670
Deliveries in February, slabs.....	12,780	5,500	12,260
Total, two months, slabs.....	21,740	10,700	27,155
Stock, second hand, slabs.....	29,150	30,809	18,526

Billiton.....	f 58	f 100	f 61

—*De Monchy & Havelaar.*

The annual meeting of the stockholders of the Virginia Coal and Iron Company was held at the Exchange Hotel, Richmond, Va., on Tuesday, the 12th inst. The company own about 65,000 acres of valuable coal lands in Wise County, immediately north of Big Stone Gap, and large tracts of iron land in Scott and Lee counties. The following are among the stockholders and officers of the company: E. B. Leisenring, Dr. J. S. Wentz, S. B. Price, A. W. Leisenring, Daniel Bertch and M. S. Kemmerer, Mauch Chunk, Pa.; Dr. George Wentz, Jeddo, Pa.; Samuel Thomas, Catasauqua, Pa.; T. A. Dodson, George H. Myers, Bethlehem, Pa.; W. W. Watson, Scranton, Pa.; G. W. Mullin and J. O. Tomblor, Philadelphia.

The Ellis & Lessig Steel and Iron Company, of Pottstown, Pa., manufacturers of cut nails, have broken ground for 12 additional puddling furnaces. The contract for the castings, amounting to about 150 tons, has been given to the Colebrookdale Iron Company, of Pottstown.

The Reading Settlement.

The following is the full text of the plan of the settlement of the Reading Iron Company:

It will not be practicable to make any cash payment if the works are to be kept going and the business continued. The company will have no credit and cannot therefore borrow working capital; the values represented by merchandise, stock and materials will be required in the future conduct of the business. The depreciation in the value of the plant in the event of liquidation will be so great that the creditors will be better off to reorganize the company and keep it a "going concern" under prudent and economical management than to convert the personal property into cash and distribute the proceeds. The practical questions, therefore, are to devise measures to give the creditors the best possible securities, to enable them to maintain their credit and carry the notes discounted in bank, to enable them to realize the largest possible amount on their claims.

The real estate and plant are valued on the books at \$1,838,050.58 as a "going concern." They have been appraised by the creditors' committee at \$1,558,450, but if sold under liquidation would bring very little in excess of liens.

There is a mortgage of \$600,000, 6 per cent., 80 years, on the plant. If the whole debt, say \$1,300,000, were funded in a second mortgage, the bonds would command a low price. It will be better to issue, say, 40 per cent. of second mortgage 6 per cent. bonds, and a third mortgage of 60 per cent., \$780,000, interest payable if earned at the rate of 6 per cent., with a sinking fund into which surplus net earnings shall be paid.

Settle and adjust with all creditors whose claims are less than \$1000 by the payment of 60 per cent. cash. This will reduce floating debt to \$1,300,000.

Adjust this \$1,300,000 by 40 per cent., second mortgage bonds, 6 per cent. \$520,000, and 60 per cent., third mortgage, \$780,000. The third mortgage bonds to be entitled to 6 per cent, if earned, and all net earnings after the payment of fixed charges and interest on third mortgage.

(A) Interest on first mortgage.....	\$38,000
(B) Sinking fund first mortgage.....	9,000
(C) Interest on second mortgage.....	31,200
(D) Interest on third mortgage.....	46,800

Total \$123,000, to be paid into the sinking fund of third mortgage, to be invested by trustee of the mortgage in purchase of third mortgage bonds at market price, not exceeding par, and with usual sinking-fund clauses regulating investment. If bonds can be purchased cancel common stock and issue deferred stock, cancel preferred stock and issue common stock in lieu.

The holders of deferred stock to deposit their stock with the trustee of third mortgage, with voting power to said trustee. The trustee to vote the stock as requested by a majority of holders of second and third mortgage bonds.

NOTE.—In lieu of third mortgage 5 per cent. perfection stock could be issued, but the third mortgage is the better security and will be more acceptable as a collateral.

A new catalogue of the E. W. Bliss Company, Brooklyn, has just made its appearance. This is the eighth edition put out by this firm and in many respects is an improvement over anything that has preceded it. Folded plates are avoided, and yet the various machines are shown in a way to meet every requirement. The volume in size measures 5 x 7 1/4 inches. It is bound in cloth with gilt side and back titles, with embossed monogram on the last page of cover. It contains no less than 263 pages. The engravings are clear and distinct; the letter-press is terse and

appropriate, and the price lists are arranged in such a form as to afford every necessary feature of information. Many new tools and machines are shown, and the sheet-metal worker will find it difficult to secure so much information in compact form in any other direction as is shown in this book, and yet the list of illustrations is by no means exhaustive. One thing to be specially noticed is the advance being made in the designing of machinery. Types of presses which have been familiar to the manufacturing public for many years past are no longer seen in this volume. Instead new styles and designs have taken their places, of better construction and greater convenience, indicating that this establishment is keenly alive to the rapid advance of the day, and is keeping its friends and customers in the front ranks of progress. The volume is one that should have large circulation and should be preserved for reference in the library of every mechanic and manufacturer.

Business Methods.

The form of remittance which was published in our issue of January 17 has called out an interesting letter from the firm of E. D. Ransom & Co., dealers in molding sand, foundry facings and founders' supplies, at Albany, N. Y. In it they inclose a form of remittance which they are employing and which they state is very convenient for the purpose. With the exception of an ornamental corner-piece the form is as follows, the blank spaces being filled in to show its practical utility:

ALBANY, N. Y., February 23, 1889.

Messrs. Jones & Co.

Dear Sirs:

We inclose Check No. 2730, for four hundred dollars, in settlement of account as below. Please acknowledge same.

Yours truly,

E. D. RANSOM & Co.

'89.

Dec.	29	Mdse.	\$200 00 300 00	\$500 00
Jan.	10 20	Cr. Allowance. Frt. and Dis.	50 00 50 00	100 00
				\$400 00
		(Receipt and Return.)		

.....188

Received of E. D. RANSOM & Co.,

.....Dollars,
in settlement of account as above.
\$.....

The lines at the bottom are to be filled in by the persons receiving the money, their signature attached in proper place, and the entire form then returned to those making the payment.

Clark Bros., Belmont, N. Y., announce that their machine shops and foundry were destroyed by fire Saturday evening, the 16th inst. Their patterns, drawings, jigs, templates, special tools and a large quantity of their stock in process of construction was saved from the fire, and they have made arrangements temporarily for occupying and carrying on their business at the large foundry and machine shop of the Rawson Mfg. Company, which is referred to as splendidly equipped with all necessary machinery and tools, so that they can fill all orders promptly.

A patent has just been granted to James A. Burden, of Troy, on a magnetic ore separator.

Hardware.

The trade for the past week has not been up to expectations, and some complaint is made by merchants and manufacturers that goods are being purchased in comparatively small quantities, the trade throughout the country manifesting a disposition to defer their orders. The volume of business is, however, fair, and it is expected that with the progress of the season there will be a satisfactory trade. Prices remain substantially unchanged.

Barb Wire.

The New York market presents no new features of importance, the demand being only fair, but prices are without change.

The recent circular of Washburn & Moen Mfg. Company and I. L. Ellwood & Co. refers at some length to Barb Wire litigation. With reference to its general features they say:

We desire the trade to understand distinctly that, with three or four exceptions, every Barbed Fence Wire manufacturer in the United States, between 40 and 50 in number, are our licensees, the infringers being all under suit. Practically but one decision has been rendered against us by a United States District Judge—in the northern part of Iowa, an appeal from which was promptly taken to the Supreme Court of the United States—and concerns but a limited portion of a single State, where no unlicensed Wire is now being manufactured. Again, this decision concerns but one patent out of the 250 odd which we own on Barbed Wire and the machinery for making same. That decision, moreover, was rendered some 13 months ago, where, but two months since, we had no difficulty in obtaining an injunction in the United States Court against certain parties in Joliet, of this State, to restrain them from manufacturing Glidden Wire, which they had not been authorized by us to manufacture.

Referring to their litigation with the Braddock Wire Company and the St. Louis Wire Mill Company and parties handling unlicensed Wire, the circular says:

In May, 1888, we filed a bill for an infringement of our patents, among which was the principal Glidden patent, sustained by Judge Brewer against the Braddock Wire Company. The defendants interposed delays and refused to answer until October 1, 1888. In October and November, 1888, we took our entire testimony, 165 printed pages, and filed the same on record, and since that time the Braddock Wire Company has not taken a line of testimony or made a single defense, and an injunction and decree will go against them by default at the next term of that court unless they now beg leave of court so to do. The record of the United States Court at Pittsburgh will show this fact.

In April, 1888, we filed a bill against the St. Louis Wire Mill Company, in the United States Circuit Court for the Southern District of Illinois, for an infringement of the Glidden patent, heretofore sustained by Circuit Judge Brewer, and being the patent referred to by District Judge Shiras. The St. Louis Wire Mill Company filed answer in May in that case, and also filed a lot of affidavits, alleging the great damage to their business by suits brought by us on the Glidden patent, and letters and circulars written by us, and asking for an injunction against us restraining the bringing of suits, writing letters, issuing circulars, &c., against infringing dealers and consumers of Barbed Wire. Of course this injunction was not granted. In July and August, 1888, we took extensive testimony and closed our proof in that case. Not a line of testimony has been taken by the St. Louis Wire Mill Company, or a defense put in in that case either; we shall obtain an injunction and decree against the St. Louis Company at the next term of court unless the company by pleading and begging and affidavits obtain the time to put in some defense.

In addition to the number of suits which we are prosecuting as vigorously as the law will allow against the very few parties who are venturing to manufacture unlicensed Barbed Wire, we have recently instituted suits against the Van Camp Hardware and Iron Company, Indianapolis, Ind.; Low & Woodruff, Chicago agents for the Braddock Wire Company; The Hazen Company, Cincinnati agents for the same company; Pappenheimer Hardware Company, jobbers at Cincinnati, who are selling the same make, and are collecting evidence against a number of jobbers and dealers, which, when completed, will lead to suits.

Wire Nails.

There is a fair amount of business in Standard Wire Nails, which are coming into constantly increasing use. The extreme prices which are made are unquestionably below cost, and some of the manufacturers are refusing to meet them.

Cut Nails.

While the volume of business continues quite satisfactory in Cut Nails, prices are still somewhat unsettled and decidedly unremunerative. We continue to quote standard quality Iron Nails, carload lots; \$1.80 to \$1.85, and small lots, \$1.90 to \$1.95.

The regular monthly meeting of the Western Cut Nail Manufacturers' Association was held in the office of the Benwood Iron Works, Wheeling, W. Va., on Wednesday, the 13th inst., about one-half of the firms being represented. Nothing but routine business was transacted. No change was made in the card rate.

Clothes Wringers.

The manufacturers of Clothes Wringers have adopted a new list, which is given below. It will be observed that this list is not now printed \$2.50 or \$3 per dozen higher than the price of the goods to the trade, as heretofore, but that it is printed net 60 days, subject to 2 per cent. discount for cash in 10 days. This change will commend itself to the convenience and judgment of the trade. Change has also been made in the matter of freights and deliveries, by which buyers of jobbing quantities will receive an allowance on

shipments to equalize freights with the factory nearest the purchaser to whom such allowance is made. By this arrangement a house in the West, for example, buying goods from an Eastern manufacturer will hereafter have to pay only what the freight would be from the Western factory located nearest to them, instead

of paying the freight from the Eastern factory, as formerly. The following are points covered by the arrangement in regard to the equalization of freights: Boston, Mass., Woonsocket, R. I., Middlefield, Conn., Auburn, N. Y., Philadelphia, Pa., Erie, Pa., Cleveland, Ohio, and Cincinnati, Ohio.

The change in list as made by the Empire Wringer Company, Auburn, N. Y., applies only to the Daisy and Volunteer Wringers, the Empire Wringers remaining at the same prices and terms as heretofore.

The foregoing is the revised price list of the Bailey Wringing Machine Company, Woonsocket, R. I., which represents also the list prices of other manufacturers. Terms, 60 days, 2 per cent. discount for cash in 10 days.

Items.

The American Buckle and Cartridge Company, West Haven, Conn., for whom the Alford & Berkele Company, 77 Chambers street, New York, are agents, have decided to go into the business of loading Shells and will be ready to deliver the goods about the middle of June or first of July next. This step is taken in view of the fact that the sale of loaded Shells is increasing, while the sale of unloaded Shells is correspondingly decreasing. We are advised that the company have ample facilities for this new departure, and with their I X L and special brands of Shells they are in a position to make this addition to their line in such a way as to meet the varied requirements of the trade.

Gibson, Parish & Co., dealers in Cabinet Hardware, who were recently burnt out at 78 and 80 Randolph street, Chicago, have established temporary quarters at 82 Lake street and re-engaged in business. They may return to their old location after the building is re-erected.

H. H. & C. L. Munger, 142 Lake street, Chicago, have increased the line of Fauber's Electric-Action Bells by adding 3 1/2-inch Plain Gong, nickel-plated, 3 1/2-inch Bell Metal Gong, nickel-plated, and 3 1/2-inch Bell Metal Gong, polished, which are numbered respectively, 081, 082 and 083.

The wholesale catalogue issued by Thos. H. Chubb, Post Mills, Vt., represents in attractive style his line of Fishing Tackle, special attention being given to Fishing Rods, the manufacture of which is made a specialty. Mr. Chubb alludes to his excellent facilities and his experience of 20 years in this business as putting him in a position to offer superior goods at favorable prices. The list represents a large variety of Rods, Reels, Flies, Hooks and miscellaneous Fishing Tackle specialties.

By an error, which from the prominent position occupied by the house was probably recognized by most of our readers, the location of the C. W. Hackett Hardware Company, successors to the Strong-Hackett Hardware Company, was in the paragraph in our last issue relating to the change in style, given as Minneapolis instead of St. Paul, Minn.

It will be observed that among the Special Notices on page 50 is one relating to a wholesale and retail Hardware business of 40 years' standing, in a centrally located city. The sales are given as \$300,000, the stock amounting to \$45,000.

The Eagle Pencil Company, 78 Franklin street, New York, issue circulars calling attention to some of their recent novelties. One of these is their Enigma Pencil, in which the lead takes its proper projection for writing whenever the point is turned downward, and on returning the Pencil to the pocket, point upward, the lead drops in automatically. As the lead wears off, by means of a knob at the end of the Pencil it is adjusted to the desired

length. A new lead can be inserted by unscrewing the tip and placing the lead in its carrier. They also issue a circular describing the Matchless Compass and Combined Pencil and Compass, so constructed that when not required for use it can be easily carried in the vest pocket, occupying no more room than the ordinary Lead Pencil, while at the same time the points are concealed, so that no damage may be done to the clothing. It is described as made of the best nickel, carefully manufactured and of superior finish.

On page 50 Haydock & Bissell, the Hardware Auctioneers, announce on March 26 and 27, an important sale of Table and Pocket Cutlery; on March 28 a large trade-sale of Hardware, and on March 29 a special sale of House-Furnishing Goods, Brushes, &c., at their rooms, 12 Murray street and 15 Park Place. Particulars in regard to this sale are given in their advertisement, and it will be seen that the opportunity is deserving the attention of buyers.

Geo. D. Winchell Mfg. Company, Cincinnati, Ohio, issue a circular showing their line of Imperial Water Coolers, the different patterns of which are illustrated with some new designs. The Gate City Stone Filter is also represented.

B. G. Farrar & Co., St. Louis, Mo., issue a circular relating to their patent Adjustable Buggy and Wagon Wrenches and Common Sense Buggy and Wagon Jacks, giving illustrations and list prices and pointing out their advantages.

In their advertisement on page 72 Peabody & Parks, Troy, N. Y., illustrate the Farmers' Favorite Potato Bug Exterminator, of which they are manufacturers. This machine is for dusting plaster, Paris green, phosphates, &c., and its simplicity, durability and satisfactory working are points made in regard to it.

The Cleveland Stone Company, Cleveland, Ohio, have been appointed agents by the Pike Mfg. Company, Pike Station, N. H., for the sale of their domestic and imported Scythe Stones, Washita, Arkansas, Hindostan and Turkey Oil Stones, &c., and have opened a branch office at 51 Chambers street, New York.

Bennett & Shirk, 112 and 114 Lake street, Chicago, selling managers of the North Star Refrigerators, manufactured by the Indiana Mfg. Company, of Peru, Ind., have just issued an illustrated and descriptive catalogue. Various styles of hardwood Refrigerators are shown, embracing small sized upright, large sized family or restaurant single door large sized double door, front door to ice chamber, four door, Sideboards, Sideboard and Cabinet combined, plain finished, and Ice Chests. The high-class Refrigerators are all finished in antique. The Sideboards are made of solid quartered oak, antique finish, or walnut, hand carved, inlaid with ebony and cherry, have embossed mosaic panels, beveled French plate mirrors, special water cooler, and complete in every other respect. All the upright Refrigerators are lined with felt throughout, including the lids. A recent test of one was made in a steam drying room heated to 165°. It was left there for eight hours, in which time two gallons of water were formed by the melting ice, and when taken out the inside temperature was 48°, which was a very creditable performance. It is claimed that in this Refrigerator perfect circulation of cold air is secured through the linings of the walls, as also through the linings of the doors and lids, in which suitable openings have been made.

James D. Frary, Meriden, Conn., is putting on the market a very interesting and complete line of Lemon Squeezers, Cork-

screws and other specialties. On page 453 of this issue a description is given of the Seaside Lemon Press and Strainer, a new article, to the convenience and efficiency of which attention is called. Emphasis is laid upon the fact that in Nos. 162 and 182 the parts of the press which come in contact with the lemon-juice, are lined with pure britannia metal. The catalogue exhibits an exceptionally complete line of Corkscrews, many of which are of new design and are combined with other tools, such as Can Openers, Picks, &c. Other specialties are also illustrated.

Hibbard, Spencer, Bartlett & Co., of Chicago, finding their present spacious quarters too small to accommodate their increasing business, have secured two additional buildings adjoining their stores on the east and will occupy them after the 1st of May. These buildings are each five stories high, 24 feet wide and 140 feet deep. The company's block will then be 160 feet long by 140 feet deep, leaving but one 24 foot building between it and an alley on the east. Their numbers on Lake street will run from 18 to 32 inclusive. This increased space will add greatly to the convenience of the firm. One of the new buildings will be used for their new Lamp Department, which will hereafter cover not only a full line of Lamps, but everything pertaining to the Lamp business. In the line of present trade the firm states that they are doing a large business thus early in the season in Ice-Cream Freezers. They handle the Lightning Freezer made by the Shepard Hardware Company, which was brought out late last year. They have also added to their stock the Jewett line of Filters, for which an active inquiry is developing in sections afflicted with impure water.

Walbridge & Co., Buffalo, N. Y., have issued a very convenient catalogue of Tinware and House-Furnishing Goods, of which they have made a judicious selection. Illustrations are given of leading goods and many specialties, the cuts being small, yet clear and satisfactory, and representing the goods attractively. The numbers, sizes, &c., of the different articles are given, but the list prices are omitted, with an intimation in the opening circular that a full list of prices, following the catalogue page by page, will be mailed on application.

Maynard's Socket Garden Trowels, described on page 453 and put on the market by Robert Murray, 24 Duane street, New York, are sold from the following list, which is subject to a discount of 20 per cent.:

5	6	7	8 inch.
\$4.50	\$4.50	\$5.00	\$5.50 per dozen.

Tucker & Dorsey Mfg. Company and Phoenix Caster Company, both of Indianapolis, Ind., have issued illustrated catalogues jointly under one cover. The line of Alarm Tills, Stove Trucks, Slaw Cutters and miscellaneous household specialties made by the Tucker and Dorsey Mfg. Company, and Martin's Patent Casters, made by the Phoenix Caster Company, are conveniently and effectively represented. The large and important line of Casters are represented in full-size cuts, and the more recent additions to the assortment shown. In regard to these two companies, it may be stated that the business of both is transacted from one office under the management of the same officers, although the companies are separate and distinct in other respects.

William Shimer, Son & Co., Freemansburg, Pa., issue an illustrated catalogue and price list showing the specialties in Hardware and House-Furnishing Goods of which they are manufacturers. Among these are represented the Keystone Sad-Irons, including those with detachable

wood handles and the regular goods, a large variety of Chest Handles, Bolts, Scales, Shelf Brackets, Hooks, Cast Nail Hammers, Stove Lifters, Match Safes, Garden Tools, &c. The Royal Washing Machine is also prominently represented.

The extent of the assortment carried by the house of Scott, Stevens & Co., Paducah, Ky., is referred to in a recent issue of the *Daily News*, of that city, their two three-story buildings being alluded to as stocked with a large variety of goods in the line of Hardware, Iron, Stoves, &c.

The *Humboldt Mechanic*, Eureka, Cal., illustrates the enterprise of E. Janssen & Co., to whose varied stock attention is prominently called, reference being made to many of the different lines of goods carried by them, in which Tools have a prominent place.

Office Salesmen.

A writer in a recent issue of *The Office*, discussing the treatment of customers who call on the home concern as contrasted with the treatment of those who are regularly visited by the traveling salesmen of the house, presents the following:

It has seemed to me, for some time past, that the matter of office salesmen in business houses is, in a great measure, a neglected subject. A merchant will use his utmost endeavors to secure the services of gilt-edged road men, and, having obtained his traveler, after much time, labor and skillful maneuvering, he will sit quietly in his chair expecting the man on the road to bring in the business. Such management puts the office in the position of a clearing-house, not of a live, active factor in the business transacted. Is this a proper way to conduct any business office? Frequently I have had occasion to enter large establishments where, on opening the door, a wilderness of goods greeted me, but no human face. Sometimes I have gone a distance of from 100 to 200 feet into a large city warehouse, and finally run against the office partition at the lower end, where a hard-worked bookkeeper, trying to find his balance, glared at me through the cashier's pigeon-hole, and in crusty tones asked, "What do you want?" That this is not an unusual case, nor an overdrawn picture, any man who has had occasion to enter large wholesale houses in New York and other cities can testify.

There are, however, some brilliant and shining exceptions to the rule. Of one case, a wholesale house in New York, I can speak from pleasant experience. At the head of the entrance stairs sits one of the partners of the concern. It is, of course, impossible for him to see every man who comes in, but every man who does come in is met at the top of the stairs by a clerk of pleasing address, who inquires his business. He is then referred to some salesman, who is instantly at his service. Should the visitor happen to be a large buyer in this particular line of goods, he is referred at once to the salesman partner already mentioned. This man was given an interest in the house, originally, on account of the immense amount of goods he could dispose of on the road. But does the ex-road salesman and present partner greet the visitor who has come in, perhaps, only to make a friendly call, with a curt, "What do you want?" Not so, at all. A hearty grasp of the hand, and "How are you?" uttered in whole-souled, magnetic tones, an inquiry as to the health of his family, and these various little incidentals that mean practically nothing, and yet are fraught with so much goodwill and interest to a man, and which seem to oil the wheels of business, are features of the greeting.

What is the result of this plan of action? Profitable business, of course. The house referred to, which, by the way, makes a

study of handling customers, whoever and wherever they may be, does the largest business in its line in the United States. It is a model for all other houses to copy after in each of its various departments. I offer these few remarks as a suggestion to the business houses that are in the habit of treating the incoming buyer almost as if he were a Pariah to be shunned, or, if attended to at all, who consider it enough that he is looked after by a junior clerk, whose ideas of business are at best nebulous. If a merchant wishes trade, and is paying much money to outside salesmen to bring it in, it seems but simple common sense to take care of it most carefully when it comes in of its own accord. Office salesmen should be provided and trained as well as road salesmen.

Exports.

PER SHIP SEA KING, MARCH 7, 1889, FOR SYDNEY, N. S. W.

By *Arkell & Douglas*.—324 dozen Handles, 140 dozen Axes, $\frac{1}{2}$ dozen Guns, 1200 feet Wire Cloth, 1 gross Wire Goods, 2 dozen Wringers, 1 dozen Lawn Sprinklers, 10 dozen Forks, 1 gross Egg Beaters, 9 dozen Wrenches, 1 dozen Wringers, 4 dozen Shears, 672 pounds Oil Stones, 1500 feet Hose, 1260 pounds Bolts, 30 cases Ranges, 12 dozen Door Springs, 8 cases Nails, 30 boxes Clothes Pins, 50 dozen Handles, 3 dozen Handles, 5 dozen Door Springs, $1\frac{1}{2}$ dozen Braces, 15 dozen Hatchets, $1\frac{1}{2}$ dozen Shellers, 32 Clocks, 2 gross Shade Rollers, 1 case Pumps, 2 cases Wrenches, 2 dozen Rakes, $\frac{1}{2}$ dozen Wringers, 12 dozen Lamp-ware, 1 case Saws, 76 dozen Brooms, 4 cases Hardware, 4 gross Blacking, 2 packages Plated-Ware, 2 cases Door Knobs, $\frac{1}{2}$ dozen Ladders, 1 dozen Levels, 50 dozen Washboards, 100 boxes Clothes Pins, 3 dozen Corn Mills, 2 boxes Saws, 1 box Wire Goods, 3 boxes Bells, 1 case Saw Sets, 600 feet Hose, 6 dozen Braces, 1 gross Blacking, 1 barrel Hose, 44 Guns, 57 sets Tools, 7 packages Hardware, 40,000 Primers, 30,000 Cartridges, 5 dozen Axes, 2 cases Varnish, 1 case Bolts.

By *McLean Bros. & Riggs*.—18 dozen Hoes, 68 dozen Handles, 7 dozen Braces, 54 dozen Axes, 10 dozen Plumbs and Levels, 18 sets Axes, 4400 Bolts, 7 dozen Braces, 18 Stoves, 30 Plows, 34 dozen Saws, 6 dozen Wrenches, 56 Guns, &c., 18 Vises, &c., 12 Scales, 24 dozen Padlocks, 12 dozen Hammers, 320 Handles.

By *A. S. Lascelles & Co.*—5 gross Axle Grease, 1 gross Handles, 3 dozen Saw Sets, 9 dozen Vises, 5 cases Cartridges, 55 dozen Axes, 6 dozen Picks, 10 dozen Axes, 100 boxes Clothes Pins, 33 dozen Saws, 20 dozen Axes, 1 case Broom Handles, 6 dozen Choppers, 10 gross Sewing Machine Oil, 1 case Tools, 5 dozen Braces, 2 cases Squares, 3 dozen Braces, $\frac{1}{2}$ gross Hammers, 72 pounds Tacks, $2\frac{1}{2}$ dozen Brackets, 1 case Tools, 25 dozen Washboards, 2 dozen Levels, 6 dozen Axes, 28 dozen Hatchets, 1 dozen Foot-Scrapers, 3 cases Brackets, 2 cases Broom Racks, 2 cases Perambulators.

By *R. W. Forbes & Son*.—1 case Hardware, 1 dozen Cow Bells, 1 dozen Wrenches, $\frac{1}{2}$ dozen Hay Knives, 2 dozen Braces, 18 sets Sad Irons, 3 sets Harness, 20 cases Sewing Machines, 17 dozen Fork Handles.

By *V. Basanta*.—171 dozen Locks and Keys, 10 Stoves, 26 dozen Lamp Goods, 4 dozen Egg-Beaters, 12 dozen Perambulators, 6 dozen Mouse Traps, 25 dozen Hatchets, 3 dozen Toy Wagons, 10 dozen Perambulators, 53 dozen Saws, &c., $11\frac{1}{2}$ dozen Barbers' Shears, 15 gross Blind Rollers, $1\frac{1}{2}$ dozen Stoves, 5 dozen Clocks, 100 gross Lamp Wicks, 1 dozen Lanterns, 26 dozen Lamp Goods.

By *Strong & Trowbridge*.—16 cases Hatchets, 1 case Hammers, 1 package Tools, 6 cases Hatchets, 6 cases Bolts, 1 case Hoes, 6 cases Hatchets, 3 cases Wrenches, 3 cases Hardware, 3 cases Hammers, 10 cases Hammers, 1 case Tools, 6 packages Castings, 1 case Nails, 1 case Pulleys, 1 case Tools, 1 case Lamp-ware, 6 cases Tools, 1 case Hardware, 1 case Brass Goods, 2 cases Tools.

By *Arnold, Cheney & Co.*—89 cases Handles, 1 crate Wheels, 3 crates Wheels, 5 Iron Castings, 14 cases Axes, 4 cases Saddlery, 6 cases Saddlery, 63,668 pieces Roofing Slate, 200 dozen Brooms.

By *Morris, Strouse & Co.*—79 dozen Axes.

By *W. E. Peck*.—3 cases Hardware, 2 dozen Churns, 9 dozen Hay Forks, 1 dozen Wheelbarrows, 1 case Call and Door Bells, $2\frac{1}{2}$ gross Mouse Traps.

By *F. B. Wheeler & Co.*—18 cases Skates, 4 cases Rubber Goods, 12 dozen sets Sad Irons, 5775 pounds Castings, 63 sets Harness, 25 dozen Axes, 36 sets Harness.

By *W. K. Freeman*.—102 pounds drills, 42 dozen Handled Axes, 6 cases Lamps, 6 packages Hardware.

By *Coombs, Crosby & Eddy*.—6 dozen House-Furnishing Goods, 4 dozen Lamp Goods, 20 dozen Mast Hooks, $12\frac{1}{2}$ dozen Tools, 11 cases Slates, 102 Stoves, 80 dozen Hatchets.

By *Welsh & Lea*.—21 cases Iron Bolts.

By *Healy & Earl*.—3 cases Saws.

By *H. W. Peabody & Co.*—86 packages Wind Mills, 14 cases Agricultural Implements, 6 cases Steel, 10 cases Carbons, 10,200 pounds Wire, 22,400 pounds Barb Wire.

By *R. W. Cameron & Co.*—3 boxes Machinery, 3000 pounds Machinery, 1370 pounds Rolling Machines, 6247 pounds Castings, 7 boxes Wheels.

By *McCoy & Sanders*.—1 bale Rubber.

By *Waterbury Clock Company*.—12 boxes Clocks.

By *Winchester Repeating Arms Company*.—188 pounds of Tools.

By *Edward Miller & Co.*—28 packages Lamp-ware.

By *S. Oppenheimer & Co.*—3 cases Machinery, 47 boxes Skewers.

By *Ilsley, Doubleday & Co.*—24,100 pounds Bolts, $12\frac{1}{2}$ gross Axle Grease, $12\frac{1}{2}$ gross Axle Grease, 24 dozen Stencils, 1 box Paint, &c.

By *A. Field & Co.*—33 dozen Axes.

By *Manhattan Brass Company*.—20 cases Lampware.

By *B. F. Avery & Sons*.—2 boxes Plow Irons, 9 packages Plows.

By *Collins & Co.*—130 dozen Tools.

By *Edward Miller & Co.*—33 packages Lamp Goods, 24 packages Lamp Goods.

By *Ansonia Clock Company*.—32 boxes Clocks.

By *Nerius & Harland*.—23 boxes Shade Rollers, 1 box Shade Rollers.

By *H. L. Judd & Co.*—8 packages Brass Goods.

By *Simpson, Hall, Miller & Co.*—7 cases Silver-Plated Ware.

By *L. H. Mace & Co.*—17 Refrigerators.

By *W. H. Crossman & Bro.*—12 Gross Fish Lines, 7 packages Carriage-Ware, 1 case Stone, 1 case Hardware, 1 case Plow Parts, 6 pairs Bolt Clippers, 2 dozen Stoves, 7 crates Hardware, 8 cases Tools, 36 cases Hardware, 2 Tire Banders, 10 dozen Glue, 34 dozen Grindstone Fixtures, 3 gross Traps, 8 cases Hardware, 500 pounds Nails, 80 dozen Handles, 9 Miter Boxes, 30 dozen Handles, 8721 pounds Iron Bolts, 3 boxes Hardware, 1500 pounds Staples, 24 dozen Lamp Goods, 6 packages Pump Parts, 3 dozen Dashers, 100 dozen Traps, 1 dozen Guns, 50,000 Primers, 1 dozen Corn Shellers, $\frac{1}{2}$ dozen Mills, 1 dozen Store Trucks, 14 dozen Hatchets, $6\frac{1}{2}$ dozen Meat Choppers, 4 cases Hardware, 336 pounds Stone, 218 pounds Glue, 40 dozen Handles, 3 gross Lemon Squeezers, 40 dozen Hatchets, 1 case Hardware, 9 dozen Grindstones and Parts, 17 dozen Cages, 2 dozen Tools, 1 case Lamp Goods, 3700 pounds Iron Bolts, $3\frac{1}{2}$ dozen Meat Choppers, $2\frac{1}{2}$ dozen Corn Mills, 2 dozen Wagon Jacks, 1 dozen Stencils, 2 dozen Squares, 20 dozen Hatchets, 7 cases Hardware, 1 case Handles, 60 sets Rifle Tools, 10,000 Primers, 1 dozen Wringers, 20 dozen Axes, 40 dozen Handles, 12 dozen Lifters, 6 gross Sewing Machine Oil, 1 case Pumps, 1 dozen Hardware, 1 dozen Egg Beaters, 2 dozen Pails, 25 boxes Clothes Pins, 1 case Hardware, $2\frac{1}{2}$ dozen Step Ladders, 6 dozen Handles, 7 dozen Hatchets, 6 dozen Lawn Sprinklers, 15 dozen Traps, $6\frac{1}{2}$ dozen Clocks, 6 dozen Miter Boxes, 60 dozen Axes, 7 dozen Freezers, 2 cases Wire, 55 cases Hardware, 57 dozen Axes, 50 dozen Polish, 1 case Stencils, 42 dozen Washboards, 420 dozen Handles, 8 gross Sewing Machine Oil, 1 case Plow Parts, 16 cases Agricultural Implements, 1 case Hardware, 5 gross Mucilage, 1 case Pistols, 1372 pounds Iron Bolts, 10 packages Hardware, 3 dozen Scales, 450 pounds Nails, 3 cases Lamp Goods, 1 case Stoves, 1 case Hardware, 1 dozen Bush Hooks.

PER BARK ALICE, MARCH 11, 1889, FOR DUNEDIN, NEW ZEALAND.

By *Arkell & Douglas*.—1 case Hardware, 1 case Whips, 1 case Tacks, 1 case Snaps, 1 case Castings, 100 dozen Handles, 3 cases Axes, 1 case Saws, 210 pounds Bolts, 1 case Bolts and Nuts, 2 dozen Churns, 2 cases Hardware, 5 cases Axes, 1 dozen Braces, 1-6 dozen Scales, 1 box Hardware, 2 cases Pumps, 2 cases Rivets.

By *H. W. Peabody & Co.*—8 cases Agricultural Implements, 45 packages Hardware, 17 cases Lamp Ware, 3 cases Bolts, 25,400 pounds Barb Wire, 200 pounds Nails, 1 case Pumps, 25 dozen Brooms, 25 dozen Stone, 18 bundles Carriage-Ware, 15 packages Lawn Mowers, 19 Stoves, 4 dozen Stencil Combinations, 7 packages Hardware, 11,248 pounds Barb Wire, 2 cases Clocks, 7 cases Axes, 1100 pounds Horse Nails, 4 packages Lampware, 12 stoves, 1 case Agricultural Implements, 2 packages Plated-Ware, 1 case Clocks, $1\frac{1}{2}$ dozen Polish, 7 cases Agate-Ware, 8 cases Lawn Mowers, 4 packages Agricultural Implements, 1 crate Freezers, 1 case Stoves, 44,800 pounds Wire.

By *R. W. Forbes & Son*.—2 packages Grinders.

By *Strong & Trowbridge*.—3 cases Spade Handles, 6 cases School Slates, 1 case Glue, 1 case Hardware, 1 case Wire Goods, 2 cases Sluice Forks, 1 case Rakes, 10 cases Nails, 3 cases Axes, 1 bale Leather Belting, 1 case Lampware, 1 case Carpet Sweepers, 2 cases Hardware, 1 case Rivets, 1 case Wire Goods, 1 case Spade Handles, 2 cases Lampware, 1 case Rakes, 1 case Plated-Ware, 1 case Manure Forks, 1 case Tin Rivets, 1 case Lampware, 1 case Hatchets, 1 case Tinware, 3 cases Axe Handles, 2 cases Hatchets, 1 crate Churns.

By *A. Field & Co.*—7 Choppers, 6 dozen Traps.

By *W. K. Freeman*.—15 packages Lamp Goods.

By *Ansonia Clock Co.*—15 boxes Clocks.

By *Chas. Brewer & Co.*—11,200 pounds Wire, 1 case Agricultural Implements, 4 cases Creamery Goods, 1 case Tools, 7 cases Tools, 3 cases Agricultural Implements, 8 cases Nails, 6 cases Hardware, 6 cases Hardware, 4 cases Agricultural Implements, 4 cases Stamped-Ware, 14 cases Hardware, 2 cases Grease, 3 cases Agricultural Machinery, 5 cases Nails, 1 case Pumps, 6 crates Stoves, 1 case Oil Stones.

FOR AUKLAND.

By *Arkell & Douglas*.—18 dozen Handles, 3 dozen Hammers, 6 dozen Hardware, 1 bale Cordage, 1 case Saws, 4 cases Hardware, 3 cases Axes, 4 packages Lampware, 4 Ranges, 1 box Hardware, 500 Broom Handles, 4 cases Varnish, 1 bale Twine, 36 dozen Handles, 5 dozen Handles, 500 Broom Handles, 23 cases Axes.

By *H. W. Peabody & Co.*—4 cases Agricultural Implements, 6 cases Hardware, 1 case Agricultural Implements, 1 case Carriage-Ware, 7 cases Hardware.

By *R. W. Forbes & Son*.—10 cases Scales, 4 crates Store Trucks, 1 case Wire Mats, 6 boxes Scales, 1014 pounds Carriage Bolts, 1 case Pistols, 1480 pounds Horse Nails, 6 dozen Lemon Squeezers, 200 boxes Clothes Pins, 5 packages Hardware, 181 pounds Horse Nails, 42 packages Hardware, 24 packages Lawn Mowers, 3 cases Shade Rollers, 111 dozen Axes, 6 cases Axle Grease, 10 cases Lawn Mowers, 70 dozen Shovel Handles, 19 packages Churns, 1324 pounds Carriage Bolts, 70 dozen Spade Handles, 8 dozen Axes, 2 packages Shellers, 9 packages Harrows, 34 dozen Handles, 51 packages Axes, 2 packages Hardware.

By *Arnold, Cheney & Co.*—7 dozen Sieves.

FOR AUCKLAND AND DUNEDIN.

By *R. W. Cameron & Co.*—3 packages Dairy Goods, 3 cases Fan Mills, 10 cases Dairy Goods, 5 packages Dairy Goods, 1 box Scales, 1 Boiler and Engine, 1 box Wheels, 1 box Speed Indicators, 21,000 Slates, $6\frac{1}{2}$ gross Grease, 125 dozen Brooms, 300 cases Clothes Pins, 30 dozen Handles, $3\frac{1}{2}$ dozen Grease, 200 cases Clothes Pins, 660 pounds Grease, 55,999 pounds Barb Wire.

A. J. List, formerly with J. P. Withrow, of Pittsburgh, and N. J. Mitchell, recently with M. V. Smith, also of Pittsburgh, have formed a copartnership under the name of List & Mitchell, for the purpose of carrying on the engineering and contracting business in all its branches. The new firm are prepared to furnish plans and specifications for the erection of gas producers, steel plants, rolling mills, &c. They are also general agents for the S. C. Collin low-blast converter, especially adapted for small steel foundries. The temporary headquarters of the firm are in the Bissell Block, Pittsburgh. After April 1 they will be found in the Lewis Block, in that city.

The visit of two representatives of the Chicago rail manufacturers to Pittsburgh, and their conferring with H. C. Frico, of the Edgar Thomson Works, led local proprietors to suspect that the Pittsburgh mill was to be gathered into the Chicago steel rail consolidation. We have good ground for stating that Mr. Frico was merely called upon to appraise some coke property in the Connellsville region belonging to one of the three Chicago mills which were consolidated.

The reports that the works with which Cooper, Hewitt & Co. are identified are to be moved to the South are premature, to say the least.

A New Detachable-Handle Sad-Iron.

The sad-iron represented herewith is put on the market by the Colebrookdale Iron Company, Pottstown, Pa. The cut shows it mounted on a stand with the handle detached. The manufacturers direct special attention to the fact that the handle is made of the best selected applewood, which is referred to as exceptionally strong and durable, every handle being worked out by machinery. They also make the point that the shape of the handle is such as to permit the hand to grasp it naturally without cramping the fingers. As indicated in the illustration, the release of the handle is accomplished by pressing downward on the button shown, the handle being then readily disengaged by a backward motion. The

New Detachable-Handle Sad-Iron.

manufacturers emphasize the importance of this feature, pointing out that in other irons the handles are released by drawing upward a button, which is very near the iron, thereby exposing the fingers to burning. The irons are highly polished and put up in sets of three, with handle and stand, in labeled cardboard boxes made specially heavy and strong. This will be recognized as an interesting and important addition to their well-known line of sad-irons.

Socket Garden Trowel.

The illustration given below represents Maynard's socket garden trowel, which is put on the market by Robert Murray, sole agent, 24 Duane street, New York. It is described as made of solid cast steel in 5, 6, 7 and 8 inch sizes. It is not intended to compete with the many low-priced

Socket Garden Trowel.

trowels which are on the market, but is offered to those who desire a durable article of exceptional quality.

The Seaside Lemon Press and Strainer.

This article is put on the market by James D. Frary, Meriden, Conn., for whom it is manufactured by the Meriden Malleable Iron Company. Fig. 1 represents it applied to table and in use, and Fig. 2 shows the strainer and plate, on the top of which the lemon is to be operated upon is placed. The special features of the press and strainer and the manner of its use are thus clearly indicated, the pressure on the lemon being exerted by means of the handle or lever with a rack

and pinion movement, thus giving all requisite force, and producing, according to the claim of the manufacturer, one-third more juice than other squeezers on the market. By means of the plate and strainer, Fig. 2, the pulp and seed are

the strainer and the plunger are accordingly lined with pure britannia metal, which is referred to as free from lead or poisonous ingredients and proof against lemon juice. It is stated that by constant use without cleaning the metal will grow dark, and it is recommended that it should be cleaned as often as once a week by using common white sand or sapolio, thus keeping it clean and white. The metal is referred to as of suitable thickness, so that it can be scoured daily for years and not wear through. It will thus be seen that the well-founded objection to the use of galvanized-iron lemon squeezers is satisfactorily met. The different parts of this

Fig. 1.—The Seaside Lemon Press and Strainer.

prevented from escaping with the juice. The arrangement by which the receptacle for the juice is held in position will be observed, and it is to be noticed that it is adjustable to any desired height. The cup in which the lemon is placed is easily removable so as to permit its convenient cleaning, and the strainer also, which is

article are furnished separately if desired, so that in case of damage it can easily be replaced. Besides the utility of this article and its efficiency and convenience for the purpose for which it is made, the elegant finish and attractiveness are also alluded to.

Buffalo vies with other lake cities in the effort to attract the ore trade, and improved docks are to be erected during the coming season. Recently the Lackawanna contracted with the Excelsior Iron Works Company, of Cleveland, for a complete plant of Thornberg patent derricks, six in number. They will be put in at the foot of Erie street, and will be used for the transferring iron ore from vessels to cars.

Fig. 2.—Plate and Strainer.

placed in it, can be taken out at pleasure, thus greatly facilitating the keeping clean of these parts of the press. A point on which especial emphasis is laid is the character of the interior finish of the removable cup and also of the plunger which presses upon the lemon, as the lemon juice is a strong acid and liable in a short time to eat into metals with which it comes in contact. Mr. Frary explains that in the effort to produce a substance proof against lemon juice he tried porcelain, enameling, tinning on iron, coating with rubber and nickel-plating, all of which were unsatisfactory; but at last it was discovered that block tin or britannia metal, was best suited for this purpose. In the machine illustrated above the cup-plate,

The work will be finished by May 1. A dispatch says: "With Ohio ironmen coming here to establish blast furnaces, and the extensive preparations making to handle large quantities of ore, it looks as if Buffalo would soon take the place in the iron trade that many observers believe to be hers by right of position as a natural receiving and shipping point."

Chandler & Washburn's Quick-Action Vises.

A vise embodying new features, intended for the use of pattern-makers and wood-workers in general, is represented in the accompanying illustration, and manufactured by Chandler & Washburn, 30 Kilby street, Boston, Mass. In this vise the nut is whole, drilled and tapped to fit a long screw. When the handle is in an

Twenty-five broke on striking a moderate blow. Yet all had been accepted and paid for previous to the agitation caused by the Parliamentary Investigating Committee.

Hay Knife.

G. & M. Nolin, Skowhegan, Me., are putting on the market the hay knife represented in the accompanying illustration,

Fig. 1.—Chandler & Washburn's Quick-Action Vise.

upright position and carried as far to the left as possible, this nut is released from the back jaw, or, more strictly, released from the long flat rod fastened to the back jaw. The front jaw is then free to slide, and the nut and screw move with it. When it has been brought up to the work by turning the handle to the right about a quarter turn the nut is clamped to the rod, and if the handle is still turned to the right the nut remains stationary, and the screw works through it until the desired amount of compression is obtained. With this construction it will be seen that in any position the jaws can be brought together by means of the screw if desired. In ordinary work, however, the front jaw is slid against the wood and the handle turned a part of a turn to the right, thus giving a secure grip, and when a new piece is to be inserted the handle is turned back to its first position, when the jaws may be adjusted to the new work, and by means of the handle the requisite pressure be again applied. If extra compression should be required it is simply necessary to continue the operation of clamping until the desired result is obtained. The manufacturers call attention to the advantages possessed by these vises in the convenience

and call attention to the improvements in its manufacture. The blade or cutting part is described as made from fine sheet steel worked in water and hardened in oil. There is a slight groove along the back for the purpose of giving stiffness or rigidity to the thin blade. The serrated form of tooth, it will be observed, is retained.

G. & M. Nolin's Hay Knife.

The blade is securely fastened to a strong iron shank, upon which are driven ferruled hardwood handles strongly riveted. The knife thus formed is 35 inches long by 3 inches wide at the widest part, weighing only 2½ pounds. That it is readily sharpened and from its extreme thinness readily forced through closely packed material are points in regard to it which are emphasized by the manufacturers, and its conse-

The Alderney Milk-Strainer Pail.

By means of the engravings presented herewith we lay before our readers a general view of the Alderney Milk-Strainer

The Alderney Milk-Strainer Pail.—Fig. 1.—General View.

Pail, which has recently been placed upon the market by Wm. J. H. Gluck, of Baltimore, Md. This device is a combination water pail, milking bucket, milk cooler,

Fig. 2.—Quick-Action Machinists' Vise.

and rapidity of their action, their finish, strength, simplicity of construction and durability. They are made in two sizes, with a width of jaw 10 and 14 inches, weighing respectively 53 and 60 pounds. Their machinists' vise represented in Fig. 2 is made on the same principle, and has the same general construction as the wood-workers', the shape of the parts being changed to correspond with the different uses for which it is intended.

Out of the 419 swords in use in the Fifth Dragoon Guards of the British army only 363 passed the test recently made.

quent adaptation for cutting hay, straw, corn stalks, ensilage, peat, &c. They also allude to their improved methods and machinery as enabling them to put it on the market at a moderate price.

A school-ship for the training of seamen will be stationed at Philadelphia, at a cost of \$25,000 per annum, of which the State will contribute \$10,000 and the city \$15,000. The Saratoga has been detailed from the navy for this purpose. Capt. Lawrence, harbor master of the port, says the training ship should be on water what our manual training school is on land.

cloth or wire strainer bucket, as the user may prefer. It is of such shape as to give a natural flow of the contents with no drip remaining. It has no spout to break off or become leaky; is easily and thoroughly cleaned, and may be employed with a wire or cloth strainer, as the case may demand. The adjustment of the strainer is very simple and requires but a moment's time to accomplish. In Fig. 1 of the cuts is shown a general view of the pail, while the small engravings shown in Fig. 2 represent the strainers which may be employed with the pail. A bar runs along under the strainer and prevents anything from passing out between the sides of the strainer and the pail. This article, it is

Fig. 2.—General View of Strainers.

claimed, may be packed very closely for shipment, eight Alderney pails requiring the same space as two of the old-style strainer pails. It is made of 10 or 12 tin, as may be desired.

Building is active in Philadelphia. Of 1363 permits issued this season, more than half are for two-story dwellings.

New Jail Padlocks.

The illustrations herewith given represent a new lock which is put on the market by the Allendale Lock Company, Lancaster, Pa. Fig. 1 represents the lock cut

Fig. 1.—Jail Lock No. 512, Cut Open to Show Interior.—Full Size.

open so as to show the interior construction, Fig. 2 the form of the nickel-plated key, and Fig. 3 their patent tumbler and stationary plate. All these cuts are full size. This lock is designated as their No. 512, and is put on the market to meet the

Fig. 2.—Key.

Fig. 3.—Patent Tumbler and Stationary Plate.

demand for a jail lock of superior quality and security. It is made of brass and weighs $7\frac{1}{4}$ pounds to the dozen. The company call special attention to the mechanism and construction as being different from that of any other padlocks. As shown in Fig. 3, the tumblers are interlocking top and bottom, and the flanges of each tumbler meet through the stationary plates, making it impossible to pick them. While by using a lockpick one tumbler can be turned open, the point is made that the pick cannot be raised to the next tumbler and cannot be taken from the lock without first turning the tumbler into position. It will be noticed that the tumblers are so arranged that when the movable tumbler is locked in position to remove the key the projection on the

stationary plate, Fig. 3, engages in the opening or cavity in the movable plate also shown in Fig. 3, and the downward pressure of the spring presses the tumblers together, so that it is impossible for them to move out of place, as is often the case with other locks. These goods are put on the market with a full guarantee that they will not get out of order. They are packed separately in cartons, half dozen in a box. The company also manufacture a line of cheaper goods, to the quality and low price of which they allude.

The Improved Brock Patent Chain Pipe Wrenches.

The accompanying illustration represents an improvement recently made in the Brock chain pipe wrenches manufactured by J. H. Williams & Co., 9 to 15 Richards street, Brooklyn, N. Y. The cut represents the wrench with one side of the head

The Improved Brock Patent Chain Pipe Wrench.

removed, so as to give some of the details of construction, which could not otherwise be so satisfactorily shown. As the wrench is now made it will be seen that, besides the steel pin by which one end of the chain is fastened, there is a steel safety link, which engages firmly with the jaws, thus giving an element of strength not found in other wrenches, and constituting, it is considered by the manufacturers, a valuable improvement in this wrench. The addition of the safety link does not affect the reversibility of the tool, and it is to be noticed that the other end of the chain engages with the jaws in a similar manner, as shown in the cut, thus giving the increased security at either end.

The Mikado Watering Pot.

William J. H. Gluck, of Baltimore, Md., has just brought out a new style of watering-pot, known as the Mikado, a general

The Mikado Watering-Pot.

view of which is afforded by means of the accompanying illustration. It is constructed in such a way that the contents will not slop over, and is of a shape which the manufacturer states gives a natural flow to the water. It is provided with a zinc rose having a detachable perforated

piece. The bottom is protected by a foot, rendering it more durable than would otherwise be the case. The pot has no stays to break off, and when drained it is said no liquid accumulates in the spout, as with the old style of watering-pots. The Mikado is made in 10 sizes, japanned in assorted colors and handsomely decorated when desired. It is well made throughout and is claimed to be one of the most practical watering-pots for the conservatory or garden ever put on the market.

Angle Gate Valve for Radiators.

Various contrivances have been proposed to catch the leakage from stuffing boxes of radiator valves, so as to prevent

Angle Gate Valve for Radiators.

damage until the valve can be repacked. In steam-heating apparatus the angle or corner valve may be closed and all leakage is prevented, but hot-water circulating jobs, where generally only one valve is used, the closing of the angle or corner valve does not stop the leakage through the stuffing box, as the water is still in contact with the upper or stuffing box end of the valve through the radiator. The accompanying cut shows a new application of a solid gate valve, and among other advantages of greater importance claimed for it, it prevents leakage at the stuffing box when closed on a hot-water heating job, as the double seat on the gate cuts off all pressure from the stuffing box, which can be easily packed. The space occupied by this form of radiator valve is the same as that of a well-designed angle valve. On an inch valve the height from lowest point to top is about $7\frac{1}{4}$ inches, and the length over all about 4 inches. Another point in this valve of particular worth is the curved elbow by which direction is given to the flow of steam or water, thus materially reducing the friction and abolishing what might be termed the rebound, which occurs in angle or corner valves. The foregoing are some of the general claims made for this valve, and an examination of the sketch will further explain its design and construction. These valves, which are made with moving or stationary spindles as desired, are manufactured by the Chapman Valve Manufacturing Company, Indian Orchard, Mass., and 72 Kilby street, Boston, Mass.

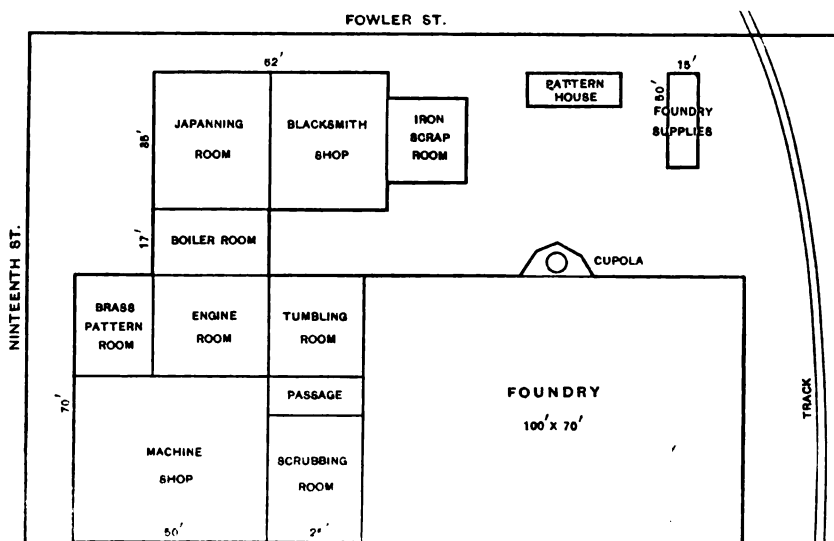

The Moore Manufacturing and Foundry Company.

The new works of the Moore Manufacturing and Foundry Company, at Milwaukee, Wis., are now in full operation. A sketch of their ground plan is shown herewith. The erection of the works was begun on August 10 last, and on November 20 the first foundry heat was taken. Much of the time since then has been employed in the construction of tools for the works, most of the machinery used being built from the company's own designs, and especially adapted to their use. From 70 to 100 hands are employed. The works have already proved too small to accommodate the increasing business of the company, and they have in contemplation the erection of an addition to the foundry in the spring, which will be of about the same size and tonnage capacity as the present one. Having an acre and a half of ground, they have ample room for the extension of their facilities.

The main building of the works is 50 feet deep and 70 feet front, with three floors. The ground floor is occupied by

All the buildings except the boiler-house are frame. The foundry is well lighted on three sides and well ventilated through revolving panels in the skylight. It is equipped with a traveling crane 25 feet long, extending over one side of the building, with a track running the whole length, and designed to handle heavy castings and flasks. The cupola occupies a small annex at the side of the foundry which is lined with corrugated iron. The whole plant is lighted by electricity furnished by a Brush dynamo operating 90 lights of 16 candle-power each.

The office is finished in Virginia pine. The stairway to the third floor is immediately outside of the office, and the space under it is utilized for a cloak-room, wash-room, &c. Under the lowest part of the stairway ten drawers or slides, 30 by 30 inches each, have been fitted in, for the storage of electrotypes. The whole building is heated by steam except the foundry, which is kept comfortable by the heat from two large core ovens. Adjoining the foundry is a brick pattern-room in which all patterns are stored, saving insurance and securing protection from fire.

Works of Moore Mfg. and Foundry Co., Milwaukee, Wis.

the machine shop, finishing department and engine-room. The second floor is used for the office, stock-room, pattern shop and draftsmen's room. The latter has complete arrangements for making blue prints, including a dark-room. In making exposures the plates are run out of the dark-room on rollers through the side of the building on a frame over the roof of the foundry which is in the rear, and thus take very little handling. The third floor is used for a store-room and for finishing. An elevator of two to three tons capacity is used in handling materials from one floor to another. The foundry is one story high, 70 feet wide by 100 feet deep, and contains 28 molding floors and a cupola with a capacity of 10 tons a day. Between the foundry and the main building are the tumbling-room and the scratching-room, each 25 feet by 35 feet, the tumbling-room having exhaust fans. The engine is of 50 horse-power, automatic cut-off, and was built by the Filer & Stowell Mfg. Company. The boiler-room adjoins the engine-room and is 17 feet by 35 feet. Beyond the boiler-room is the japanning-room, which, in connection with the blacksmith shop in the rear, occupies a building 35 feet by 62 feet. The japanning room contains two large baking ovens, built of solid brick, with brick arches, and a large annealing oven. The baking ovens are fired from the boiler-room. Attached to the blacksmith shop is an iron stock-room.

The works are located on the Milwaukee and St. Paul, Wisconsin Central and Milwaukee and Northern railroads, having a switch 300 feet in length for their exclusive use. Along the track near the foundry is a building, 15 by 50 feet, two stories high, for storing inflammable material and coke, sand and general foundry supplies. An ample supply of water is secured from a well on the premises 80 feet deep. It is stored in a tank from which the boilers are supplied. The pumping is governed by an automatic float which regulates the supply and keeps the water in the tank at a certain depth.

The company are now engaged in making their own hardware specialties, such as door hangers, pulley blocks, vises, &c., and will shortly engage in some new lines which they are not as yet prepared to mention. They are also making job castings for a great variety of machinery as well as for hot-air furnaces, and are in a position to take contracts for building machinery.

The Interstate Commerce hearing at Washington, at which the trunk lines were represented, was suspended on Monday for two weeks, to allow Southern roads an equal opportunity. In concluding the hearing, Judge Cooley said: "Here is the law, and it is not for you hereafter to say to us that there are practical obstacles in the way of complying with it; that you would lose business by

so doing, and all that sort of thing. We are not concerned in that. We do not wish to do anything to make you lose business; at the same time we cannot accept it as a valid excuse that if you obey the law you will thereby lose business. The time ought to be considered as gone by when a manager can come to us and say: 'I named this rate, and I did it regardless of law, because my competitor has done the same thing.' * * * I trust that, after saying so much, we shall not two weeks hence have complaints brought to us that these practices have been going on in the meantime. Parties must not take the redress of wrongs into their own hands when the legality of what they complain of is, to say the least, very doubtful. They ought to remember, too, that, though the hearing is suspended two weeks, the law is not suspended; that remains in force, and the penalties are in the meantime pronounced against all violators, just as much as though no such continuance had been taken."

A New Natural Gas Company.

A new corporation, known as the Equitable Gas Company, has just been organized at Pittsburgh for the purpose of dealing in natural gas. The new organization has a capital stock of \$1,000,000, and has secured 2000 acres of gas territory with a high pressure, lying 5 miles north of Murrysville. The line from the field to Pittsburgh is to be cast iron, and the contracts for making the pipe have been placed with the Addystone Pipe Company, of Cincinnati, and Dennis, Long & Co., of Louisville. These contracts are now being filled, and the first of the pipe will be received within a short time. Starting at the wells, the line will be 24 inches in diameter for 6 miles. From that point to the city the size will be increased to 30 inches. The mains in the city will be 30, 24, 18 and 12 inches, according to the service demanded. All will be of cast iron. The company is composed of manufacturers who organized it for their own benefit. The primary object will be to furnish gas to the mills and factories of the firms interested, while any surplus will be sold to other mills. The idea in putting down so large a main is to prepare for any contingency that might arise in future years by reason of the pressure at the wells becoming reduced. The following are the officers of the company: Directors, Reuben Miller, J. Stuart Brown, James Hemphill, Robert B. Brown, Charles H. Zug, A. F. Keating, George Trautman, L. M. Morris and Frank B. Robinson; president, Robert B. Brown; treasurer, Reuben Miller; secretary, William H. Alldred; engineer, William D. Hartupce.

Witherbees, Sherman & Co., of Port Henry, have announced their opening prices for "Old Bed 21 Ore," offering to sell 150,000 tons of selected lump for puddling at \$4 per gross ton, and 225,000 tons of furnace ore at \$2.50. If the purchaser elects to pay cash for any month's delivery on or before the 15th of the following month an abatement of 50 cents per ton will be allowed on selected lump and 25 cents per ton on furnace ore. These abatements for cash payment are increased to 65 cents and 35 cents respectively prior to August 1.

The Beckett & McDowell Mfg. Company, of Arlington, N. J., are putting up a plant of crushers, rolls, &c., for an electric separating mill for the Theall Mine, at Croton, N. Y., owned by the Cheevers. We understand that the capacity of the plant is to be 100 tons of concentrates daily.

CURRENT HARDWARE PRICES.

MARCH 20, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

THE IRON AGE

THURSDAY, MARCH 28, 1889.

Horizontal Boring, Turning and Milling Machine.

The machine of which we herewith present a perspective and cross sectional view is designed for general use in manufacturing and repair shops; it may be used for boring and drilling, as a turning lathe, and as a milling machine on large work. When used as a boring mill, the large flat table upon which to bolt work facilitates the setting, as it is necessary to consider but one point at a time. When bolted to the table the cross-wire adjustment permits of accurately reaching the desired line horizontally, while the up-and-down adjustment of the head and tail spindles provides for vertical alignment. When, as is frequently the case, the distances required are from planed base and side, the measurements can be made and fixed before the work is placed on the table. When a drill chuck is substituted for the

driven from a pinion upon a cone shaft. Back gears furnish ample power for heavy work. A pulley outside the pinion on the main spindle drives an intermediate shaft, upon which a cone is arranged to drive the gear of the feed-screw for operating the apron. Through suitable gearing the carriage is moved laterally and the table crosswise. The carriage is provided with clamps for binding in position when milling is being done. This machine is made by Nicholson & Waterman, of Providence, R. I.

The Duty on Fancy Nails.

The Treasury Department, acting under a decision in a suit brought for the recovery of alleged excessive duties exacted on certain brass-headed and gilt-headed nails, holds as follows:

The United States attorney reports that the importations in question were of two

the rate upon "britannia ware and plated and gilt articles and wares of all kinds."

With regard to the nails first above mentioned—viz., those which were not treated with any overlaying substance to give them the gilt appearance—a judgment was rendered in favor of the defendant, while with regard to the second class of nails, which were found to be actually gilded, the jury found for the plaintiffs, and to be dutiable at the rate of 35 per cent. ad valorem, as gilt articles, under paragraph 210.

It is also understood that the trial in question was a retrial of the case, with a similar result in effect to that of the first trial. Upon submitting the matter to the United States Attorney-General, that officer certifies that no appeal or writ of error will be taken by the United States from the judgment of the Circuit Court. The Department, therefore, concurring in said judgment, authorizes the Collector to

HORIZONTAL BORING, TURNING AND MILLING MACHINE.—NICHOLSON & WATERMAN.

face-plate the machine is adapted for drilling holes in large pieces. By means of the cross-traverse of the table and the up-and-down feed of the head a hole can be located anywhere in a space 27 x 36 inches on the 48-inch swing machine. The mill is converted into a swing lathe when provided with a turning rest, and will then perform all the work of a lathe except screw cutting, which feature can be added if necessary. By means of the cross-traverse feed of the table and the power-feed connected to it large pieces can be milled.

The bed of the machine measures 12 feet in length. Both the head and tail spindles can be adjusted up and down. The latter is moved lengthwise in its box, which is fitted to the sliding frame, and is moved vertically by means of a screw and gears operated from the top of the frame. The frame is moved laterally by rack and pinion connection. The front spindle runs in two long and large bronze taper take-up boxes fitted to boxes which are adjustable up and down in the frame, which is stationary. The spindle passes through a center sleeve, to which the elevating screw is attached; the screw passes through a nut in one of two bevel gears operated by wrench. The outer end of the spindle is fitted with a large gear

general kinds; first, small nails with large brass heads, such as are used in upholstering furniture, the heads of which were not treated with any overlaying substance, but got their gilt appearance from the brass out of which they were made, being subjected to a lacquering process which enhanced their luster, but did not change their color; second, a line of nails with much larger heads, in fancy shapes, such as crosses, *fleur de lis*, imitation roses, &c., which were found to be actually gilded—that is to say, subjected to an overlaying substance which gave them the color of gold.

All of these articles, it appears, were classified by the defendant (Collector) at the time of importation, under the clause which imposes a duty of 45 per cent. ad valorem upon "manufactures, articles or wares not specially enumerated or provided for in this act, composed wholly or in part of iron, steel, copper, * * * or any other metal, and whether partly or wholly manufactured," while the plaintiffs claimed that the same were dutiable either at the rate of 4 cents per pound, the rate upon "horseshoe nails, hob nails and wire nails, and all other wrought iron and steel nails not specially enumerated or provided for in this act," or at the rate of 35 per cent. ad valorem,

take the necessary steps for the settlement of the same.

American machinery will make a fine display at the approaching Paris Exhibition, perhaps the best ever seen beyond the boundaries of the United States. The American division of Machinery Hall has 40,000 square feet. Chief among the exhibits there will be seen the display of Edison's works and inventions in applying electricity to machinery and lighting. The Thomson-Houston Electric Welding Company will contribute a noteworthy feature to this department by exhibiting a process for welding metals by electricity. The power for the machinery in the American department will be furnished by two steam engines of 100 horse-power each. C. H. Brown & Co., of Fitchburg, Mass., built one, and the other is a new style automatic high-speed engine, constructed by the Straight Line Engine Company, of Syracuse. Agricultural implements will be fully represented and also milling and flour-cleaning machinery. Noteworthy exhibits will be seen, such as Colt's patent firearms and steam engines; a specimen of the work of the Crosby Steam Gauge and Valve Company; a circular loom from J. Van Dussen Reed; an example of the work of the Worthington Pumping Ma-

chine Company. Among the novelties will be found machine tools from William Sellers & Co., of Philadelphia; the Brown & Sharpe Mfg. Company, of Providence, and Warner & Swasey, of Cleveland. In this line will be exhibited a new process for rolling metals into different forms and a machine for rolling and swaging steel screws. J. S. McCoy will show some pneumatic tools for dressing stone and other materials. A new invention is a leather link belt from the American Leather Link Belt Company, through which will be transmitted 100 horsepower. Another peculiar feature for transmitting horse-power is a steel wire belt. George Fred Simmons, of Fitchburg, Mass., will send a machine for rolling metal into forms, and Clough & McConnell a machine for making corkscrews.

Northern Freight Rates.

TWO GREAT IRONMASTERS TALK.

During the past week two of the leading ironmasters of the country, Andrew Carnegie, of Pittsburgh, and Abram S. Hewitt, of New York, have expressed opinions which it would be well for railroad managers to act upon at an early date.

In the course of an address before the Franklin Institute, at Philadelphia, Mr. Carnegie, speaking of Pennsylvania industries, is reported to have said:

If the railroad companies of this State were satisfied with fair tolls its iron manufacturers would still have a show against Southern competition, and Mr Carnegie said he knew that two-thirds of the present rates would leave the railways a good profit in Eastern Pennsylvania. The rates on pig iron were three times greater than in the South. The only hopeful view to take of the situation in Eastern Pennsylvania was that railway rates could and would be reduced on all materials used in the manufacture of iron, which gave the railways so much of their business. The adoption of the basic process of steel-making would also be a helpful factor. It was an ominous circumstance that a big steel company of Harrisburg abandoned its works and occupied others near Baltimore, and it was humiliating to a Pennsylvanian that Baltimore was preferred to Philadelphia as a seaport, where the latter was the natural entry.

It was not easy to fix the responsibility for this removal, and the decadence of Philadelphia as a seaport, he said, but the railways might easily elevate the situation by a reduction of their rates to the rates on products of other States brought through Pennsylvania. It was not by this policy of unjust discrimination that the Pennsylvania Railroad was built up, nor by the maintenance of this policy could it be long maintained.

"I come now to speak of the measures that must be adopted in order to remedy this ill condition, due to coal and railway discrimination. The industries of Pennsylvania are at the mercy of the railroads, and whether her future is prosperous or disastrous is a matter for the railway general freight agent. We are all at his mercy. It is these railroads that most impede the progress of the State that has given them existence than anything else. All portions of the State suffer alike. The Pennsylvania Railroad was once noted for its efforts for the development of the State. Recently such is not the case. If a State commission ever sits—and I hope this will come to pass—it will decide that the charges of the Pennsylvania Railroad Company will be as much less than those of the New York Central and the New York and Lake Erie as reports show them to be greater.

"In 1885, 1886 and 1887 the freight rate per mile of the Pennsylvania in this State was 26 per cent. greater than the New York Central and 22 per cent. greater than the New York and Lake Erie. In the

same years the passenger rates were 20 per cent. more than the New York Central and 15 per cent. more than the New York and Lake Erie's. The profit exacted last year by the Pennsylvania from this State upon freight was 2.20 mills per ton per mile, while in New Jersey it was 1.56 mills—40 per cent. less.

"From their profits in Pennsylvania last year were paid the entire dividend upon the stock—\$1,200,000 handed over to Western lines apparently as a gift and \$1,161,100 expended on repairs and improvements. Here we have this gigantic monopoly levying upon the State whose creature it is a tax beyond a fair return upon its stock of fully \$3,000,000, or, with improvement expenditures, \$4,000,000. Nor is the Pennsylvania alone to blame, for the Delaware, Lackawanna and Western Railroad in 1887 showed a profit per ton per mile charged in Pennsylvania of 1.31 mills, or 31 per cent. more profit per ton per mile than it got in New York State."

Abram S. Hewitt, in an interview at Atlanta credited to him, said:

"It is true that we have been very deeply impressed by all that we have seen

Sectional Elevation Through Head Stock of Machine Shown on First Page.

here in the South, and especially by what we have learned about the sensible and liberal spirit manifested by your railroads toward the industries of the section. It is to this, in my opinion, more than to anything else, that the extraordinary development of your section is due. The wealth is here, but it might have lain here untouched had not the railroads shown so liberal a spirit toward those who undertook its development."

"Are present rates lower than those in the North?" he was asked.

"Very much lower. I should say that the rates upon new materials given by the Southern roads are less than half those given by the roads in the North. You have superior ores and the coal supply at your doors, but your greatest advantage is in your cheap railroad rates, which enable your manufacturers to place their products in any part of the North or West as cheap or cheaper than we can do it.

"The fact that we are dissatisfied with our treatment at the hands of the Northern roads doesn't necessarily mean a change on our part. What we shall insist upon is a change on the part of our railroads, which must give us better rates or we shall be unable to compete with the iron mills of the South."

The Tennessee Coal, Iron and Railway Company have sold to the Anniston Pipe Works, of Anniston, Ala., 11,000 tons of

pig iron, with the stipulated understanding that all of the iron is to be covered by warrants of the American Pig Iron Storage Warrant Company. We understand that the sellers are instructed to deliver the iron into warrant stores, the delivery to begin in April and to cover a period of six to ten months. The sale includes 5000 tons of Gray Forge, 4000 tons of No. 8 foundry and 1000 tons each of open and of close silvery.

The Boiler-Makers' Meeting.

A. T. Douthett, Jr., of the Porter Foundry and Machine Company, Limited, of Allegheny City, Pa., has issued a call for a convention of boiler manufacturers of Pennsylvania, Ohio, New York, West Virginia, Maryland and New Jersey, to be held in the Hotel Anderson, Pittsburgh, on April 16 next. Mr. Douthett informed the representative of *The Iron Age* that the object of this convention is to organize, if possible, an advisory board of boiler manufacturers. In the States named above there are about 450 establishments engaged in boiler-making. An effort will be made to create a greater interest in the manufacture of boilers, make the use of the very best material compulsory, thus decreasing the number of explosions, and to establish a minimum price which will insure a reasonable profit on all boilers built, thus offering a premium for superior style and workmanship. It has been charged that the manufacturers propose to form a trust. We are informed that there is no truth in this report whatever. Each manufacturer entering the association will manage his own trade and sell direct, but it is expected that an agreement will be made that none will sell below the minimum price decided upon. The question of wages will not be considered. Boiler manufacturers, it is claimed, are paying more in proportion to their employees than other workmen in like crafts receive, but members of the new organization will attend to their individual affairs in this respect, and it is contended that the uniform scale of selling will ultimately result in an advance of wages. The sole object of the new association is declared to be to stop the cutting of prices and secure a better grade of boilers. Mr. Douthett is in receipt of a number of letters from different concerns promising their co-operation and stating that they will be present at the meeting. The following manufacturers from Pittsburgh are expected to be present: Porter Foundry and Machine Company, Limited, Ritter & Conley, R. Munroe & Son, Jas. McNeil & Son, Velte & McDonald, S. B. Rheams & Co., Dougherty & Morrison, and W. S. Pendlebury, Son & Co.

John Scott, one of the projectors of the Edgar Thomson Steel Works and until a short time ago a member of the firm of Carnegie, Phipps & Co., died in Pittsburgh on Sunday, aged 68 years. In addition to being president of the Allegheny Valley road he was a director in the People's Savings Bank, a director in the Mansfield Coal and Coke Company, a heavy stockholder in the Pittsburgh Locomotive Works and the Pittsburgh Plate Glass Works, at Creighton Station. He was at one time president of the Pittsburgh, Virginia and Charleston Railroad, and a director in the Pennsylvania Railroad.

The Treasury Department has decided that exported galvanized fencing, manufactured in New Jersey from imported steel and spelter, is entitled to a drawback equal to the duty paid on the imported material, less the legal retention of 10 per cent.

The Hinkle Furnace Plant at Ashland, Wis.

The remarkably heavy output of pig iron achieved by the Hinkle Furnace has attracted much attention. No other charcoal furnace has ever succeeded in making over 85 tons of pig iron in 24 hours, while this furnace has repeatedly exceeded 100 tons, its highest yield thus far having been 111 tons, which was accomplished on the 19th of February. The coke furnaces of the country have improved wonderfully in recent years, totally eclipsing the records of the managers who first became famous for their achievements in furnace driving, and who inaugurated the new departure in

only is this point the natural lake port of shipments for Gogebic ores, but it is also within easy reach of the Vermillion district of Minnesota. Ashland is situated on an estuary of Lake Superior, known as Chequamegon Bay, which is 12 miles long and about 6 miles wide, and forms one of the finest harbors on the lakes. The close proximity of extensive forests of hardwood timber is a natural advantage of paramount value. Thus the three prime requisites for a successful operation of a charcoal furnace, an abundant supply of rich ores, forests of hardwood timber and cheap transportation are found at Ashland. The Ashland Iron and Steel Company were organized and incorporated in November,

long experience in the management of charcoal furnaces running on Lake Superior ores, and he was also made manager. The lines of the furnace were materially changed, other minor alterations were made and the furnace was again blown in August 31, since which time its performance has been in every way satisfactory. A stop of seven days was made from January 18th to the 20th for the purpose of adding some improvements then found desirable. Although it was built to make 80 tons a day, the average for the first blast was but 48½ tons a day. The second blast is much better, averaging 70 tons a day up to January 20, which would have been much increased if the supply of fuel had not run short and if it had not been largely soft-wood coal. Since January 20, up to March 9 (the latest information at hand), the daily average has been 91 tons over. Hardwood charcoal is now being used, but the heavy production of the furnace, it is claimed, is not being accomplished at the expense of fuel. In fact, a slight saving of fuel is being effected as compared with the consumption prior to January 9. Although the cubical capacity of the furnace was somewhat reduced in its reconstruction, it was expected that the output would be increased, but the owners were hardly prepared to find the product running so far in excess of the original estimate made by the builder.

The Hinkle furnace plant is well arranged for handling stock and the finished product. It has direct connections with the Wisconsin Central, Milwaukee, Lake Shore and Western, Northern Pacific and Chicago, St. Paul, Minneapolis and Omaha railroads, with another connection soon to be made with the Duluth, South Shore and Atlantic. In addition, it possesses the advantages of a location on the lakes, affording cheap water transportation for a large part of the year with a vast area of country. The buildings are all of the most substantial character, having Lake Superior red sandstone foundations, brick superstructures and iron truss roofs. The stack is an iron shell, supported on cast-iron columns, with bell and hopper top and a gas-pipe water jacket system for cooling the boshes. The arrangement of the blowing engine and the hot-blast stoves in relation to the furnace stack is most excellent. They stand directly in line, with the stoves between the engine and the stack, so that the air pressure is delivered from the blowing cylinders to the furnace through pipes which are as straight as it is possible to make them. This is illustrated in the accompanying diagram of the works.

The ore is received on two elevated tracks running directly into the stock-house. Each of these tracks covers about 800 feet of linear measurement, and with their approaches, which furnish additional storage room underneath, afford a total capacity for about 30,000 tons of ore. The stock-house is 62 feet by 150 feet and 32 feet high, with an annex in the rear, into which the tracks are continued, which is used for storing charcoal to be held for emergencies, and will contain a very considerable supply. The charcoal for daily use is received on tracks outside of the stock-house, and is unloaded from the cars into the charging buggies within a short distance of the hoist tower. A Blake crusher of the largest size, with an independent engine, is located in the stock-house and is used for crushing limestone and the hard ore from Minnesota. The tower for hoisting stock to the top of the furnace is 85 feet high, built of brick and contains a double cage worked by an Otis hoist engine.

The house in which the blowing engine is located is 36 feet by 42 feet, affording sufficient space for the addition of another engine if that should at any time be

PLAN OF HINKLE FURNACE PLANT.

American coke practice which has so heavily increased the production of pig iron by individual plants. But, while this has been true of coke furnaces, the charcoal furnaces have been lagging, by comparison. The progress they have made has not been brilliant, although it has been steady. The opportunity for distinction in this respect seems to have been left for the Hinkle Furnace, and the manner in which it has distanced its competitors shows the possibilities of large charcoal-iron output which have always existed, and the probability of still greater achievements to be realized through the sleepless rivalry of ambitious managers. The following information about this new furnace will be of interest to our readers.

The discovery of large deposits of rich iron ore and the development of numerous mines in the Gogebic range of Northern Wisconsin and Michigan suggested the location of this furnace at Ashland. Not

1886, aided and encouraged by the generosity of enterprising citizens. A site was chosen for the furnace in the west end of the city of Ashland, the property of the company comprising a total of 14 blocks with an extensive frontage on Chequamegon Bay.

A contract for the erection of an 80-ton charcoal furnace was made with James P. Witherow, of Pittsburgh, in the spring of 1887. The work of construction was performed under the direct supervision of his constructing engineer, E. C. Darley. The blowing engine, however, was built by Edward P. Allis & Co., of Milwaukee. The furnace was completed and blown in April 4, 1888, under the management of C. P. Perrin. The furnace not operating satisfactorily, the owners decided to blow it out and remodel it in some respects, so that this blast ended on June 30. The work of reconstruction was placed in the hands of Morris R. Hunt, who had had

deemed desirable. This engine is of the vertical type, with a heavy cast frame, was built by Edward P. Allis & Co., of Milwaukee, and is described in a separate article. It is now run at a speed of about 26 revolutions per minute and delivers a pressure in the furnace of about 5 pounds. Adjoining the engine-house is the pump-house, 18 feet by 34 feet, containing three Dean duplex pumps and one No. 10 Cameron pump. Water is obtained from a natural reservoir in the immediate vicinity, but a supplemental pump works has also been provided to supply water to the furnace directly from the lake in case of accident to the regular supply. The roof of the engine-house is composed of a water tank which holds 76,000 gallons. The boiler-house is 42 feet by 38 feet and contains three Heine safety boilers, each of 150 horse-power, with space left for additions. The furnace supplies all the gas needed for fuel to operate these boilers. The draft stack is built with an iron shell with fire-brick lining and is 150 feet high and 7 feet in diameter. The stove-house, 55 feet by 65 feet, contains two Whitwell fire-brick stoves, as improved by Witherow, each 18 feet by 60 feet. These stoves, as now run, average about 900 degrees.

The furnace stack has been incorrectly reported to be 65 feet high and 12½ feet in diameter of bosh. It is only 60 feet high and 12 feet in diameter. But it is too large for the cast house, which will soon be extended to accommodate the enormous product. Its dimensions at present are 52½ feet by 132 feet. Four casts are made daily, and each cast covers considerably more than half the floor of the house, keeping the workmen very busy in getting out the iron and making up the pig beds afresh. It may be remarked incidentally that the large production of this furnace is principally confined to Nos. 1 and 2, showing most excellent results as to quality. Each pig is broken in the cast house and carefully graded before it is taken out, which is done by a grader who makes this his especial business. The iron is piled in the yard adjoining the cast house and in carload lots, according to the usual practice in the Lake Superior region. A railroad track passes along conveniently for shipping the iron from this yard, which is sufficiently large to store 10,000 tons. A dock immediately in the rear of the cast house enables iron to be loaded directly into the cars from the pig beds. A feature sufficiently unusual about charcoal blast furnaces to make it worthy of remark is the comfortable office building which has been provided for the manager and clerical force. It is a two-story brick building, with a vestibuled entrance and double-sashed windows, which are needed for comfort in the winters of this Northern location. The manager's room is very tastefully fitted up and furnished.

The Ashland Iron and Steel Company own timber property within easy reach of the furnace by rail, comprising about 10,000 acres of heavily-wooded land. The timber is mainly hardwood, such as maple and birch, and its extent insures an ample supply of fuel for the furnace for many years. The company have built 77 kilns, each with a capacity of 55 cords, along the line of the Wisconsin Central and Milwaukee, Lake Shore and Western railroads, within a short distance of Ashland. The kilns are built of brick on what is known as the Hottentot plan, which was introduced into the Lake Superior region by H. S. Pickands, and has proved a very satisfactory system for making charcoal. The cars used for transporting charcoal from the kilns to the furnace are 35 in number, and were specially constructed for the purpose. While the furnace company have thus arranged to control their fuel supply, they have made no investment in iron ore mines, believing that their proximity to the numerous mines of the Gog-

bic and Vermilion regions producing high-grade low phosphorus ores insures them an ample supply of the best quality at reasonable prices. The ores used now are almost entirely from the Gogebic, the admixture of Vermilion ore being but slight. The average yield is now 57 per cent. in the furnace. The limestone used is brought from Depere and Fond du Lac, Wis., and is said to be a fine flux, but its value in this respect is not being very severely tested, as only 150 pounds of it are used to the ton of pig iron.

The officers of the Ashland Iron and Steel Company are as follows: A. H. Hinkle, president, Cincinnati; W. H. Hinkle, secretary and treasurer, Minneapolis; Morris R. Hunt, manager, Ashland. The founder is Thomas Mackey. The

Pipe Cutting and Threading Machine.

This machine is made by Curtis & Curtis, of Bridgeport, Conn., in four sizes, as follows: 2½ to 4 inches, 4 to 6, 3½ to 6 and 2½ to 5 inches, inclusive. It consists of either of the larger sizes of their hand machines placed on a power base. At the back is a worm wheel which engages with a worm on the driving shaft, and through it is transmitted the power from the pulley to the pinion. The machine is operated by placing the pipe to be cut through the vise at the back, with its end against the back of the dies, and then tightening the hand wheel at the top of the machine, which brings the pipe central with the dies and also clamps the vise. The large gear is furnished with a lead screw cut on

PIPE CUTTING AND THREADING MACHINE, MADE BY CURTIS & CURTIS.

sales agents are Pickands, Brown & Co., Chicago; Pickands, Mather & Co., Cleveland; Rogers, Brown & Co., Cincinnati; Rogers, Meacham & Shields, St. Louis. The brand under which the iron is known is "Hinkle."

The Antrim Iron Company, whose furnaces are at Mancelona, Mich., announce through their secretary and treasurer, J. C. Holt, at Grand Rapids, that they have undertaken the sale of their own Lake Superior charcoal iron from the Grand Rapids office. The furnace is running successfully, making about 60 tons of iron per day.

High ocean freights continue to restrict the business in foreign iron ores. We understand that from Mediterranean ports freights are 14/ to 15/, according to port, although they have been higher. Only a few cargoes have been sold thus far.

its back of the same number of threads to the inch as the pipe to be cut, and as the gear revolves it is drawn back into the shell and the dies on to the pipe. The dies can be changed by simply loosening the thumb-nuts a few turns and drawing the face plate forward about ¼ inch, when the dies will drop out. The dies are adjusted to the size of pipe to be cut by turning the face plate to the graduation corresponding to the size of pipe. By deviating a little from the standard graduation the pipe can be cut either over or under size to allow for any variation of the fittings. In cutting off pipe the gear is run as far back in the shell as it will go in order to free the lead screw and allow the gear to have simply a rotary motion in the shell. The cut-off tool is forced into the pipe as it revolves by a wedge screwed down behind it. An important feature of these machines is that, if at any time a single die of a set becomes broken or lost, it can be replaced at a small cost without

buying an entire set. This machine is particularly adapted for those who, while they have power in their shops, still want a machine that can be taken out on a job to be worked by hand; it can be easily taken from the base and used as a hand machine. When arranged as a hand machine, it is said that a boy can thread a 6-inch pipe in 10 minutes without assistance and without fatigue.

Cylinder Boring Machine.

It is claimed that this machine will bore 12 inches per hour in cylinders 18 or 20 inches in diameter, and in small cylinders,

CYLINDER BORING MACHINE.

from 6 to 12 inches in diameter, it will bore from 15 to 20 inches per hour, as it can feed faster on small work. On the feed-screw turns an internally-threaded hub rotated by either one of two wheels of unequal diameters. Adapted to engage with these two gears are two unequal pinions mounted upon a sleeve revolving with and sliding upon a second shaft, which is driven by a pinion engaging with a spur-and-bevel wheel loose upon a sleeve on the main shaft. The beveled portion of this wheel meshes with a pinion on a shaft having at its outer end a gear meshing with a pinion on a crank shaft. Either one of the two pinions may be brought into gear with its spur gear. Through this train of gears the feed-screw is turned. The two cutter heads are placed directly opposite each other, thereby insuring accuracy, and each cutter may be set in or out by a set-screw, and so arranged as to bore both ways. The machine is so compact it is unnecessary to detach the cylinders. The sole agent for this machine is J. R. S. Nichols, St. Louis, Mo.

An incident of some importance to the Chicago iron trade is the concentration of interests in a particular locality which is now in progress. Pig iron commission houses, manufacturers' agencies for the sale of bar iron and steel, and city offices of local iron and steel works have hitherto been scattered over a considerable part of the city. Some office buildings contained a fair sprinkling of the trade, but quite generally the representatives of iron and steel interests were isolated from one another. The movement now in progress bids fair to pretty thoroughly concentrate the trade by the 1st of May in the two large office buildings known as the Rookery and the Phenix buildings, which are within a block of each other, the Grand

Pacific Hotel lying between them. The Rookery is by far the larger of the two buildings, ranking among the largest office buildings in the world. It is 11 stories high. The whole of its tenth story has been secured by the North Chicago Rolling Mill Company, the Joliet Steel Company and the Union Steel Company. Scattered through the other stories of this large building are pig iron commission houses, manufacturers' agencies for all kinds of iron and steel works, agents for railway supply manufacturers, offices of local iron and steel works, offices of railway associations for the regulation of traffic, a bureau of inspection of railway material, financial corporations,

and a host of representatives of other interests attracted to the building by the character of its principal tenants. The Phenix Building has an excellent showing of iron and steel houses, railway supply agencies, &c. The location of these buildings is admirable in many respects, the post-office being on the next block, several passenger depots lying

tion of the company to establish their works in the natural gas district, and locations are now being investigated in Indiana with a view to the adoption of a site wherever the greatest advantage can be secured, taking into consideration the supply of gas, railroad facilities, &c. The company will manufacture sheet iron and tin plate, their purpose being to make a specialty of the latter. They claim to have looked into the question of cost very closely, and to have satisfied themselves that with free fuel and proper management it is possible to make tin plate at a profit under existing conditions. If the duty on tin plate is advanced, as was proposed in the Senate tariff bill, their chances of success will of course be improved, but they are not depending on that contingency. The iron-making plant at Pittsburgh now owned by Mr. Hammond is to be removed to the location selected and will form part of the company's works. Encouragement is stated to have been received from quite a number of dealers in and consumers of tin plate at Chicago, who would welcome the domestic product if it should be of good quality and would compete with imported tin plate in prices.

Journal Box.

The patented journal box which is here illustrated was designed by Pedrick & Ayer, of Philadelphia, for use on their universal milling machines. To apply the box it is best to bore a straight true hole through the housing and turn the outer shell to fit, and cut a ratchet tooth thread inside, as shown in the longitudinal section, Fig. 1. The bronze bearing proper is threaded to fit the outer casing. Both the outer casing and the bearing are split as shown in the cross sectional view, Fig. 2, one cut going entirely through and the other two nearly through. It will be readily seen that by screwing them both together in the housing each will be screwed up to a perfect bearing, at once making a very essential feature, an end fit. By continuing the process, as the threads attempt to slip or pass over each other, the inclined surface of the threads acts at all points as a wedge and closes the inner shell to a perfect fit on the journal,

Fig. 1.

Fig. 2.

within easy walking distance, and the street-car lines of the different divisions of the city running close to them.

The Rogers Siberian Iron and Tin Plate Company, of Chicago, incorporated under the laws of Illinois, with a capital of \$200,000, has been organized by the election of the following officers: Samuel W. Adams, formerly superintendent of Crane Bros. Mfg. Company, president; William Rogers, formerly of Rogers & Burchfield, Leechburg, Pa., general manager; Wm. J. Hammond, a Pittsburgh iron manufacturer, vice-president; Francis W. Holbrook, formerly Chicago manager for A. T. Stewart & Co., treasurer. It is the inten-

while at the same time the outer one fills the place prepared for it in the housing, making a solid bearing for all parts. An essential feature is that the bearing never changes end ways, and all trouble and wear arising from this cause are overcome.

United States Consul Griffin, at Sydney, who has just returned from Australia, says the colonists in New South Wales manifest much cordiality toward Americans and desire to form closer trade relations with this country. They are more American than English in business matters, and in fact have adopted as nearly as possibly American systems of conducting their public institutions.

The Progress of Electricity.

The meeting of the National Electric Light Association at Chicago was opened by an address by its president, S. A. Duncan, in which the progress made in the introduction of electricity as a business was reviewed as follows:

But few of the gentlemen of this country who are commercially connected with the manufacture and distribution of electric light and power and the apparatus used therefor are aware that five years ago this month a handful of men met in this city and organized a movement which has grown into the large and powerful organization of which we are members and which is in session at the present time.

The industry of electric lighting at that time was carried on with all the enthusiasm which comes with a new undertaking, and with the mistakes which are sure to arise in the commercial introduction of any great industrial agency. The gentlemen engaged therein, strangers to one another, working independently with no attempt at harmony, with but little knowledge of one another's methods of business, with no established custom or precedent to guide them, came together for the purpose of deriving those benefits which invariably result from the deliberate discussion of those mooted questions which are common to the experience of all electric-light men. It may be remembered that in the early days of this association the chief question before the electrical fraternity was the then all-important question of arc lighting. The incandescent light had scarcely come into commercial use. No sooner had the questions involved in arc lighting been solved by the natural pressure of public demand than the complicated questions involved in the distribution of incandescent lighting absorbed the attention of the fraternity and occupied the meetings of this association. Following closely upon the problem involved in incandescent lighting came the question of electrical distribution of power; first for stationary motor purposes and afterward for the purpose of electrical locomotion. This question is to-day perhaps the most important one before the electrical fraternity. To say that electrical power is not to-day a success would be to reflect upon the scores of electrical railways now in successful operation in this country, and upon the thousands of electric motors that are every day commercially serving the wants of man.

We may here profitably consider some figures indicating the growth of the electric lighting and power industry, the increase in the number of central stations, arc and incandescent lamps, electric motors and electric railways now in operation. At the meeting of this association one year ago it was estimated that there were not less than 4000 central stations and isolated plants in operation in the United States. From the accompanying statistical table, it may be seen that the number of central stations and isolated plants at the August meeting of 1888 was 5351, and at the present time is 5747. This shows an increase during the first six months of the year of 1351 central station and isolated plants and an increase during the latter half of the year of 716, making a total increase during the year of 2067 plants. Figuring in percentages, the increase during the first half of the year was 32.3 per cent. in the total number of central station and isolated plants, and during the latter half of the year it was 13.5 per cent., making a total increase for the year of 45.8 per cent. It was estimated a year ago that there were 175,000 arc lamps in daily use in the United States. Six months ago I found upon investigation that there were 192,500. At the present time I find that there are 219,924, making an increase during the first half of the year of 62,625 arc lamps, and during the latter

half of the year an increase of 27,424, making a total increase of arc lamps in use during the whole of the year 32,525. Figured in percentages, the increase the first half of the year shows 20.1 per cent. the second half 14.2 per cent., making a total gain of arc lamps for the year of 34.3 per cent. A year ago it was estimated that there were 1,760,000 incandescent lamps in daily use in the United States. Six months ago I found that there were 2,142,440. At the present time there are no less than 2,504,490, making a gain during the first half of the year of 392,924, and during the latter half of the year of 361,546, or a total gain for the year of 754,990 incandescent lamps. Figured in per cent., it shows a gain during the first half of the present year of 32.3 per cent., during the latter half 16.7, a gain during the whole year of 49 per cent. It is also interesting to notice what the increase in capitalization has been in the electric-light companies in the United States during the year. During the first half of the year the increase was \$42,210,100; during the latter half it was \$27,187,634, making a total gain during the year of \$69,397,734.

It is also interesting to note some comparative figures upon the electric-railway industry. Six months ago there were 84 electric railroads in operation in the United

The F. C. Austin Mfg. Company.

The new factory of the F. C. Austin Mfg. Company, of Chicago, is now in full operation, turning out a great variety of earth-handling machinery. The factory is a brick structure, two stories in part, covering a tract of ground about 200 feet square at the corner of Carpenter street and Carroll avenue. A large and well-equipped blacksmith shop forms an important department of the works. It is supplied with a steam hammer, drop-forge and shaping machines. A machine shop and wood-working shop are fitted up with the most approved tools for working in iron and wood. The company have their own dynamo for electric lighting, so that they are enabled to run both day and night in getting out orders for quick delivery. Part of the building is used as a warehouse, in which machines are so placed that those to be operated by steam-power can be connected with overhead shafting and shown in motion for the satisfaction of buyers. A large elevator in the center of the building is used for the purpose of loading machinery on wagons from the warehouse floor or to convey it to the second story. The company have secured control of the New Era grader and excavator, which is a standard machine in use

States. During the last six months there has been an increase of 19, making at the present time a total of 53. Six months ago there were 83 roads in process of construction. There are 39 less at the present time, making the number of roads now under construction, not finished, 44. Six months ago there were 39 electric roads incorporated in the United States upon which construction had not yet begun; at the present time there are 42. Six months ago there were 223 electric cars in operation. Since that time 155 have been put into commission, making at the present time 379 cars in operation. Six months ago there were 144 cars under contract but not in operation. This number has increased by 185 during the last six months, making a total of 329 electric cars at present under contract but not running. Six months ago there were 138 miles of single track in operation; during the past six months there has been an increase of 157½ miles, making a total at the present time of 294½ miles of single track in operation. Six months ago there were 189½ miles of single track under contract but not in operation. At the present time there are 273¾ miles of single track under contract but not in operation. It would be profitless for me to draw elaborate deductions from these figures. They tell for themselves the story of prosperity and rapid growth throughout every department of the electric light and power industry.

by railroad contractors, public road commissioners, irrigating ditch contractors, &c. It is drawn by 12 horses, and delivers the excavated earth by means of a wide belt passing crosswise over it to a bank above the level of the grader or to a wagon or cart alongside. Road scrapers are made for leveling ordinary roads which are in demand all over the country. Appliances for boring wells are also made, and in connection with this line it is proposed to manufacture windmills and a special pump. Among other products of the company are mills for grinding feed, steam farm cookers, &c. The offices are located in connection with the warehouse. While this establishment may be regarded as an outgrowth of the well-known firm of Goulds & Austin, it is an entirely independent organization, none of the members of the company being now connected with the old firm, whose business is being conducted under the name of the Goulds, Austin & Caldwell Company, making a specialty of pumps, pump supplies, pipe, &c.

We are informed that the American Pig Iron Storage Warrant Company now have signed contracts with furnaces representing an annual output of 813,500 tons, and agreements to sign, subject to confirmation of boards of directors, from furnaces representing an annual product of 629,000 tons.

Screw Machine.

We herewith illustrate the No. 5 screw machine made by the Brown & Sharpe Mfg. Company, Providence, R.I. Although their machines are designed primarily for making screws, they are, whenever screws are not required in sufficient quantities to render entirely automatic machines preferable, also used in making a large variety of pieces from iron or steel bars, and in finishing castings or forgings that may be held in a chuck while being subjected to one or more operations. This fact is illustrated in the works of the manufacturers

simple and durable device. The spindle-boxes are $2\frac{1}{4}$ inches and $2\frac{1}{2}$ inches in diameter and $2\frac{1}{4}$ inches and $2\frac{1}{2}$ inches long, and are of steel, hardened and ground inside and out. The spindle is also of steel, and its front bearing is hardened and both bearings are ground. The cone has three diameters, 6, $8\frac{1}{2}$ and 11 inches, for 3-inch belt. The size of the holes through the spindle is $1\frac{1}{2}$ inch; the number of holes in the revolving heads is seven, and the diameter of these holes is $1\frac{1}{4}$ inch; the movement of the revolving head-slide is $9\frac{1}{2}$ inches, and the length that can be milled is 6 inches. The swing over the slide-rest is

Company, of Dighton, Lane County; capital, \$100,000; directors, C. T. Prouty, J. C. Wilkinson, P. J. Murphy, W. M. Woods, D. R. Bennett, J. F. Andrews, J. R. Greenlees, F. P. Stearns, and V. H. Grinstead, all of Dighton. The American Sugar Company, of Meade Center, Meade County; capital, \$500,000; directors, N. J. Adamson, M. J. O'Meara, William K. Palmer, O. B. Hamilton and George M. Cockrell. The Spiney Sugar Company, chief offices at Spiney and Kingman; capital, \$125,000; directors, J. J. Strickland, E. B. Poole, J. G. Conkling, Joseph Strickland and N. P. Strickland,

NO. 5 SCREW MACHINE, MADE BY BROWN & SHARPE MFG. COMPANY.

of this machine, where only one out of every eight screw machines is usually employed in making screws; the eight are generally employed in finishing studs, nuts, washers, pins, &c., from round, square and hexagonal bars, while one-half the machines are engaged on small wheels, cams or the small parts of machine tools. So many of the last-mentioned tools have come to be made on the screw machine in the Brown & Sharpe shops as to call for special drawings marked "small parts made on screw machine." In this machine ten tools can be used without removing the work from the chuck. A lever, to be used in operating the cutting-off slide in place of the screw shown in the cut, is furnished when desired. The turret-head is secured in position by a

$6\frac{1}{2}$ inches, and over the bed $13\frac{1}{2}$ inches, while the length of the bed is 50 inches. The floor space occupied by the machine measures 32 x 62 inches.

A press dispatch from Topeka, Kan., states that the new law enacted by the State Legislature which has just adjourned, enabling counties, townships and cities to vote bonds not to exceed \$20,000 for the purpose of encouraging the building of sugar factories, is already being taken advantage of, and the Governor expresses the opinion that 50 factories will be established under the law before the close of the season. Three charters were filed with the Secretary of State on the 20th inst. for sugar companies, as follows: The Dighton Sugar

all of Kingman. An opening is thus being established for the consumption of considerable quantities of machinery, which will be furnished by those in a position to take advantage of this new demand.

The continued decline of the foreign trade of Philadelphia is shown by the report of Collector Cadwalader, just completed. While the value of imports in 1888 amounted to \$45,020,000, an increase of \$5,449,000 over the previous year, the exports dropped to \$28,013,000, a decline of \$5,800,000, the lowest since 1872. Local papers attribute this difference wholly to discrimination against Philadelphia by the railroads. More than one-third of the entire value of imports comprised sugar brought to that port to be refined.

Trimming and Squaring Shear.

The illustration here presented is that of a trimming and squaring shear especially intended for the use of manufacturers of sheet-metal work for building purposes. It will accurately cut sheets from 30 to 14 gauge in thickness and up to 10 feet in length at one stroke. It is claimed by the manufacturers, the E. W. Bliss Company, of Brooklyn, N. Y., to be a step in advance of any machine heretofore built for a similar purpose. In general design this shear somewhat resembles another and heavier machine built by the same company for rolling mill work; but in some of the details of construction it is radically different. The cutter-bar is operated by a shaft with two cranks in the usual way, and there is an adjustable clamping bar worked automatically by cams on the crankshaft and sliding in guide-ways

removed when the whole width between housings is required for making rectangular cuts. Both sets of gauge slots are marked with convenient graduations. Mounted on long arms on the back of the machine is an adjustable gauge so connected by long screws and miter gears that it may be quickly placed at any desired distance from the cutters by turning the hand-wheel shown at the top of the cutter-bar. Both ends are moved equally, and accurate adjustment is thus quickly accomplished without the necessity of the operator leaving his position in front of the machine.

Molding in the Third Story.

A decidedly novel arrangement of a molding-room has been made in the foundry recently built by the L. Wolff Mfg. Company, of Chicago, at Hayne

from the cupola to the flasks. Chain hoisting blocks hold the ladles at any desired elevation. The cupola is situated midway on one of the sides of the molding-room, and it has a heavy iron floor back of it for holding charges, which are brought up from the ground floor by a steam elevator. The soil-pipe cores are made on the molding floor, six machines being used for the purpose, operated by power. They are put into the flasks green. A power press is used to press sand into small molds for fittings, thus saving considerable labor, one press answering for four molders, two benches being on each side of the press. The engine is on the ground floor, and power is transmitted by belts. It is of 125 horse-power, and is of the Reynolds-Corliss pattern, built by E. P. Allis & Co., of Milwaukee. The second story of the building is used for a machine shop, pattern shop and storage.

TRIMMING AND SQUARING SHEAR, MADE BY THE E. W. BLISS COMPANY.

immediately in front of the cutter-bar for firmly clamping the sheets while being cut. Counterweights under each end of the table raise this bar after the cut is made and it has been released by the cams. There are three or four openings provided in this bar to enable the operator to clearly see the cutting lines on the sheets. Upon a heavy bracket attached to the left side of the machine a shaft is placed for carrying the fly-wheel, which is 34 inches in diameter and weighs 400 pounds; also the 20 x 5 inch tight and loose pulleys and pinion. This pinion drives the spur-gear on the main crankshaft, which is 36 inches diameter, the proportion between them being six to one. A new and very powerful clutching device is used to lock the spur-gear to the crankshaft, the construction of which is simple, yet effective. A slight rocking or side movement of the treadle serves to trip the clutch and set the cutter-bar in motion.

In addition to the usual side and front gauges, one arranged especially for cutting any angle up to 90° is provided on left side of the table, which may be quickly

street and Carroll avenue. The building is a very substantial brick structure three stories high, and the molding-room is in the top story. Ample ventilation and an abundant supply of light are thus secured, which would not be the case if the ground floor was used for this purpose, with the other departments of the works in the upper stories. Wherever economy of space is desired and castings are not excessively heavy, this arrangement seems to be most excellent. The L. Wolff Mfg. Company make plumbing supplies, and use their foundry for casting soil-pipe, sinks, bathtubs, pipe fittings, &c. The floor of the molding-room consists of heavy planking, on which cedar blocks 4 inches high have been set on end as in street paving, over which a good coating of loam has been spread, forming a thorough protection against fire from the splashing of hot metal. The roof of the foundry is constructed with a wide deck running down the center having windows along both sides of it. The deck is supported on heavy trusses resting on pillars. The trusses are also used to hold overhead railways to carry ladles of metal

The ground floor is devoted to offices, storage-room for pig iron, coke, soil-pipes, sand, &c., engine-room, galvanizing-room, for galvanizing kitchen boilers; enameling room, for enameling the insides of cast-iron sinks, bathtubs, &c.; and tarring-room, for tarring pipes and fittings. The entire building seems to be most admirably adapted to the business which the firm carry on in it.

The Portsmouth *Blade* makes a strong plea for the building of an extension of about 13 miles of the Ohio and Northwestern Railroad from Portsmouth up Pine Creek and beyond Waterloo into the coal and iron region of that section, for which it claims exceptional advantages.

The city of Ogden, 13 miles from Salt Lake City, has 13,000 inhabitants. A correspondent at that point says: "Ogden has iron, coal and limestone within a few miles of the city, and her chief ambition has been to make iron and iron products, especially merchant bar and stoves."

Tension Carriage With Staggered Arm Sheave.

The framework of the tension carriage illustrated consists of side iron beams, secured to the upper side of which are the axles on which the truck wheels revolve. These wheels are chilled on their outer faces and are supplied with a series of anti-friction rollers to facilitate their sensitive action. The large wheel over which the cable passes is made with staggered arms, which add to its rigidity. The chain connecting with the tension weights engages in a sprocket-wheel, and an idler is placed below the chain, which is kept in contact with one-half the circumference of the wheel. The worm shaft on which the operating hand-wheel is located, being carried in a slide, is readily engaged and disengaged. This tension carriage, which is made by the Walker Mfg. Company, of

very narrow. The refuse amounted to 7½ per cent. of the coal burned. Much soot was found and some trouble was caused by its igniting in the chimney. When using this coal it is necessary to reduce the calorimeter of the bridge wall, and in the Albatross this was made one-seventh the area of the grate. To reduce the consumption the grate surface was reduced from 58½ square feet to 45 by bricking off the back. It was easy to burn 20.7 pounds per square foot of grate per hour, and in order to keep the consumption of coal down to this allowance it was necessary to clean each furnace of chinker only once every 12 hours. The steam generating power of the coal was from 75 to 80 per cent. of that of good Welsh coal.

Wellington coal from the mines at Departure Bay, Vancouver Island, is declared to be the best fuel mined at the present time on the northwestern coast of this

tained in them renders them liable to spontaneous combustion under favorable conditions. Of course each colliery owner strenuously denies that his particular coal has this dangerous property, but the testimony of responsible persons who have used these coals on steamers leaves no doubt in my mind that the Wellington and Nanaimo coals, as well as those mined near Seattle, W. T., are liable to such accidents. The following case forms part of my own experience:

"Five days after we had filled our bunkers with Wellington coal at Departure Bay smoke and fumes were observed to issue from the bunker. It was found that the covering of the auxiliary steam-pipes, which pass through the bunker, was completely charred, and that great heat had been developed in the surrounding coal. No actual ignition of the coal had taken place, but was no doubt pre-

TENSION CARRIAGE WITH STAGGERED ARM SHEAVE, MADE BY WALKER MFG. COMPANY.

Cleveland, Ohio, is in use on the Fifth Street, Twelfth Street and Eighteenth Street Cable Railroad, and the Union Railway, of Kansas City; the St. Louis Cable and Western Railway, of St. Louis; and the Butte City Street Railroad, of Butte City, Mon.

Coals of the Pacific Coast.

During the present cruise of the steamer Albatross, Passed Assistant Engineer C. R. Roelker, U. S. N., made notes regarding the steaming efficiency and other characteristics of the coals of the Pacific Coast as determined by actual use at sea on that vessel. At Lota, Chili, 170 tons of coal from the Alberto Mine were taken aboard. This coal has a dull look, with a peculiar yellowish-gray tint at the planes of cleavage; it breaks up easily in rhomboidal particles. Its bulk is about 11 per cent. greater than that of ordinary anthracite. It ignites easily and burns rapidly with large flame. It does not cake, but breaks up into small particles in the furnace, which run through the grate, unless the spaces between the bars are

continent. In steaming efficiency it is only slightly inferior to good Welsh. The rate of combustion was limited to 18½ pounds per square foot of grate. It formed about 12½ per cent. of refuse and trouble was caused by the burning of the soot deposited.

The Nanaimo coal, supplies of which were obtained at Unalaska, Aleutian Islands, and at Kadiak, does not differ greatly from the Wellington in general characteristics. It was found to be 13 per cent. inferior to the Wellington in steaming efficiency and the amount of refuse produced was 14 per cent. The supply obtained at Kadiak had been exposed to the weather and had deteriorated to such an extent that its steaming efficiency was 18 per cent. less than that of the coal received at Unalaska, while the refuse amounted to 19 per cent.

The foregoing we condense from the *Journal* of the American Society of Naval Engineers. Concerning the spontaneous combustion of these coals the report says: "All the coals mined at present on the northwestern coast of this continent are of relatively recent formation, and the large percentage of gaseous matter con-

vented only by the timely discovery of the danger. The steam-pipes were covered with hair felt and wrapped heavily with manila rope. The heat of the pipes was probably sufficient to evolve gases from the coal, and by a process of slow combustion of these gases additional heat was generated, causing the charring of the rope and felt covering, and accelerating at the same time the evolution of gases. If this process had been allowed to continue a point would soon have been reached where only a liberal supply of air was wanted to produce active combustion of the coal.

"The coal came fresh from the mine, and, as there was a slight rain falling at the time, it was somewhat wet when put into the bunkers. No signs of unusual heat in the bunkers had been observed on any former occasion, either with Wellington or any other coal, although stored in the same manner."

Ex-Mayor Hewitt, in a speech delivered at the Chamber of Commerce in Chattanooga, startled his hearers by predicting that 100 years hence Chattanooga would have a population of 1,500,000.

MANUFACTURING.

Iron and Steel.

On Tuesday, the 19th inst., a charter was issued to the Pittsburgh Company, of Pittsburgh (charter perpetual), for the manufacture of iron or steel or both, or any other material, or of any article of commerce, from wood or metal or both: capital, \$5000. The directors are Andrew J. Lawrence, William C. King, John F. Scott, Edward H. Jbley and Fred W. Vanosten.

The National For and Iron Company, organized at Chicago, some time since for the purpose of erecting a rolling mill, have secured a very good location for their works at Burnside, which is at Ninety-third street, on the Illinois Central Railroad and the Belt road, with other railroad lines in the immediate vicinity. Contracts for the erection of the buildings and the construction of the machinery have been let. The work of erection will begin on the 1st of April. The buildings will be principally frame, with iron supporting columns, sheet-iron siding and iron roof for fire protection. The machinery will be built at Fort Wayne, Youngstown and Pittsburgh. The company now expect to have their works completed by the 1st of July.

The telegraphers, hot-bed men, drawers and chargers employed at the Edgar Thomson Steel Works, of Carnegie Bros. & Co., Limited, at Braddock, Pa., have been notified that their wages will be advanced next month. They have been paid \$2 a day, but hereafter will receive a certain percentage on all rails produced. The amount is not given, but it is considered an advance over present wages. The blowing boys will also receive an advance. It is stated that the present month's production of rails at the above-named establishment will be larger than for any previous month in their history.

No. 8 stack of the Thomas Iron Company, at Lock Ridge, Pa., produced 407 tons of pig iron week before last, which is said to be the largest yield for any one week in the history of the furnace.

From the Reading (Pa.) *Times* we take the following: "Mr. J. H. Carpenter, who had been in Reading for several days inspecting the P. and R. rail mill, on North Ninth street, with a view of leasing it for a New York party, left for the latter city yesterday afternoon. If the P. and R. company will agree to make a number of changes about the mill and give the New York party a lease for a term of years the mill will be put in working order and started as soon as possible. Tool steel will be the product of the works. The mill has been idle for a number of years, and it is said costs the P. and R. Company about \$4000 annually in taxes and keeping in repair, without any return whatever. For this reason it is thought satisfactory terms will be offered to the parties desiring to open it."

After an idleness of about six weeks, the steel tube department of the Riverside Iron Works, at Wheeling, W. Va., resumed operations last week on double turn, giving employment to about 250 men.

No. 4 furnace of the Bethlehem Iron Company, at Bethlehem, Pa., resumed operations on Monday, the 25th inst.

The crucible steel department of the Black Diamond Steel Works, of Park, Brother & Co., Limited, at Pittsburgh, was idle last week on account of lack of orders.

A charter was filed in Pittsburgh last week for the Totten & Hogg Iron and Steel Company. The capital stock is \$150,000, divided into 3000 shares at \$50

per share. The directors are Nathaniel B., George E., George A. and William C. Hogg and Robert C. Totten. One hundred and thirty-five thousand dollars' worth of the capital stock was issued to Nathaniel B. Hogg for the machinery, patents, &c., of the late firm of Totten & Co., foundrymen, formerly engaged in business in the above-named city.

The plant of the Warren Tube Company, at Warren, Ohio, which originally cost \$250,000, has been appraised several times and offered for sale, without success. The last appraisement was \$30,000. It will again be offered for sale on April 13 next.

The Tidewater Steel Works, Chester, Pa., report a gratifying demand for their fish-plates, which they are turning out very satisfactory to both customers and themselves. Among recent orders, covering part of '88 and '89, are the following: Eighty thousand pairs to Central Railroad and Banking Co., of Georgia, 30,000 to Savannah, Florida and Western Railroad, and 50,000 to New York Central and Hudson River Railroad, making an aggregate of 160,000 pairs.

The Duluth Iron and Steel Company, of Duluth, Minn., have let the contract for three 18 x 60 fire-brick hot-blast stoves to Gordon, Strobel & Laureau, Limited, of Philadelphia, together with other work. The stoves to be erected are of the Gordon-Whitwell-Cowper type.

The Cartwright Iron Works, better known as the Alikanna Mill, situated about 2 miles east of Steubenville, is to be started up on Monday, April 1, by the National Tube and Rolling Mill Company, of McKeesport. This mill was originally built with 12 single puddling furnaces and two trains of finishing rolls. The main product was to turn out light iron, with cotton ties as a specialty, but since the spring of 1882 it has been idle. It has been enlarged recently and there are now 20 single and one double puddling furnaces, with a capacity to turn out about 45 tons of muck iron a day. All of this iron is to be rolled into pipe iron and shipped to the pipe mill at McKeesport.

At the annual meeting of the St. Louis Ore and Steel Company, held at St. Louis recently, the following board of directors was elected: R. M. Olyphant, H. G. Marquand, Le Grand B. Cannon, M. Dwight Collier, R. M. Hoe, Jr., R. S. Grant, Geo. B. De Forrest, E. A. Hitchcock, O. L. Garrison, Geo. Henry Warren, Jr., H. M. Olmstead, Solon Humphreys and Chester Griswold.

Notices have been posted in the rolling mills of the Columbia Iron Company, at Lancaster, Pa., that after April 6 \$3.50 per ton will be paid for puddling iron and other ton men in proportion. The management say that either a reduction or complete shut-down is necessary. The Penn Iron Company, of that city, have also posted the same notice of reduction.

The strike at the Wheeling Steel Works, at Wheeling, W. Va., which was inaugurated on January 1 last, has finally been settled by the signing of a wages scale substantially the same as that of last year and the reinstatement of all old employees. The Knights of Labor controlled the mill last year, but the Amalgamated Association presented a scale for the new year and, on its rejection by the firm, ordered the strike. The present agreement was made with the employees irrespective of organization, and holds good till December 31.

The works of the Novelty Steel Wheel Company, recently organized at Pittsburgh, will be located at Bissell, on the Baltimore and Ohio Railroad, about 15 miles from Pittsburgh. The works will consist of an ironclad building, 50 x 200

feet and two stories high. The following officers were elected at a recent meeting of the company: President, W. W. Acheson, of Pittsburgh; vice-president, William O'Bryon, of McKeesport; secretary, Joseph Painter, of Kittanning; treasurer, James L. DeLong, of McKeesport; superintendent, John McGeorge, of Washington.

G. E. Beach, P. Durack and John Taylor are a committee for the organization of the Minneapolis Iron and Pipe Works, with an office at 306 Hennepin avenue, Minneapolis, Minn. It is proposed to establish in or near Minneapolis works for manufacturing cast-iron pipe for gas and water, waste-pipe for buildings, &c., the plan being to start during the present season with a paid-up capital of not less than \$50,000.

H. S. Fleming, superintendent, reports that No. 1 Furnace of the Cameron Iron and Coal Company, at Emporium, which was blown out for some weeks for repairs, resumed on the 11th inst., and is now doing good work in foundry iron.

The Fowler Steel Car-Wheel Company, of Chicago, have determined to erect a steel plant to make steel by the Robert process, introduced into this country by J. W. Bookwalter. They will make steel exclusively for their rolled steel car-wheels, casting the blanks in a steel foundry which is also to be erected at their works. They will at first put up one converter to hold a charge of 1½ tons, but their plans provide for two converters. Their foundry when fully completed will have a capacity of 250 wheel blanks a day. Contracts are being made this week for the buildings and machinery. The company hope to have their steel plant in operation by the 4th of July.

Machinery.

The Cleveland Twist Drill Company, of Cleveland, have moved from their old quarters to their new and commodious shop, corner of Lake and Kirtland streets, in that city. They have added new machinery to their already large plant, and expect to double their capacity in the next six months. They have been established since 1874, and their products are shipped all over the country.

The Aetna Machine Company, of Warren, Ohio, recently received an order from the Eureka Iron and Steel Company, of Wyandotte, Mich., for one of M. V. Smith's gas furnaces, producer and valves.

Francis Whitaker & Sons, of East St. Louis, have placed their order for all their steam pumps for their new packing house at Wichita, Kan., with the Laidlaw & Dunn Company, of Cincinnati, Ohio. All of them are Standard Duplex pumps. The Laidlaw & Dunn Company have also sold two 300 horse-power Galloway boilers to the Geo. H. Friend Paper Company, of West Carrollton, Ohio, for their new paper mill.

An order has been received at the machine shops of the Pennsylvania Railroad Company, at Altoona, Pa., for 15 new class "A" anthracite locomotives. It is stated that another similar order will follow at an early date.

Within the last six weeks the Westinghouse Machine Company, of Pittsburgh, have shipped 13 steam engines, each of over 200 horse-power, to foreign countries. Six of them went to London, England, to be used on electric light plants; one was sent to Truro, Nova Scotia, another to Chili, one to Montreal, Canada, and two to Toronto, Canada; one to Copenhagen, in Denmark, and the last one went to Moscow, in Russia.

The Porter Foundry and Machine Company, of Allegheny, Pa., have completed their contract for the engines, boilers and special machinery for the Howard Plate

Glass Company, of Duquesne, Pa., and have just contracted to build eight pairs of their engines and four extra boilers, making 18 in all, for the Standard Plate Glass Company, Butler, Pa.

The St. Louis Iron and Machine Works, of St. Louis, Mo., again have a contract for a hydraulic brick press, which they are to furnish within 60 days. They are also building two of their own Lion dry presses. They have built all the hydraulic presses now in use.

W. F. Sauter, of the firm of Godfrey Rebmann & Co., has purchased E. L. Harrington's interest in the business of The Moore & White Company, manufacturers of friction clutches, &c., 1812 Buttonwood street, Philadelphia.

William Tod & Co., founders and machinists, of Youngstown, Ohio, are building a pair of blooming mill engines for the Chester Rolling Mill Company, at Chester, Pa., which are worthy of special notice. The bed is 30 feet long, and is extended so as to carry the countershaft, all formed from one casting. The cylinders are 30 x 48 inches, and the two engines are solidly joined together so as to act on the shaft. The links are supported centrally and the reversing gear is controlled by a hydraulic engine.

The employees in the machine shops of the Pennsylvania Railroad Company, at Altoona, Pa., have been notified that hereafter nine hours will be considered a day's work, with a half-holiday on Saturdays. This affects about 4000 men.

Sebastian, May & Co., of Cincinnati, Ohio, are sending out a "sheet" of illustrations of their improved machines. The sheet just received is devoted mostly to lathes, from their 8-inch hand lathe to their new 18-inch power-engine lathe. There are also shown drill presses, engines and boilers, portable forge, emery grinding machine, &c.

We have received from the Babcock & Wilcox Company a copy of their new edition of "Steam," which has been rewritten and enlarged by the addition of new matter. Although this book is issued primarily in the interest of the Babcock & Wilcox boilers, yet it has always contained so much original matter of direct value to the engineer as to make it in many respects a standard of reference. We congratulate our contemporary "Steam" upon its enhanced value and improved appearance, especially in regard to board covers within which it is now incased, and expect to soon avail ourselves of its courteous invitation to select from its columns.

The Cady Mfg. Company, of Cleveland, Ohio, have recently incorporated, and elected as officers R. C. Moody, president; Frank P. Cady, vice-president, and Irving A. Brown, secretary and treasurer. They will engage in the manufacture of machinery and will make a specialty of machines for the working of wire into all of its forms. Mr. Cady, who has charge of the mechanical department, is well known to the trade as being the inventor of the link barb fence and numerous other inventions in wire. The new company have already secured contracts for building machines for the manufacture of wire chain and wire coat and hat hooks which will keep them busy for two or three months to come.

There is a movement on foot among the manufacturers of wood-working machinery to hold a convention for the purpose of discussing matters relating to their business. The aim of the projectors is to bring about a proper adjustment of the conflicting opinions as to the best methods of serving their customers. Lumbermen and wood-workers are to be consulted in order to better understand their wants,

that improvements may be made and a uniform standard be adopted in quality, sizes and systems. The Egan Company, of Cincinnati, Ohio, have taken the initiative in this direction, and are bringing about the necessary steps to have the builders of wood-working machinery come together at an early day.

The Pond Engineering Company, of St. Louis, Mo., have just issued a catalogue describing their system of steam plants for driving dynamos. This company are prepared to furnish and erect high-speed engines, Corliss engines, steel boilers, water-tube boilers, furnaces, heaters, pumps, injectors, belting, pipework, foundations, &c.—all specially adapted for electrical service.

Riehle Bros., Philadelphia, report the following orders: A 20,000-pound horizontal testing machine for the Bridgeport Brass Company, Bridgeport, Conn.; a 20,000-pound vertical testing machine for the United States Naval Academy, Annapolis, Md.; one rope twister to Columbus Iron Works Company, Columbus, Ga.; one turntable and two pig-metal trucks for the New River Mining Company, Ivanhoe, Va.; a furnace charging scale each to the Stickney Iron Company, Baltimore, Md.; to the Mont Alto Iron Company, Mont Alto, Pa.; to Joanna Furnace, Joanna, Pa., and to the Struthers Furnace Company, Struthers, Ohio; one 200-ton forcing press to Providence, R. I.; two 4000-pound rolling mill scales to Newark Steel Company, Newark, N. J.; one 30-ton railroad track scale to the Phoenix Iron Company, Phoenixville, Pa.; a pipe proving press for the Pennsylvania Pipe Mfg. Company, and platform scales to Johnson Foundry Company, Johnstown, Pa. This firm have recently filled large orders for their platform scales for South America.

Hardware.

St. Louis Shovel Company, St. Louis, Mo., during the past month have doubled their capacity by the introduction of considerable new machinery. They report the outlook as very promising for a large spring trade.

The I X L Pump, Lumber and Mfg. Company, Goshen, Ind., in addition to their line of Wood Pumps, have recently added sash doors, blind and screen doors, and are also giving attention to furnishing building materials, all of these lines being represented in the catalogue which they issue.

Wood, Smith & Co., Fort Plain, N. Y., announce that a slight fire occurred in the foundry department of their spring and axle works on the night of the 19th inst., but that they will be in full operation again in a very few days, and that they have a large stock of goods and boxes on hand, there being but little interruption in their business.

F. F. Adams Company, Erie, Pa., report that they are fully occupied in filling orders for milk shakes, cork pullers, wringers, &c.

The Enterprise Mfg. Company, of Philadelphia, report that notwithstanding their strike they are now running 36 parties. They have contracted with outside parties for 100 tons of castings, which are being furnished them in regular shipments. Last week the strikers attempted to intimidate the new men, but one of the leaders was arrested and placed under bail, which terminated this effort on their part. The company announce that it is their intention to run their foundry independent of any labor organization.

Miscellaneous.

At the annual meeting of the Republic Iron Company's stockholders, held recently at Cleveland, Ohio, the old board

of directors of the company was re-elected to serve for the ensuing year, and at the meeting of the board to choose officers of the company which followed the old officers were also elected for another year. The board of directors is as follows: Charles Hickox, Peter White, J. V. Painter, Charles G. Hickox, G. W. R. Matteson, Henry B. Perkins, Samuel P. Ely, Joseph Perkins, William D. Rees. The officers are: President, Chas. Hickox; vice-president, Samuel P. Ely; auditor, Douglas Perkins; secretary, treasurer and general manager, William D. Rees.

St. Louis Lead Company, St. Louis, Mo., manufacturers of babbitt metal and solder, are running full time and have enough orders booked to occupy them actively for the next three weeks. They make a specialty of fine engine babbitt, for which they have a large trade.

THE WEEK.

California expects to gather three months hence the largest wheat harvest ever seen in the State. The fruit crop will include 1,000,000 boxes or 2000 carloads of oranges.

The firm of Henry R. Worthington, of this city, who put the pumps in the Inman steamship City of Paris, received a cable dispatch that the vessel made 22 knots an hour on the trial trip, and the machinery and pumps worked satisfactorily.

An illustration of the demand for American products which exists in foreign countries is given in an account that Sir Charles Dilke has recently written of a trip which he made last fall to the Afghanistan borders of India. The Indian Government is building railroads well into the domain of the Afghan Ameer, for the defense of India against a future Russian attack. To complete this strategic system a long railroad tunnel has to be constructed, and Sir Charles in visiting this work noted with surprise that the timber used for bracing and lining this extensive work was all brought from Washington Territory.

Gen. R. A. Alger, of Detroit, has made large purchases of timber and coal lands in Tennessee.

Although it was recently reported that one of our principal railroad companies had become dissatisfied with iron ties after experiment, C. P. Huntington says he will use iron ties for his entire system known as the Southern Pacific if he can get moderate American prices.

In the Canadian Parliament a protracted discussion upon the subject of unrestricted trade with the United States has just closed, giving an opportunity for the Montreal *Casette*, Government organ, to remark that the effect will be good: "Let it be grounded in the minds of the electors that free trade with the United States involves disruption of British connection, the opening of our markets to the surplus products of the neighboring republic, the surrender of tariff control, the imposition of the high American tariff, and resort to direct taxation in exchange for the liberty to send a few products across the line free of duty, and there need be no fear of the result of an appeal to the country on this issue."

A suit to test the constitutionality of the Chinese exclusion act is on trial in the Supreme Court in Washington. The appellant is a Chinese laborer, whose certificate entitling him to a domicile in the United States, obtained in accordance with law, was declared void by the Collector at San Francisco. Solicitor-General Jenks has filed the brief for the Government and is assisted in presenting the case

to the court by Hon. John F. Swift, of California, the recently appointed Minister to Japan. The brief for the Chinaman is filed by Judge George Hoadley and James C. Carter, of New York.

It appears from the complaints of stockholders that a great deal of money has been made and squandered by persons interested in what is known as Leaycraft's invention, consisting of a kind of aerial railway which has been introduced in stores in New York, Philadelphia and Boston as a substitute for "cash boys." It is now alleged that the property is being wrecked for the purpose of creating a monopoly.

Several Japanese nobles from Tokio, after examining American naval vessels and equipments, will leave this city for France, where two vessels of 8000 tons are building for the Japanese navy.

The Naval Board at Washington report that the gunboat Yorktown has been completed in accordance with the contract.

Chief Engineer Green, of the Dock Department, contends that piers in New York City should be 700 feet long. It becomes the duty of the Secretary of War to see that the navigable waters of the harbor do not suffer from encroachments.

It is conclusively shown that the gold mining excitement in Lower California, which has paralyzed all legitimate business on that part of the Pacific Coast for some weeks past, is part of a scheme to promote colonization and other speculative objects. San Diego, where Boston parties are largely interested, is charged with sharing in the responsibility for the craze which has proved disastrous to many rash adventurers.

The enormous cost of the "Q." strike is phenomenal in the record of labor disturbances. The detailed statement of expenses which the Chicago, Burlington and Quincy gives in its annual report presents, when compared with 1887, many striking facts. The engine service increased by \$1,078,404 to \$4,177,948; repairing locomotives increased by \$871,872 to \$1,333,494, and miscellaneous loss and damage increased by \$623,877 to \$936,660. Here are three items of increase mainly due to the strike, amounting to \$2,074,365. Boston believes that "as the outside lines must have lost by the strike a million more in increased expenses and loss of business, the total cost of this strike must have been not far from \$5,000,000, or 6½ per cent. upon the share capital."

The Phoenix Bridge Company have completed a 3-span iron bridge across the New River, at River View, W. Va., for the Chesapeake and Ohio. One span is 300 feet long, one 250 feet, and the other 200 feet. Over 40 new iron bridges of all sizes on the line of the road are being built by the Phoenix Bridge Company, the Edge Moor Bridge Works, and the Passaic Rolling Mill.

The Southern negro being to such an extent "a producing automaton," there are some who regard his position to-day as one of no small danger, if not from an increase beyond the demand for labor then by reason of the introduction of labor-saving machinery. A South Carolina paper says: "One important source of his earnings is cotton-picking, on which he earns, at a low estimate, \$5 per bale of lint cotton. A machine has been invented and perfected up to the point of an entire working success which will pick the cotton as it stands at a nominal cost and dispense with all hand work. The general use of such a machine would save, upon a crop of 6,000,000 bales, hand-picking which now costs \$30,000,000 per annum. This machine could become available to the smallest planters through hiring it as

reapers are now hired." Respecting the destiny of the negro, the fact is significant that after 25 years of freedom the colored race in South Carolina own only about 5 per cent. of the entire cotton lands, including those that were so held before the war.

A letter from Honduras speaks of the exceedingly primitive condition of that country, and particularly of the lack of the means of internal communication, closing with the statement that "with a position unequaled, a climate adapted, as one might say, to every caprice, the finest forests of the earth, untold mining wealth and opportunities for agriculture, it can be but a few years before Honduras will take the first place among the republics between the Rio Grande and the Isthmus."

One of the deck spans of the New London bridge across the Connecticut River has been erected, and it is hoped that all the superstructure will be up and ready for trains before the end of July. This bridge is remarkable as having the heaviest and longest draw span yet undertaken anywhere in the world, being 503 feet between centers and carrying two tracks.

The contractors for convict labor at the State prison in Trenton, N. J., have unanimously refused to renew their contracts with the State unless the law of 1887 governing the same is repealed. That law requires that all goods made in the prison shall bear a tag, stamp or label showing that they are manufactured in that institution. The contractors say that the mark will greatly lessen the sale of the goods and cause prices to deteriorate.

Claus Spreckels, just from Honolulu, says the Hawaiian sugar crop will be about 125,000 tons, the largest ever known.

The trustees of the I. V. Williamson Free School of the Mechanical Trades have purchased about 205 acres of land in Delaware County, Pa., between Elwyn and Glen Riddle, and about a mile and a half west of Media, as a site for the institution. The average price was about \$225 an acre.

Thirty additional electric cars, to be used on the Fourth and Madison avenue surface road, have been ordered. They will run with the storage battery system.

The Government proposes to expend \$6,200,000 in fitting League Island for a naval station, making it the most important in the country. Jas. E. Simpson & Co., of New York, have contracted to build a dry dock to cost \$550,000, and are making the preliminary borings, which are unexpectedly favorable. It will be a wooden structure, 500 feet long, 130 feet wide in the body, 80 feet at the entrance, and will accommodate at low tide a vessel drawing 25 feet of water. From the floor of the dock to the upper edge will be 35 feet, perpendicular height. The material employed will be yellow pine and oak.

A movement has been begun in Paterson, N. J., for the establishment of a technical school, where designing, weaving, dyeing and furnishing will be taught. The movement is a strike at trades unions, which do not allow more than one apprentice to a certain number of weavers. "The aim is to broaden the scope and enlarge the field, and have a market abroad for the goods we manufacture at home."

In the thriving town of Charlotte, N. C., a number of sites have been placed at the disposal of the Chamber of Commerce, to be donated to manufacturers who will locate there permanently.

Three successive gas explosions in the electric subway near the junction of Broadway and Fifth avenue on Monday afternoon have thoroughly aroused the Subway Commissioners to the necessity for measures to prevent their recurrence, and

the Board of Electrical Control has notified the several gas companies that they must take immediate steps to prevent the escape of gas from their mains. No live wires are in the subways blown up by these repeated explosions. The plan is to force air through them by steam power.

The Secretary of the Navy has approved the report of the trial board of the York town, and the vessel, including her fittings and machinery, will be accepted, subject to the special reserve of \$20,000, and to a further reservation of \$5000, to be held until the lighting plant shall be completed and tested.

Bills from New York City introduced into the Legislature propose appropriations aggregating \$19,541,000. If they become laws the city debt will be increased to within \$4,000,000 of the amount limited by law, which is 10 per cent. of the valuation of the real estate.

The students in mechanical engineering in Cornell University are going through the principal industrial works in this city, and find much to engage their interest.

The entire work on the Panama Canal was inspected by Captain Edwards, of the British steamship Jamaica, arrived at New Orleans. He says that large quantities of abandoned machinery are strewn on the line of the canal, on which steam had never been raised.

The famous mansion in Elizabeth, N. J., known as "Dimmock's folly," built at a cost of \$240,000 by Anthony W. Dimmock, at one time president of the Pacific Mail Steamship Company, has been presented to the city by Joseph A. Batten, a wealthy citizen, and will be devoted to educational purposes.

After nearly three months of dilly-dallying in the New York Legislature, a bill designed to restore productive labor in the prisons has been made the special order for to-day. The bill was reported from the Assembly Committee on Prisons by Mr. Savery and provides that the Superintendent of Prisons, the President of the State Board of Health, the President of the State Board of Charities and the Commissioner of Labor Statistics shall constitute a board to determine the number of convicts that may be employed in any single industry, and to select such industries as may be carried on in the prisons, choosing those which shall least conflict with outside labor. There are strong hopes that this measure or its equivalent in some shape will be passed through to success.

Work is in progress in erecting the iron superstructure for the new elevated railroad in Fifth avenue, Brooklyn.

A renewed effort is making to utilize the swamp lands adjacent to the Brooklyn Navy Yard, and it is intimated that the Washington authorities may soon decide to relinquish all title to the same, so that a park may be laid out or market buildings erected, or that a temporary lease of these lands to the city may be executed, with the understanding that in case of war the use of the property shall revert to the Government.

Mexican papers remark that American capital is being withdrawn from that country, and that English capital is coming in, controlling mines and railroads. The Central Railway line has become substantially an English corporation, and the Inter-oceanic Railway is now owned in England. Millions of dollars have been loaned for the drainage of the Mexican capital. Besides, vast tracts of land in the border States have passed into the possession of Englishmen. The *Financier* says that the English are acquiring a hold on the transportation system of that country that can never be shaken off.

The Iron Age

New York, Thursday, March 28, 1889.

THE IRON AGE INDEX.

The Index for Vol. XLII is now ready, and will be sent to subscribers on application.

Two Supreme Court Decisions.

We noticed in our news columns recently the decision of the United States Supreme Court in the case of the Liverpool and Great Western Steam Company *vs.* the Phoenix Insurance Company. The points of the case make it an important one to all shippers. The point of most consequence to the public was clearly before the court. This was the right of the steamship company to exempt itself by a bill of lading from liability for its own negligence. On land, in spite of some doubtful decisions, the courts have very generally held that a carrier could not plead the bill of lading in cases where damages occurred through its own negligence. On the seas, however, the reverse has been the case. Every conceivable marine risk has, by slowly-growing custom and by terms of the marine bill of lading, been shifted from the ship to the owner of the goods. A clause in the bill of lading relieves the company from loss arising from the negligence, default, or errors in judgment of the navigators of the vessel. In the present suit it was proved that the stranding of the ship *Montana* on the coast of Wales was due to negligence, so the ship-owners fell back upon the bill of lading. The Supreme Court enters into a long and exhaustive consideration of this clause, and reaches the conclusion that the fundamental principles of transportation will not permit any carrier, by land or by sea, under any circumstances, to contract to escape payment of losses due to its own negligence.

It must be confessed that to an unprejudiced mind the carriers by water appear to have long had things too much their own way. Limitation has followed limitation until no liability at all was left. Our merchants who ship largely abroad or on our inland lakes will be glad that marine risks will now be put upon a footing equitable to both carrier and shipper. The alarm felt by the steamship people seems to have somewhat subsided. Even under the new construction, the fact of negligence must be proved against the officers of a vessel before recovery is possible. The utmost effect, therefore, will be the shifting to the ship-owners of part of the expense of the insurance for the possibility of getting back the amount of the policy in cases of negligence and will probably result in a lowering of the insurance rate.

Another decision of the same court is in the same line. The case of *Inman vs. the South Carolina Railway* turned upon the

subrogation clause in bills of lading. These generally contain a clause to the effect that the carrier shall have the benefit of any insurance which may have been effected upon the property destroyed. The New York Court of Appeals and other courts have upheld the right of the railroads to make such a stipulation. The insurance companies, alive to the situation, also inserted clauses in their policies to the effect that they (the insurance companies) should, in case of loss, become owners of any claim which shippers might have against the offending carrier. These contradictory clauses have caused much confusion, both railroad and insurance companies insisting upon their contracts, each against the other. The Supreme Court now settles the general principle by affirming the right of the owner to sue the railroad for his loss (in this case cotton destroyed carelessly by fire) in spite of the subrogation and allowing the owner's claim against the insurance company to wait until the measure of the carrier's liability could be judicially determined. This is in line with common sense, which forbids any technical discharge of a railroad from its common law liability for damages to goods in its keeping. If any company should pay for a loss caused by negligence, it should be first of all the company which was negligent.

American Tin Plates.

President O. W. Potter, of the North Chicago Rolling Mill Company, states that one of the purposes which he expects to see accomplished by the consolidation of Chicago steel companies is the manufacture of tin plate. The erection of a special plant devoted to this object is seriously contemplated. The field is an inviting one to enter, because tin plate is not now manufactured anywhere in this country, while the consumption is enormous, furnishing a large business to the tin-plate works of Wales and England. Every other branch of the iron and steel industry has been thoroughly established on this side of the Atlantic, and our productive capacity is in excess of the present demand in almost every line. An American establishment which could manufacture tin plate at even a slight profit would for some considerable time enjoy a trade largely its own. Mr. Potter believes that the high quality of Lake Superior ores would produce a steel eminently suitable for the production of sheets to be coated with tin. Some of his new associates in the consolidated companies are known to have been very strongly impressed for a long time with the desirability of domesticating the tin-plate trade, and have given the subject much thought and careful investigation. The ample resources at the disposal of this great organization, together with the strong array of mechanical skill and scientific attainments which the combined forces of the three companies will muster, should certainly be able to satisfactorily solve the problem how to produce tin plate here in successful competition with the foreign article. If the depressed condition of the steel-rail industry and the enforced search for other avenues of trade should lead to the creation of a new and most important industry, the decline in rails will indeed prove to

be a blessing in disguise. President Potter and his associates will deserve much credit if this result is accomplished through their efforts. In 1865 Mr. Potter was present at the rolling of the first steel rail made by an American mill, and he asserts that there is quite a strong probability that he may witness the first American tin plate made in the successful introduction of the business on a sound commercial footing—and Chicago the scene of both achievements.

Rapid Transit in New York.

Any thorough and well-considered plan for rapid transportation in this city must have reference not only to durability of construction, but must provide for demands based on calculations of future growth. There is no reason why New York should not become one of the most populous centers on the globe, attracting to itself trade and population from across seas and continents. The topography of Manhattan Island is such that the main thoroughfares must of necessity be longitudinal rather than lateral. Moreover, it is obvious that all obstruction to the most feasible route, whether natural or artificial, above ground or subterranean, must eventually yield to the pressure for right of way and at whatever cost. Within a comparatively brief period we have seen the entire shipping of the harbor, with few exceptions, change from wooden sailing vessels to great iron ships propelled by steam. In like manner the advent of the steam motor for land transportation and of cables and electricity must speedily drive out all antiquated methods. The horse-car must go, following the omnibus. The extent to which property valuations are influenced by facilities for transit—always a primal consideration—is indicated by the single statement that in the four years immediately subsequent to the opening of the elevated railroads, from 1879 to 1882 inclusive, the assessed valuations of real estate in the city of New York increased by the sum of \$134,848,316. During the following four years—from 1883 to 1886 inclusive—the increase of assessed valuations of real estate in the City of New York was \$178,544,062, making a total increase for eight years of \$312,892,678.

The ability of a passenger to move 11 miles in 33 minutes—that is to say, from Wall street to 155th street—and to make this change of locality without personal discomfort is a commercial fact of wide significance in its bearing upon local improvements. Of late the necessity for improved rapid transit has come prominently into view. Not to speak of the financial success of Jacob Sharp's Broadway scheme, which must have whetted the appetite of investors, ex-Mayor Hewitt boldly put himself on record as favoring heroic methods. He is a full believer in a viaduct system at any cost. More recently came a decision from the Supreme Court, summarily sweeping away several moribund projects and by removing legal impediments inviting new enterprise. Mayor Grant next appears in the arena, warmly espousing the cause of rapid transit and urging the need of improved facilities. At this point Jay Gould becomes apprehensive lest some formidable rival should impair the value of his interests represented by the elevated railroads. Addressing Mayor

Grant in a carefully prepared communication, Mr. Gould claims from the people of New York some consideration for his property. The Manhattan road, in his judgment, offers a solution of the whole difficulty. He shows that on an extraordinary occasion they can, even with their present equipment, transport 700,000 passengers a day. Only grant permission to put a third track on Third and Ninth avenues, with adequate terminal facilities at City Hall Park and the Battery—"loops," as he calls them—and the thing is done. But Mr. Gould's methods are severely criticised, and his judgment called in question. Obviously no temporary expedient or make-shift will satisfy the clamor for works of a permanent character, adapted to the future wants of a city already imperial in its greatness, although yet only on the threshold of its existence. To provide for generations yet unborn is less a source of worry with some people than the more pressing question of fat dividends for those who yet survive. As the case stands viaducts have the preference.

Four Years of Gold and Silver Production.

Silver has so far this year been remarkably steady in the London market, the ounce being worth 42½d on January 1 and 42½d on March 22. The only thing of interest that occurred having a bearing on the silver question has been an application to the German Treasury office by Rardroff, the bimetalist, and consorts requesting the same to induce the Federal Council to declare its readiness to co-operate at any time with England toward the restoration of silver as a standard should the latter take the initiative in the matter. The treasurer declined to make any such declaration beforehand; it would be different, he added, if the German Parliament passed a resolution to that effect. Meanwhile some additional light has been thrown on the silver question by the publication in detail of the production of the precious metals at large during the four years 1884 to 1887, both inclusive, and certain figures published by the Indian Government. The production of the precious metals in different countries was as follows:

United States.					
Gold.			Silver.		
	Kg.	Dollars.	Kg.	Dollars.	
1884....	46,244	32,500,000	1,174,206	44,000,000

1886....	149,355	104,200,000	3,027,632	106,320,000	
1887....	149,048	101,400,000	3,259,144	107,550,000	

Proportion of Value.

	Percent.	Percent.
1884.....	51.8	48.4
1885.....	50.8	49.4
1886.....	50.7	49.3
1887.....	48.6	51.4

The international trade balance of British India was as follows, in thousands of rupees:

	Export.	Import.	Excess of export.
1872-1877. { average }	591,870	356,500	235,370
1885-1886....	838,810	556,590	282,220
1886-1887....	884,700	617,770	266,930
1887-1888....	905,440	650,050	255,390

The movement of precious metals and council bills was:

	Excess of gold import.	Excess of silver import.	Council bills.	Average exchange.
1872-1877. { average }	15,102	83,214	146,824	21.87
1885-1886....	27,630	116,000	152,380	18.25
1886-1887....	21,770	71,500	175,340	17.44
1887-1888....	29,890	92,190	216,240	16.89

The trade balance of India is becoming more unfavorable to it, and the money required to cover current indebtedness in England cannot be covered any more as easily as formerly by an increased export of merchandise. This is one of the chief causes why the exchange has been steadily drooping. In other respects the silver question is such a complicated one in that vast and populous country that economists and financiers in England and India have arrived at the conclusion that nothing can be mended by interference, least of all by bimetallic interference, and that in monetary matters India must be left to shift her own course as well as she can. Besides, circumstances bearing on the question are continually undergoing modifications in India, baffling the keenest financial forethought. Hence bimetallics can draw little to comfort and support them in their schemes from the Indian aspect of the silver question, much to their discomfiture and annoyance.

An apparent paradox is noted in the price ruling for old iron rails. When they are scarce they are cheap, and when they are abundant they are dear. The supply is limited at present, and yet prices cannot be advanced above a certain point, which seems to be established by the relative price of other raw irons, and not by the laws of supply and demand as applied directly to old rails. They are a commodity advancing and declining in value in sympathy with the prices of other materials. Hence occurs the paradox, the explanation for which is simple. Extensive renewals of railroad tracks almost invariably occur when times are very prosperous, when prices are high, and when the demand for finished products at high

prices absorbs the supply of old rails taken up and for which correspondingly high prices are paid. They are then abundant yet dear. When times are hard, however, the forced economy of railroad companies interferes with renewals, the quantity of old rails thrown on the market is small and prices of finished product compel the manufacturers to beat down the cost of the materials they use. Old rails are then scarce but may be and often are quite cheap.

The Western Cut-Nail Trade.

Again the condition of the Western cut-nail trade has exhibited the singular features which have so often characterized it at this time of the year. For almost four months the factories in operation have been filling the orders which were taken in November and December at the extremely low prices which then prevailed. Those prices were declared at the time to be under cost at the best equipped factories, even those controlling their own steel supply and manufacturing their own pig iron. So unsatisfactory was the outlook at that time that some of the largest manufacturers announced their intention of running only part of their machines during the winter. They alleged that while they desired to retain their hold on the trade they could not afford to run to their full capacity on account of the very heavy loss which they would thus suffer. Yet they and their associates were apparently unable to resist the temptation to book large orders offered them, even if they could not figure out actual cost received. They were not satisfied to fill a present demand when they were taking orders in November and December, but they anticipated the future and glutted every distributing channel with nails enough to last well into the spring.

After having booked orders from everybody in the trade who could be influenced, these manufacturers put in operation the rules and regulations of an association they had organized for the purpose of "improving the condition of the trade." They made quotations for new business and adhered to them strictly. For months there has not been a whisper of cut prices by Western manufacturers belonging to this association. A few concerns outside of the organization have made some slight disturbance, but hardly enough to excite apprehension. An advance of 5 cents in the card was made, and this has been adhered to. But how much new business has been taken? If the reports of accredited agents are strictly correct, all the orders taken by the united factories since the association was formed would hardly keep one factory of any decent size in operation. The manufacturers have not been able to sell to any extent because their quotations have been above the price at which dealers were able to sell and make a very fair profit. The contracts with the factories which the dealers made have enabled them to sell a brand of nails from 5 to 10 cents per keg cheaper than the manufacturer himself could, and the orders on which he bid and was beaten have been filled from his own warehouse at his loss and the dealer's profit. An illustration of the way in which these contracts for future delivery were made in November came to our notice during the past

week. A manufacturer quoted the card rate to a small dealer who inquired the price of nails. The price named amused the dealer, who said he could beat it some 10 cents or more. Being pressed for an explanation, he said he had an unfilled contract for three carloads of nails which was made last November. The contract was really an option, to be filled at his own discretion, without limit as to time, the dealer's trade in nails being so small that a carload would last him for months. How many such options were among the "orders" booked in November and December there is no way of finding out, but until they are closed the trade can hardly be said to be in good condition or to be in shape to get into good condition.

Yet with all this to contend against there is really a faint appearance of improvement. Stocks in the hands of the large dealers are undoubtedly running low and their contracts with the factories are expiring, as is shown by the gradual growth of a firmer feeling among them. The renewal of contracts at higher prices looming up in the near future would be very likely to have this effect. If the associated manufacturers are now able to maintain their organization and will faithfully adhere to their adopted scale of prices, even though orders may be withheld for a time, or massed on a particular factory to create the impression that prices had been broken, they can possibly work their trade up to a profitable point. But much better management is needed than was shown last fall, or, in fact, for several previous seasons.

The fourth number of the *Technic*, the annual of the Engineering Society of the University of Michigan, contains many interesting and valuable contributions upon timely topics. The work most appropriately opens with an article, accompanied by portrait, giving the main facts in the life of Charles E. Green, who has for 16 years been connected with the University as Professor of Civil Engineering. Following this are articles upon cements and the raw materials from which they are made; ventilation of houses; a graphical treatment of a retaining wall for earth; long-distance distribution of electric energy; dynamics of reciprocating engines; blue printing, and a notice with portrait of the late Prof. Byron W. Cheever. The number closes with an illustrated description of the new physical laboratory and the engineering laboratory. The latter is divided as follows: Mechanical and steam engineering, machine-shop, carpenter and pattern-shop, forge and foundry, engine-room, drafting-room. The mechanical and steam engineering laboratory will eventually contain all the apparatus necessary for conducting experiments to determine the efficiency of machines and to make tests of the machines employed in engineering construction. The tests will be conducted by the professor giving instruction on the work involving the tests.

The Louisville Realty and Improvement Company, of Louisville, Ky., are a corporation recently perfected in that city. The company are capitalized at \$1,000,000, and have purchased land worth \$700,000 on the western boundary of the city and situated on the Ohio River. This company was projected to secure the establishment here of the American Fire-Proof Steel Car Company by offering them a manufacturing site and other inducements. This latter company, who have a capital of \$1,500,000, will probably soon begin the erection of shops, as they have a num-

ber of orders for their fire-proof cars from Western roads. The land company have assurances of the erection on their land of a number of enterprises, among them a large steel bridge works who are now at work further North.

CORRESPONDENCE.

Advantages of Manganese in Iron Ores for Furnace Practice.

To the Editor: That manganese is a valuable element in iron ores when present in proper and regular proportions is a fact well known to most of the large steel rail companies of this country who have been in the habit of purchasing large quantities of iron ore containing from 3 to 5 per cent. of metallic manganese, which they use in mixture with other ores containing little or none, in the manufacture of Bessemer pig iron. Many other steel companies who manufacture Bessemer pig iron which goes into nails, billets and merchant steel have recently perceived the advantages of an ore containing 50 to 60 per cent. iron and an average of 4 per cent. of manganese, and its use in Pittsburgh, Wheeling and other Western manufacturing blast-furnace districts has become quite prevalent. It is their practice to use from one-eighth to one-fourth of such a grade of ore on their furnace burden, according as to whether they wish to get one-half of 1 per cent. of manganese in their Bessemer pig iron, or three-fourths to 1 per cent.

Its advantages are twofold: First, in furnace practice, where the presence of manganese in their ore mixture tends to a more rapid working of their furnace, aiding materially the yield of the furnace in the amount of pig iron produced, and also by its action in keeping the lining walls of the furnace smooth and free from agglomerations that are apt to accumulate there. Second, the affinities of manganese for sulphur, oxygen and carbon being very energetic, render the presence of manganese in Bessemer pig iron very valuable to eliminate oxygen in steel, sulphur in pig iron, and for the obtaining of high carburized pig. In the Bessemer converter manganese present in the Bessemer pig iron in the proportion of 0.75 to 1 per cent. prevents "during the blow" the oxidation of so much iron. It prevents the absorption of much oxygen in the bath of steel, and insures more solid steel with less blow-holes and with less oxygen in the final product, which is most important to prevent cracks or flaws in the rolling or hammering of the steel. It is generally accepted that the quality of the steel is improved when made from iron carrying about 1 per cent. of manganese, and most of the Western steel companies find that by careful attention in the use of manganese in the Bessemer pig iron they can use up to 1 per cent. with very good results. Beyond that there is perhaps a loss in metal which is not compensated for by the beneficial effects of the manganese in the pig iron "during the blow."

While, as has been stated above, the advantage of manganese in Bessemer pig iron is now well known and appreciated at most of the steel-converting works, its advantages in foundry pig iron are not as yet so generally appreciated, and yet the presence of manganese in foundry pig iron is most valuable to sound castings. By its fluidity it obliterates the faults of iron too rich in graphite. It takes out the shrinkage of red short iron and makes strong and clean castings. The valuable qualities of the imported Scotch foundry pig iron are well known throughout the trade, and yet few users of this iron are ably aware of the fact that the imported Scotch iron invariably contains from 1½

to 2½ per cent. of metallic manganese. We append reliable analyses of two of the best known grades of imported Scotch iron:

	Coltness.	Glengarnock.
Metallic iron.....	90.26	90.70
Silicon.....	3.89	2.83
Manganese.....	1.77	2.13
Graphitic carbon.....	3.27	2.69
Combined carbon.....	0.60	0.85
Phosphorus.....	0.44	0.54
Sulphur.....	0.04	0.04

Already in the Mahoning Valley there are being manufactured at several of the wide-awake Ohio furnace company plants a grade of iron which goes by the name of the Ohio Scotch, in which they aim by the admixture of iron ores containing manganese in uniform and proper proportions to get an iron which shall be similar to and in some respects superior to the imported Scotch pig iron. They have met with signal success, and their brands are well-known throughout the East as well as in the West as combining softness, strength and fluidity.

It is not alone, however, in foundry and Bessemer iron that the presence of manganese in right proportions is valuable. In mill iron it is equally so, although not entirely for the same reasons. During the process of puddling manganese insures a more complete elimination of sulphur and phosphorus. During the period of boiling it protects the carbon from total oxidation, leaving some in the final product or muck bar, making what is termed fine-grained or steelish wrought iron. The presence of oxide of manganese in the puddling cinder makes the same fluid, and thus prevents an excess of cinder from going into the muck bar. While the manganese melts freely in the puddling furnace, it saves in that process an equal amount of iron, and through its strong affinities for sulphur and phosphorus enables a purer product to be obtained. Abroad on the Continent, when pig iron of inferior quality is used in the puddling furnaces, a certain proportion of maganiferous pig iron is added to the mixture to improve the same. High phosphorus and sulphurous white and mottled pig is puddled with a mixture of a certain amount of low-grade spiegel, and notwithstanding the large amount of impurities in the inferior character of pig used the bar obtained is fairly good, through the beneficial action of the manganese in the spiegel.

The Eastern blast furnace maker would do well to follow in the footsteps of his Western brother by adopting the practice of the use of ores containing manganese, especially as his native ores in most instances contain sulphur in much larger proportion than do the ores used in the West, and, as above stated, manganese is especially valuable for eliminating sulphur in pig iron. EDMUND D. SMITH & Co.

PHILADELPHIA, March 25, 1889.

Louisville, Ky., will soon be using natural gas. The Kentucky Rock Gas Company have persisted, against censure and opposition, and now have the pipe line complete from the wells in Meade County, about 80 miles distant, into the heart of the city, and by the 1st of May or sooner many factories and mills will be using the gas. Some contracts have already been made, and the pressure will be turned on just as soon as the necessary plumbing can be completed. The entire capacity of the present main is expected to be taken by the fall, when additional lines will be laid. The supply of gas in the fields is considered equal to all demands of the city, and the permanency of the supply can only be determined by time.

A corporation, under the title of the Pennsylvania Concentrating Company, is experimenting with the Edison magnetic separator in Washington Township, near Reading, Pa.

The Copper Situation.

What is a Fair Price for Copper?

The great question which the producers and holders of copper will be forced to decide at an early date—so far as the decision rests with them—will be at what price can they hope to inspire confidence among consumers and speculators. Under normal conditions the safe price would be that at which enough copper could be produced at an adequate profit to the mines throughout the world to supply its requirements. There are few commodities with which this price can be fixed with greater accuracy, because in nearly every great producing district of the world, Chili alone excepted, there are public companies whose published annual reports allow of a close approximation to the cost of production. Under ordinary conditions the normal price thus arrived at, approximately, if borne out by a study of the history of the trade during the depression, would represent the figure below which purchases would be safe, providing consumption came up to a fair average. But the present conditions are extraordinary because there has been an accumulation of stock held by parties of whom at least some will be anxious to part with their unusual holdings as soon as they can do it without too great a loss. The amount of the advances made is the most potent factor determining the figure at or near which this copper will be pressed on the market.

All interests point in one direction—the establishment of a low price. If the great mining companies in the world, nearly all of them having been members of the French pool, agree to restrict production, which has its difficulties, and at the same time make the mistake of placing their price too high, they will render a great part of their sacrifice nugatory, because the smaller scattered concerns will not alone continue, but will extend, their operations. They will be the ones to reap the benefit. The leading mines will continue to suffer from the hostile attitude of consumers, and will constantly be tormented by speculators. Safety lies in not alone going right down to that price at which only the best mines can produce with moderate profit, but to cut below it. Any effort to hold above that figure must lead to embarrassment and final discomfiture. The reduction of the output will represent that quantity which the mines are willing and able to let the holders of the stock place on the market.

Turning first to the United States, we may state at the outset that our home consumption, putting it as high even as 130,000,000 pounds, could be covered very easily, without real hardship to the leading mines, at 10½ cents for lake and 10 cents for other brands. At 10½ cents the Calumet and Hecla, the Tamarack, Quincy, Osceola, Atlantic, Central and Franklin mines could live, they representing a total product of about 80,000,000 pounds. At 10 cents for other brands, in Montana the Anaconda, Boston and Montana, Parrott and the mines working chiefly on argentiferous ore could run to full capacity and pay relatively small dividends. They would represent an output of least 90,000,000 pounds. Among the Arizona mines the Copper Queen, Holbrook and Cave, Detroit and Old Dominion could stand up under 10-cent copper and supply the markets with 20,000,000 pounds at least. Add that part of the product of Colorado which is derived from argentiferous ores, and the copper coming from the lead smelters and desilverizers, say 3,000,

000 pounds, and a grand total is reached of 193,000,000 pounds of copper, which could be marketed with present facilities at 10 and 10½ cents respectively, without any loss whatever to the weakest of the mines participating in the product, and with a very good profit to the best-equipped and richest of them. These are not rough guesses, but are based, in the majority of cases, upon actual cost of production. Placing the consumption of the country at 180,000,000 pounds, which is very liberal, we would have available for export 63,000,000 pounds annually, which could be laid down in Liverpool at less than £50 for best tough cake, or, say, £45 for Chili bars, the quantity being, say, 28,000 tons. It is probable, however, that there would be far less pressure to produce than there was during the bonanza year of 1888, and the export would in all likelihood not be more than 20,000 gross tons.

In Europe we must look to the year 1886 to judge of the capacity of the copper companies to meet low prices. In Spain and Portugal, in that year, Rio Tinto dividends went down to 3 per cent. and Tharsis to 7½, while Mason & Barry distributed nothing. The average price of Chili bars during that year was slightly over £40, so that at £45 the three concerns could produce at a moderate profit at the rate of about 50,000 tons per annum, not counting any of the other Spanish mines.

In Germany the Mansfeld Company, with a product of about 13,000 tons, was hard pressed when the price fell to £40, but would certainly continue at £45. Chili fell off rapidly at low prices, but might be expected to supply at least 25,000 tons. The Cape makes good dividends at the lowest prices, and could ship 7500 tons. Australia is weak, and, judging from the Wallaroo and Moonta reports, could not supply more than 7000 tons at £45. Japan has gone right along at a 10,000-ton rate in bad times. Venezuela lost money in former years, but has improved its practice after American models, and might furnish 3000 tons. The Boleo mines, in Mexico, may be credited with 2500 tons; Canada with 2000 tons, of which the bulk comes to this country in the form of pyrites, and Newfoundland may be put down at 1000 tons. Then there are a number of sources of supply, partly local, like the Russian, which would aggregate about 12,000 tons. Summarizing, we have:

	1888.	1886.	At £45 C. B.
United States.....	100,667	69,971	86,000
Spain and Portugal.....	63,800	49,653	50,000
Mansfeld.....	13,380	12,595	13,000
Chili.....	31,240	35,025	25,000
Cape.....	7,500	6,015	7,500
Australia.....	7,450	9,700	7,000
Japan.....	11,000	12,000	10,000
Venezuela.....	4,000	3,708	3,000
Mexico.....	2,766	250	2,500
Canada.....	2,250	1,440	2,000
Newfoundland.....	2,050	1,125	1,000
All others.....	13,288	18,620	12,000
Total.....	260,058	220,102	219,000

It is evident, then, that with copper ruling in London on the basis of £45 for Chili bars, or its equivalent here of about 10½ cents for lake, enough metal can be produced without loss to the mining companies to supply the world with about as much metal as it received in 1886. In that year, with the price averaging £40½ in London, and the lake companies' sales for the year ranging between 10½ and nearly 11 cents as the average, the stock in England and France increased 58,170 tons on January 1 to 63,290 tons on the 31st of December. Assuming that the mines likely to aid the copper holders, with an annual product of 180,000 tons, are willing to cut down production 20 per cent., equal to 36,000 tons, the relief would be inadequate. It is estimated by James Lewis & Son, of Liverpool, high authorities, that the total stock is now 175,000 tons. Even granting that

100,000 tons be regarded as a quantity which the trade might carry fairly well, if widely distributed, we have 75,000 tons which must be pushed into consumption in two years. Even putting the matter in its most favorable light, that low prices would stimulate the consumption, say to the extent of 20,000 tons, even then over a year of restricted output would have to continue before the stock became manageable, and that always assuming that the basis be fixed as low as £45.

Ten-cent copper may seem startling to the mining companies, but unless they apply the heroic treatment indicated, and perform the part at the same time of dwelling in harmony together for a year of curtailed output all over the world, the present agony will be prolonged for years. We believe that the situation warrants the conclusion that no buyer, whether it be of the crude metal or of manufactured goods, is entitled to feel safe over his purchase if it was made above the basis of 10½ cents for lake or £45 for Chili bars.

Can the Mines Agree to Reduce Output?

These views are strengthened by further considerations. It is not an easy matter for some of the mines, notably in the Spanish Peninsula, to restrict production, even if they earnestly desire it. With all of the American copper producers, the copper in the ore is extracted in a relatively short time after it has been hoisted. In the great Lake mines the rock is crushed under stamps and then washed, the product being metallic copper, carrying 75 to 88 per cent., the so-called "mineral" which is refined. The Arizona mines produce almost exclusively carbonate and oxidized ores, which need only smelting in cupola furnaces to yield the black copper, running from 95 to 97 per cent. The Montana mines turn out sulphuret ores, which are first put through concentrators, are then roasted and smelted in reverberatory furnaces, the product being matte, running from 55 to 65 per cent. of copper. The exception is the Parrott, which converts its matte into blister copper, running as high as 99 per cent., by the Manhès-Bessemer process. In two weeks, at the utmost, the ore is converted into a high-grade shipping product from the time it reached the mouth of the shaft. Under these circumstances a total suspension of work for a brief period, or a slackening by employing only a part of the plant, is a matter easily arranged.

Now, let us study the methods in vogue in Spain and Portugal. The ore is an iron pyrites carrying a small percentage of copper, say 3 per cent. A considerable part of the raw ore raised is exported as such, being sold in England and on the Continent for the manufacture of sulphuric acid. It is then, after the expulsion of the sulphur, treated in special metal extraction works for the recovery of the copper, silver and gold it contains. The quantity of pyrites thus used is dependent upon the demand for sulphuric acid, and indirectly upon the consumption of Leblanc soda, in the manufacture of which the greatest part of the sulphuric acid is used. Whatever the Spanish companies may agree to do they cannot and will not interfere with that part of their product which is marketed in this way. The quantities are considerable. Thus the three leading pyrites miners shipped in 1887:

	Pyrites for shipment.	For local extraction of copper.
Rio Tinto.....	362,796	819,642
Tharsis.....	282,653	352,562
Mason & Barry.....	80,838	248,290

In England alone the quantity of copper produced from burnt pyrites, after their use in sulphuric acid works, ranges be-

tween 14,000 and 15,000 gross tons annually.

Let us turn now to the methods of extraction at the mines to which the larger percentage of the output is subjected. The old method and that still largely used consists of forming large piles of the raw ore containing many thousands of tons. These are fired to expel a great part of the sulphur, by roasting, a process which takes months. Then water is run over the roasted ore, leaching out the copper, which is precipitated from the liquor by scrap iron. Now, while the greater part of the copper contents is taken out in a relatively short time, very important quantities are obtained from the old heaps year after year. The leading mines have millions of tons of these old heaps weathering, from which certain amounts of copper are derived. A reduction of output could only be effected by abstaining from starting new heaps burning. Naturally the effect of such a policy would only tell months after it had begun, but it would, if continued for some time, have its effect upon the yield of the mines for years to come. Where the other mines throughout the world suffer only temporarily from a reduced output, the Spanish mines must face the fact that a sacrifice made now will be felt for years to come.

Another circumstance deserves serious consideration with them. The enormous quantities of water required in an arid region in past years were the most important factor in determining production. Then the quantity of rainfall measured pretty accurately the output of precipitate copper, and prices felt the effect of a drought near Huelva, Spain. To the mining companies water was precious, and in order to render themselves as independent as possible of the fluctuations in the supply, enormous works, in the way of storage dams, were created at a great outlay. All this cost money, and the principal mines have very large amounts of fixed charges in the way of interest on bonds which, distributed over a smaller product, run its cost up materially. Relatively speaking, the amount of capital actually invested in the Spanish mines is much greater than it is with any large copper undertakings in any other part of the world.

The policy of the Spanish mines and of the Rio Tinto, the largest, in particular, has been to distribute these fixed charges over as large a tonnage as possible. Now they are asked to abandon what is their true line of action, and embark in a system from which they more than any other producer must suffer most.

It is just, however, to call attention to one point, and that is, that so far as the Rio Tinto Company are concerned the hampering effect of the slow extraction under the old methods has less weight. For some years the company have been gradually abandoning the old method of roasting and leaching, and have adopted the Doetsch process. It would take us too far to enter into technical details; suffice it to say that the tedious roasting process is entirely suppressed, the raw ore being treated directly. This means quicker work, less quantities of partly treated ore, and lower working capital. Besides, the leading spirits in the Rio Tinto are the Mathesons, who are supposed to be favorable to the scheme for the relief of the copper holders. But the other companies are less likely to let such considerations override broader questions of policy, and we doubt whether their assent will be as readily obtained and are inclined to believe that if they do join they will prove restive members.

Will the Weak Mines Stop?

It is generally assumed that with a lowering of the price of copper the small

mines in this country and in other parts of the world will stop work. There can be little doubt that from the standpoint of the stockholders that would be the wisest policy. Unfortunately past experience has pretty clearly shown that such a step is only taken in very rare instances. Usually those in control of the management lure their associates along by promises and hopes. It is probably a fact that in the majority of cases superintendents and managing directors are honestly sanguine. In a few instances the desire to secure their own salaries outweighs any considerations from the point of view of the best interests of stockholders. We may divide the weak mines into two groups: Old decrepit concerns galvanized into life by the hope of profit while the copper corner lasted, and new enterprises called into being by the high prices. The former are not likely to survive a drop in values very long. The latter will prove more tenacious of life. A good many of them have made enough money on a small output to pay for considerable improvements. Their constituents have not been bled to exhaustion, and can be relied upon to supply considerable funds before they conclude that it is better not to throw good money after bad. Individually these concerns do not amount to much, but in the aggregate they will furnish considerable metal even when the prices are low. Then there are the concerns which were lingering on the verge of bankruptcy when the syndicate began its famous operations. They have been making considerable money during 1888, and may have strengthened their position by making improvements in plant and equipment and bettering their finances, which will actually enable them to meet low prices without serious loss. They will certainly show readiness to test their capacity to bear the burdens of a low market before they are forced to succumb.

Considerations like these are not likely to weigh seriously with the great corporations, but in spite of that their influence will be quite keenly felt. The tendency of the leading mines will be to place the price limit higher than the condition of their smaller competitors warrants. Consumers and the trade generally will not be misled by their earnest protestations. They may be made in good faith, but we repeat that it will not be safe on the long run to contract on anything above the basis of 10 to 10½ cents for lake copper. The great concerns which can live at that price will act wisely if they thrust in the knife to that extent.

The annual report of the New York local inspectors of steam vessels, soon to be handed in to the Treasury Department, will show that the total number of steam vessels licensed in the United States during the year 1888 was 6425, with an aggregate tonnage of 1,235,134.62. Of the total number New York was represented by 972 steamers, with an aggregate tonnage of 216,148.42. The total number of masters licensed was 7931; in New York, 1223; total mates, 1692; in New York, 107; total pilots, 6586; in New York, 1021; total engineers, 13,422; in New York, 2176. There were 56,000,000 people carried during the year, and 40,300,000 traveled on the New York boats. The total loss of life in the United States was 202, and only 12 deaths occurred on the New York boats. Of these eight were drowned. There were found 254 defective boilers in New York and nine were condemned. During the year two masters, nine mates, 36 pilots and 96 engineers were refused licenses. There were 191 reports of accidents made to the office of the local inspectors, and 161 of these were of collisions from which no loss of life resulted. In all 114 investigations were made, of which 57 were in

New York. Two licenses were revoked, two decisions were sustained on appeal and one is yet pending.

We have the authority of Abram S. Hewitt himself for the statement that there is no truth whatever in the reports that any of the works in which Cooper, Hewitt & Co. are interested are to be moved to the South, or that Mr. Hewitt has purchased any interest in the Tennessee Coal, Iron and Railroad Company, or in any other Southern iron enterprise in which he was not already interested previous to the trip from what he has just returned. Messrs. Hewitt, Cooper and Fackenthal visited the South with the object of personally studying the situation. We understand that a good many data were collected notably on the point what relation railroad freights bear to the iron industry of the South as compared with the cost of hauling raw materials and products in the North. We are informed that these figures will form the basis of a letter to be written to four leading railroad companies serving the iron districts of Eastern Pennsylvania and New Jersey. The protest if unheeded will throw upon the managers of the railroad companies the responsibility for whatever consequences may grow out of the continuance of the present policy of freight rates.

A meeting of the creditors of the Reading Iron Works was held in Philadelphia on the 21st inst. At the first meeting it was announced that for the past four years the iron works had made \$600,000. This was on the face a good showing, but an examination of the books for the period stated showed the result to be entirely different. It was found that in 1885 the works were operated at a loss of \$26,000. In 1886 a profit of \$180,000 was charged to the credit account, while in 1887 there was a profit of \$22,000, and in 1888 a loss of \$389,000, so that instead of having made \$600,000 in the four years mentioned the loss has been \$263,000. It appeared also by the report of the Committee on Appraisal that there has been a shrinkage of nearly \$500,000 in the book accounts, and that instead of having \$870,000 of stock and material, there is only \$380,000 worth. A number of the largest creditors have refused to sign the plan of reorganization, and seem disposed to co-operate with those who have applied for a receiver.

Mr. Jos. Gest, of the South Side, Pittsburgh, has recently invented and patented a method of rolling iron and steel rails into merchant bar iron, structural iron, &c., which has been put into successful operation in Pittsburgh by Lean & Blair, the well-known contractors and engineers of that city, and is about to be put into operation also at the Tidewater Steel Works, at Chester, Pa., by them and their associates, who have organized under the title of the Structural Steel and Iron Company. It is claimed that this method of rolling will do the same work in three passes that under the ordinary processes requires 11 and 12 passes. The rolls are now being turned and the necessary alterations are being made in the mill to start this new plant on several large orders of car bars. The main office of the company will be in Messrs. Lean & Blair's rooms in the Penn Building, Pittsburgh, and their Eastern agents are the well-known firm of J. B. Wilson & Co., Limited, whose offices are in the Drexel Building, Philadelphia.

The Louisville and Nashville Railroad have just let out contracts to the Missouri Car and Foundry Company for the construction of 500 box cars, and to the Indianapolis Car and Mfg. Company for 500 fruit cars.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington street, CHICAGO, March 25, 1889.

Pig Iron.—The country trade was the main reliance of the market last week, taking quite a considerable quantity of Coke Iron for forward delivery. As this business was secured principally by local furnaces the dealers handling outside Iron found business very quiet. The policy of the consolidated Steel companies with respect to Pig Iron has been announced, and, as intimated last week, they propose to run some of their furnaces on Foundry, Mill and Bessemer Irons for the general market. This will insure a local supply of ample proportions as long as the Steel Rail trade is dull or until other finished products will be turned out in such quantities as to absorb their entire furnace capacity. Prices have not advanced, and there appears to be no reason to expect an advance in the near future; but, on the other hand, no evidence of further weakening has transpired, so that the market can be called fairly steady. Lake Superior Charcoal is quiet and without change. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Coke, No. 1, \$16 @ \$16.50; No. 2, \$15 @ \$15.50; No. 3, \$14 @ \$14.50; Chicago Scotch, No. 1, \$17.50, for small quantities; Lake Superior Charcoal, all numbers, \$19.50; American Scotch (Blackband), No. 1, \$18 @ \$19; Jackson County Silvery, No. 1, \$18 @ \$18.25; other Ohio Soft Irons, No. 1, \$17.25 @ \$17.50; Southern Coke, No. 1 Foundry, \$16.25 @ \$16.75; No. 2 Foundry and No. 1 Soft, \$15.75 @ \$16; No. 3 Foundry, \$15 @ \$15.50; Gray Forge and No. 2 Soft, \$14.50 @ \$14.75; Tennessee Charcoal, No. 1, \$19.

Bar Iron.—Orders are a little more plentiful, particularly from manufacturers of agricultural implements, wagon makers, and others depending upon the patronage of the farming community. The demand for small lots is much stronger, and jobbers are at length doing a fairly satisfactory business. At the same time, the Iron manufacturers are reported to be much firmer in their views, and buyers are looking with some interest for the "cheap" mills. The firmer feeling is hardly caused by heavier business, but probably arises from the close scrutiny of cost sheets. With raw material and wages at the rates now existing there was certainly no margin of profit but very likely a loss on the low prices recently made. Representatives of Valley mills quote 1.50¢, half extras, at mill, and insist that this is a firm rate, fixed by agreement among them. Mills located nearer to this market have an advantage, of course, in quoting on the same basis, so that prices for mill lots of Good Common Iron now range from 1.80¢ to 1.65¢, half extras, f.o.b. Chicago. Store prices are unchanged at 1.80¢ @ 2¢, according to quantity and quality.

Structural Iron.—Contracts were placed during the week for the erection of several good-sized buildings, and orders for Beams are consequently larger than they have been at any previous time this spring. In other lines business is quite light. An order for 300 tons of Angles and Heavy Sheets, cut to pattern, was placed at a very low figure. On ordinary lots quotations by the mills are unchanged.

Plates, Tubes, &c.—A repetition of the heavy business of the previous week was hardly to be expected, yet orders for considerable quantities of Plates were taken. Work which has been in prospect for some time is now taking definite

shape and realizing the hopeful predictions of members of the trade. Tubes are firmer in consequence of the recent action of the manufacturers, but quotations are no higher, as extra concessions have merely been cut off. Mills are trying to advance their figures on Plates about \$1 ¢ ton, but enough of them are to be found taking old prices to keep quotations as they have been.

Sheet Iron.—Jobbers are still endeavoring to place orders with the mills for summer and fall delivery, but are making slow progress for reasons stated in previous reports. Prices on large lots for early delivery hover around 2.90¢ for No. 27 Common, f.o.b. Chicago. Small lots of No. 27 sell at 3.10¢ @ 3.20¢ from store, with but little doing.

Galvanized Iron.—The heavy demand reported by manufacturers' agents last week did not keep up its pace, but slackened down considerably. Nevertheless, a fair business was transacted, and the result for the month will undoubtedly be excellent. Small lots continue to be quoted at 65 ¢ off for Juniata, and 65 and 2 1/2 ¢ off for Charcoal.

Merchant Steel.—Business in this branch continues to improve. The demand from store is growing, and the manufacturers of agricultural implements are buying to some extent. Syndicate Steel is in request by plow manufacturers who appear to be running out of stock in consequence of their trade exceeding their estimates. Quotations are unchanged.

Steel Rails.—Notices have been issued for meetings of the stockholders of the North Chicago Rolling Mill Company and the Union Steel Company, to be held in this city on May 1. The notices embody in them the propositions with regard to consolidation which were set forth in the last issue of *The Iron Age*. The stockholders of the North Chicago Rolling Mill Company will vote upon a proposed increase of stock from \$6,000,000 to \$25,000,000, a change of name to the Illinois Steel Company, an increase of the number of directors from 3 to 11, &c. Proxies have already been received representing a large amount of stock, and are all to be cast in favor of the scheme. The demand for Rails has been light during the week, but prices are maintained at \$30 @ \$30.50.

Old Rails and Wheels.—Offerings of Old Iron Rails are limited, and holders assert their ability to secure \$21.25 @ \$21.50, but the demand is by no means urgent. Local consumers insist that they will not pay over \$20 @ \$20.50. Inquiries are in the market for Old Car - Wheels, but buyers and sellers are apart in their views as to the value of lots of any size. Some carload lots have been sold by Scrap dealers at \$18.25, and buyers insist that large lots should sell at a lower rate, while sellers ask \$18.50 @ \$19.

Scrap.—Lively "drumming" is necessary now to effect sales. Consumers are apathetic and buy only for immediate wants and in small quantities. In this way some business has been transacted during the week in No. 1 Forge, Mill Scrap, Mixed Steel, &c., but the aggregate was not large. Dealers are now paying \$13 for Mixed Country Scrap. Carefully Selected is quoted to consumers as follows, ¢ ton of 2000 lb: No. 1 Forge or Railroad Shop, \$19 @ \$19.50; Track, \$19; Fish Plates, \$20 @ \$21; Axles, \$24; Horseshoes, \$18.50; No. 1 Mill, \$14; Pipes and Tubes, \$13 @ \$14; Light Iron, \$9; Cast Machinery, \$13; Stove Plate, \$10; Cast Borings, \$8.50; Wrought Turnings, \$11.50; Axle Turnings, \$13 @ \$14; Mixed Steel, \$11.50; Coil and Leaf Steel, \$14; Tires, \$15 @ \$16.

General Hardware.—Jobbers of both Shelf and Heavy Hardware report their

business steadily gaining from day to day. Some Shelf Hardware houses have been obliged to keep their packers at work late at night during the past week to catch up to current business. No change of any consequence is reported in prices.

Nails.—Cut Nails are selling very slowly from factory, but plenty of orders for Wire Nails are being booked by manufacturers' agents. This peculiar condition of affairs is hardly to be taken as an indication that the Wire Nail has supplanted the Cut Nail more than ever, as in certain lines of trade a reaction has set in against the former. The cause of the greater activity in Wire Nails is plainly the strong demand from jobbers who did not stock up when the price was very low, believing that a still lower point might be touched. Now that the price has been forced up slightly they are placing their orders. The Cut-Nail manufacturers, however, appear to be still filling the contracts they made at low figures last fall. This comparatively better condition of Wire Nails is described by a well-posted member of the trade as an accident rather than a piece of good management. The manufacturers would have filled their order-books at low prices just as the Cut-Nail manufacturers did if they could have induced the trade to buy at that time. The Muncie Nail Company, of Muncie, Ind., successors to the Greencastle Iron and Nail Company, started their factory last week. Jobbers report a very good demand now ruling for both kinds of Nails, but they have made no change in prices as yet. Steel Nails are selling at \$2 for small lots and \$1.95 for carload lots; Wire Nails, \$2.40 for small lots and \$2.35 for carload lots.

Barb Wire.—Stocks have been run off very rapidly of late. Manufacturers' warehouses are about empty, and orders now coming in take their production as it comes from the machines. Heavy orders have been refused at rates which would have easily passed from two to three weeks since. Decided firmness has been imparted to the whole trade. Jobbers are instructing their salesmen not to sell below 2.80¢ for Painted, and manifest an indisposition to name any lower price for carload lots. Galvanized maintains the usual advance of 60¢ @ 65¢ ¢ 100 lb over Painted.

Pig Lead.—Prices for carload lots declined in this market to 3.45¢ last week, with sales of about 200 tons. It is intimated that the stocks held by New York banks are likely to pass into stronger hands, with favorable effects on prices.

A joint sales agency has been established at Chicago by the Trumbull Iron Company, the Falcon Iron and Nail Company and the Salem Wire Nail Company under the management of E. C. Brainard, an accomplished salesman of long experience, whose office is located in the Phenix Building.

James Johnston, agent for the Springfield Iron Company, has removed his office from 115 Dearborn street to the Phenix Building.

Rogers, Brown & Co., Rookery Building, Chicago, announce that they have secured the sale agency of the Mayville brand of Pig Iron manufactured by the Northwestern Iron Company. They have also added to their list of Southern brands the Trussville, made by the new furnace just completed by Pennsylvania capitalists at Trussville, near Birmingham, Ala.

Pickands, Brown & Co., dealers in Pig Iron, Iron Ore, &c., will remove some time in April from their present location at 115 Dearborn street, Chicago, to the Rookery Building, corner La Salle and Adams streets. They will add to their other business the sales agency for Pig Iron and Spiegeleisen manufactured by the con-

solidated Steel companies. It is the purpose of these companies to turn their attention largely to the manufacture of Foundry, Mill and Bessemer Pig Iron to supply the Chicago district. In entering the general Pig-Iron trade it was deemed advisable to use an established commission house, with its regularly organized channels of distribution and its close relations with consumers, rather than to attempt to make direct sales. The long experience in the Pig-Iron trade of the members of the firm of Pickands, Brown & Co. will also be of great value to the Steel companies in determining upon the exact qualities and characteristics of their Iron to meet the demands of general consumers.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
PITTSBURGH, March 26, 1889.

There has been no perceptible improvement in the general Iron business in this district during the past week; dullness is still the order of the day. Just as soon as buyers can be convinced that hard-pan has been reached orders for all kinds of Finished Iron will commence to come forward freely and they in turn will stimulate the demand for the raw article. It is pretty confidently expected that there will be a general improvement in the situation within the next week or two. The reports from the West and South are generally of an encouraging character, and we look for a good demand from these sections, not only for Iron and Steel, but all kinds of manufactured goods. There is no branch of business more overdone here than that of Iron brokerage; Iron brokers have more than trebled within the past few years, and brokerages, like everything else, are down very low as compared with what they were years ago. Some of the brokers are offering to sell for a commission of from 15¢ to 25¢ per ton, and some of the city furnaces are disposed as much as possible to shut the brokers out and sell direct to consumers. It is asserted by some, who are disposed to be sarcastic at the expense of the brokers, that whenever a man fails in other branches of business, as a last resort he enters the iron brokerage business. Some of the best men in the iron business are brokers; they study it up close and are hard workers, and these, as might be expected, are the ones who succeed. Mr. H. P. Smith, general manager of the Allegheny Bessemer Company, whose works are located at Duquesne, about 10 miles from this city, on the Monongahela River and on the line of the Pittsburgh, Virginia and Charleston Railroad, who has been absent in the South for his health since last November, has returned home and resumed his duties. The Rail mill of this company has been started. The management claim that they are able to compete with any mill in the country, having all of the latest appliances and improvements. The Allegheny Bessemer are a strictly Pittsburgh company; included in their active managers are W. G. Park, of the Black Diamond Steel Works, and Edward Clark, of the Solar Iron Works.

Pig Iron.—There is no improvement to note, but it is hoped and expected that there soon will be. Consumers are buying only as their immediate necessities require, and it is not likely that they will do otherwise as long as the market continues in its present unsatisfactory and depressed condition. Mill owners generally report a very light demand for Finished Iron, and while this is the case there is not likely to be much improvement in the demand for the raw article. However, there is not much offering. Our city furnaces are well sold up, and Shenango and Mahoning valley furnaces are not very anxious to sell in this market at present prices. It may

be noted in this connection that furnace-men frequently and unintentionally depress the market by placing their product in the hands of several brokers, who are all offering it for sale at the same time, and thereby making the offerings appear much larger than what they really are. There has been no quotable change in prices during the past week, with the exception of Bessemer, which is a shade lower. We quote prices as follows:

Neutral Gray Forge.....	\$14.50 @	cash
All Ore Mill.....	15.00 @	15.50	"
White and Mottled.....	13.50 @	14.00	"
No. 1 Foundry.....	16.00 @	16.50	"
No. 2 Foundry.....	15.00 @	15.50	"
No. 1 Charcoal Foundry.....	23.00 @	24.00	"
No. 2 Charcoal Foundry.....	21.50 @	22.00	"
Cold Blast Charcoal.....	25.00 @	26.00	"
Bessemer Iron.....	16.50 @	16.75	"

Muck Bar.—There is no improvement in demand, and, while the market continues dull, prices remain nominally unchanged at \$26.50 @ \$27, cash. It is said that Muck made from Southern Pig is being offered here pretty freely, but that it is difficult to get consumers to take hold of it—it appears that they would rather pay more for the home-made article. The trouble with this Southern Muck is that it is unknown here, as but very little of it has as yet been used in this market.

Manufactured Iron.—There has been no improvement in the demand since our last report; but very few of the mills are busy, and prices continue unsettled and unremunerative. As intimated elsewhere, however, there is reason to look for a considerably improved demand just as soon as buyers can be convinced that prices have reached the lowest point; it is not to be expected that large buyers will anticipate future wants as long as there is a possibility of lower prices. We continue to quote Bars at 1.65¢ @ 1.75¢, and Skelp Iron at 1.65¢ for Grooved and 1.90¢ @ 1.95¢ for Sheared. As the Pipe trade is about to open up, an increased demand for Skelp Iron is looked for within the next few weeks.

Nails.—There is no improvement in the Nail trade. Full card rates are still demanded, and we continue to quote upon a basis of \$1.90 for 12d to 40d, 60 days, 2 % off for cash.

Wrought-Iron Pipe.—The meeting of the Wrought-Iron Pipe manufacturers last week was largely attended, nearly every mill in the country having been represented, and the proceedings were, as we learn, harmonious. This was the first meeting since last summer, and since early last fall the market has been an open one, each firm being clear to make its own price. As a consequence, the market has been in an exceedingly unsettled and unsatisfactory condition; prices were cut to such an extent that orders were taken at cost and even below cost. A price list was adopted as follows: Discounts on Black Butt-Welded Pipe, 55 and 5 %; on Galvanized do., 47½ and 5 %; on Black Lap-Welded, 67½ and 5 %; on Galvanized do., 55 and 5 %; 2-inch Tubing, 13¢ per foot, net; 5½-inch Casing, 62½ % off; Boiler Tubes, 62½ % off regular list.

Old Rails.—There is some inquiry for Old Iron Rails, and we are advised of a couple of sales—400 tons at \$23 and 500 tons at \$23.50. It is claimed by brokers that there are but few sellers at inside quotation. Old Steel Rails are quoted at \$17.50 @ \$18 for short and \$19 @ \$20 for long lengths, with an increasing demand.

Steel Rails.—Mill owners here are in favor of co-operation in regard to prices, provided it is adhered to in good faith. Large shipments are being made South and West on contracts made some time ago.

Blooms, Billets, &c.—Bessemer Steel Billets and Blooms are quoted at \$27 @ \$27.50, cash, at maker's mill. We hear of

a sale of 12,000 tons to be delivered at the rate of 2000 tons a month, but the price was not stated. There appears to be no demand for Nail Slabs; sale of 2000 tons Domestic Bloom Ends at \$18, cash. There has been considerable inquiry for these of late.

Railway Track Supplies.—There has been no recent change in prices. Spikes, 2¢, 80 days, f. o. b., at works. Splice Bars, 1.70 @ 1.75¢ and Track Bolts 2.75¢ with Square and 2.85¢ with Hexagon Nuts.

Old Material.—Demand continues light and prices weak, but without quotable change. No. 1 Wrought, \$19 @ \$19.50, per net ton; Wrought Turnings, \$13 @ \$13.50; Car Axles, \$24.50 @ \$25; Cast Scrap, \$14.50 @ \$15, gross ton; Old Car-Wheels, \$19 @ \$19.50.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., March 26, 1889.

Pig Iron.—There is very little change to report in Pig Iron, although the general position of the trade shows improvement as compared with last week. It is true that the decline in Finished Iron was greater in proportion than that in the raw material, so that it is perhaps only natural that the reaction should commence at the weakest point. As regards Pig Iron, there is a fairly good demand and prices are steady, but at the moment there is nothing to indicate very much change in the near future. Bottom prices are believed to have been reached some time ago, but there are too many sellers to permit of any advance being demanded at present. A good deal depends, however, upon the condition of the Western and Southern markets. Apart from their competition, it would be perfectly safe to predict a better market, but so long as there is a possibility of having to take their surplus prices are not likely to be advanced so as to invite such a contingency. At present the offerings are not urgent from these sources, although some sales of Alabama Irons are being made at \$15.25 for Gray Forge and \$17 @ 17.50 for No. 1 Foundry, delivered in consumers' yards. These are largely of sample lots, although in one case 1000 tons of Forge were taken at \$15.25, delivered. The main object appears to be to introduce the Iron, after which price will depend upon circumstances. But it is pretty well understood that prices of local Irons will have to be kept at a low point, otherwise this will always be more or less of a dumping ground. Many improvements have been introduced at near-by furnaces, however, and although freights and fuel are altogether too high, there is no doubt that the leading companies are making Iron much cheaper than formerly, although the impression is that current rates are about as low as makers of Pig Iron will be called upon to meet during the present period of depression. Something might be said in regard to the possibility of an advance, but as these points were touched upon last week it is unnecessary to refer to them again, although they are still worthy of consideration. Suffice it to say that sales during the week have been on a moderately liberal scale, with the following as the usual asking prices for tidewater deliveries: No. 1 Foundry, \$18; No. 2 do., \$16.50 @ \$17, and Gray Forge, \$15.25 @ \$15.50. Foundry Irons may have been shaded a trifle on some brands, but for strictly good qualities prices have been held very steady, while the number of inquiries points to a very good demand in the near future.

Blooms.—There is no special change to notice as regards prices, but the volume of business is steadily increasing. Quota-

tions depend very much upon requirements as to analysis, &c., but in ordinary cases the following fairly represent the market: \$28 @ \$28.50, at mill, for Nail Slabs; \$29 @ \$30 for Sheet-Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for Flange purposes; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 7/8 "Bloom" ton of 2464 lb.

Muck Bars.—There is a little more disposition to buy, but bids are still low, and only small lots are taken at the asking prices, which are about \$27, delivered, for good qualities. Some hold for \$27.50, but, on the other hand, bids of \$26.50 have been accepted for 1000-ton lots for what sellers claim to be strictly good Bars. On the whole, the feeling is better, and \$27 seems to be a fair quotation to-day.

Bar Iron.—There is more business around, and sellers claim to be firmer than they were a few days ago. There is undoubtedly more business offering, and the outlook is better, but it is questionable if prices are any higher. There are too many mills wanting business to permit that, although some parties who intimated that they might accept certain very low prices on firm offer did not feel so inclined when the bids were made. To that extent, therefore, there is some improvement, and it appears likely enough that additional hardening will be met with in course of the next two or three weeks. Prices have been much too low, and the cutting in extras has been so general that the low quotations failed to show the serious position into which the trade had fallen. There is reason to believe that matters are improving, however, and while uniformity in prices can hardly be expected in times like these, the feeling is that the lowest prices have been passed and more or less improvement may be looked for in the immediate future. Car building is picking up again, and the general demand is also larger than it has been. Nominal prices are from 1.75¢ to 1.85¢, but there is not as much business done at the outside figure as there is at the lower one, while even that has been shaded on good-sized orders.

Plate and Tank Material.—A better demand is reported, although prices are still at the lowest point yet reached. Mills are beginning to accumulate orders, however, so that if the demand keeps up, as seems probable, a little stiffening may be looked for before long. A good deal of talk is indulged in in regard to the large amount of business near at hand; and while it cannot all be verified, there is no doubt something in it. Consumers are all pretty well employed, and the recent orders for bridge work, tank cars and elevated work can hardly fail to benefit local mills, although competition from the West is unusually close. Prices in the meantime remain as before, viz.: 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates; 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.3¢ @ 3.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3 1/4¢; Fire-Box, 3 1/4¢ @ 3 1/2¢.

Structural Material.—Important additions have been made to some of the order-books recently, although at this stage of the proceedings it is impossible to obtain particulars. Besides a liberal amount of bridge and ship orders, it is understood that from 8000 to 10,000 tons of elevated work is under negotiation, and if not actually closed, it is so near to it that there is very little room to doubt its final consummation. The outlook is therefore decidedly more hopeful than it was three or four weeks ago, and the chances appear now to be favorable for a very active summer's business. For the present prices remain about as follows:

Bridge Plate, 2¢ @ 2.1¢; Angles, 1.95¢ @ 2.05¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

Sheet Iron.—The demand is a little dull, but prices are steady and are quoted as follows for carload lots of the best makes:

Best Refined, Nos. 14 to 20.....3¢
Best Refined, Nos. 21 to 24.....3.20¢
Best Refined, Nos. 25 to 26.....3.40¢
Best Refined, No. 27.....3.50¢
Best Refined, No. 28.....3.60¢
Common, 1/4¢ less than the above.

Best Soft Steel, Nos. 14 to 20.....3 1/4¢
Best Soft Steel, Nos. 21 to 24.....3 1/2¢
Best Soft Steel, Nos. 25 to 26.....3 3/4¢
Best Soft Steel, No. 27.....4¢
Best Bloom Sheets, 1/4¢ extra over the above prices.

Best Bloom, Galvanized, discount.....65 %
Common, discount.....67 1/2 %

Steel Rails.—There is no change to note from last week. Prices are firm at \$28, at mill, but orders for large lots come in rather slowly, although manufacturers express full confidence in the ultimate outcome. The demand for Blooms, Billets, &c., is remarkably active, and goes a long way to offset the dullness in Rails. On the whole, the tendency is toward improvement, although as yet the pace is not very rapid.

Old Rails.—The demand is hardly as brisk as it was some time ago, but the light stocks enable holders to maintain prices very fairly. Sales have been made at from \$24 to \$24.50 for T's, delivered at mills near by, but buyers are not bidding over \$24 to-day. Nothing doing in spot lots, prices nominally \$23.50 for shipments, or \$24 and upward for lots in store.

Scrap Iron.—Scarce and in good demand at quoted rates. The feeling is better and holders show a good deal of firmness on desirable qualities. Quotations are about \$20.50 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$18 @ \$19; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$23 @ \$24; Old Car-Wheels, \$17 @ \$18, Philadelphia.

Wrought Iron-Pipe.—There is a decided improvement both in demand and price, and while no change in discounts is quoted, sellers have from 5 % to 10 % in their favor, as compared with selling prices two or three weeks ago. Discounts are now firm as follows: Butt-Welded Black, 55 %; Lap-Welded Black, 65 %; Butt-Welded Galvanized, 45 %; Lap-Welded Galvanized, 55 %; Boiler Tubes, 62 1/2 %.

Nails.—There is very little change to notice, although the demand is a little more active. But prices are unsettled, with \$1.95 @ \$2 as the usual quotation for small lots from store.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,
CHATTANOOGA, March 25, 1889.

Pig Iron.—The market, so far as prices are concerned, appears to be about at a standstill, although there are large amounts of Iron moving, and some of the furnaces are not able to ship their orders promptly, from the fact that they have taken more than they can do. There seems to be an indisposition on the part of the producers at the present time to book large orders for far-off deliveries. They do not think that prices will go any lower, and should there be an advance they propose to be in a condition to reap the benefit of it. As long as they can sell their output right along and keep their yards quite cleared up on current orders, which most of them appear to be now doing, it would be poor policy to sell at present low prices. So far as speculation is concerned, very little is now being done apparently. Many of the stacks have received offers to

advance them money on storage warrants, but so far as can be ascertained very little, if anything, has yet been done in that line, the producers preferring to dispose of their output and realize on it at once.

Miscellaneous.—The movements to establish new manufacturing centers and manufacturing enterprises seem to be more widespread than ever. The interest taken by many Northern capitalists has never been so great as it is now, and several new towns have been recently laid out, and as a general thing the movers in these enterprises have an abundance of money to back them in carrying them out successfully. From all indications it would appear that the South is receiving a much greater impetus on the road to prosperity than at any time in the past.

Louisville.

LOUISVILLE, KY., March 25, 1889.

Pig Iron.—There has been a fair demand for Iron during the past week. Prices are firm for standard brands and show a light increase. A number of Irons, however, are being offered at the same prices that have prevailed for some time, but strong Mill Irons are firm, and buyers are willing to meet the furnaces' views in case quality is assured. There has been some complaint among consumers that furnaces were forcing an output, with the result that some Irons were hardly up to their usual standard, the Mill Irons especially of some of the furnaces who usually rank high being a shade off color. We quote as follows:

Southern Coke, No. 1 Foundry,
new classification.....\$14.75 @ \$15.25
Southern Coke, No. 2 Foundry,
new classification.....14.25 @ 14.75
Southern Coke, No. 3 Foundry,
new classification.....13.75 @ 14.25
Gray Forge.....13.25 @ 13.75
White and Mottled, different grades.....12.75 @ 13.25
Silver Gray, different grades.....13.00 @ 13.50
Southern Charcoal, No. 1 Foundry
No. 1 Mill.....14.75 @ 15.25
Southern Car-Wheel, standard
brands.....21.75 @ 22.75
Southern Car-Wheel, other brands.....18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry.....15.50 @ 16.00
Hanging Rock Charcoal, No. 1
Foundry.....19.50 @ 21.00
Hanging Rock, Cold Blast.....20.75 @ 23.75

St. Louis.

OFFICE OF *The Iron Age*, 212 N. Sixth st.,
St. LOUIS, March 25, 1889.

Pig Iron.—There is very little of interest transpiring in this department at the present time. The improvement noted two or three weeks ago seems to have spent itself, and the market has apparently settled down into the old rut, and is at the moment dull and apathetic, with occasional sales of from 100 to 300 tons, to relieve the monotony. Prices are holding fairly well under the circumstances, and any decided increase in the demand would likely stiffen them up. Production keeps increasing, while consumption fails to show any material improvement, and stocks of Iron on the furnace banks, while they are not large at the moment, are gradually increasing. The furnaces which are at present out of the market cannot remain so very long, and any pressure to sell would probably result in lower prices. We quote as follows:

Southern Coke, No. 1 Foundry, \$15.50 @ \$16.00
Southern Coke, No. 2 Foundry, 15.00 @ 15.25
Southern Coke, No. 3 Foundry, 14.50 @ 14.75
Gray Forge.....13.50 @ 14.00
Ohio Softeners.....18.00 @ 20.00
Lake Superior Charcoal.....21.00 @ 21.50

Missouri.

Charcoal Foundry, No. 1.....16.00 @ 16.50
Charcoal Foundry, No. 2.....15.00 @ 15.50

Tennessee.

Charcoal Foundry, No. 1.....16.50 @ 18.50
Charcoal Foundry, No. 2.....17.75 @ 17.50
Connellsville Coke, f.o.b. East St. Louis, \$4.70; St. Louis, \$4.85.

Bar Iron.—The volume of business continues large and some good-sized orders have been booked during the past week to be delivered during the next 30 days. Prices, which have been the discouraging feature of this department for some time, fail to show any improvement, and it is claimed in some cases sales have been made that hardly cover cost of production. Mills are hopeful, however, and are looking forward to a revival of railroad work, which may stimulate trade and have a beneficial effect on prices. Lots from store are quoted at \$1.80; carload lots, from \$1.65 to \$1.75, according to circumstances.

Barb Wire.—A little more inquiry is reported, but as far as actual business is concerned there is no improvement. There seems to be a disposition among consumers to wait until freights are reduced, as they have been anticipating something in this line for some time. It is evident, however, that the railroads intend to maintain the present schedules, and when the consumer becomes convinced of this fact some improvement in demand can be looked for, but hardly before. Prices are weak and unsettled at about as follows: For carload lots Two and Four Point Painted, \$2.80; carload lots Two and Four Point Galvanized, \$3.40, f.o.b. St. Louis; less than carload lots, 5¢ additional.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, March 25, 1889.

Pig Iron.—The local trade is a unit in pronouncing dullness the most prominent feature of business in Pig Iron during the past week, but there is some difference of opinion regarding the tone of the market. The accumulation of Iron at furnaces during the past month has given buyers courage to hold off, and strengthens them in the belief that lower prices will prevail. Producers as a rule, however, have shown no disposition to force sales. Southern manufacturers of Car-Wheel Iron have about caught up with their orders and an easier feeling has prevailed. Forge Iron, too, is reported less firm, but buyers of Foundry grades have found a strong market and moderate offerings of desirable brands. A few large contracts are in process of formation, but nothing is settled. Sales have been mainly small and for present or near-by delivery. Among the larger sales have been 1000 tons Lake Superior Car-Wheel, at \$20.50, cash, and 500 tons Gray Forge, at \$13.25, cash. A rumor gives sales of this latter grade at \$13, but the report is not verified. The following are the approximate prices current here at the close, for cash, f.o.b.:

Foundry.

Southern Coke, No. 1 (new classification).....	\$15.00 @ \$15.50
Southern Coke, No. 2 (new classification).....	14.50 @ 14.75
Southern Coke, No. 3 (new classification).....	13.75 @ 14.25
Ohio Soft Stone Coal, No. 1.....	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.25
Mahoning and Shenango Valley.....	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.00
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

Forge.

Strong Neutral Coke.....	13.25 @ 13.50
Mottled Neutral Coke.....	12.25 @ 12.75
Gray Forge.....	13.00 @ 13.50

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @ 21.50

Manufactured Iron.—There has been no improvement in the demand for Manufactured Iron, and a weak tone has prevailed, but prices are without quotable change.

Nails.—There has been a moderate order trade and a steady market for both Iron and Steel. 12d @ 40d sell at \$1.95 @ \$2.00 keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$2, and Steel Wire Nails at \$2.55 @ \$2.60 keg.

Old Material.—There has been some little improvement in the demand for Old Rails, with moderate sales on basis of \$20.50 @ \$21, cash, here. Old Wheels have been slow and easier, with moderate sales at \$17.50 @ \$18, cash.

Evans & Robertson, Iron and Steel factors, have secured comfortable and convenient quarters in the Chamber of Commerce Building, Room No. 7, to which they cordially invite members of the Iron trade and other friends.

Detroit.

WILLIAM F. JARVIS & Co., under date of March 25, 1889, report as follows: While the tonnage for the week has been above the average, the market has not shown as much strength as reports from other sections would seem to justify. Inquiries for round lots have been received, and as they come from widely separated points, the indications are that April will meet the expectations of sellers and a large amount of buying take place. For the present we quote as follows:

Lake Superior Charcoal, all numbers.....	\$19.50 @ \$20.00
Lake Superior Coke, all ore.....	18.75 @ 19.25
Lake Superior Coke, cinder mixed.....	17.75 @ 18.25
Standard Ohio Black Band.....	18.75 @ 19.25
Southern No. 1.....	17.00 @ 17.50
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	16.50 @ 17.00
Jackson County (Ohio) Silvery.....	18.25 @ 18.75
Old Wheels.....	18.50 @ 19.00

Cleveland.

CLEVELAND, March 25, 1889.

Iron Ore.—Additional sales of Minnesota Ore for far Eastern furnaces are reported at prices approximating \$5.75 a ton, f.o.b. vessels, Buffalo. There are rumors of sales of Menominee Ore, also, intended for the Anthracite region, at \$5.10 @ \$5.25 at Buffalo, but the reports are not wholly verified. Some Ore from the Chapin Mine has been sold, the consolidated Steel companies at Chicago, and the price paid therefor is believed to be equivalent to \$5.15, f.o.b. vessels at Cleveland. Representatives of high-grade Bessemer Ores are not attempting to force sales, believing evidently that the improvement in the market for Bessemer Pig Iron has not reached its limit. No actual sales of Ore for delivery via Ohio ports are yet reported. Furnacemen have asked for Ores in lots varying from 10,000 to 50,000 tons, subject to the established market price. As the latter can only be fixed upon after the much-disputed question of lake freights is settled, it follows that the actual selling prices for Ore cannot yet be given. Vessel rates are still far from being fixed, several Ore men being determined to pay no more than \$1.20 or \$1.25 per ton from Ashland to Two Harbors, while others believe the rate from that port will be \$1.40. The several charters from Escanaba at \$1.10 are genuine and run through the entire season.

Pig Iron.—The market retains its firmness, but not its activity, except in Bessemer grades of iron, which are in strong demand at prices considerably in advance of the long prevailing quotations. The fact that Foundry and Forge Irons are selling less freely than was the case ten days ago is not looked upon seriously by the furnacemen, but rather as the natural result of the sudden impetus recently given the whole market. Sales of 500 and 1000 ton lots of Mill Iron at \$13.60, cash, at the

valley furnaces, are reported. There is, however, little attempt to force the market from either side, the furnacemen being quite willing to trust to the future.

Scrap Iron.—An occasional sale of Old American Rails at \$22.50 is reported. Large quantities of Old Wheels are for sale at \$19, and No. 1 Scrap sells at the same price.

New York.

Office of *The Iron Age*, 65 and 68 Duane street, New York, March 27, 1889.

If anything the feeling is weaker. Although there have not been any new sales of any consequence at lower prices, there are indications that the tendency is downward. Commission merchants here are in receipt of letters from a number of parties asking them to undertake the placing of blocks of Iron at reductions in price, the parties in question being concerns who usually seek a market through other channels, or sell direct. It is reported that outsiders are offering mixed blocks of No. 1 and No. 2 Foundry at a very low price, delivered at tidewater. The effect of Southern competition is being felt, too, in another way. Important consumers are not taking their usual quantity of Northern Iron, and in reply to questions frankly admit that they are melting considerable Southern Pig purchased \$1 less than what Northern Standard Iron costs them. We quote for standard Northern brands, tidewater delivery, \$17.50 @ \$18 for No. 1 Foundry; \$16.25 @ \$17 for No. 2 Foundry, and \$15 @ \$15.50 for Gray Forge.

Scotch Pig.—We quote: Coltness, \$20.50 @ \$21; Shotts, \$20 @ \$20.50; Langloan, \$20 @ \$20.50; Summerlee, \$20.25 @ \$20.50 and Dalmellington, \$19.25 @ \$19.50.

Spiegeleisen and Ferromanganese.—There is little doing in Spiegeleisen, which we quote nominally \$27.50 @ \$28 for German, and \$28 @ \$28.50 for English. In Ferromanganese the demand is quite good, and sales have been made at \$57, New York, with some important business pending.

Structural Iron.—We quote: Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 1.9¢ @ 2.1¢; Tees, 2.35¢ @ 2.5¢; and Channels and Beams, 2.8¢, on dock.

Plates.—We quote Iron Tank, 1.9¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3¢ @ 4¢.

Bar Iron.—We quote: Carload lots on dock, half extras, Common, 1.6¢ @ 1.65¢; Medium, 1.65¢ @ 1.7¢, and Refined, 1.7¢ @ 2¢.

Steel Rails.—Aside from a few small lots there has been no business, either East or West, and the outlook is unsatisfactory except to a few mills who are fairly well booked up to and during the summer months. No more purchases of allotment have been made, an option for an additional quantity not having been availed of by the mill, which has taken in all 28,000 tons. We quote for large lots, standard sections, \$27 @ \$27.50, at Eastern mill.

Wire Rods.—There has been no business in Foreign Basic, which is quoted at \$41.25 @ \$41.50. A lot of a few hundred tons of Belgian Acid Rods on dock here is being offered at \$39.50.

Old Rails.—A small lot of consigned Foreign Old Rails has gone into store because \$23 could not be obtained for them. We quote, nominally, \$23 for Tees.

Scrap Iron.—Very little inquiry, the mills buying to cover immediate requirements only. It is said that low figures have been named to buyers of Choice No.

1 Scrap, but in spite of these inducements the stock in yard remains large. We quote: No. 1 Scrap, \$20.50 @ \$21, far carload lots, delivered; Turnings, \$13 @ \$14, for cargo lots, do; Cast Scrap, \$15.50 @ \$16, do; and Horseshoes, \$23 @ \$23.50.

Track Material.—We quote Spikes: \$2 @ \$2.05, and Angle Bars \$1.75 @ \$1.85, delivered.

Financial.

The commercial situation is improved, particularly in respect of those departments most sensitive to speculation, the collapse in Copper being already regarded as among past events. Wheat has dropped to a basis where export trade is possible, and a larger outward movement is observed than before for a long time. Wheat became higher on the Government report showing a reduction of 25,000,000 bushels in the crop, but broke on Saturday on the news of higher duties in Portugal, our principal export market. Provisions are going out freely. From the Atlantic ports there were taken last week 8,151,000 lb lard, against 4,128,000 lb last year, besides 8,085,000 lb bacon, against 6,203,000 lb last year. Sugar tends steadily upward, equal to 1¢ $\frac{3}{4}$ lb for refined within two months. Other markets quiet. The Chicago *Tribune* says the spring crop prospects are phenomenal. Winter wheat is everywhere thriving. Anthracite coal is phenomenally dull, but bituminous is active. All the collieries in the Pittston region, including the Pennsylvania Coal Company, Lehigh Valley and individual operators, suspended mining operations for six weeks.

The Stock Exchange market was dull and featureless; the possibility of financial disturbance in Paris and London growing out of the copper speculation and consequent depression in this market has operated to discourage investors. The decline in the prices of anthracite and the unsatisfactory condition of the iron trade exerted a like tendency. Considerable amounts of securities are believed to have been sold on foreign account. The unfavorable bank statement had no other effect than to strengthen the bearish sentiment. Burlington and Quincy declined to the lowest point yet reached, a good deal of this stock coming on the market from Boston. On Tuesday there was much more activity than for some days previously, there being an increased business in Atchison, Burlington and Rock Island. The movement was irregular in the morning, but in the afternoon Atchison, Topeka and Santa Fé again declined and the tone was irregular to the close.

United States bonds were quoted as follows:

U. S. 4½s, 1891, coupon.....	107½ @ 108½
U. S. 4s, 1907, coupon.....	129¼ @ 129½
U. S. currency 6s, 1895.....	120
U. S. currency 6s, 1896.....	123
U. S. currency 6s, 1897.....	123
U. S. currency 6s, 1898.....	120
U. S. currency 6s, 1899.....	131

General trade begins to feel the opening spring, attended with the opening of navigation on the rivers, canals and lakes, even the Straits of Mackinaw being navigable without difficulty. This is the earliest opening between the upper and lower lakes of which there is any record. One immediate effect will be the sailing from Chicago of a large fleet of grain vessels to discharge at Buffalo. Railroads already complain of competition by the water routes.

The weekly statement of the Associated Banks shows an unexpected decrease of reserve amounting to \$1,371,950, so that the surplus now stands at \$6,698,925. The currency movement was heavily against this city, Boston drawing in large amounts. Loans increased \$905,400; specie was down \$1,198,800, and deposits decreased \$1,182,200. It is now stated

that the Secretary has decided to continue the policy of his predecessor regarding purchases of bonds, and it is supposed that he will soon commence to buy 4%. Time money for five, six and seven months is quoted at 5%. Commercial paper was in a little better demand last week owing to the fact that some of the banks had come into the market as buyers, but rates were not materially changed. The offerings of bonds since March 4 have been somewhat less liberal than previously, and have been chiefly of 4½s, although there have been repeated efforts to tempt the Secretary into the purchase of 4s. The total amount of bonds purchased to date under the circular of April 17 is \$126,208,500, of which \$51,337,800 were 4½s and \$74,871,200 were 4s.

The clearings of 40 cities last week were \$1,015,989,076, an increase of 11.5%. New York gained 12.8, Boston 2, Chicago 8.7, Philadelphia 14.9, St. Louis 10.8, Cincinnati 11.3, San Francisco 5.9, New Orleans 23.9, Pittsburgh 26.2, Kansas City 16.1, Louisville 26.5, Milwaukee 18.1, Omaha 30.7, Denver 33.7, Cleveland 15.8, Memphis 41.6, Richmond 53.9 and Duluth 15.9%. Baltimore decreased 28 and Los Angeles 42.5%.

Sterling exchange was unaffected by the financial flurry in Paris, and was dull at \$4.86½ @ \$4.89½. A shipment of \$1,000,000 in gold was on special order rather than an exchange operation. London, however, at latest advices, was expecting large arrivals from America, and, in view of failures supposed to be impending in connection with metal, financiers were moving with caution. The London *Statist* says the crippling of trade in France is inevitable; and that the injurious effects will be felt not only in Europe, but in South American commerce.

The *Financial Chronicle* computes the gross earnings of 122 roads for February at \$25,434,878 on 71,577 miles of road, an increase of \$1,261,838, and in mileage of 2833, as compared with last year. The indications are that the shading of rates by the roads tributary to Duluth, and by those that feel that they are competitors of those roads, has not as serious an effect upon earnings as Western advices would lead the public to believe. This is an irregularity that can be localized, and it will be the first work of the Interstate Traffic Association and of Chairman Walker to adjust these differences, or at least to confine them to the roads directly interested.

The Bank of North America, of which William Dowd is president, removed to its new quarters on Nassau and Cedar streets.

Creditors of the Reading Iron Works learned that instead of the company having made \$600,000 in the last four years, as stated at their first meeting, there was, in fact, a loss of \$263,000. There has also been a shrinkage of nearly \$500,000 in the book accounts, and only \$380,000 of stock and material on hand, instead of \$600,000 worth.

The imports of merchandise at this port during the week were valued at \$11,225,000, of which \$3,488,000 represents dry goods. Since January 1 the aggregate is \$122,798,000, as compared with \$114,995,000 for the same time last year and \$108,000,000 in 1887. Exports were decidedly larger, amounting to \$7,807,241. Since January 1 the total is \$81,871,700, against \$67,991,000 for the same time last year. According to the custom-house report, the exports of specie from New York during the week were \$1,962,000, making a total since January 1 of \$10,448,000, against \$6,462,000 for the same time last year.

Durham furnace, anthracite, at Riegelsville, Pa., owned by Cooper, Hewitt & Co., has blown in.

Metal Market.

Copper.—A week ago London had declined to £40 all round; since then there was an improvement of a couple of pounds sterling, but closing again at £41 @ £41. 10/, spot, and £41. 5/, futures, 65 tons Rio Tinto Cakes bringing, at auction, £44. 7/6 yesterday. It is cabled from Paris that a judicial inquiry into the facts bearing upon the formation of the syndicate has been ordered. A good many complications may arise on this side in the near future as to the carrying out of the contracts made prior to the failure of the Société des Métaux, like, for example, the stopping of delivery on the part of mining companies for two months from March 15, the pool sale to consumers of 14,000,000 at 16½¢, to be delivered from March 1 to May 31. If, in view of recent events, the American parties to any of these contracts should try to repudiate them, in whole or in part, the question would arise whether the agents of the syndicate can enforce them. The said pool sale, it should be remarked, however, was made in the name of the Calumet and Hecla. The 20 per cent. suspension of production by the companies was agreed to by the latter, with the understanding that the "Société" was to resume its purchases subsequently, which, since it failed, it evidently cannot. The companies, it is true, hold bank credits as a security for the fulfillment of the contracts, but it is questionable whether these will prove available, even with the best banking concerns, under the circumstances, in all cases. Another question arises as to the lot, or lots, of Copper from which deliveries to consumers are to be made. While all these points are naturally canvassed actual business on this side is kept in suspense, and quotations remain nominally 14½¢ @ 15¢ for casting brands.

Henry R. Merton & Co., of London, have just published their annual estimate of the production of Copper. Making minor changes where official data are available, we reach the following:

Countries.	1888.	1887.	1886.
Europe:	Long tons.	Long tons.	Long tons.
Great Britain.....	1,500	3,891	1,471
Spain and Portugal:			
Rio Tinto.....	32,000	26,668	24,700
Tharais.....	11,500	11,000	11,000
Mason & Barry.....	7,000	7,000	7,000
Sevilla.....	1,700	2,300	2,125
Portuguesa.....	900	856	1,258
Poderosa and others.....	7,300	4,060	3,560

Australia.....	7,450	7,700	9,700
Grand total.....	250,391	223,585	214,533

At least one small lot of Copper is on its way back, and the market abroad has been pretty thoroughly scoured to secure

American Copper in original packages. It seems that up to date very little has been secured. When the Copper has been taken from its original packages abroad a good deal of difficulty is encountered in getting it in here. It remains to be seen whether European consumers have much which they can reship. Thus far no news has been received concerning the negotiations now progressing in Paris. We discuss the situation at length elsewhere.

Tin.—Pending the publication of statistics at the end of the month, Tin has ruled dull in London and rather easier, Spot going from £94 to £93. 15/ yesterday, and futures from £95 to £94. 10/, with sales of 100 tons. Here hardly anything transpired, 10 tons April bringing 21½¢, and 10 tons May, 21.20¢, closing heavy at 20.85¢ @ 21.20¢ for March and April. The January shipments from the Straits settlements to the United States were 9079 piculs, against 5891 in 1888; 9167 in 1877; 5045 in 1886; 1260 in 1885, and 6476 in 1884. The closing Spot quotation on a quiet market to day is 21½¢ @ 21¼¢. **Tin Plates.**—Although the trade on the spot has not assumed much greater proportions than before, there has been great firmness and a hardening tendency. Large dealings have meanwhile taken place in futures at gradually improving prices, in sympathy with the strong position in England. We quote at the close, large lines, $\frac{3}{4}$ box: Siemens-Martin Steel, Charcoal finish, \$4.75 @ \$5.50; Coke finish, \$4.65 @ \$4.70; Terns, \$4.12 @ \$4.25; Coke Tins, \$4.22½ @ \$4.30, and Wasters \$4.12½ @ \$4.15.

Lead.—Slightly greater activity has developed at easier rates, some 350 to 400 tons changing hands at 3.65¢, which remains the closing quotation, but very little to be had at this figure. St. Louis has been active at 3.45¢.

Spelter.—The market has been decidedly weak and the few sales effected have gone as low as 4.70¢ for Common Domestic. Silesian is 5½¢, nominally.

Antimony.—Dealings have been confined to a moderate jobbing trade at 12¢ for Hallett and 13½¢ for Cookson.

New York Metal Exchange.

The following sales are reported:

THURSDAY, March 21.	
10 tons Tin, May.....	21.20¢
10 tons Tin, April.....	21.25¢
16 tons Lead, August.....	3.80¢
25,000 lb Lake copper, March.....	15.80¢
28,000 lb G. M. Copper, March.....	11.50¢
28,000 lb G. M. Copper, March.....	11.35¢
28,000 lb G. M. Copper, July.....	10.00¢
FRIDAY, March 15.	
16 tons Lead, April.....	3.70¢
MONDAY, March 18.	
100 tons Lead, April.....	3.65¢
TUESDAY, March 19.	
100 tons Lead, September.....	3.75¢
WEDNESDAY, March 27.	
32,500 lb Lead, July.....	3.75¢

Coal Market.

Reduced prices and short time at the mines alike fail to stimulate the demand for Anthracite, and the complaint of dullness has become a chronic condition. An examination of the statistics shows that, despite the efforts to restrict, production has steadily increased for three weeks past, and averaged 512,000 tons every week. During the week ending March 23 the total was 536,938, a decrease of 140,000 tons compared with the same week last year. Since January 1 the aggregate is 6,378,318 tons, a decrease of 600,000 tons compared with 1888. The present determination on the part of the companies appears to be to maintain prices by controlling production, with the expectation that in July mining can be resumed in full force. Nevertheless individual miners possessing large interests, while professing to "follow the market," cause more or less irregularity

and reports of concessions are freely circulated. The stock of Anthracite Coal at tidewater on February 28 was 887,216 tons, against 232,500 tons last year and 470,609 tons in 1887. The Philadelphia Ledger says: "The collieries now running are being operated principally to supply the demand for fuel from iron furnaces and manufacturers. A number of iron furnaces have recently gone out of blast, and consequently the consumption of the furnace sizes has decreased."

Free Burning, f.o.b., is quoted as follows; Broken, \$3.75; Egg, \$3.90; Stove, \$4.15; Chestnut, \$4; Lehigh, Lump and Broken, \$4.10; Egg and Chestnut, \$4; Stove, \$4.15.

A decision in the Coxe Bros. suit against the Lehigh Valley road is expected in about one month.

A meeting of freight agents to consider a reduction of tolls at tidewater was to have taken place yesterday in this city, but in the absence of principal parties action was postponed. To-day the Western Association meet to harmonize prices with the recent reduction here.

The Anthracite Coal-producing companies have agreed upon the division of output for the coming year, as follows:

	New per cent.	Old per cent.
Reading.....	21.45	21.63
Lehigh Valley.....	17.13	18.97
New Jersey Central.....	15.24	15.98
D., L. and Western.....	18.03	15.54
Delaware and Hudson.....	10.97	10.65
Pennsylvania Railroad.....	10.80	10.45
Pennsylvania Coal Co.....	4.15	4.84
Erie.....	2.23	1.94
Totals.....	100.00	100.00

The Pennsylvania Railroad Coal tonnage for the year thus far is 2,200,264 tons, a decrease of 253,000 tons. Reading reports for the week 110,000 tons, of which 15,000 were discharged at Port Richmond and 9000 at Port Liberty.

Bituminous Coal is unchanged. The problem now is to market the production and pool issues.

Yaquina Bay, 115 miles south of the Columbia River, will soon become an important seaport, with 32 feet of water on the bar when the jetties now building by the general Government are completed. About \$300,000 have already been expended on this work. At average high tides there is now from 28 to 24 feet of water on the bar. The deepest water on the Columbia River bar is only 30 feet. Ships entering the Columbia River are at the expense of towage to Portland, over 100 miles, to reach railroad transportation. Ships that can go to Portland and load to their full capacity can enter Yaquina Bay and reach transcontinental railway connections in 20 minutes after crossing the bar. Yaquina Bay inside is 1½ miles wide, 6 miles long and perfectly land-

locked. All the vessels on the Pacific Coast could ride safely at anchor in this bay at the same time. Inside of the bar there is from 30 to 45 feet of water.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, March 27, 1889.

The Copper market has developed a much firmer tone and Merchant Bars found quick sale at between £41 and £42. There is now a hopeful feeling here, and the belief is general that the worst has passed. Brokers representing consumers are eager buyers for considerable quantities which, if negotiated, would greatly reduce the stocks. Trading is checked, however, by the fact that material is not obtainable from the producing companies, the latter not being free to sell until matters between themselves and the syndicate are more clearly defined.

It is reported that the syndicate owes mining companies large sums for Copper delivered, including £25,000 to the Tharsis Company. One company is said to have been unable to pay an intended dividend owing to default in payments by the syndicate.

A new pool is forming to purchase the syndicate's stocks at an average of about £45, provided arrangements now pending with the mining companies as to future output come to a satisfactory termination.

Messrs. Morrison, Kekeovich & Co., brokers, have made their creditors a material payment on account of contracts executed in the firm's name, and will proceed against the Société des Métaux syndicate for the balance. This enables the firm to proceed with business as heretofore. Articles of the new Comptoir are settled.

The fluctuations in prices of Block Tin have been small and little business has been transacted. The market has fully recovered from the late uncertainty.

Tin Plate has been in brisk demand, Terns more especially, and prices for all kinds are decidedly stronger. The much-talked-of syndicate to control supplies is no longer seriously considered.

There has been a large business in Pig Iron warrants and prices for Scotch have advanced to 44/6. The statistical position is pleasing to operators for a rise and the demand for consumption continues brisk. Middlesboro' Pig has advanced 3d and Hematites are fully 1/ dearer.

Large Government orders for Steel have been given out in Scotland and prices are higher throughout. The general demand has been better than during the preceding week in most branches. Slabs and Wire Rods are exceptionally quiet. Manufactured Iron of all descriptions is strong and active.

There is no improvement in the demand for old material, and prices are greatly nominal. A parcel of Flanged Rails was offered at 54/6 in London and found no takers.

Cleveland Pig.—The demand has continued active, and prices show a further advance. No. 3 Middlesboro', G.M.B., 37/9.

Bessemer Pig.—Trade in this line still large and the market strong at 1/ advance. West Coast brands, mixed numbers, 48/8, f.o.b. shipping point.

Scotch Pig.—There continues to be a brisk demand, and the market is strong, with prices again higher on some brands.

No. 1 Coltness, f.o.b. Glasgow	56/
No. 1 Summerlee, " "	55/
No. 1 Gartsherrie, " "	52/
No. 1 Langloan, " "	55/
No. 1 Cambro, " "	47/
No. 1 Shotts, " at Leith	53/8
No. 1 Glengarnock, " Ardrossan	50/8
No. 1 Dalmellington, " "	45/8
No. 1 Eglington, " "	44/8
Steamer freights, Glasgow to New York, 5/;	
Liverpool to New York, 10/.	

Spiegeleisen.—The demand is fairly active and prices are firm. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—A large demand continues, and the market is strong, without, however, any rise in prices. Heavy sections quoted at £4. 7/6, and light sections £4. 15/ @ £4. 17/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—There is only a moderate demand, but prices are firm. We quote £3. 19/8 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—A fair business has been done, and prices remain firm. Bessemer, 2½ x 2½ inch, £4. 6/3, f.o.b. at N. W. England shipping point.

Steel Slabs.—No improvement in the demand. Some sellers name slightly lower prices. Bessemer £3. 18/6, f.o.b. at N. W. England shipping point.

Old Rails.—The market continues flat, and prices are nominal. Tees quoted at £3. 5/ @ £3. 6/6, and Double Heads, £3. 10/ @ £3. 12/6, c.i.f., New York.

Scrap Iron.—There is but little doing, and prices are without change. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Crop Ends.—Transactions are still moderate, but holders remain very firm. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

Tin Plate.—The market is strong and fairly active, with business at the advanced prices. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/3 @ 15/9
IC Bessemer Steel, Coke finish	14/3 @ 14/6
IC Siemens " "	14/3 @ 14/6
IC Coke, B. V. grade	13/9 @ 14/
Charcoal Terne, Dean grade	12/6 @ 13/

Manufactured Iron.—A large business has been done. The demand is still active and the market strong. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d. @ 8 2 6
Common " "	£ s. d. @ 5 12 6
Staff. Bl'k Sheet, singles	£ s. d. @ 7 12 6
Welsh Bars (f.o.b. Wales)	£ s. d. @ 5 2 6

Copper.—The market quieter, after a good week's business, but fairly steady. The quoted prices at the close were: Bars, £41 for spot; £40. 10/ @ £41 for three months' futures. Best Selected, £47.

Tin.—The demand fair and prices steady. Straits quoted at £98. 15/, spot, and £94. 15/ for three months' futures.

Lead.—Trade has been slow and prices are a trifle weaker. Quoted at £12. 7/6 for Soft Spanish.

Spelter.—The demand moderate and sales at 5/ decline. Quoted at £17 for ordinary Silesian.

The North German Lloyd is becoming an enormous steamship corporation. Orders have been given for two more steamships of 5000 tons each, to be built in Scotland, in addition to five others in process of construction in Kiel and Stettin. These completed will swell the North

German Lloyd fleet to 73 steamers of a total tonnage of 172,000 tons, with 158,000 horse-power. There is scarcely another mercantile fleet like it as regards the number of steamers and the variety of lines of communication.

WEST INDIES.

PORT OF SPAIN, TRINIDAD, February 15, 1889.—**Asphaltum.**—During the fortnight there has been a steady, moderate demand at \$14.04 per ton Boiled and \$6.84 Crude. Since January 1 1889 tons have been shipped, against 8536 same time last year and 1828 in 1887. **Exchange.**—Ninety days' sight on London, \$4.74 @ \$4.80.—**E. P. Masson**

EAST INDIES.

SINGAPORE, February 12, 1889.—**Tin.**—Our last review was dated 28th ult. The Chinese New Year holidays have taken up a great portion of the interval, and there is, in consequence, but little business to report. As was to be expected, the arrivals of Tin have not been large, which rather helps dealers in their present attitude—that of holding off—while prices are moving upward in sympathy with the home markets. Steamers clearing from here and Penang during the fortnight will have on board at least 2700 tons. The closing price is \$36.25 per picul, at which there are buyers. **Gum Copal.**—Stocks are large, but firmly held for higher prices. There is a fair demand. **Gum Damar.**—No supplies have come in since the holidays. **Tonnage.**—The regular liners are more or less again in possession of the market, with the result that rates have risen to 42/6 for dead weight to London. **New York via Cape.**—The vessels noted in our last are loading. There have been no fresh fixtures. **Via Canal.**—The Duke of Westminster passed through a few days ago, taking Tin at 27/6. For Boston there are no fresh charters. **Exchange,** 3/1½ for 6 months' draft, with a hardening tendency. January Tin shipments from the Straits Settlements to the United States have been as follows: 9079 piculs, against same time last year 5891; in 1887, 9167; in 1886, 5045; in 1885, 1280, and in 1884, 6476.—**Gillfillan, Wood & Co.**

MANILA, March 4, 1889.—**Hemp.**—There are buyers at \$15 15-16, against \$7½ in 1888, equaling per ton, cost and freight, \$53. 10/, against \$28. 7/6. Clearances for the United States since January 1 amounted to 82,000 bales, against 39,000 in 1888; loading, 22,000, against 15,000; cleared for England since January 1, 65,000 bales, against 72,000; loading for do, 1000, against 30,000; cleared for all other ports, 8000, against 15,000; receipts at all ports since last cable, 18,000, against 15,000, and since January 1, 149,000, against 128,000 and 94,000. **Freight.**—\$7.50, against \$5. **Exchange,** 6 months' sight, 3/7½, against 3/8½.—**Ker & Co., per cable direct to their agent in New York, Mr. Charles Nordhaus, 89 Water street.**

COLOMBO, February 14, 1889.—**Plumbago.**—A fair business has been transacted during the fortnight at ensuing quotations, in rupees per ton: Large Lumps, 145 @ 170; Ordinary Lumps, 125 @ 160; Chips, 80 @ 95, and Dust, 40 @ 64. Shipments since October 1 have been as follows: To England, 47,612 cwt.; to Hamburg, 4419; to Bremen, 659; 3086 to Antwerp, 63 to India, 88 to Australia and 36,810 to the United States; together, 92,737, against same time last year, 111,486; 84,523 in 1887, and 65,954 in 1886. **Coir Yarn** is moderately active and steady at from 7 to 12 rupees per cwt, Nos. 1 to 4. **Exchange.**—Six months' sight, 1/4 31-32.—**Volkart Brothers, to Mr. John W. Greene, 82 Wall street, New York.**

BELGIUM.

BRUSSELS, March 16, 1889.—**Iron.**—The Belgian iron markets continue firm and well sustained. Beams, in spite of French and German competition, are bought in Belgium as extensively as ever for export. Orders have dropped in from Holland and her colonies, the price obtained for these Beams being 143.09 @ 148.22 francs per ton, free on board at Rotterdam. On some railroad bridges for Spain the Creuzot has, however, beaten our makers. Out of the 50 blast furnaces there are in Belgium 30 were in operation on March 1 and 20 blown out. The February production was 46,000 tons of Forge

Pig, 5740 Foundry do. and 17,780 Bessemer; together, 69,580 tons of Pig Iron.—**Moniteur des Intérêts Matériels.**

GERMANY.

HAMBURG, March 16, 1889.—**Iron.**—The Rhenish Westphalian Iron market has been characterized by unwavering stiffness, upheld by a good consumptive demand. Prices are tending upward, especially as regards Pig. Spiegel continues being taken as freely as before, both for export and domestic use, at 63 marks for 10 @ 12 per cent. Manganese. Forge Pig is being contracted for all the way to October 1, No. 3 being 1 mark higher. We quote the same 54 marks per ton, and Foundry Pig, which is steady, 54 @ 63. Thomas is wanted at 47; Bessemer moderately so at 56; English at 46/9; the range for Luxembourg is 38 @ 46. Although the inquiry remains active, the syndicate of rolling-mill owners has deemed it more advisable not to advance the price in proportion to the improving raw material. The Wire branch does not yet emerge from its apathy. Car works, foundries and machine shops are all kept busy. The quotations at Dortmund are 128 @ 130.50 for Merchant; Wire Rods, 114 @ 120; Steel Rails, 120 @ 128, and Steel Rails for mines, 110 @ 115. **Metals.**—Lead is firm at 13.10 @ 13.40, German Pig; Spelter, Silesian, spot and futures, 8 @ 9 marks.—**Borsenhalle.**

Natural gas at Muncie, Ind., is working wonders. The average well yields 4,000,000 cubic feet of gas per day, which is equal to 200 tons of coal, and this fuel is as "free as the water which is pumped into the boiler." There are now 33 wells in operation in Muncie, averaging a capacity of 5,000,000 cubic feet each; and the largest of these wells has a capacity of something like 12,000,000 cubic feet. Altogether the capacity of these wells is reckoned at at least 100,000,000 feet, equal to 500,000 tons of coal, a day. As the lowest cost of coal is \$2 a ton, the daily capacity of the wells already existing there is equal to \$10,000 a day, or over \$3,000,000 a year. According to estimate, every 10 acres will support a well. Supposing that there should be, on the average, one well to each 40 acres, or 576 wells to the entire township, and estimating the value at only \$200 a day, or just one-half the amount computed by experts, the gas-flow of these 576 wells would be worth \$115,200 a day, or \$41,048,000 a year. There are 54 factories already located in Muncie, and the amount of gas they consume is equivalent to the heating power of 125,000 tons of coal, or a value of at least \$250,000, all obtained simply for the cost of sinking a well and laying pipes, and supplying other requisite appliances for its control. About the same amount of fuel is consumed there now for domestic purposes.

A Boston newspaper publishes the following in its financial column: The letters credit of the Boston and Montana Copper Company were issued, as has often been remarked, by the Messrs. Baring Bros. & Co. Those of the Tamarack, Calumet and Hecla and the other companies were issued by the Comptoir d'Escompte. Tamarack people furnish these particulars regarding the Boston and Montana and Tamarack and Osceola credits:

	Boston and Montana.	Tamarack.	Osceola.
Expire.....	Dec. 31, 1890.	Feb. 1, 1891.	May 1, 1890.
Amount.....	\$4,875,000	\$6,500,000	\$520,000
Withdrawn....	1,142,829	458,250	200,000
Available...	\$3,732,170	\$6,041,750	\$320,000

That the new Comptoir d'Escompte or any new combination will assume the letters credit and other obligations of the old Comptoir now in liquidation is at least problematical. The Baring Bros. will have to take the product of the Boston and Montana, and may reasonably be expected to support any proper measure calculated to maintain the price of copper at about 12 cents or higher per pound, the contracting price with this company being a fraction under 12 cents.

S. W. Goodridge, Grafton, Vt., issues a price list of a line of Fishing Rods of which he is manufacturer. In the introductory circular it is mentioned that in

making these Rods no machinery is used, each joint being worked out by hand, and all parts showing imperfections being rejected. The quality of the wood and the care taken in manufacturing the Rods are also referred to. In addition to his regular line, we are advised that he is making a Rod of lancewood or greenheart on the same principle as the Split Bamboo, which is referred to as giving special satisfaction, the gluing up of it being said to add greatly to its elasticity and strength.

The Edward Storm Spring Company, Poughkeepsie, N. Y., for whom J. H. Graham & Co., 113 Chambers street, New York, are agents, have issued a revised edition of their catalogue, describing their Dumb Waiters and Hand Elevators—the New York Safety, Manhattan and the Humphrey. Attention is also called in it to Ives' patent Door Bolts and Sash Locks, and Lane's Door Hangers and Tracks.

The Lloyd & Supplee Hardware Company, Philadelphia, issue a circular in the form of a paper called *Blades of Grass*, in which they describe the Pennsylvania and the Continental Lawn Mowers, giving illustrations of the different patterns and pointing out the advantages of their construction. Other information is given relating to Lawns and Lawn Mowers and some miscellaneous matter of interest.

The Peerless Wringer and Mfg. Company have moved their factory from Cincinnati to Cleveland, Ohio, and consolidated the Mercantile Mfg. Company with the Peerless Wringer Company. Their new factory is fitted up with late improvements and modern machinery and situated at the junction of two leading lines of railway, thus giving them excellent shipping and manufacturing facilities and putting them in a position to turn out a large quantity of Wringers.

A circular has been issued by Goulds, Austin & Caldwell Company, 167 and 169 Lake street, Chicago, announcing that they have purchased the interest of F. C. Austin in that corporation, and that the business will hereafter be under the entire control and management of Robert W. Caldwell, aided by an experienced corps of assistants. They request that all correspondence intended for them be addressed to the company and not to Goulds & Austin.

The Planet Screw Showcase, formerly manufactured by W. I. Gardiner & Co., Seymour, Ind., is now made by Gardiner & Cross, Louisville, Ky.

Cordley & Hayes, 37 Barclay street, New York, have recently issued a new price list for the trade on Indurated Fibre Ware, showing a large variety of goods lately added to their line. The growth of their business is such that they find their present quarters insufficient and have leased the large double store, 173 and 175 Duane street, New York, to which they will remove in April.

Dame, Stoddard & Kendall, 374 Washington street, Boston, Mass., issue a convenient catalogue devoted to Lawn Tennis, Croquet and general Athletic Goods for the season of 1889-1890. An interesting line of these goods is exhibited, including Photographic Outfits.

Goodnow & Wightman, Boston, Mass., issue a convenient price list of the extensive line of Tools for machinists, pattern-makers, carvers, cabinet-makers, amateurs, jewelers, &c., which they manufacture. It is fully illustrated and gives the retail prices at which they sell the goods.

Blood's Patent Adjustable Hose Holder, which is put on the market by C. H. Taisey, Denver, Col., is shown in the advertisement on page 65. This article holds any size Hose from $\frac{1}{4}$ to 1 inch in any desired position for watering a lawn. Its

simplicity, neatness of appearance and adjustability are points that are made in regard to it.

I. F. Force, New Albany, Ind., issues a convenient price list without illustrations showing the line of Axe, Pick, Hammer and other hickory Handles of which he is manufacturer.

Empire Mfg. Company, Forestville, N. Y., issue a neat catalogue illustrating their line of Step-Ladders, Wash-Benches, Ironing-Boards, &c. They advise us that they keep on hand a full line of these goods, so that they are in a position to fill orders without delay.

William Read & Sons, 107 Washington street, Boston, Mass., issue an attractive pamphlet describing the New Mail for 1889. A full description is given of this machine, with many testimonials in regard to its merit. The New Mail Safety is also illustrated and also the American Ideal, Ideal Tricycle and American Ideal Tandem.

Abbey & Imbrie, 18 Vesey street, New York, issue a very complete catalogue of nearly 150 large pages, in which they represent a very complete line of Fishing Tackle. It begins with Fish-Hooks, of which a very large assortment is exhibited, the cuts being the actual size of the Hooks. It passes on to Flies, of which selected patterns are shown and descriptions and list prices of others given, Lines, Sinkers, Rods, Reels, Spoons, Spinners, &c., and a large variety of specialties following. The pamphlet closes with a convenient and interesting codification of the game fish laws in the different States, showing at a glance where the different kinds of fishing are lawful.

Moore & Barnes Mfg. Company, 103 Chambers street, New York, have established an agency for their goods with the well-known and enterprising house of Cutler, Woodrough & Co., 19 Lake street, Chicago, where a complete stock of the goods is carried, and where Western buyers can have their orders filled at factory prices. The goods thus represented consist of Colton's Patent Vise, Re-enforced Sash Chain, Phoenix Door Springs, Door Checks, &c., Window Cleaners, Carpet Stretchers, &c.

The price list issued March 7 by E. C. Meacham Arms Company, St. Louis, Mo., is printed on exceptionally good paper, and represents a line of Rifles, Guns, Revolvers, &c., Roller Skates, Bicycles, &c. It has the usual key to the quotations, which are given in cipher.

The Coventry Machinists' Company, Coventry, England, with a branch house 239 Columbus avenue, Boston, have issued an illustrated catalogue of the Club Bicycles and Tricycles. It describes an interesting variety of these machines, and gives a number of testimonials from those who are familiar with them. The sundry department represents an assortment of Lamps, Saddles, Alarms, Cyclometers, Whistles, &c.

Enterprise Mfg. Company, Philadelphia, Pa., for whom J. C. McCarty & Co. are agents, 97 Chambers street, New York, have issued their catalogue for 1889, which represents their varied line. The pamphlet opens with the Enterprise Lawn Mower '89, which is followed by their Lawn Mower '87. Sad Irons, Coffee, Spice and Drug Mills, Measuring Faucets, Tobacco Cutters, Meat Choppers, Cork Pullers, Cherry Stoners and other goods follow.

Among the special notices on page 48 is one in which a business long established in a city of 20,000 inhabitants and having natural gas is offered for sale. The amount of the stock is put at \$8000 and the annual sales \$40,000. An interest in the business will be retained if desired. This

is referred to as a favorable opportunity to acquire a valuable business without bonus.

S. B. McCord and Basche & Co., Baker City, Ore., the two Hardware houses in that city, have both fitted up their buildings, and are now in good shape for the coming season's business. The outlook for trade is referred to as very favorable.

The Yale & Towne Mfg. Company,

Stamford, Conn., and 62 Reade street, New York, have issued their catalogue No. 12, a large volume of nearly 600 pages, describing the manufactures of the Yale Lock Mfg. Company and the Weston Crane Company, the larger portion of the volume being devoted to the products of the Yale Lock Mfg. Company, and representing their very extensive line of Locks, Door Furniture, Post-Office Equipments, &c. The volume is divided into the following departments: Yale Locks, Yale Master Key Duplex Locks, Standard Locks, Keys, Lock Furniture and Real Bronze Hardware, Prison Locks and Equipments, Time Combination Bank and Safe Locks, &c., Post-Office Equipments, Letter-Boxes, &c., and Hoists. Comparing the catalogue with the former one of the company, it is found that many important additions have been made to the line of Locks to adapt them to special requirements. The line of Yale Master Key Duplex Locks will be regarded with especial interest as new, and solving the difficult problem of giving an unlimited number of Locks of which the change keys may be all different, and yet one master key fitted to the whole number. The line of Standard Locks has also been greatly increased, and includes a very complete assortment, from which architects or the trade can find patterns adapted to nearly every purpose, and at moderate prices. An interesting line of Real Bronze, Brass, Wrought-Iron or Cast-Iron Strap Hinges, Number Plates, Wrought-Iron Grilles, &c., is exhibited, beginning with page 418, and the volume illustrates as far as a catalogue of this character properly can the company's line of Bronzed, Brass and Bower-Barffed Iron Hardware. The company have, however, we understand, many other unique and special designs in these lines which it is not feasible to illustrate in a catalogue of this kind, but which they are prepared to bring to the attention of architects who may desire them, while they are also in a position to manufacture advantageously any special designs that may be called for. It will, of course, be understood that the best designs are special and cannot be reproduced and are changing from day to day. The company advise us that many of their goods can now be furnished with the exposed parts in trimmings in iron or steel with the Bower-Barff rustless finish. After an experience of several years with this finish and having fitted up a number of important buildings with it throughout and having used it under most trying conditions, the company confidently recommend it as the most desirable for public buildings and for use on outside doors in all situations, and indeed for any situation where a beautiful and changeless finish is desired without the necessity of attention after the goods are put on. Every department in the book seems to contain interesting additions, among which special attention may be directed to the Seamless Steel Shell Padlock, which is referred to as possessing advantages for many purposes not possessed by other goods. In this catalogue prices are in all cases omitted, blanks being left for their insertion when desired. A price-list accompanying the volume is also issued, which contains the prices at which the goods are retailed over the counter at their several warehouses, with blank columns for

the insertion of the net prices at which the goods are sold to the trade. The company announce that hereafter they will in all cases quote net prices, having abandoned their system of list and discount.

Business Methods.

We give below a form of remittance and receipt which is used by the Low Moor Iron Company, of Virginia, in their office, 31 Burling Slip, New York. It is used in remitting to parties for goods bought, payments by check or cash being accompanied by this voucher and returned signed by the party to whom the payment is made. At the end of each month these are filed together and form a complete record of the payments for that month.

stored with agreeable and humorous reminiscences of the times when Cincinnati was nothing more than a flourishing Ohio River town, struggling in friendly rivalry with Madison, which was then the leading city of Indiana. Mr. Sonntag has two brothers living—Mr. William Sonntag, of New York, who is one of the most distinguished of American painters, and Mr. John H. Sonntag, a well-known citizen of Evansville. As a man of business, methodical and correct in all commercial transactions, George S. Sonntag's reputation in this community has been so long established and well sustained that it is unnecessary to speak of it further than to say that it was without a blemish. Until ill health laid its withering hand upon him George Sonntag was the most companionable of men, always welcome in the choicest coteries of congenial natures, and lending to the entertainment a quality of humor that was unlike any of the others in its quaint originality and hearty, gen-

In case discount or deduction is made it is noted as indicated in the form. This system has been in use some eight years, and has been largely adopted since by parties who have tested its utility. Its chief merits are referred to as being its brevity, the fact that it requires no letter of advice or acknowledgment and that the blanks are made of uniform size and small, their size being $7\frac{1}{2} \times 3\frac{1}{4}$ inches.

Obituary.

Wm. Henry & Co., wholesale Hardware merchants, Fort Worth, Tex., announce the death of their senior, Col. Wm. Henry, Jr., which occurred on the 16th inst. We are advised that the firm's business will be carried on without interruption.

Geo. S. Sonntag, member of the house of Geo. S. Sonntag & Co., Evansville, Ind., who have been in the Hardware business for upward of 35 years, died on the 12th inst. The estimation in which he was held is evidenced by the following extracts from the tribute which was paid to him in the *Daily Courier*, 13th inst.:

George S. Sonntag was a man of unusually distinguished presence, having about him at all times, whether in business affairs or in the social circle, the air of a man who had been fortunate in birth and associations. His grandfather, William Sonntag, was a Philadelphia merchant of great wealth and prominence nearly a century ago. He was an original claimant under what is known as the French Spoliation, his ships having been among those that were seized and confiscated by French cruisers during the war of 1812. An uncle of George S. Sonntag, and the one for whom he was named, was a sea captain and went to Russia many years ago, entered the naval service of that country and became a rear admiral in the Russian navy. He was one of the largest land owners in Southern Russia, and when his nephew and namesake was entering manhood, the old admiral invited him to come to Russia and cast his fortunes with him. But there were too many ties that bound George Sonntag to his native country. He was born in Cincinnati, Ohio, and finished his education in Woodward High School, the Hon. George H. Pendleton, the present Minister to Germany, having been one of his schoolmates and comrades.

It was always a pleasure to him to recall those youthful days, and his memory was

erous mood. His love for the bright side of all of the phases of life and his appreciation of whatever had a trace of humor in it never forsook him until health gave way.

Show Window Decoration.

The following remarks upon a subject which is receiving considerable attention at the hands of the retail stove and hardware trade of the country, we take from a recent issue of the *American Storekeeper*:

Window-dressing has become a leading feature in the business of retail merchants in all lines of trade. It is looked upon by most storekeepers as a useful art, yet all things which are useful are not cultivated, and there are many, far too many, stores throughout the country where no attention is paid to the decoration of windows; the smoky, dusty sheets of glass remain the same from season to season, and, as an almost universal rule, the trade total remains unincreased. So far as a somewhat extensive experience in mercantile matters has gone, no case has been observed in which window-dressing did not pay in a degree corresponding to the attention devoted to it. This has been the universal testimony of all business men who have ever expressed themselves on the subject, and the number of merchants who are paying more attention to this important subject is constantly increasing.

One reason why this art is not more freely cultivated may be because most storekeepers are men with a lack of an acute perception of the harmony of design and color which has caused them to avoid the decoration of their windows lest some offense to good taste might be perpetrated. Others are negligent because they find no time to devote to that part of business. At any rate, this journal hopes to convince every storekeeper who does not dress his windows that it is not a difficult thing to accomplish; also to extend to such storekeepers, as well as to those who have been practicing window decoration, such information as will enable them to produce good results with a modest outlay of thought, time and, especially, money.

To clerks seeking advancement in mercantile life, no surer passport to success is

to be found than to be an expert window-dresser. There is a dearth of clerks, even among women, who are able to lay out an intelligent plot for a window, and then follow it out completely. It has seemed to be the desire of most writers on the subject in the trade press to impress their readers with the idea that window-dressing is a most complex and laborious operation, difficult to acquire and necessitating the possession of great artistic ability and a creative brain. It may be that this course has discouraged clerks from making a beginning. If so, let the idea be dispelled. Any clerk who has wit enough to sell goods can certainly train himself to be a good window-dresser, particularly if helped along by rudimentary suggestions. A few words on the aims to be sought after in window decoration will give a better understanding of the benefits to be expected and the methods to be employed.

A decorated window must have three principal objects:

1. To serve as an index to the class of goods kept in the store.
2. To attract attention of people to the store.
3. To show goods which will excite in the people the desire of possession.

The first object for which windows should be decorated to serve as indices of goods kept in stock, is simply an advertisement, and must be so considered. It should be made to supplement advertising in the local papers, over which it has the advantage of presenting the object advertised directly to the purchaser, while in a newspaper the object may only be described. Advertising by window-dressing is very effective and costs nothing. A clerk's time is the only requisite, unless the merchant prefers to expend some money—wisely, too—for fixtures specially designed for the purpose. In a newspaper advertisement the merchant announces the articles he desires to sell. The purchaser reads the advertisement and starts on a shopping expedition with an intention of calling in to see the article advertised. If this is displayed in the window the customer is more apt to follow out the original intention of purchasing, and the sale is made more certain. That a customer may see, before purchasing, just the effect produced by combinations as artistically arranged in windows, is often a great aid to selection. The window advertisement goes constantly before hundreds of people who do not read papers, and is a standing invitation to people to purchase your goods.

The second object for which windows are dressed—to attract attention to the store—may seem to be inseparable from an advertisement, but it is that and something more. An advertisement simply announces that you have goods of a certain kind to sell. The window display does the same thing, but it also stimulates curiosity and excites examination and scrutiny of the objects displayed. Persons who have in mind the future purchase of certain articles, will invariably examine goods of the character desired, when displayed in windows which they may be passing. An article appeals more certainly to the taste of a buyer if it is harmoniously displayed. There is no doubt that taste in dress and decoration has been freely cultivated by good window-dressing. A writer has said: "To see just how a purchase is going to look in the home or on the person; to know how to place a vase, easel, picture, or a statuette so the best effect will be secured; to know just what shade of table-cover will best display the prettiness of knick-knacks placed upon it, or how to drape a fabric to the best advantage, are matters which window-dressing helps to decide. That purchase follows close upon decision is a logical certainty. But more than this, an artistic display in a window creates wants which sooner or later end in

purchases which otherwise might never have been made." Windows permit persons who are unfamiliar with prevailing fashions to learn what articles are being used without exposing their ignorance of styles to salesmen. These persons then become easier buyers.

The third object which windows should serve is to excite the desire of possession and induce purchases. The attractively dressed window is a silent salesman appealing for trade. Goods should be so displayed as to force people to feel that they would really like to possess them, and this feeling ends sooner or later in purchases. The result will be an instant sale to people able to gratify their desires; but those who have to plan and contrive before investing the store will be remembered and the goods called for long after they have been taken out of the window; by others the location will be communicated to friends who intend making purchases. In some one of these three ways the window will create business. As it is a constantly changing advertisement the wants of many different people will be catered to and all lines of trade be covered.

Having outlined the objects which should be sought in window-dressing, the merchant will have to use discretion in making his display fit well with his business. The character of the trade he is catering to should be understood; for it would be manifestly unprofitable for a merchant to show only high-priced goods to a trade of which 99 per cent. are unable to buy. It should be borne in mind that the millions use goods of medium quality, while only the hundreds use the finest grades. Hence, it will be wise to display medium-priced goods with exactly the same attention to detail as is used with the better goods. Remember that it is from the millions that most trade comes, and their interests should be served. Following this line of reasoning, the windows in a frontier town will differ very much in their composition from those in a well-settled community. The wants, habits and customs of frontier people are much more pronounced than those in interior towns, and they will stand and appreciate a style of window-dressing which would not be enjoyed in other places.

Another principle to be religiously followed is never to display goods for sale which you do not keep in stock, unless a statement is made to that effect. When the attention of a customer is attracted by a feature in the window, he wants to see the same thing in stock. Substitution is a sin of the first magnitude. If you display a bargain in the window be prepared to duplicate it on the counter. Use every legitimate means to get people into the store, but when they are inside do not deceive them.

The interest of passers-by must be drawn to your window. This may be done in one of three ways: By displaying an immense stock of the same article. Such an arrangement impresses people by its mass and ponderousness, and people will look at it for the same reason they look at a big horse, a large man or a massive block of coal. Americans admire largeness in almost anything. The second manner of attraction is by the peculiar and unlooked-for arrangement of the goods displayed. In this style of window-dressing is the skill of the dresser most to be displayed. In this may be called into use all the artistic feeling and ingenious faculties. To attract attention by mass requires but slight power; to attract it by delicate adjustment of light and shade, by skillful imitations of objects and by happy combination of fabrics, brings into play the dresser's best skill and force. In this division of dressing would be formulated all set pieces, all designs simulating windmills, lighthouses, cradles, ladders, stars, crescents, &c. Their invention can be

multiplied indefinitely by the clever dresser. A third method to attract notice to a window is by the use of means extraneous to the goods kept in stock. In this class might be arranged all mechanical toys, all exhibitions of curious animals, &c. They are very effective, but some merchants look on them as undignified.

After attracting attention to the window the looker-in should have his curiosity gratified by being able to discover the price at which the goods are sold. For this purpose neat price cards are very useful. In this branch of advertising set for your clerks the problem of having the best dressed windows in your town, and then attain your goal if you can.

Exports.

PER BARK N. B. MORRIS, MARCH 4, 1889, FOR MONTIVIDEO, URUGUAY.

By Coombs, Crosby & Eddy.—10 dozen Axes, 25,000 Fish-Hooks, 100 reams Sandpaper, 25 dozen Wheelbarrows, 44 dozen Slates, 55 gross Rubber Goods.

PER BRIG MARENA, MARCH 5, 1889, FOR ROSARIO, ARGENTINE REPUBLIC.

By Higganum Mfg. Company.—77 cases Agricultural Implements.

By A. D. Hitch.—60 dozen Mattocks, 13 dozen Hinges, 42½ dozen Knobs and Cranks, 42½ dozen Wrenches, 27 dozen Wrenches, 24 reams Sand Paper, 241 dozen Sledge Handles, 9 packages Axe Handles, 1 package Faucets, 20 packages Tacks, 1 package Plumbs and Levels, 7 packages Scales, 1 package Spring Balances, 200 pounds Nails, 2 Scales.

By J. H. Snyder.—228 packages Agricultural Implements.

By W. H. Crossman & Bro.—59 dozen Hatchets, 6 dozen Picks, 12 reams Sand Paper, 50 dozen Pick Handles, 50 dozen Axe Handles, 100 dozen Spades, 4 Hay Presses, 15 packages Hay Rakes, 222 Plows, 150 Plowshares.

By Markt & Co.—9 Carbines, 54 Revolvers, 31,500 Cartridges.

By Neuss, Hesselein & Co.—6 Corn Shellers, 6 Corn Mills.

By Emil Rump & Co.—12 dozen Chain, 1955 pounds Sand Paper, 6 cases Ladders, 17 crates Stoves, 17 packages Lamp Goods.

By Lyon & Co.—18 dozen Picks and Mattocks, 2 Harrows, 48 Stove-Pipe Joints, 16 Stove Elbows, 16 Stoves and Parts, 24 Plows, 4 dozen Hatchets.

By J. Norton & Sons.—35 Rakes, 55 packages Bulky and Hay Rakes.

BY BARK SCOTS BAY, MARCH 18, 1889, FOR MONTEVIDEO, URUGUAY.

By J. B. Woodward.—225 Sewing Machines, 1170 Plows and Repairs, 70 Corn Shellers.

By A. D. Hitch.—4 dozen Bush Hooks.

By Smith, Lyon & Co.—13 Plows and Extras, 2 Harrows.

By Stevens, Corwin & Co.—127 Clocks, 68 dozen Hay Forks, 118 reams Sand Paper, 1 cask Lamp Goods, 9 packages Hardware, 18 dozen Shovels, 4 casks Lamp Goods, 2 packages Lamp Goods, 42 packages Hardware.

By Waterbury Clock Company.—21 cases Clocks.

By E. Miller & Co.—44 packages Lamp Goods, 14 packages Lamp Goods, 27 packages Lamp Goods.

By W. E. Peck.—12 packages Hardware, 96 Plows.

BY BARK CELINA, MARCH 20, 1889, FOR LAUNCESTON, TASMANIA.

By H. W. Peabody & Co.—728 packages Hardware, 300 pounds Stone, 7 cases Shade Rollers, 13½ gross Grease, 15,680 pounds Barb Wire, 2780 doz. Handles, 26 packages Stoves, 15 cases Lampware, 6 dozen Firearms, 21 cases Agricultural Implements, 63 cases Fiber-Ware, 9 bundles Step-Ladders, 425 dozen Brooms, 1552 pounds Nails, 75 Churns, 29 cases Perambulators, 2 dozen Clocks, 2 cases Lawn Mowers, 1 case Trucks, 1 case Blocks, 2 cases Pumps, 17 packages Windmills, 50 bundles Washboards, 3900 pounds Nails, 12 dozen Shade Rollers, 5 cases Hardware, 9 cases Clocks, 3 cases Springs, 5 packages Axes and Wheels, 1 case Hydraulic Machinery, 4 dozen Garden Sets, 6 dozen Wringers, 25 bundles Tubs.

PER SHIP WARRIOR, MARCH 22, 1889, FOR MELBOURNE, AUSTRALIA.

By Arkell & Douglas.—½ dozen Spoke Trimmers, 2 dozen Augers, 850 pounds Castings, 22 sets Hubs, 1280 Spokes, 4 cases Castings, 523 pounds Bolts, 697 pounds Castings, 1 case

Lawn Sprinklers, 1 gross Glue, 1 case Lead Pencils, 11 cases Axes, 1 dozen Wire Goods, 2 cases Saws, 2500 Broom Handles, 9 cases Fruit Jars, 1 case Hardware, 9 dozen Hammers, 1 case Wire Goods, 1 case Latches, 10 dozen Axes, 2 gross Axle Grease, 560 pounds Axle Grease, 12 dozen Hammers, 18 dozen Locks, 12 dozen Gate Hinges, 6 dozen Hardware, 2 cases Wood Spoons, 50 gross Wicks, 1 case Bolts, 15 cases Axes, 9 cases Forges, 1 case Bolts and Nuts, 10 cases Bolts, 1 case Brackets, 1 case Wire Goods, 1 case Nails, 450 pounds Rivets, 2 cases Hardware, 2 cases Hubs, 1 case Guns, 3 dozen Fry Pans.

By McCoy & Sanders.—1 case Hardware.

By W. H. Crossman & Bro.—2 cases Boring Machines, 1 case Hardware, 6 dozen Burners, 6 dozen Braces, 1 gross Mouse Traps, 5½ dozen Wringers, 1 dozen Sad Irons, 1 case Hardware, 350 pounds Rubber Packing, 2 dozen Stocks and Dies, 60 pairs Tongs, 1 gross Valves, ¼ dozen Graters, 1 1-6 gross Fish Lines, 3 dozen Oilers, 2 dozen Sifters, 1 case Hardware, 3 dozen Match Safes, 1½ gross Spoons, 3 dozen Rolling Pins, 1 box Pails, 13 dozen Braces, 1 dozen Tire Gauges, 4 dozen Screw-Drivers, 3 cases Hardware, 10 packages Hardware, 2 dozen Grindstone Fixtures.

By R. W. Forbes & Son.—2 dozen Clothes Wringers, 8 gross Fruit Jars, 5 gross Axle Grease, 11 dozen Clothes Wringers, 14 packages Lampware, 20 packages Hardware, 900 Nails, 2400 pounds Carriage Bolts, 9 packages Hardware, 60 sets Hubs, 1 case Hardware, 5 dozen Clocks, 14 cases Hardware, 26 dozen Hatchets, 53 dozen Axe Handles, 4 dozen Bench Screws, 13 cases Hardware, 3 dozen Rifles, 12 dozen Axle Grease.

By Winchester Repeating Arms Company.—62 Guns, 70 sets Tools, 110,000 Primers, 20,000 Metallic Cartridges, 17,000 Metallic Cartridges, 50,000 Paper Shells, 24 Rifles, 26,000 Metallic Cartridges, 70,000 Primers, 55,000 Paper Shells, 35,000 Cartridges, 650 pounds Cartridges, 10,000 Paper Shells, 25 Guns, 8000 Cartridges, 7000 Shells, 18 Guns, 30,000 Primers, 20,000 Shells.

By Crane & McMahon.—10 bundles Crowbars.

By Coombs, Crosby & Eddy.—3053 pounds Machinery and Castings, 100 boxes Clothes Pins, 4 dozen Lamp Goods.

By Welsh & Lea.—8 packages Axes, 4 cases Hardware, 3 cases Saws, 2 cases Hardware, 1 case Hardware, 1 case Handles.

By H. W. Peabody & Co.—24,000 feet Fuse, 11 cases Type-writers.

By Edward Miller & Co.—23 packages Lampware.

By R. W. Cameron & Co.—44 cases Handles, 8 cases Hardware, 11 cases Handles.

By Strong & Trowbridge.—3 cases Hatchets, 1 case Axle Grease, 3 cases Axe Handles, 1 case Wringers, 1 case Brooms, 1 package Clothes Pins, 1 case Harness Polish, 1 case Springs and Axes, 1 case Nails, 2 cases Spokes, 1 case Hardware, 1 case Spokes, 1 case Hardware.

By A. Field & Co.—95 dozen Whip Handles, 24 dozen Harness-Ware, 12 dozen Whip Handles, 4 cases Harness Goods, 300 dozen Whip Handles, 124 dozen Harness-Ware, 12 gross Whips.

By Mailer & Quereau.—65,005 pieces Roofing Slate, 230 dozen Axes, 360 dozen Handles, 3 packages Iron Castings.

By Morris, Strouse & Co.—14 dozen Hatchets, 16 dozen Axes, 24 dozen Hammers, 1225 pairs Skates, 3 dozen Wringers, 4 gross Sewing Machine Oil, 1 gross Wood Handles, 152 dozen Rules, 48 dozen Gate Latches, 17 dozen Hardware, 29 dozen Iron Stands, 2 cases Hardware, 2 dozen Hatchets, 72 dozen Tacks, 2 gross Egg Beaters, 3 gross Mucilage.

By McLean Bros. & Rigg.—1 dozen Card Knives, 12 Scales, 12½ gross Axle Grease, 9 dozen Saw Sets, 6 dozen Bench Stops, 12,800 Bolts, 130 dozen Axes, 12 Guns, 40,000 Primers, 20,000 Paper Shells, 20,000 Loaded Shells, 30 packages Belt Studs, 36 dozen Hammers, 9 cases Pulleys, &c.; 900 pounds Nails, ¼ dozen sets Sad Irons, 5 Scales, 7 dozen Augers, 7 cases Brackets, &c.; 6000 feet Hose, 3500 pounds Nails, 3 cases Agate Ware, 40 kegs Nails, 84 dozen Handles, 15 dozen Barrows, 130 dozen Axes.

By New Haven Clock Company.—18 Clocks, 940 Clocks.

By Meriden Britannia Company.—2 packages Plated-Ware.

By Lalance & Grosjean Mfg. Company.—1080 pounds Household Utensils.

By E. N. Welch Mfg. Company.—1 box Clocks.

By Healy & Earl.—2 boxes Scales, 1 box Emery Machinery, 1 box Emery-Wheels.

By W. K. Freeman.—90 dozen Axe Handles, 6000 Loaded Shells.

By F. B. Wheeler & Co.—82 Velocipedes, 6 dozen Hammers.

By H. Behr & Co.—3 cases Sandpaper.

By John A. Gifford.—1 case Springs

By Singer Mfg. Company.—113 cases Sewing Machine Oil.

New Butchers' Tools.

Robert Murray, 24 Duane street, New York, is putting on the market the solid cast-steel splitting knives and cleavers

different uses indicated in its name. The efficiency of its operation for these different uses is pointed out. It is made entirely of malleable iron, and finished in Vienna bronzed lacquer. It is also pointed out

Fig. 1.—Solid Cast-Steel Splitting Knives.

which are here represented, for the sale of which he is sole agent. The socket splitting knife is made in 10 and 12 inch sizes. The cleavers shown in Fig. 2 are

by the manufacturers that it will serve as a stove-lid lifter and a pair of pinchers.

Triumph Halter Chains.

The Bridgeport Chain Company, Bridgeport, Conn., are making a line of Triumph Halter Chains, the form of link being represented in the accompanying illustra-

Fig. 2.—Solid Cast-Steel Cleavers.

made either double bit or single bit, in 7, 8, 9, 10, 11 and 12 inch sizes.

A New Combination Tool.

The Wire Washboard Company, Canton, Ohio, are manufacturing the Champion Combined Tack Hammer, Setter and

Fig. 1.—Combination Tool as Tack Setter.

Pipe Wrench, which is represented in the accompanying illustrations, Fig. 1 showing it as a tack setter and Fig. 2 as a gas

Fig. 2.—Combination Tool as a Gas Burner and Pipe Wrench.

fixture and pipe wrench. From these illustrations it will be seen that it is so constructed as to be adapted to the three

tion. They are described as made of steel throughout and possessing great tensile strength, while they are much lighter in weight than the flat sheet-metal chains or

Triumph Halter Chain.

the welded chains. The point is also made that they have no sharp edges and do not kink, while as there are no welds additional security is obtained. They are made in a variety of numbers, $4\frac{1}{2}$ and 6 feet lengths. Coil-chain is also made of the same pattern.

The Boston Athenæum Building has been reconstructed and wire lathing substituted for wood as a precaution against fire.

Abbe's Patent Sash-Cord Fastener.

The accompanying illustrations, Figs. 1 and 2, represent a new device which is manufactured by Edwin W. Abbe, New Britain, Conn. It is intended, as the name and illustrations indicate, for fastening braided and all hard laid cords to the sash and weights without tying knots. As will be seen by these illustrations, the cord passes down through the opening

Fig. 1.—Abbe's Patent Sash-Cord Fastener.

in one end of the fastener and up through the opening in the other end, when the spurs or points in both ends are driven in so as to hold the cord securely. The point is made that this fastener can be applied in much less time than it takes to unbraid and tie a knot in the old cord iron, and that its use saves cord. The two points on top which by the weight of the sash are drawn into the wood are referred to as keeping it from working against the casing. These sash-cord fast-

Fig. 2.—Sash-Cord Fastener with Sash Weight.

eners are manufactured in two sizes. No. 1 is the most commonly used and takes Nos. 7 and 8 cord, while No. 2 takes No. 9 and No. 10.

The new State of Washington is being equipped with railroads. The recently formed Spokane Falls and Northern Railway Company, who are going to construct a standard gauge road 175 miles long from Spokane Falls to the Columbia River, will have officers from this city and Brooklyn. J. K. O. Sherwood has been elected president, and Mayor Alfred C. Chapin, of Brooklyn, treasurer. The capital of the company is about \$7,000,000. The new road will connect at Spokane Falls with the Northern Pacific, and by boat to Revelstroke with the Canadian Pacific. The road will open up valuable timber and coal regions. A contract to build the entire road has been made with D. C. Corbin, brother of Austin Corbin

Little Gem Adjustable Hose Holder.

This article is manufactured by the Gibbs Lawn Rake Company, Canton, Ohio, for whom John H. Graham & Co., 118 Chambers street, New York, are general agents. The illustration herewith given represents it in use. It is described as made of No. 10 spring steel wire, heavily tinned, making it neat in appearance and preventing rusting. The hose, when placed in the holder, is held firmly

factory, is practically solid and of standard size, and which can be placed in a collet, plate, or chuck any number of times, and always cut the same size until wear takes place, which can readily be compensated for in the manner shown.

The Gem Post-Hole Auger.

J. H. Osborne & Co., Union City, Ind., are putting on the market the above-named article, which is represented in the

Little Gem Adjustable Hose Holder.

and can be quickly adjusted, the manufacturers making the point that no thumb nuts or other annoying contrivances are embodied in its construction. It is also pointed out that the holder can be readily changed from place to place without shutting off the water before approaching it. The convenience of the holder in watering small lawns or narrow strips of grass and the low price at which it is offered are also referred to.

New Adjustment for Dies.

The illustration shows a new threading die brought out by J. M. Carpenter, Pawtucket, R. I., the special feature of which consists in the insertion of a taper pin into a hole reamed for its reception in the slot or opening and intended to serve the purpose of the more costly collet or collar in which such dies are usually placed. These dies are so made as to have a tendency to spring together or close up the opening, which makes them grasp the pin firmly. When worn large, it is only necessary to

New Threading Die.

drive the pin out slightly, when the die closes. After properly adjusting the size, the projecting end of the pin can be smoothed off. Should the two parts of the dies be sprung sidewise in hardening, the insertion of the pin restores them to their proper places, making the threads match as before. By this means the advantages of a solid die are secured, and yet it can readily be adjusted. Neither is it necessary to readjust it each time it is placed in the stock or holder. It will thus be seen that by this simple device a die is provided which, when it leaves the

accompanying illustrations, Fig. 1 showing it open for dumping and Fig. 2 showing the blades closed for the removal of fine dirt after it has been inserted in the ground. It will be perceived the opening and closing of the blades is accomplished without removing the hands from the handles, there being no latches or springs in their construction. The manufacturers claim that this is the only post-hole auger having blades so shaped as to permit them to close tightly at the points, thus retaining the finest dirt or sand. The peculiar shape of these blades has been patented. The auger is described as made almost entirely of steel and is referred to as very strong, the leverage extending clear to the

Fig. 1.—The Gem Post-Hole Digger—Opened.

Fig. 2.—The Gem Post-Hole Digger—Closed.

cutting blades. The ease and efficiency of its operation, as well as its substantial construction, are also pointed out.

Detroit expects to have a permanent exhibition, \$247,000 of the \$300,000 desired for this object having been subscribed. The proposed site is a tract of 70 acres below Fort Wayne.

The Yale Steel-Shell Padlock.

The construction of the Yale bronze padlock is well known, and consists of an outside seamless bronze shell, which incloses the gun-metal block carrying the

The Yale Steel-Shell Padlock.

working parts. When the lock is together, therefore, it is practically a solid block of metal, and gives very great strength against blows or against any crushing strain designed either to open the lock or to interfere with the working of the mechanism. In some situations where the locks are subjected to very severe usage, such as for switch-locks, it has been found desirable to use steel shackles, which are stiffer than the bronze, and also more secure against cutting or other violence. For certain situations these steel

shackles have been found so desirable that the Yale & Towne Mfg. Company have followed this matter still further, and have now ready for the market a padlock with a seamless steel shell as well as a steel shackle. The mechanism of this lock is also carried by a gun-metal block, which gives the lock the same solidity against being crushed as the bronze lock has. It

is proposed to finish the case of the lock by the Bower-Barff process, which will make it rustless. The mechanism is the same as in the bronze lock, so that the lock is offered as possessing very great security against picking, against violence and against the action of the weather. Facilities have been provided for its manufacture, so that despite its high grade the price will be moderate. The list number of the lock is 8454, and it is at present made in only one size, as illustrated.

The Sullivan Cork-Puller.

The illustration herewith given represents a new cork-puller put on the market by James D. Frary, Meriden, Conn., and embodying features for which he is obtaining patents. As will be inferred from the illustration, the corkscrew is inserted in the cork by means of the handle at the top of the puller, when, by raising the lever or principal handle, which, by means of the gears attached to it, is connected with the rack to which corkscrew is attached, the cork is easily extracted. It will be seen that the cork-puller has a clamp attachment for fastening it to the counter or shelf. The screw is described as made of the best cast steel, hardened and tempered.

The Sullivan Cork-Puller.

This puller is made in two styles, ornamented in Berlin bronze and nickel-plated. The simplicity and strength of its construction, its ornamental appearance and the efficacy of its working are the points in regard to it which are emphasized by the manufacturer.

Steel Tray Wheelbarrow.

The Sidney Steel Scraper Company, Sidney, Ohio, are manufacturing the wheelbarrow represented in the accompanying illustration. The tray, which is neatly blackened, is made from a single piece of steel bent to shape, and has round corners, thus leaving no place for dirt to stick. Particular attention is directed to

the wheel, which is made of wrought iron. As indicated in the engraving, the inner ends of the spokes are firmly welded to the axle; the other ends are shouldered, permitting them to be securely riveted in the tire. The manufacturers point out that the spokes, hub and axle, being thus welded together, form one solid piece, insuring

Haslup's Steel Tray Wheelbarrow.

great strength. The barrow is described as thoroughly braced and attractive in appearance, the frame being made of good lumber, planed smooth and well painted. All parts are bolted together, making it very easy to set up, and the manufacturers allude to it as being lighter than an all-wood barrow.

The Ehman & Simon Wood Mantels.

Wood mantels are now regularly carried in stock by many hardware merchants all over the country. Prominent among the establishments giving special attention to this branch of trade are the Ehman & Simon Mfg. Company, whose factory is at

ing the demands of the people whose æsthetic tastes have been found worth cultivating in this line as well as in others. From 80 to 100 hands are employed in this establishment and shipments of goods are made all over the country, from Portland, Me., to Portland, Ore., to points in Florida, and to Galveston, Tex. No catalogue is issued, as the designs are constantly changing, but photographs are made whenever deemed necessary or desirable.

American Screen Wire Holder.

This article, patented April 17, 1888, is manufactured by John Hosford, Monroe-

American Screen Wire Holder.

the corner of Elizabeth and Fulton streets, Chicago. They make a very large line of mantels and over-mantels in either stock patterns or special designs. They occupy a brick building whose dimensions are 50 x 140 feet, four stories high, devoted entirely to their own purposes. The lumber in the rough is received on the first floor, where it is dressed and cut to size. Carving is done on the second floor, joining on the third floor, and finishing on the fourth floor. The second floor also contains a drafting-room and a sample-room. In the latter a large line of samples is carried,

ville, Ohio, and is represented in the illustration given above. As thus shown, it will be seen that this is a construction for holding rolls of wire cloth of different widths, having accommodations for seven rolls. The point is made that there is no difficulty in putting the rolls in place, and that when the holder is full a fine display is secured. The moderate price at which it is offered is also alluded to as further commending it to the attention of the trade. The convenience and utility of the holder are referred to in some testimonials which are furnished.

Self-Acting Sprinkler.

A. J. Lane, of Glenville, Ohio, is offering the trade a self-acting potato-bug sprinkler, a general view of which is afforded by means of the engraving presented herewith. The sprinkler consists essentially of a cylinder $8\frac{1}{2}$ inches in diameter and 24 inches high, having a funnel-shaped top so constructed that the sprinkler may be easily filled with liquid. Within the cylinder is an agitator connected with the lever extending over the left shoulder of the operator. A string is attached to the end of the lever which is employed by the operator to occasionally agitate the contents of the sprinkler. The cylinder is fastened to a back-board, to which is attached the shoulder straps by which it is carried. The sprinkler

Lane's Self-Acting Sprinkler.

holds 5 gallons and weighs when full about 40 pounds. The nozzle is made entirely of brass and is constructed with a valve at the end so placed as to prevent any loss of liquid when the valve is shut. An inspection of the engraving will show the manner in which this valve operates. The nozzle is of simple construction and may be taken apart for the purpose of cleaning or repairing, as may be necessary. It is connected with the cylinder by means of a piece of rubber hose. The construction of the sprinkler is such that its contents cannot spill over, while the back-board tends to prevent the operator taking cold. To the latter feature the manufacturer directs special attention, as at the season of the year when these sprinklers are likely to be employed the operator is lightly clad and without some protection would be likely to be chilled by the cold cylinder upon his back. In using this sprinkler care should be taken to have clean water, as otherwise the nozzle may become clogged. The proportion of Paris green employed is one tablespoonful to 5 gallons of water. The device is said to be very satisfactory in operation, and to prove a sure method of exterminating bugs and insects on potato, cotton and tobacco plants. The maker states that it can also be satisfactorily employed for cleaning carriages and watering plants and flowers.

Rake Cap.

This article is manufactured by the Rake Cap Company, Bridgeport, Conn., and illustrated herewith, the cut giving a view of the cap unapplied and also attached to the rake. The caps are made of galvanized-wire netting, and are firmly and neatly put together. They are readily attached to any garden, lawn or hay rake, and are very durable. Two

sizes are made, a large one for wooden rakes and a smaller one for garden rakes. The former is hooked or fastened over the head of the rake, while the latter is hooked under the head. A staple may be used to secure the semi-circular rod at the point where it rests on the rake handle, thus holding the cap firmly. The manufacturers emphasize the value of this cap in

Rake Cap.

raking, in that it prevents leaves, sticks, grass, &c., from escaping over the rake head, referring also to the low price at which it is offered.

Peerless Reversible Window.

In the engraving presented herewith we show a general view of the Peerless Reversible Window which is being introduced to the trade by Edgerton & Metcalf, of No. 120 Twenty-second street, Chicago, Ill. The form of construction employed is such that the window may not only be raised and lowered in the ordinary manner, but it may be reversed without difficulty, bringing either side of top and bottom sash within convenient reach of a person standing on the floor. Inserted edgewise in grooves in the stiles of the window is a clamping plate which extends from top to bottom of the sash. This plate is provided with rounded projections and slots at the top, center and

Peerless Reversible Window.

bottom, through which pass spindles or bearing pins. The center spindle carries an eccentrically mounted cam roller, by means of which the plate referred to may be moved in or out of the grooves in the window stiles something after the manner of an ordinary lock. Midway from top to

bottom of the sash a sleeve is inserted through the stiles at each side of the window for the reception of a spring bolt or catch which locks the window in place or, when the plate above referred to is withdrawn from the jamb, allows the window to be revolved as on a pivot. The groove for the sash cord instead of being in the stiles, as is ordinarily the case, is formed in the jamb or frame inclosing the window proper. The cord plate forms a pivotal connection between the sash cord and the window, so that no matter what the position of the window may be, the cord remains relatively the same. The projections at top and bottom of the clamping plate fit the grooves for the sash cord in such a manner as to prevent the window from rattling, at the same time maintaining a tension that permits the window to easily move up and down. When the window is to be placed in position, the clamping plate is drawn into the stiles by turning with a key the spindles upon which is mounted the cam roller. The perforated end of the cord-plate is then slipped over the inner end of the sleeve, when the window may be set in place. By turning the spindles in the opposite direction one edge of the clamping plate is partially thrown into the cord groove in the jamb and, as the plate advances, the projections or lugs, at top and bottom, are forced into place.

New Design Metallic Shingle.

The Cincinnati Stamping Company, of Cincinnati, Ohio, are introducing to the building trade some new design

New Design Metallic Shingle, Showing Size of Shingle, Method of Joining and Position of Joints.

metallic shingles, a general view of which is afforded by means of the engraving presented herewith. The shingles are stamped from 10 x 14 inch tin plate, and when laid have very much the appearance of 7 x 10 shingles. The lock employed is the same as that which the company use in connection with their other shingles, many thousands of squares of which are said to have been placed upon buildings scattered through the country. By reference to the engravings, the reader will be able to gather a very clear idea of the manner in which the shingles are put together, the position of the joints and the form of lock employed.

A cargo of bones from Alexandria, Egypt, which was delivered in Brooklyn last week for fertilizing purposes, was gathered from the Desert and comprises bones from all parts of the human frame as well as those of beasts. The mines are practically inexhaustible, and are being worked by German speculators.

CURRENT HARDWARE PRICES.

MARCH 27, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.
